# A

**A** is the first letter in the Eng. alphabet, as in all the European alphabets. It is derived through the Lat. and Etruscan from the Gk. *alpha*, and we still retain in our cap. A the Gk. and Rom. lapidary form. The Gks., who learned the art of writing from the Phoenicians (see ALPHABET), borrowed this letter from the Semites. Indeed, whereas the Gk. name is meaningless in Gk., the Semitic name, *aleph*, is a word in the Semitic languages, meaning ox, as the Phoenicians thought it resembled the head of an ox. Our small a, in both its forms, *italic* (a) and *roman* (a), derives from the Caroline form (employed in the Frankish empire at the end of the eighth century), which in its turn descended from the semi-uncial book-hand (used from the fifth to the ninth century). The Venetian minuscule, nowadays known as *italics* (introduced in Florence in the fifteenth century), and the Rom. type of letters (perfected in N. Italy, chiefly at Venice, where it was used in the printing presses about the end of the fifteenth century), were here adopted. from Italy, in the sixteenth century. The black letter or Gothic, also developed from the Caroline (at the end of the twelfth century) and employed in N.W. Europe, including England, until the sixteenth century, is still used in Germany as the 'national' hand.

The Semitic *aleph* was (and still is, for instance, in Hebrew) a consonant, not a vowel. Its sound was that of a guttural breathing, and, strange to say, this sound is perhaps the most commonly represented by our own A, as in *aboard*, *aground*, etc. The Gks. adopted the symbol to represent what is now the general continental pronunciation of A, but which is rather rare in Eng.; this is the purest and simplest vowel sound, and is uttered by opening the air passage to its fullest extent, as in *father*. It is regarded as the primitive vowel sound. The third sound represented by A is that in the word *call*; this sound should really be represented by *au*, and is influenced by the double consonant at the end of the word in which it occurs. The modified pronunciation of A, as in the word *tame*, is partly due to the mute vowel *e* at the end of the word. Again, in words like *care*, *pare*, *rare*, A represents a sound which might be more accurately represented by the diphthong *ai*. Finally, we come to the short A as in *cat*, which is the most common in the conversation of educated people. These sounds are modified in the various dialects of the country.

The letter A is the most easily pronounced of the vowels, requiring neither the retraction of the lips like *i* (= *ee* in *feet*), nor their propulsion as in *u* (= *oo*).

A is readily interchanged with O, as in the Ger. and Eng. *kalt*, *cold*. It

is interchanged also with E. Thus the Rom. generally substituted an A where we now find E in Ger. names, as *Albis* for *Elbe*; *Amisia* for *Ems*. A is interchanged with I, as in the Gk. *ai*, *av*, and the Lat. *in*, and in the Lat. *sine* and the Fr. *sans*.

A (in music), see SCALE.

A or An, the indef. art., a being used before a consonant, an before a vowel; as *a king*, *an emperor*. Sometimes a virtual consonant exists at the beginning of a word without being written, as in *union* and *once*; before these words it is customary to drop the final letter of the article in conversation and writing. When an *h* is mute, however, we may at the risk of pedantry retain the *n* in writing and speaking; thus, *a history*, *an historical work*. That *an* and not *a* was the original form is proved by the A.-S. *an* and the Ger. *ein*; indeed our numeral one is nothing but a form of it. The *a* in 'three shillings a pound,' however, is not an indefinite article but a deteriorated form of an O.E. preposition. The double form of our article has caused certain words to be wrongly written, as *a neut* for *an eul* (*eft*). The letter *a* often appears prefixed to a word, as in *aside*, *afont*, *aboard*, *nowadays*, etc.; these are derived from *on syde*, *on fote*, *on borde*, *now-on-daies*, all of which forms are found in our old Eng. poets; this *on* is an A.-S. preposition meaning *in*. In many places *a* now takes the place of *on*, as 'he fell asleep,' which in an old version of the N.T. was 'he fell on sleep.'

**Aa**, the name of sev. small rivs.—3 in Germany, 1 in Switzerland, 2 in Holland, 2 in Latvia, and 1 in France. The Fr. riv. is in the Pas-de-Calais dept., and flows through Gravelines and St. Omer.

**Aach**, a small riv. and tn. Baden, Germany. The tn. is situated near the source of the riv. Pop. 1000.

**Aachen**, the Ger. name for Aix-la-Chapelle, a historic cathedral city in Rhineland, Germany, 40 m. W.S.W. of Cologne. In 1668 a peace signed at A. terminated the Franco-Sp. war; the second war of the Austrian Succession was ended there by a treaty (1748); and in 1818 a congress met there to settle the disposition of Europe after the Napoleonic wars. The cathedral was begun by Charlemagne in 796. Under its dome was placed his tomb, opened in 1000 and found to contain the emperor's body, imperially robed and seated on a marble throne; his remains were later put into a shrine. Its manufs. include textiles, needles, machinery, rubber tyres, and electric light bulbs. Before the Second World War the sulphur springs of A. were much patronised, some being of 136°. There is a fully equipped technical high school, with the right of granting degrees.

**Pop.** (1939) 165,700. The city prospered from 1815, owing to the neighbouring coal-mines. A. fell to the Amer. forces on Oct. 20, 1944, after a week's bitter fighting in the streets. Despite the fact that much of the city was reduced to rubble, the cathedral was comparatively little damaged by the bombardment. In the octagon chapel, which was untouched, Charlemagne's throne was found by the Amers. still there in its gallery encased in concrete. Many other religious and historic relics had been removed from A. before it became a battlefield. The tn. hall was a shattered mass of broken masonry and shapeless roofs, with the metal girder-work of its towers fantastically twisted by fire. *See also* WESTERN FRONT IN SECOND WORLD WAR, *Battle of Aachen*.

**Aaland Islands**, the chief is in an archipelago of the same name consisting of more than 6500 is. islets, and skerries, at the entrance to the gulf of Bothnia, forming part of Finland. Only about two of the is. are inhabited. Taken from Sweden by Russia in 1809, and occupied by the Allies in 1854. They were used in the First World War by the Gers. as a naval base, but in 1921, neutralised and demilitarised under a convention signed by Great Britain, France, Italy, and all the Baltic states except Russia, and the forts razed. A plebiscite taken in the same year was favourable to self-gov. but the is. now form part of the republic of Finland.

In 1939 an agreement was concluded between the Finnish and Swedish Govs for the remilitarisation of the is., and approved by the signatories of the 1921 convention, but action was blocked by Soviet opposition. The is. are of the greatest strategic importance because they dominate the entrance to Finland, Russia, and N. Sweden. **Pop.** 28,000.

**Aalborg**, in N. Jutland, on the S. side of the Limfj. Fiord, is a cathedral tn. and the seat of a bishopric. It exports cattle, hides, wool, dairy produce. Bombed by the R.A.F. in Apr. and May, 1940. **Pop.** 42,820.

**Aalborg Amt**, the most N. div. of Jutland, the cap. of which is Aalborg (q.v.).

**Aalen**, a tn. on the Kocher, near Stuttgart in Wurttemberg, Germany, pre-war manufs. iron and woollen goods, **pop.** 14,600.

**Aalesund**, a tn. in Romsdal, Norway, a great port for cod-fishing; burnt down in 1904, but rebuilt since; bp. of Rollo. Has broadcasting station. **Pop.** 13,400.

**Aali Pasha** (1815-71), a Turkish statesman. At the Congress of Paris he represented Turkey, and maintained its rights with great skill. He helped to put down the Cretan rebellion (1867-68) and subdued the khedive of Egypt (1869). From 1861 to his death he shared with Fuad Pasha the post of vizier.

**Aalst**, *see* ALOST.

**Aalten**, a vil., Gelderland, Holland, **pop.** 7500.

**Aamot**, a tn., Hedemarken, Norway, noted for textiles; **pop.** 3500.

**Aar**, a trib. of the Rhine; rises in the Grimsel in Switzerland and flows through Lakes Brienz and Thun, joining the Rhine near Waldshut. On its banks are Moringen, Interlaken, Thun, Berne, Aaberg, Soleure, Aarburg, Aarau, and Brugg. It has sev. tribs., among which are the Reuss and the Limmat. It is 170 m. long.

**Aarau**, cap. of Aargau, Switzerland, on the Aar, 40 m. N.E. of Berne, manufs. silk, leather, cotton goods, mathematical instruments, **pop.** 12,000. Here met the assembly of the diet of the cantons, 1798, and proclaimed the Swiss Republic.

**Aardvark**, the (Cape ant-bear), is an animal closely related to the great anteater. It has large pointed ears, tapering snout and tail, stumpy legs, a long slimy tongue, and little hair on its body. Its name (*aard-vark*) is the Dutch for earth-pig, a very appropriate one, as it resembles the pig in its burrowing and grubbing, for which its sharp snout is of great use. Its hams are esteemed as good as those of a pig. When fully grown it is about 5 ft. long. During the heat of the day it lies in its burrow. It is the only ant-eater possessing teeth, having 7 molars on each side above and 6 below. It is very timid, and if pursued burrows very rapidly: it can be killed by a smart blow on the snout. *See* ANT-EATER.

**Aardwolf**, the (*Proteles cristatus*), is an African animal 3 ft. 6 in. in length, of yellowish-grey colour, with heavy dark stripes and a long bushy tail. It resembles a young hyæna; it has peculiar teeth: the first 3 above are false and the fourth is small: it has no cutting teeth. As its name indicates, it is a burrowing animal, of nocturnal habits and timid disposition. It is like the hyæna in its taste for carrion and termites, which it digs up with its sharp claws.

**Aarestrup**, Carl Ludvig Emil (1800-1856), a Dan. poet, b. in Copenhagen. He pub. *Aftenladte Digte* in 1838, which made some stir, but it was not till after his death, when Brandes edited his *Samlede Digte* (1877), that he became known throughout Denmark as one of the greatest lyric poets.

**Aargau**, or **Argovie**, a canton of Switzerland, taking its name from the Aar, which flows through it. It is bounded on the N. by the Rhine, on the S. by the canton of Lucerne. Area about 550 sq. m. Became democratic after the war of the Sonderbund in 1841. In the fertile parts the people are engaged in agriculture, dairy farming, and cattle-breeding. **Prin. tns.** Aarau (cap.), Baden, Brugg, Laufenburg, Lenzburg. **Pop.** 260,000; the majority are Protestants.

**Aarhus**, second port in Denmark; has a good harbour, improved 1880-90, exports grain, flour, dairy produce, oysters, and tallow; imports coal, timber, wine, sugar, tobacco, and manufactured goods, it has long been the seat of a bishop and has a large cathedral; **pop.** 91,000.

**Aarhus Amt**, a div. in the E. of Jutland; cap. Aarhus (q.v.); pop. 120,000.

**Aaron** (Heb. 'Aharôn), brother of Moses, 3 years his senior. He seems to have acquired some influence with his tribe, the Levites, and by divine suggestion he came to meet Moses and assembled the elders to confer with him (Ex. iv.). He became the associate and spokesman of his brother in their interviews with Pharaoh (Ex. v.). The priesthood was fixed in his line (Ex. xxviii.). While Moses was on the mt. A. was intimidated into making the golden calf (Ex. xxxii.). Notwithstanding this A. was not deprived of the priesthood. He was consecrated high priest (Lev. viii.), and his consecration was ratified by the budding of his rod, while the rods representing the other tribes remained unchanged (Num. xvii.). He married Elisheba and had 4 sons.

**Aaron's beard**, the common name for *S. sarmentosa* of the order Saxifragaceae. It is a well-known Chinese plant usually grown in a hanging basket. The name is also applied to the *Hypericum calycinum*, the large-flowered St. John's wort.

**Aarschot** or **Aerschot**, tn. of Brabant, Belgium, on the R. Demer. Was a fortified crossing place in Rom. times. In Aug. 1914 the Gers. shot more than 150 of its inhab. on various pretexts; about 400 houses went up in flames and another 1000 were pillaged. Important agric. centre. Pop. 8750.

**Aarsens, Frans van** (1572-1641), Dutch diplomatist. Ambass. to France, England, Venice, enemy of Barneveldt.

**Aartsen, Pieter**, see **ARTSEN, PIETER**.

**Aasen, Ivar** (1813-96), b. in Romsdal, Norway, self-educated; studied the Norwegian dialects, in which he was regarded as the greatest authority. Attempted to construct from them a composite language; pub. a grammar (1848), and a dictionary (1850) of the 'Norwegian Popular Language.' In this composite language he wrote plays and poems.

**Aazariyeh, El**, see **BETHANY**.

**Ab**, the eleventh month of the Jewish civil year, corresponding to a part of July and a part of Aug.; it does not occur in the A.V. of the Bible, but is often found in the Talmud.

**Ababde**, a vil. of Middle Egypt, on the Nile, near which are found ruins of Antinôe, a city built by Hadrian and named after Antinous, and also ruins of Bosa.

**Ababde**, a nomad tribe of Hamitic people, partly of Arabian descent, who dwell between the Nile and the Red Sea. They are hospitable and honest, but at times treacherous, they travel extensively. Their homes are huts and caves, and their speech is usually Arabic. They possess herds of sheep and goats, the camel is their beast of burden, and they trade in gum and senna. In number they are nearly 40,000.

**Abaca**, the Philippine name for *Musa terilis*, yielding fibre for ropes and cordage; cultivated in the Philippines, whence exported; resembles banana in growth. See **HEMP**, **MANILA HEMP**, **BANANA**, **FIBRE**.

**Abacenum**, anct. tn. of the Siculi in Sicily, W. of Messina and S. of Tyndaris.

**Abaco**, see **BAHAMAS**.

**Abaculus**, a small tile of glass or marble used in mosaic work.

Norman: New Romney, Kent

Early English: Oxford Cathedral Chapter House

Decorated: Merton College Chapel

Perpendicular: Henry VII. Chapel, Westminster

#### ABACUS, IN ARCHITECTURE

**Abacus**, instrument used for aiding calculation; the name may be given to any machine for counting with beads, etc., in which one row stands for units, another for tens, etc. In England it is only used nowadays in infant schools to teach children to count. Used by Romans, and still used in parts of Russia, China, and Persia. Also. 1, in architecture a flat stone at the top of a column; 2, a dice board; 3, a mathematician's table covered with sand on which figures were drawn; 4, a sideboard.

**Abadan**, is. at entrance to Persian Gulf, with oil refineries. Pop. 40,000.

**Abaddon**, the name given to the king of the mystical army of locusts (Rev. ix.), the 'angel of the bottomless pit.' The Gk. equivalent is Apollyon. The Heb. term occurs thrice in Job, twice in Proverbs, and once in Psalms, rendered by 'destruction.' It is thrice associated with 'Sheol,' and once with 'Death.'

**Abadeh**, a tn., Persia, halfway between Isfahan and Shiraz, noted for wood-carving and fruit; pop. 10,000.

**Abakansk**, a tn. on the Yenisei, in the Khakass Autonomous Region of the R.S.F.S.R., noted for coal-mines; pop. 36,000.

**Aballo**, see **AVALON**

**Abalone**, or ear shell, a shell fish of the family *Haliotidae* found chiefly on Californian coasts and largely used for food

**Abana** or **Amana**, one of the rivers of Damascus (2 Kings i), now the Barada the Gk *Chrysorroas*

**Abancay**, cap of Apurimac Peru near Cuzco, noted for sugar pop 6000

**Abancourt, Charles Xavier Joseph d'** (1759-92), b at Douai supporter of Louis XVI minister during the Revolution in 1792 appointed minister of war, declared an enemy to freedom and murdered at Versailles by the mob Sept 9 1792

**Abandonment**, see **PARENT AND CHILD HUSBAND AND WIFE DEFECTIVE SALVAGE INSURANCE MARINE, NOLE PROSLOU DOMICIL**

**Abanilla**, in Murcia, Spain pop 6500

**Abano, Pietro di (Petrus Aponus)** (1250-1316) b at Abano Bagni (qv) studied first at Padua went to Constantinople to study Gk, and after wars to 1288 studying medicine and mathematics. Travelled in England and Scotland but in 1303-4 was recalled to Padua to be prof of medicine his reputation was great and his fees high. With astronomy he studied astrology and made some pretence to magic. In 1306 this study brought him before the Inquisition as a magician but he cleared himself. In 1314 he was invited to Treviso where he went next year an other accusation was brought against him and he came up for trial, he d, however before judgment was given the inquiry continued after his death he was found guilty and his body was burned. He wrote scv works on philosophy and medicine, and made translations of ancient and Arabic medical writers. He was the most learned physician of his time.

**Abano Bagni**, a vil near Padua in Italy. It has hot springs, known to the Romans as *Aponi Fons* or *Aque Pataviana*. Bp of Pietro di Abano pop 4600

**Abantes**, ancient inhab of Fubcea said to have been of Thracian origin to have first settled in Thracia where they built Abae and afterwards crossed to Euboea they assisted in colonising scv of the Ionic cities of Asia Minor

**Abanto y Ciervana**, a tn in the prov of Vizcaya Spain, containing rich iron mines pop 7000

**Abarbanel, Abrabanel, or Abarbenel, Isaac Ben Jehudah** (1437-1508) Jewish statesman and author b at Lisbon of an ancient Jewish family. Distinguished for his learning and wealth, minister of state to King Alfonso V of Portugal. Suspected of treason by John II and had to escape. Served Ferdinand King of Aragon, until the expulsion of Jews from Spain 1492. Lived thenceforward in Naples and Venice where he d 1508. Wrote commentaries on the OT and the expected Messiah. His first son, Leo Hebraeus (Juda Leon), a doctor and philosopher wrote *Dialoghi di amore* (1535), his second son, Joseph, was a

doctor at Venice and Ferrara, and the third son, Samuel, a statesman

**Abaris**, legendary Hyperborean priest of Apollo, came from near Caucasus to Greece during a plague said to have taken no earthly food, and to have ridden through the air on an arrow the gift of Apollo. See Herodotus iv 36

**Abas**, 1 Son of Metanira changed by Demeter into a lizard because he mocked the goddess when drinking to quench her thirst in his mother's house, where she had come on her wanderings. See Ovid *Metam* v 451 61

2 Twelfth king of Argos, grandson of Danaus and father of Acrisius and Proetus received as a reward the shield of Danaus which had the power of reducing a revolted people to submission

**Abasia**, see **ABIAHAZIA**

**Abate Ciccio**, P, see **SOLIMENA, FRANCESCO**

**Abatement**, derived from O Fr word *abatir*, to prostrate or destroy

In a literal sense to destroy as to abate a nuisance. See **NUISANCE**

In the old law of pleading a plea in abatement was one which showed some reason for abating or quashing the plaintiff's statement of claim on the ground that it was improperly framed, without at the same time tending to deny the right of action itself (i) the misnomer of a defendant, or the non joinder of a necessary party. But for long the Orders and Rules of the Supreme Court have abolished all such pleas. The defendant must himself correct the misnomer, and he may, if he thinks fit, take out a summons to have the missing plaintiff or defendant made a party.

In heraldry a mark of dishonour on a coat of arms for some stain in the character of the wearer. The only A now used is the *baston* to indicate bastardy.

**Abati, Abatti, or Abbate, Niccolò** (1512-71) b at Modena executed in fresco under Primiticcio (qv). The Adventures of Ulysses in the palace at Fontainebleau, originals destroyed but prints were pub by Van Hulden in Paris, 1630. His best known easel work. The Martyrdom of St Peter and St Paul painted on wood for the church of the Benedictines at Modena (1546) is now in the gallery at Dresden. Between the years 1546 and 1552 he lived at Bologna, where he painted and worked in fresco. After this he accompanied Primiticcio to France where he d at Paris (1571). He has been compared to Titian and Raphael. His brother Pietro Paolo was a clever horse and battle painter. His son Giulio Camillo his grandson Ircole, and his great grandson Pietro Paolo were all painters. Ircole, b at Modena, 1563 d 1613, executed with B S bidoni frescoes of the council hall of Modena.

**Abatis** or **Abattis**, in military art a number of felled trees with smaller branches cut off, and placed side by side with their butt ends towards the defenders, and secured to the ground by forked pickets, serves as an obstacle to the advance of an enemy.

**Abattoir**, the name given to the public

slaughter house estab in Paris by a decree of Napoleon, finished 1818 first estab in Great Britain at Edinburgh 1851, Islington, 1855 now in all towns where many cattle are slaughtered under careful inspection to prevent the sale of unwholesome meat. The site should be outside the city, within easy access of the cattle market, the floors and walls to a certain height should be tiled to prevent absorption, all woodwork should be avoided and proper accommodation for killing, dressing and cooling should be provided, the offal should be destroyed or removed immediately, this can be used for manure, there should be a separate chamber for the preparing of the feet and intestines. The largest cattle and hog-killing centre in the world is Chicago (qv). See also under ABUL TERATION.

**Abba** (Syriac for father) a word occurring 3 times in the N I (Mark xiv 36, Rom viii 15, Gal iv 6), always with its translation subjoined. In the Syriac, Coptic and Ethiopic Churches the title came to be applied to the bishops.

**Abbadie, Antoine Thompson d'** (1810-1897) b at Dublin, educated in France, 1835 sent on mission to Brazil by the Académie des Sciences. 1837-48 explored Abyssinia. 1867 made a member of above academy. 1882 went to San Domingo to see the passage of Venus across the sun. Prin work is *Geodésie de la haute Éthiopie* (Paris 1873). His brother, Arnaud Michel (1810-93), b at Dublin, travelled with him. His prin work is *Unze ans dans la haute Éthiopie* (Paris 1868) a record of the travels and observations of both.

**Abbadie, Jacques** (1654-1727) b at Nav and educated at Sedan, Summi and Puy-launs, where he graduated D.D. In 1680 he was appointed pastor of the 1st Protestant church in Berlin by Frederick William, elector of Brandenburg. During the years 1688 and 1689 he accompanied Marshal Schomberg to Holland, England and Ireland and was made pastor of the 1st church in the Savoy. In 1699 he was made dean of Killaloe by William III. He d at Marylebone, London. His chief works are *Traité de la vérité de la religion chrétienne* 1681, *Traité de la divinité de Notre Seigneur Jésus Christ* 1689, *L'art de se connaître soi-même*, 1692, *Défense de la nat on britannique*, 1692, a vindication of the revolution of 1688, *La Trandéconspiration d'Angleterre* 1696, written by the order of William III.

**Abbas** (566-632) the uncle of Mohammed. He became the chief supporter of Mohammed although he was at first opposed to him. The founder of the dynasty of the Abbasids (qv), who ruled as caliphs of Baghdad from 750 to 1258.

**Abbas I**, shah of Persia 1587-1628, known as Shah A. the Great. He was b 1557, was the son of Mohammed Mirza and grandson of Tahmasp. He defeated the Turks in Ghilan and Azerbaijan 1590, and the Usbeks near Herat 1597, honourably received Sir Anthony and Sir Robert Shirley, 1598, and in 1599

Sir Anthony was sent to the Christian princes of Europe to offer them the shah's friendship, with a view to some combination against the Turks. A. defeated the Turks in a great battle, 1603, and the Turks and Tartar of Kipchak between Sultanleah and Tabriz 1618. The Persians and Eng took Ormuz from the Portuguese 1622, and Abbas d at Cashin 1628. During his reign he encouraged commerce, promoted the prosperity of Persia, added largely to his dominions, and made Isfahan the cap of his kingdom.

**Abbas II**, shah of Persia 1641-66. He was b in 1620 and during his reign promoted the prosperity of his people and tolerated the Christians. He took Kandahar, formerly taken by A. I but lost under the Mogul domination.

**Abbas III**, shah of Persia 1732-36. He was b 1712 and crowned shah when he was only 8 months old, was the last of the Safi dynasty.

**Abbas Hilmy** (1874-1927) 1st khedive of Egypt which as A. II he ruled before the First World War, studied at Theresianum Academy, Vienna, and succeeded his father Tewfik on the throne of Egypt 1892. He at first tried to overthrow Brit rule, abolished and reduced taxes and disagreed with Lord Cromer and Lord Kitchener. Affairs were however settled when Lord Kitchener took the Egyptian Sudan 1896-98 and A. visited England 1899. He threw in his lot with Turkey in 1914, was deposed Dec 18, 1914 and the khedivate passed with the title of sultan to Hussein Kemal Pasha, his uncle. D at Vienna.

**Abbas Mirza** (1783-1833) prince of Persia, and son of Shah Feth Ali. He commanded the Persians against the Russians 1811-13 without success, concluded the peace of Erzerum with the Turks, 1823. In 1826-28 he again fought against the Russians, signing the treaty of Turkmanchai, which gave to Russia the Persian dominions in Armenia and Caucasus.

**Abbas Pasha**, Abbas I (1813-54), viceroy of Egypt 1848-54 b 1813, grand son of Mehmet Ali (Mohammed Ali). He took part in the Syrian war 1840-41, became viceroy of Egypt on the death of his uncle Ibrahim Pasha 1848 and was found dead, probably murdered 1854. He was a bad ruler and during his reign undid the good done by Mehmet Ali. However, he promoted the establishment of the railway from Alexandria to Cairo, 1851.

**Abbasids**, a family of sovereigns who occupied the throne of the Arabian empire from A.D. 750 to A.D. 1258. The name is derived from their ancestor Abbas ben Abd al Motalleb, a paternal uncle of Mohammed. They made war on the Omayyad caliphs who had occupied the throne of the Arabian empire from 661, and completely defeated them in a battle on the banks of the R. Zab, near Mosul, 750. Under Harun al Rashid (786-809) the prosperity of the Abbasid empire was very great, flourishing towns

were estab., literature and the arts were encouraged, and the splendour and luxury of the court of Bagdad are exhibited in many of the *Arabian Nights Tales*. Under Mamun (813-33) colleges and libraries were founded, and works on astronomy, mathematics, metaphysics, natural philosophy, and medicine were trans. from the Sanscrit and Gk. into Arabic. Later in the century the prosperity was broken by invasions by the Saracens and Turks, and by internal disturbances. From the time of Rhadi (939-40) almost all power had passed from the caliphs to the emirs al-Omara, and the caliphate then became a mere nominal dignity, with the possession of the tn. of Bagdad. The last caliph, Mostasem, was defeated and killed by the Mongol chieftain Hulagu, 1258, and thus ended the gov. of the A.

**Abbate, Niccolo dell'**, see **ABATI, NICCOLO**.

**Abbatess Milites, Abba-Comites, Abbi-Comites**, see under **ABBOT**.

**Abbaye**, a military prison close to the church of St.-Germain-des-Prés; was built by Gamart between 1631 and 1635, and was the scene of a terrible massacre on Sept. 2 and 3, 1792, during the Fr. Revolution, mentioned by Carlyle in *The French Revolution* (Part III. bk. i. ch. iv.).

**Abbazia**, a tn. in Istria, Italy. Its position on the bay of Fiume, and its warm climate, make it a favourite health resort. It is noted for its gardens and pretty villas. It is an airport. Pop. 2500.

**Abbé**, originally the Fr. term for abbot. Before the Fr. Revolution it was applied to many persons who had little or no connection with the church, but who acted as tutors, profs., and men of letters. 'Abbés commendataires' were persons who received revenues from their monasteries, but who were not necessarily monks.

**Abbe, Cleveland** (1838-1916), Amer. meteorologist, b. in New York. Studied astronomy at Ann Arbor and Cambridge (Massachusetts), and spent 2 years in Russia at the Pulkovo observatory. He became director of the Cincinnati observatory in 1868, and meteorologist of the weather bureau in 1891. Among his publications are: *Report on Standard Time*, 1879; *Preliminary Studies for Storm and Weather Predictions*, 1889; *The Mechanics of the Earth's Atmosphere*, vol. i. 1891, vol. ii. 1909; *Physical Basis of Long-range Forecastings*, 1902.

**Abbeokuta**, see **ABEOKUTA**.

**Abbess**, the superior of a nunnery or other female religious community. She is usually elected by the nuns subject to the approval of the bishop. In the Rom. Catholic Church an A. possesses the same dignity and exercises the same functions as an abbot, except those of confession and preaching. According to a decree of the council of Trent, it is recommended that an A. at the time of her election, should be at least 40 years of age, and should have made profession for 8 years; and it is forbidden that any

person be elected to the dignity who has not been professed for 5 years, or is under 30 years of age.

**Abbeville**, a tn. near the mouth of the R. Somme in N. France. It is an important industrial and commercial centre; manufs. woollen goods, rope, sacking; does a considerable trade in grains; and has dyeing and bleaching works. The tn. is noted for the church of St. Wolfram and for its medieval appearance. The houses are for the most part built of brick, but some old wooden ones still remain. Historically it is noted for 2 treaties which have borne its name—one between Henry III. of England and Louis IX. of France in 1259, and the other between Henry VIII. of England and Francis I. of France in 1527. The scene of fighting in the Second World War in May, 1940; the church of St. Wolfram, with its fine sixteenth-century flamboyant facade and thirteenth-century belfry, was gutted; the museum was destroyed with all its contents, and the hôtel de ville was razed to the ground (see **WESTERN FRONT IN SECOND WORLD WAR**). Afterwards, when in Ger. occupation, frequently attacked by the R.A.F. Pop. 21,000.

**Abbey** (from the O.Fr. *abate*), a religious community presided over by an abbot or abbess, a building occupied by the community, the church of a monastery, or a private dwelling-house. See **MONASTERY**.

**Abbey, Edwin Austin** (1852-1911), one of the foremost Amer. figure-painters, was b. in Philadelphia. He was sent by Harper Brothers of New York to England in 1878 to gather material to illustrate Herrick's poems. These illustrations, together with his work on Shakespeare's plays, secured his fame. From 1891 to 1902 he was engaged on a series of panels, 'The Quest of the Holy Grail', for the Boston Public Library, and in 1901 he was commissioned by Edward VII. to paint his coronation. Among his pictures may be mentioned: 'A May-Day Morning,' 'Fiammetta's Song,' 'Crusaders Sighting Jerusalem,' 'Pot-pourri,' and 'A Measure.' In 1896 he was elected A.R.A., and in 1898 he became an R.A.

**Abbeyleale**, a tn. of Limerick on the R. Feale, Ireland (Eire). Pop. 900.

**Abbeyleix**, a tn. in Leix (formerly Queen's co.), near Maryborough, Ireland (Eire). Pop. 800.

**Abbey Theatre**, Dublin, see under **DRAMA**.

**Abbiategrosso**, a tn. near Milan, Italy, on the Naviglio Grand Canal; was taken by Frederick I., 1167, and by Frederick II., 1245; pop. 15,900.

**Abbot**, the title of the head of a monastery or an abbey. The word 'abbot' or 'abbat' is derived through Syriac *abba*, from the Heb. *ab*, father. Originally the title was given as a mark of respect to any member of the clerical order, and when monastic institutions were first founded, to the head monk of the institution (not necessarily a priest). In the Gk. Church the corresponding title to A. was archimandrite (chief monk), or hegumenos (leader),

Since the sixth century monks have generally been priests. In orders founded after the tenth or eleventh century the title A. was discontinued, and superiors were known as priors, guardians, and rectors.

In dignity an A. is considered to stand next to a bishop. In England 26 As. and 2 priors (wearing the mitre and carrying the crosier) used to sit in the House of Lords. Cardinal As. were those who presided over an establishment with sev. branches, and in Germany there were prince As. as well as prince bishops. In the tenth century there were field As. (in Lat. 'Abbatēs Militēs'), and A. counts ('Abba Comites' or 'Abbi-Comites'), secular persons who rendered military service in return for certain abbeys bestowed upon them by the prince, and this practice continued in Great Britain after it had been discontinued on the Continent.

An A. is usually elected by the monks, subject to the approval of the pope or of the bishop, according as the monastery is independent or under episcopal jurisdiction. There was friction between the As. and the Church owing to an attempt by the As. to free themselves from the authority of the dioceses. Some became independent and possessed great power and wealth. Long before the Reformation, however, their power was reduced to narrow limits, and subjected in all material points to the civil authority.

**Abbot of Unreason**, Lord or Abbot of Misrule, the title of the master of Christmas revels, used respectively in Scotland and in England while *L'abbé de L'esee* (i.e. Jollity) is the Fr. equivalent. In Sir Walter Scott's *Abbot*, the falconer Adam Woodcock masquerades as A. of U. under the name of Father Howleglass.

**Abbot, Charles**, see COLCHESTER, BACON.

**Abbot, George** (1562-1633), archbishop of Canterbury, b. at Guildford, Surrey, Oct. 29, son of a cloth-worker. Educated at the grammar school, Guildford, and Balliol College. He became private chaplain to Thomas Sackville, Lord Buckhurst, chancellor of the univ., 1592; master of Univ. College, 1597, 1599; of Winchester, 1600; 3 times vice-chancellor of Oxford Univ., 1600-5; chaplain to the Earl of Dunbar, 1608; dean of Gloucester, 1609, bishop of Lichfield and Coventry, 1609; bishop of London, 1610; and archbishop of Canterbury, 1611. He was a Calvinist and opposed popery and Arminianism. A violent opposition of theological sentiment existed between him and Laud, making them political enemies and rivals. In 1621 he accidentally shot a keeper at Harringworth, but was formally pardoned by the king. He was deprived of his authority, 1627, for opposing the doctrine of passive obedience preached by Dr. Manwaring and Dr. Sibthorp; but was summoned as usual to Parliament, 1628. He was buried at Guildford. His works include: *Exposit-*

*tion on the Prophet Jonah; A Brief Description of the Whole World*, 1599.

**Abbot, George** (1603-48), son or grandson of Sir Thomas A. of Easington, Yorks. Fought on the parl. side in the civil war. He was a member of the Long Parliament for Tamworth. He wrote *Paraphrase of the Book of Job*, 1640; *Vindiciæ Sabbathi, or an Answer to Two Treatises of Mr. Broad*, 1641; and *Brief Notes upon the Whole Book of Psalms* (pub. posthumously), 1651.

**Abbot, John**, a poet, was educated at Sidney Sussex College, Cambridge, taking his degree of B.D. 1617. He wrote a poem entitled *Jesus Prefigured; or, a Poeme of the Holy Name*, 1623.

**Abbot, Robert** (1560-1617), elder brother of George A., archbishop of Canterbury, was educated at the grammar school, Guildford, and Balliol College, Oxford. He became one of the chaplains in ordinary to James I., 1603; master of Balliol College, 1609-15; fellow of Chelsea College, 1610; Regius Prof. of Divinity at Oxford, 1612; and bishop of Salisbury, 1615. He was a great preacher, and wrote theological works, including: *A Mirrour of Popish Subtillies*, 1594; *The Eccallation of the Kingdom and Priesthood of Christ*, 1601; *A Defence of the Reformed Catholicke of W. W. Perkins*, 1606; *Apologum adversus Apologiam Andree Eudemon Joannis*, 1613; and *De Suprema Polestake Regna, contra Bellarminum et Suarez*, 1619.

**Abbot, William** (1789-1843), dramatist and actor, performed at Covent Garden, 1812; played Romeo to Miss Fanny Kemble's Juliet, 1830, and Apollon Claudius and Modus in Sheridan Knowles's *Virginius* and *The Hunchback*. He wrote *Youthful Days of Frederick the Great* (1817) and *Swedish Patriotism* (1819).

**Abbotsford**, on the r. b. of the Tweed, about 2 or 3 m. to the W. of Melrose, was the home of Sir Walter Scott from 1812 until his death in 1832. It was formerly a small farm, which Scott bought in 1811. He built a villa there and called it A., and continued until 1817 to add new buildings of the old baronial style, making it a picturesque and irregular estate. There is a large collection of books, curios, and paintings. See Lockhart's *Life of Sir Walter Scott*, 1837-8.

**Abbot's Hall**, a par. near Kirkcaldy, Fifeshire, Scotland, in which canvas is manufactured. Pop. 7500.

**Abbots Langley**, a par. near Watford, England, said to be the bp of Nicholas Breakpear, Pope Adrian IV. Pop. 5500.

**Abbott, Charles**, see TENTERDEN, BARON. **Abbott, Edwin Abbott** (1838-1926), was b. in London, and was educated at St. John's College, Cambridge. He was headmaster of the City of London School, 1865-89; and Hulsean lecturer at Cambridge Univ., 1876. He was a select preacher at both Oxford and Cambridge, and the author of many works—mainly scholastic and theological. His *Shakespearean Grammar*, 1870, is an enduring contribution to Eng. philology.

His many theological works include the article on the Gospels in the ninth ed. of the *Ency. Brit.* and *The Fourfold Gospel* (in 5 parts), 1913-17.

**Abbott, Emma** (1849-91), an Amer. singer, b. at Chicago, studied music in Europe, appeared in opera at Covent Garden, and later, having formed a company of her own, toured the U.S.A. She d. at Salt Lake City.

**Abbott, Evelyn** (1843-1901), a classical writer, was educated at Balliol College, Oxford, where he became tutor and librarian, 1874. His chief works are *Elements of Greek Accidence*, with *Philological Notes*, 1874; *Index to Plato*, compiled for the Second Edition of Professor Jouett's Translation of the Dialogues, 1875; edited *Hellenica* a Collection of Essays on Greek Poetry, Philosophy, History and Religion, 1880, and *A History of Greece*, 1888-1900.

**Abbott, Jacob** (1803-79), an Amer. author, b. at Hallowell, Maine, U.S.A., and educated at Bowdoin College, where he graduated 1820, and at Andover. He entered the ministry of the Congregational Church, but he is best known by his writings—educational and religious. His first book, *The Young Christian* (1832), was followed by about 200 others, the best among which were in the 28-vol. series concerning *Hollo*, and being instructive tales for the young in the manner of Day's *Sandford and Merton*. Many of his works were pub. in England, and many have been trans. into foreign languages in Europe and Asia.

**Abbott, John Stevens Cabot** (1805-77), an historical writer, was b. at Brunswick, Maine, U.S.A. He was the brother of Jacob Abbott, and was educated at Bowdoin College and at the Theological Seminary, Andover. Associated with his brother in the preparation of a series of brief historical biographies. But he is chiefly remembered for his partisan, unscholarly, but interesting *History of Napoleon Bonaparte*, 1852-55. His other biographies are of Amer. presidents, Gen. U. S. Grant, Napoleon III., etc.

**Abbott, Lyman** (1835-1922), Amer. Congregational minister and editor, b. at Roxbury, Massachusetts. He received the pastorate of a church in 1860, and succeeded Henry Ward Beecher at Brooklyn in 1888, resigning in 1899. He became editor in-chief of the *Outlook*, 1893, and he pub. *Henry Ward Beecher*, 1883; *The Theology of an Evolutionist*, 1897; *Life and Literature of the Ancient Hebrews*, 1901; *The Great Companion*, 1904; *The Industrial Problem*, 1905; *The Home Builder*, 1908; *The Temple*, 1909; *The Spirit of Democracy*, 1910; *America in the Making*, 1911; *The Twentieth-century Crusade*, 1918; *What Christianity Means to Me*, 1921; *Silhouettes of my Contemporaries*, 1922.

**Abbottabad**, a tn. in Hazara dist., N.W. Frontier Prov., Pakistan, founded by Sir James Abbott; important military cantonment. Pop. 9000.

**Abbreviation**, in music, consists of signs or terms used to facilitate the work

of the composer and copyist. In organ music, G.O. or Gr. = Great Organ, F.O. = Full Organ, etc. In pianoforte music, L.H. or M.S. (It. *mano sinistra*) or M.G. (Fr. *main gauche*) = left hand; R.H. or M.D. (It. *mano destra*, Fr. *main droite*) = right hand; ped. = depress pedal, \* = release pedal. General A. are. ∞, pause; < or cres. = *crescendo*, get gradually louder; > or dim = *diminuendo*, get gradually softer; f = loud; ff = very loud; mf = fairly loud; p = soft; pp = very soft; mp = fairly soft. D.C. = repeat from the beginning of the movement (*da capo*). D.S. or : §, *dal segno* — repeat from previous sign : §; ten, or *tenuto* = hold, or sustain; sf, or sfz = *sforzato*, or *sforzato*, accentuate; rit. = *ritenuto*, slacken immediately in speed, rall = *rallentando*, slacken gradually in speed, accel. = *accelerando*,

ABBREVIATION IN MUSIC

quicken gradually, and so on. In full scores, the instruments are named in abbreviation, e.g. F. = flauto or flute, Fag. = fagotto, Viol. or Vo = violin, Va. = Viola, etc. Another kind of A. is shown in the illustration; for instance, in the figure above the passage A may be abbreviated into the form B, and C into that of D.

**Abbreviations**, methods by which the initial letter, the initial syllable, or a sign is made to represent a word or phrase, in order to save space and time. These methods were employed to a large extent in anct. inscriptions, (A and Rom. MSS., and documents. A. were also used in legal documents until the reign of George II, when they were discontinued. The following is a list of the most important A. used in England. (For chemical A., see ELEMENTS.)

A. A. A. Automobile Association.  
A. A. A. Amateur Athletic Association.

For Classical A., see Grævius's *The-saurus Antiquitatum* (1694); Mommsen's *Corpus Inscriptionum Latinarum* (1863); Alph. Chassant's *Paleographie* (1854), and Campelli's *Dizionario di Abbreviature* (1899). See also DIPLOMATICS and PALEO-GRAPHY.

Abbreviator is more particularly used for an officer of the Court of Rome, appointed as assistant to the vice-chancellor for drawing up the pope's briefs and reducing petitions, when granted by the pontiff, into proper form for being converted into bulls. The As. are supposed by Ciampini to be the successors either of the *cancellarii* of the imperial household or of the *7 notarii* said to have been placed by Pope Clement I. in the 7 quarters of Rome, to write down the acts of the martyrs within their sev. dists. They are said to have taken their name either from their writing the *brevia* or shorter epistles of the pope, or from making use of notes or abbreviations in writing. A. is also a name given by some authors to an anct. literary academy supposed to have been at Rome in the fifteenth century and composed of the chief men of letters of the age, as Pomponius Lætus, Platina, Pontanus, Sannazarius, Sabellicus, etc., who, by the rule of the society, latinized their names as a condition of their admission, but the existence of such an academy is doubtful.

Abbi. Thomas (1738-87), a Ger. author, b. at Ulm; studied at Halle. Appointed prof. of philosophy, in 1760, at Frankfurt, and of mathematics at Renteln, Westphalia; one of the creators of modern Ger. prosa. There is a biography by C. F. Nicolai, 1767.

Abdalattif, an Arabian physician and writer, b. at Bagdad 1162 A.D. Held professorships at Mosul, Damascus, and Cairo, and at the latter place wrote in 1203 a *Compendium of the History of Egypt*. The titles of 166 works by Abdalattif have been recorded, about one-fourth of which are on medical subjects.

Abdallah III, see AL-MAMUN.

Abd-el-Kader (1807-83), Algerian patriot and hero of the long struggle against the Fr. This he commenced at Oran in 1833, and with varying fortune sustained till he surrendered to General de Lamoricière in 1847. He displayed great skill and perseverance in his conduct of the campaign and in 1834 he compelled the Fr. Gen. Desmichels to

\* The Y is a corrupt representation of the Anglo-Saxon þ, or th.

recognise his authority in a treaty. On a resumption of hostilities he inflicted a serious defeat on a large Fr. army at Makta, but he was driven to seek refuge in Morocco in 1843. After his final capture he was released by Louis Napoleon in 1852, and received a pension of 100,000 francs. In retirement at Damascus he wrote a book on the consolations of philosophy under the title *Rappel à l'intelligent: avis à l'indifférent*, 1858, and supplied commentaries to N. J. E. Daumas's *Chevaux du Sahara*, 1854. See A. Bellemare's *Abd-el-Kader*, 1863; C. H. Churchill's *Life of Abd el Kader*, 1867.

**Abdel-Khalek Pasha Sarwat**, see SARWAT PASHA.

**Abd-el-Krim** (b. 1881), leader of Rifs in the Moroccan campaigns 1921 and 1925. The son of a tribal chieftain, and a man with some pretensions to culture, he was, in the heyday of his brief career of military adventure, an able leader and an adept in the arts of intrigue. During the First World War he was in the Sp. service and engaged in helping the Sp. authorities to consolidate their hold on their Treaty zone. Later, however, he turned against his Sp. masters and strove to incite the Rifs against the invader. So successful was he in the field, notably near Melilla, where he almost exterminated an army of some 20,000, that he produced an upheaval in Spain, with the result that a military dictatorship was estab. to cope with the situation. In 1925 he launched an offensive against the Spaniards, this really being his only course when the Fr. had joined the latter. Previously Gen. Primo de Rivera, the Sp. dictator, had offered to make peace on terms very favourable to the Rifs, but the offer was refused by A. K., who wanted nothing less than complete independence. Ultimately he was forced to abandon the struggle through the defections of the tribesmen, who, though unbeaten in their inaccessible fastnesses, had grown tired of fighting, and in May 1926 he surrendered unconditionally to the Fr. Moroccan commander at Fez and was exiled to the Mascarene Is. When being brought to France in 1947, he escaped to Egypt.

**Abd-el-Rahman**, Moorish chief, invaded Gaul in 731 at the head of the largest Mohammedan army which had yet menaced Christendom. He was defeated and slain by Charles Martel at Tours. Abd-el-Rahman I. founded in 755 at Cordova the Umayyad dynasty of Sp. caliphs. The second caliph of this name, 822-52, was a great patron of learning, and under the third, 912-61, the Cordova caliphate attained its most brilliant period. The fourth was killed in battle near Granada, 921, and the last monarch of the name was assassinated in 1023. See MOORS IN SPAIN.

**Abdera**, tn. in Thrace, the bp. of such distinguished men as the philosopher Democritus and the historian Hecataeus, nevertheless its inhab. had a reputation for stupidity, and 'Abderite' became a term for a simpleton.

**Abdication**, the voluntary renouncing and giving up of an office by a ruler or sovereign. The essential characteristic of A. is that it is *voluntary*, but it is generally the result of internal or external pressure upon the holder of office. In a few striking instances office has been relinquished in the plenitude of power owing to a desire for the freedom of private life, as was the case with the Rom. dictators Cincinnatus, B.C. 438, Sulla, B.C. 80, and the Rom. emperor Diocletian, A.D. 305. One monarch, Philip V. of Spain, who abdicated (1724) in favour of his son, resumed the royal functions after his son's death. Other notable As. in more modern times are: Isabella II. of Spain, June 25, 1870; Amadeus I. of Spain, Feb. 11, 1873; Prince Alexander of Bulgaria, Sept. 7, 1886; Milan of Serbia, Mar. 3, 1889; Oscar of Norway, Oct. 27, 1905; Abdul Hamid II. of Turkey, Apr. 27, 1909; Manoel of Portugal, Oct. 4, 1910. The emperor Pu-yi of China not only abdicated (Feb. 12, 1912), but by a final decree converted China from an absolute autocracy into the largest republic in the world. According to Blackstone, no Eng. sovereign may abdicate without the consent of parliament. This was done in the case of James II. (1688), who was declared by a joint sitting of both houses to have abdicated.

The As. during or after the two world wars were: Nicholas II. of Russia, 1917 (see RUSSIAN REVOLUTION), Ferdinand (of Bulgaria), 1918; William II. of Germany, 1918; Nicholas of Montenegro left his country in 1916 and was dethroned in 1918; Constantine of Greece, 1917 (restored 1920), abdicated finally, 1922; Karl of Austria, 1918; Mohammed VI. of Turkey, 1922; George II. of Greece, 1924 (restored 1930); Hussein, king of the Hejaz, 1924; Ali, king of the Hejaz, 1925; Amanullah of Afghanistan, 1929; Michael of Rumania, 1930 (restored 1940) and 1948; Alfonso XIII. of Spain, 1931; Prajadhipok of Siam, 1935; Edward VIII. of Great Britain, 1936; Zog I. of Albania, 1939; Charles II. (Carol) of Rumania, 1940; Peter II. of Yugoslavia, 1943; Simeon of Bulgaria, 1946; Wilhelmina of the Netherlands, 1948. The position of Leopold of Belgium, who capitulated to the Gers. (May 28, 1940), is undetermined.

When the Allies entered Rome in 1944 King Victor Emmanuel 'retired' in favour of his son, Prince Umberto, who assumed the title of 'Lieutenant-General of the Realm.' The king remained head of the House of Savoy, and kept the title of king of Italy. In 1946, however, a referendum showed that a majority of voters were republican, with the result that Prince Umberto had no option but to retire into exile.

**Abdomen**, that part of the body separated from the thorax by the diaphragm, enclosed by the lower ribs and muscles of the belly, and supported by the pelvis. The diaphragm is a partition of membrane and muscle with a movement determining the action of the lungs

in breathing. The whole abdominal cavity is lined by a membrane called the *peritoneum*, which is the seat of the inflammation known as *peritonitis*. The term abdominal cavity lends itself to a possible misunderstanding, as it is most economically packed with a number of organs which are concerned in the nutrition of the body, and whose relative positions are adjusted by a system of enclosing muscles. If these muscles are not properly co-ordinated, the contents of the cavity are liable to protrude through the abdominal wall, giving rise to a *hernia*, or *rupture*.

REGIONS OF THE ABDOMEN

A, stomach; B, spleen; C, pancreas; D, kidney; E, rectum; F, small intestine; G, liver; H, large intestine; I, appendix; K, bladder.

Of the organs themselves, it is unnecessary in this place to do more than indicate the position of the more important. The stomach is situated in the upper part of the A., with the liver in front, and the kidneys, pancreas, and spleen behind. From the stomach, the intestines, with a total length of about 25 ft., lead to the rectum.

Serious disease within the A. is now often investigated and treated by opening the muscular wall, the operation being attended with comparatively little danger if proper precautions against septic poisoning are possible. In cases of wounds penetrating the A., particularly under unhealthy conditions of climate, it is more usual to avoid surgical measures, unless dangerous internal bleeding makes it advisable to suture, or stitch up, the bowel or intestine.

**Abduction.** In anct. legal codes the word implied the unlawful taking away of a free person, or a slave of another person. Under the Rom. criminal law the word *plagium* stood for the buying of a free person, and the term is still used in Scotland for the theft

of a child. In Eng. law, A. technically means the taking away by force, fraud, or persuasion of a woman (or child) against her own will, or, if the woman be under 21, against the will of her parents or guardians. The term is also applied under the Corrupt and Illegal Practices Act, 1883, to the action of preventing the free exercise of the franchise of any elector. The common forms of the crime are defined by the Criminal Law Consolidation Act, 1861, and the crime is also dealt with in the Criminal Law Amendment Act, 1885. The more serious forms of the offence, the A. of women, are held to be a felony, and the heavy penalty of 14 years' imprisonment may be inflicted. It is also a misdemeanour punishable by a term of 2 years' imprisonment to take a girl under 18 for the purpose of seduction, provided there were no reasonable grounds for supposing the girl to be above 18. The abduction of children under 14 is technically called 'child-stealing,' and is an offence punishable by a maximum term of 14 years' penal servitude, but the mother of a child or the father of an illegitimate child cannot be indicted. A. must not be confused with *kidnapping* (q.v.). The latter includes the theft of any person, but is more properly applied to taking away beyond the seas—so that the person loses the protection of his country's laws. Throughout the U.S.A. A. is a felony, and in some states is punishable by a fine, not exceeding 10,000 dolars, or by solitary confinement at labour for a term not exceeding 25 years.

**Abdul-ahî-el-Taachi**, or **Abdullahi ibn sayid Mohammed** (c. 1850–99), 'Khalifa,' follower of the Mahdi, Mohammed Ahmed, succeeded him in 1885. He was defeated by Kitchener at Omdurman in 1898, and killed at the battle of Om Dabrikat in 1899.

**Abdul Asiz** (III. of Nejd) **ibn Sa'ud**. See SA'UD, ABDUL ASIZ IBN.

**Abdul-Aziz** (1830–76), sultan of Turkey, succeeded his brother, Abdul Medjid, in 1861. His reign was one long struggle against revolt: Bosnia, Herzegovina, Crete, Rumania, and Serbia all rising against his misgovernment. He was deposed May 30, 1876, and found dead 4 days later.

**Abdul-Hamid I.** (1725–89), sultan of Turkey, came to the throne 1774. His reign was signalised by the struggle with Russia and Austria. The former wrested from him the Crimea in 1783, and the latter inflicted a crushing defeat on him at the battle of Ochakov (1788).

**Abdul-Hamid II.** (1842–1918), sultan of Turkey, succeeded in 1876, on the deposition of his brother, Murad V., and was himself deposed in 1909. In his reign occurred wars with Serbia (1876), Russia (1877–78), Greece (1897). The Armenian atrocities (1894–96) earned him the titles 'Great Assassin' (Gladstone), and 'Abdul the Damned' (poem by Sir Wm. Watson). The revolution of the 'Young Turks,' which deposed him estab. parl. gov. in Turkey. He was kept prisoner in Salonika till it was taken

by the Gks. in 1912, when he was removed to Constantinople. In 1915 he was transferred to Magnesia near Smyrna, where he d. Feb. 10, 1918.

**Abdul-Medjid** (1823-61), the 'Grand Sultan' of Turkey, succeeded to the throne (1839) 8 days after the disastrous defeat of his father's (Mahmud II.) army at Nisib by Mehemet Ali, the rebellious viceroy of Egypt. The intervention of the Christian powers checked the advance of the victorious Egyptians on Constantinople, and thus saved the Ottoman dynasty. The treaty of 1841, imposed on both parties by the European powers, settled the relationship of Egypt to Turkey. This sultan instituted many reforms, the rights of person and property being, *inter alia*, secured to all his subjects irrespective of their creed. The Crimean war between England and France on the one hand, and Russia on the other, arose from Russia's claim to a protectorate over his Orthodox subjects.

**Abdullah el Hussein**, first king of Transjordan (b. 1832), b. in Mecca, second son of Hussein ibn Ali, who was sheriff of Mecca and later king of the Hejaz (see **HUSSEIN**). A's elder brother was King Ali and his younger brothers were King Faisal (q.v.) and the Amir Zaid. Under his father Hussein, A. commanded the E. Army during the First World War, and accepted the surrender of the Turkish garrisons of Medina and Taif. Later, he was King Hussein's minister of foreign affairs. He arrived in Transjordan in 1921 and by arrangement with the Brit. Gov. set up a unified administration. This administration received formal recognition under an agreement (signed in 1928) between His Britannic Majesty and His Highness the Amir A., which recognised the existence of an independent gov. in Transjordan, while reserving to His Majesty powers enabling him to fulfil his international obligations and to ensure that the ter. was governed constitutionally. Until 1946 Transjordan was under the same Brit. mandatory rule as Palestine, the high commissioner for Palestine being also high commissioner for Transjordan. An ann. subsidy of £60,000 was paid by the Brit. Gov. to the amir. On March 22, 1946, the mandate for Transjordan was abrogated and a new treaty signed with Britain. This is a treaty of friendship and alliance in which Great Britain recognises Transjordan as a fully independent state and A. as its sovereign. Each party to the treaty undertakes not to adopt in foreign countries an attitude inconsistent with the alliance—a close alliance in consecration of their friendship, their cordial understanding, and their good relations.' On May 26, 1946, the Amir A. was crowned the first king of Transjordan at a ceremony in Amman (q.v.) which was attended by Gen. Sir Alan Cunningham, high commissioner of Palestine, and delegations from Syria, the Lebanon, Egypt, Palestine, and Iraq. When Arab forces invaded Palestine in 1947-48 A. led the Transjordan Frontier Force. See further under **TRANSJORDAN**; **PALESTINE**.

**Abd-ur-Rahman** (1778-1859), sultan of Morocco, reigned from 1823 to 1859. Much of his time was occupied in putting down internal insurrection. It was during his reign that the practice was abandoned of European states paying a tribute for protection against the piracy of the Moors.

**Abd-ur-Rahman Khan** (either 1830 or 1841-1901), amir of Afghanistan from 1880. Supported successfully for a while the claim of his father, Afzul, against his uncle, Shere Ali, but in 1868 had to take refuge in Russian Turkestan. Finally he overcame the son of Shere Ali, Yakub Khan, and firmly estab. himself as amir. He was eminently friendly to Great Britain, and did much to consolidate his power and to promote the social welfare of his country.

**Abecedarians**, name (derived from A B C) of small sect of Ger. anabaptists. Holding that only a knowledge of the Scriptures, communicated by the Holy Spirit direct, was necessary, they refused to learn to read.

**A Becket**, Thomas, see **BECKET**.

**A Beckett**, Gilbert Abbott (1811-56), was the first editor of *Figaro in London*, one of the first contributors to *Punch*; he wrote leaders and articles for *The Times*, *Morning Herald*, and *Illustrated London News*. Essentially a playwright, having produced over 50 plays, he helped to dramatise some of Dickens's novels; his fame now principally rests on his *Comic Blackstone* (1846) and comic lists of England and Rome.

**Abel**, 'breath' or 'vapour', second son of Adam (Gen.). He was a shepherd, and because he offered to God a more acceptable sacrifice than that of his brother Cain, the latter slew him in a fit of jealousy. Ranks as the first martyr.

**Abel** (d. 764), archbishop of Rheims; aided Boniface in missionary work in Germany.

**Abel**, Carl (1837-1906), Ger. philologist. He was b. in Berlin, educated at the univs. of Berlin, Munich, and Tübingen, and lectured at Oxford and Berlin. He pub. numerous works, which include: *Linguistic Essays*, 1880; *Slavic and Italian*, 1881; *Über den Gegensinn der Urworte*, 1884; and *Russland und die Lage*, 1888.

**Abel**, Carl Friedrich (1725-87), Ger. musician, player on the viol da gamba, and composer of many melodious pieces. Originally in the court band at Dresden, he came to England in 1759 and became one of the queen's chamber musicians. Joined John Christian Bach in giving concerts in England, 1759.

**Abel**, Sir Frederick Augustus (1827-1902), a high authority on explosives, sharing with Prof. Dewar the credit for inventing cordite. Also invented close-test apparatus for ascertaining the flash-point of petroleum. Commenced his career as prof. of chem. at the Royal Military Academy (1851-55), and was afterwards appointed chemist to the war department (1854-88). He was the first director of the Imperial Institute, being appointed in 1887, and pub. many

important works on gunpowder and other explosives.

**Abel, Niels Henrik** (1802-29), Norwegian mathematician, b. at Findø, son of a clergyman. Entered univ., Christiania, 1821, and later became a lecturer there. Is chiefly known for his development of the theory of elliptical functions and algebraic equations. In 1825 the Gov. gave him an allowance to enable him to travel, and, after his premature death from consumption, pub. his works.

**Abelard, Peter, or Pierre** (1079-1142), scholastic philosopher and theologian, b. at Pallet near Nantes; destined to a martial career, he gave up his patrimony and right of primogeniture to study the sciences of his time, and became the disciple of William of Champeaux; he soon rivalled his master in dialectics. At the age of 21 he opened a school of his own, first at Melun, then at Corbeil, and finally at Paris in 1115, where he found that Wm. of Champeaux had been made bishop of Châlons-sur-Marne. The dialectic conflicts now over, A. went to Laon, where he studied divinity under Anselm, dean of the chapter of that tn.; he soon returned to Paris and estab. a school of divinity there, in which he had 5000 pupils; in this school were trained a pope, 19 cardinals, and more than 50 bishops. When he was about 36 years of age, he became enamoured of Héloïse, a damsel of about 17 years of age and daughter to Fulbert, canon in the cathedral at Paris; he became her tutor. She returned his love and bore him a son, being secretly married. Not to impede A.'s preferment she declared that there was no marriage, and Fulbert, enraged, caused A. to be cruelly mutilated, which he knew would prevent preferment in the church. A. recovered; the perpetrators of this crime were similarly punished, and he retired to the monastery of St. Denis, while Héloïse became a nun in the convent of Argenteuil. At the call of his pupils he gave public lessons again, but his enemies raised accusations against his *Introduction to Theology*, in which he attempted to solve anew the doctrine of the Trinity. The council held at Soissons in 1121 ordered this work to be burned. A. retired again to St. Denis, where he irritated the monks by declaring that the monastery had not been founded, as was commonly thought, by St. Dionysius of Athens, the Areopagite converted by St. Paul. He was driven by persecution from St. Denis, and founded a small oratory made of wicker in the ter. of Troyes, but so many pupils flocked to him that it was soon rebuilt of stone; this was called the Paraclete or Comforter. But persecution followed him here, and he left to become superior in the abbey of St. Gildas de Ruys, near Vannes in Brittany. Meanwhile an abbot had claimed Argenteuil, and Héloïse and her nuns were forced to leave it. They were estab. at the Paraclete, A., after an absence of 11 years, officiating in the consecration. Bernard, abbot of Clair-

vaux, objected to the form of prayer used by Héloïse, but A. defended her. Bernard appealed to the council of Sens in Champagne in 1140, at which A. defended himself, but was condemned; he appealed to the pope, but the pope confirmed the condemnation; A. set out for Rome, but Peter the Venerable of Cluny persuaded him to stay with him and influenced Pope Innocent II. to suspend the sentence. A. moved for his health to St. Marcel near Châlon.

THE TOMB OF ABELARD AND HELOISE

He was buried at Cluny, but his remains were removed to the Paraclete; Héloïse lived 20 years after him, and at her death was by her own request laid at the side of A. In 1497 their ashes were moved to the abbey; in 1800 to the garden of the Musée Française at Paris, and in 1817 to the cemetery of Père-Lachaise. After his first fall A. seems to have become sensual, as his letters show; and after his mutilation his affection waned; Héloïse was always devoted till his death. His philosophy, as in *Nosce Teipsum*, often approaches modern rationalism. His *Sic et Non*, showing discrepancies in the writings of the Fathers, was singularly bold for that time of religious intolerance. He opposed both nominalism and realism (*q.v.*). See *Life*, and a philosophic drama, *Abelard*, by Hémusat (Paris, 1845 and 1877); Works ed. by Victor Cousin, 1836. Correspondence between Héloïse and A. is extant; *vide* Pope's *Epistle of Héloïse to Abelard*; *Peter Abelard*, by J. McCabe, 1901; Goo. Moore's *Héloïse and Abelard*.

**Abele**, the Eng. name of the *Populus alba*, or white poplar. See **POPLAR**.

**Abelin, Johann Philipp** (d. c. 1646), Ger. historian, better known under his pseudonym of Johann Ludwig Gottfried, was b. at Strasburg. His writings, all pub. at Frankfort, include vols. i. and ii. of *Theatrum Europæum* (21 vols., 1633-1738); *Historia Orientalis Indiæ*, 1628; *Inventarium Sueciæ*, 1632.

**Abencerrages**, name of a noble family in the Moorish kingdom of Granada, the story of whose long struggle with the rival family of the Zegrís has been the theme of many Sp. chroniclers and romance writers. See **MOORS IN SPAIN**.

**Abenezra** (c. 1093-1167), a celebrated Jewish scholar, b. at Toledo. He lectured and pub. works on philosophy, grammar, medicine, mathematics, and astronomy, and in connection with the last-named science gave his name to a star. He is chiefly known for his great commentary on the O.T.

**Abensberg**, a tn. in Bavaria on the Abens, a trib. of Danube; noted for sulphur baths. A. is the Castra Abusina of the Romans. Pop. 2000.

**Abeokuta**, a tn. in S. Nigeria, cap. of the prov. of the same name. Constituted in 1914, it having previously been the centre of a semi-independent native state. It was founded in 1823 by the inhab. of many neighbouring villages to protect themselves from slave-hunters. The mud walls are 18 miles in length and the tn. consists mainly of mud houses. It is a busy trading centre and exports timber, palm oil, yams, etc. The numerous Christian converts form an influential part of the pop. In 1917 a rising caused by taxation occurred in the prov. Area of the prov. 4266 sq. m. Pop. of tn. 53,000, of prov. 435,000.

**Aber**, a Celtic word, meaning 'mouth of river,' which forms the prefix of many names of places in Great Britain.

**Aber**, name of small vil. in Carnarvon, Wales. Pop. 300.

**Aberavon**, a seaport near the mouth of the Avon in Glamorgan, S. Wales. It is noted for its copper, iron, and steel works, has a good harbour, and is one of the parl. bors. of Swansea. It is now joined with the municipal bor. of Port Talbot. Pop. 16,800.

**Aberayron**, small watering-place in Cardigan, Wales. Pop. 1100.

**Aberbrothock**, see **ARBROATH**.

**Abercarn**, tn. in Monmouthshire; collieries and iron-smelting industry. Pop. 20,600.

**Aberchirder**, tn. in Banffshire, Scotland. Pop. 400.

**Aberconwy**, see **CONWAY**.

**Abercorn**, a place in N. Rhodesia near the S. end of Lake Tanganyika. On Nov. 14, 1918, the Ger. troops surrendered to the Brit. here.

**Abercorn, Duke of**, Irish title held by the family of Hamilton (q.v.). James Hamilton, a Scottish nobleman, was made baron, 1603, an earl in 1606 and, in 1790, his descendant became a marquis. In 1868 the 2nd marquis was made a duke and became lord-lieutenant of Ireland.

His family is portrayed in Disraeli's *Lothair*. James, the 2nd duke (1838-1913), was chairman of the Brit. S. Africa Company; James, the 3rd duke (b. 1869), was governor of N. Ireland, 1922-45.

**Abercrombie, John** (1726-1806), a writer on horticult. subjects, employed at Kew Gardens. In 1767 he pub. *Every Man his own Gardener*, which is said to have been submitted to Goldsmith for purposes of literary revision and returned without any alteration.

**Abercrombie, John** (1780-1844), eminent Scottish physician, b. at Aberdeen; graduated at Edinburgh, and rapidly became one of the foremost men in his profession. Was appointed physician in ordinary to the king in Scotland, 1824, and elected lord rector of Marischal College, Aberdeen, 1836. In addition to many medical treatises he was the author of 2 works that had considerable vogue at the time. These were *Inquiries concerning the Intellectual Powers* (1830), and *Philosophy of the Moral Feeling* (1833), in which he sought to harmonise the facts of science with the revelations of religion.

**Abercrombie, Lascelles** (1881-1938), Eng. poet and prof. of Eng. literature. Was lecturer in poetry at Liverpool Univ., 1919-22, and, from 1922, prof. of Eng. literature at Leeds Univ. His poems include: *Interludes and Poems*, 1908; *Emblems of Love*, 1912; *Deborah*, 3 vols. of plays and verse, 1922; *Four Short Plays* (verse), 1922; *Phoenix*, 1923; and *Twelve Idylls*, 1928. His poetry is complex and generally dramatic in form. It expresses a metaphysical sense of life, with something of the energy of life itself. All his dramatic poems deal, if not with tragedy in the Gk. sense, at least with disaster. Occasionally they suggest the themes of Hardy's lyric or narrative studies, notably *The End of the World*, a fantasy in the *Four Plays* vol. A's normal medium is blank verse, and it exhibits considerable skill in the utterance of colloquial sentiments without being casual or conventional. Perhaps his most notable achievement is the *Emblems of Love*, which contains much of his scattered work. *Deborah* is a tragedy of an attempt to shape life which fails; *Phoenix* expresses the shock of the actual world coming upon a group of romantics. The poems, *Interludes and Poems*, which are highly metaphysical, are concerned with the meaning of Self.

**Abercrombie, Sir Leslie Patrick** (b. 1879), Brit. architect, son of William A. Educated at Uppingham. Prof. of Civic Design, Univ. of Liverpool, 1915-35; prof. of Town Planning, Univ. College, London, 1935-46. Member of Royal Fine Art Commission; of royal commission on location of industry; chairman of Council for Preservation of Rural England; consultant for rebuilding and planning London, Plymouth, Bath, Hull, Bournemouth, and the Clyde region. Pub. *Town and Country Planning* (1935); his later planning, as shown in the second ed. of this work (1943), takes account of the fact that, after the Second World

War had begun, the absence of the normal security of life and the destruction of the centres of many of our tns. have made us reconsider our whole environment from what it appeared to be in 1933. His *Greater London Plan, 1944* (1945) is a report prepared on behalf of the Standing Conference on London Regional Planning at the request of the minister of Tn. and Country Planning. Many persons contributed to this plan, 'the area being so vast, the population so great, the aspects so complex and the existing conditions so determining, that no single technician could hope to resume in his person the necessary knowledge and skill' and therefore 'all such attempts at foreseeing the trends of, and proposing some direction to, human environment, must be a co-operative task'; but the task of co-ordinating the whole plan was the responsibility of A. alone. The broad principle of this ambitious report is to locate pop. and industry more logically, to improve transport radically, and to determine a proper use of land. It represents an attempt to make use of the opportunity offered by the late war, which introduced three new factors: the destruction of large areas, particularly in the centre; the evacuation of a large proportion of the pop.; and the industrial upheaval due to almost universal war production. Other publications include: *The Preservation of Rural England, 1926*; *County of London Plan, 1943* (with J. H. Forshaw); *A Plan for Plymouth, 1943* (with J. Paton Watson).

**Abercromby, David** (d. 1701-2), a Scottish physician and metaphysician of the seventeenth century, of whose life little is known save what he himself has told in his book, *Protestancy to be Embraced* (1682). Was educated as a Rom. Catholic, and lived for 18 years with a Fr. Jesuit order, but finally embraced the Protestant faith.

**Abercromby, Patrick** (1656-1716), antiquary and historian, was physician to James II., 1685. Was a Jacobite, and opposed to the union of Scotland with England. His chief work was *Martial Achievements of the Scots Nation* (1762).

**Abercromby, Sir Ralph** (1734-1801), general, b. at Menstrey, Clackmannanshire, educated at Rugby, and studied law at Edinburgh and Leipzig. Represented Clackmannanshire in parliament for a while. He accompanied the Duke of York on the 2 disastrous campaigns against the Fr. in Holland (1793 and 1799), and by his skill and humanity gained the affection and admiration of the whole army. This humanity led to his removal from the post of commander in Ireland during the rebellion of 1797 to a similar post in Scotland. On Feb. 18, 1797, Chacon, Sp. governor, surrendered Trinidad to A. without a fight, and the cession was confirmed by the treaty of Amiens, 1802. He was wounded during an engagement with the Fr. at Alexandria, Egypt, and, though victorious, d. a week later.

**Aberdare, a tn., Glamorgan, S. Wales.** It is situated on an important coalfield,

has extensive coal and iron works, and is in direct communication with the large ports in S. Wales, whence its coal and iron goods are exported. Pop. 48,700.

**Aberdare, Henry Austin Bruce, first Baron** (1815-95), statesman. Stipendiary magistrate for Merthyr Tydvil and Aberdare from 1847 till 1852, when he entered parliament as representative of the same dist. as a Liberal. Held many high appointments, including the home secretaryship, 1869-73, and the Presidency of the Council, 1873-74. In the former capacity he conducted the reform of the licensing laws. Was the first chancellor of the univ. of Wales, 1894.

**Aberdeen:** 1. An important city in the N. of Scotland, situated between the mouths of the Dee and Don rivs. In 1179 William the Lion granted it a charter, and it became a royal burgh, but in 1336 it was burned down. It was rebuilt as New A., and soon became a flourishing tn. It is a beautiful city, mostly built of granite, and amongst its buildings are the municipal buildings, the market hall, the art gallery and school, the Royal Infirmary, the lunatic asylum, trades hall, Marischal College, and Gordon's College. There are many places of worship, of which the most important are the church of St. Nicholas and the Rom. Catholic cathedral in Old A. Old A., on the Don, is now incorporated in the municipality. The statues and the Duthie public park are also famous. As a commercial and industrial tn. it plays a leading part, the ann. value of its trade running into millions of pounds. Its harbour has been greatly improved by a pier of granite, and its chief industries are herring and salmon fishing, brewing, distilling, shipbuilding, paper-making, quarrying, and the manuf. of woollen, cotton, linen, and jute goods. In recent years the ann. value of the fish landed has exceeded £2,000,000. As mine-sweepers and patrols the A. trawlers did good service during the First World War. King George V. opened the city's war memorial in 1925. A. has a disadvantage in not being within easy reach of coal and iron. It trades chiefly with Great Britain, America, the E. Indies, the W. Indies, and the Baltic and Mediterranean ports. It is a univ. city. King's College was founded in 1494 at Old A. by Bishop Elphinstone, and Marischal College was founded in 1593 by George Keith, Earl Marischal. Celebrated people connected with A. are Barbour, whose tomb is in the cathedral, and who was archdeacon of A. from about 1356 until his death; Hector Boece, prin. of King's College; George Campbell, prin. of Marischal College; and Byron, who received his early education at the grammar school. Pop. 168,000. 2. Cap. Monroe co., Mississippi, U.S.A.; manufs. bricks and machinery; exports cotton seed. Pop. 14,000. 3. Cap. Brown co., S. Dakota, U.S.A.; manufs. chemicals. Pop. 17,800. 4. Tn. in Chohals co.,

Washington; has saw-mills and machine shops. Pop. 18,500.

**Aberdeen Angus Breed**, see under CATTLE.

**Aberdeen, George Hamilton Gordon**, fourth Earl of (1784-1860), statesman and Prime Minister of England. Educated at Harrow and Cambridge, and in 1801, on succeeding to the earldom, travelled in Greece; hence Byron's oft-quoted line, 'The travelledthane, Athenian Aberdeen.' Ambas. at Vienna (1813), and signed the treaty of Teplitz.

LORD ABERDEEN, FOURTH EARL

Entered political life as a Tory, and became successively chancellor of the duchy and foreign secretary in Wellington's Cabinet (1828-30), but although he held office (colonies and war) under Peel (1834-35) and was again foreign secretary (1841-46), he gradually abandoned his high Tory principles and resigned with Peel in 1846. In 1852 succeeded Lord Derby as Prime Minister, forming a popular coalition ministry. His ministry soon met with disfavour owing to the mismanagement of the Crimean war, and he resigned after the carrying in the House of Commons of Mr. Roebuck's motion of censure.

**Aberdeen, Sir John Campbell Gordon**, first Marquess and seventh Earl of (1847-1934), grandson of fourth earl, was twice lord-lieutenant of Ireland (1896 and 1905-1915), and governor-general of Canada, 1893-98. Marquisate created Jan. 4, 1916.

**Aberdeenshire** is one of the N. cos. of Scotland, with an area of about 1972 sq. m. The coast-line is fairly regular; but there are points and headlands towards the N.E., of which Buchanness is the most easterly point of Scotland. Further N. there are high rocks and caves. In the S.W. the co. is bounded by the Grampians, which in their highest

peaks rise to over 4000 ft. Cairngorm, Ben Macduh, Cairntoul, and Loch-nagar are the prin. points. The surface is generally hilly, and is watered by the rs. Dee (87 m.), Don, with its trib. the Urie (82 m.), Ythan (36 m.), Deveron (50 m.), and the Ugie with their various tribes. The soil on the whole is not fertile except in that portion between the rs. Don and Ythan, but owing to the industry of the people crops of barley, oats, and turnips are produced. Much of the land is covered with fir, ash, birch, and poplar trees, and in some parts sheep and cattle are reared. Herring and salmon fishing is a great industry, especially at Peterhead and Aberdeen. The co. is divided into 5 divs., Mar, Formatin, Strathbogie, Buchan, and Garrioch; and the most important tns. are Aberdeen, Peterhead, Fraserburgh, Inverurie, Kintore, Charlestown, Old Meldrum, Huntly, and Turriff. There are many small vis.—Ballater, Boddam, Newburgh, Newlyth, and Strichen. The ruins of old feudal castles still exist, among which may be noted Dundargue, Ken-Edgar, Craigston, Fedderessett, Slains, and Fyvie. Balmoral is noted for its castle. The co. returns 2 members to parliament. Pop. 323,000.

**Aberdeen Terrier**, see Scottish Terrier.

**Aberdevine**, see SISKIN.

**Aberdovey**, a seaside resort in the urb. dist. of Towyn in Merionethshire, Wales, on the estuary of the Dovey, about 10 m. N. of Aberystwyth. Pop. of urb. dist. 4500, of tn. 1200.

**Aberfeldy**, a vil. on the r. b. of the R. Tay in Perthshire, Scotland. The scenery around, referred to by Burns in *The Barks of Aberfeldy*, is very beautiful, the falls of Moness being a great attraction. Pop. 1560.

**Aberfoyle**, a vil. on the R. Forth in Perthshire; the scene of Scott's *Rob Roy*. Pop. 1200.

**Abergeldie Castle**, an Aberdeenshire royal seat, situate on the R. Dee near Balmoral.

**Abergavenny**, a tn. in Monmouthshire, at the confluence of the Usk and Gaveenny. It is an old Rom. settlement (Gobannium); there are remains of an old castle and of a Benedictine priory; and it has an old church and sev. other places of worship. Coal and iron are found in the vicinity, but it is chiefly noted as a wool market. Pop. 8600.

**Abergavenny, Baron**, see NEVILLE.

**Abergele**, on the coast of Denbighshire, N. Wales. It is an old Rom. camp, and Harold was defeated by Gruffydd ap Llewelyn near there. It is now noted as a seaside resort. Pop. 2600.

**Aberhart, William** (1878-1943), Canadian politician, b. in Ontario and educated at Queen's Univ. Principal at high school in Calgary, Alberta. Organised a social credit movement, which won the provincial election in 1935, A. becoming Prime Minister of Alberta on Sept. 3 of that year. He then tried to establish a currency system on social credit principles, his proposals involving the grant of a 'basic dividend' of \$25

a month to every citizen, payable in non-negotiable certificates deposited with a special bank. These proposals also involved price control and taxation to recover expenditure for the dividends. The Alberta legislature passed the necessary legislation, including the Bank Taxation Bill, the Credit Regulation Bill, and a Press Control Bill, but all these measures were declared *ultra vires* by the Supreme Court of Canada, and their decision was upheld by the Judicial Committee of the Privy Council. Other unorthodox measures having failed A. reverted to orthodox finance but, in 1937, the Alberta budget showed a deficit of 1½ million dolrs. By 1940 his majority had become considerably reduced. A.'s Social Credit Gov. was defeated for the first time in Feb. 1937 on a motion to adjourn the debate on the budget; after which A. introduced a social credit bill providing for a commission to administer the social credit plan. But, in 1940, on his own advice, the legislature was dissolved, though the Social Credit Gov. was returned to power in the provincial election with A. at its head.

**Abernethy**, a vil. on the Tay, Perthshire. It was the ant. cap. of the Picts, and possesses a round tower, the date of which is uncertain. Pop. 1150.

**Abernethy**, John (1680-1740), Irish Protestant divine. By his refusal to accept the synod's decision that he should go to Dublin (1717) he caused a div. in the Irish Presbyterian Church, the 2 parties becoming known as 'subscribers' and 'non-subscribers.' Ultimately he went to Dublin (1730), where he engaged in many theological controversies, and strongly opposed the Test Act.

**Abernethy**, John (1764?-1831), celebrated surgeon, grandson of Irish Presbyterian clergyman (*supra*). Place and date of birth doubtful, probably Derry in Ireland. Educated in Wolverhampton, he was appointed assistant surgeon at St. Bartholomew's Hospital, 1787. Full surgeon from 1815 to 1827, during which period he gained a wide reputation for his daring and skilful conduct of operations for the cure of aneurism. He pub. many medical works, and laid down two important principles, which greatly influenced all subsequent surgical practice, the first being that local diseases had a constitutional origin, and the second that this origin could generally be traced to disorders of the digestive system. His reputation, however, rests mainly on his power as a lecturer, and he was easily the most popular medical teacher of his day.

**Aberration**, a deviation: in biology, an abnormal structure, or departure from the type. In optics, the term is used in two different senses.

**A. of Light**, the apparent deviation of a star from its path, a phenomenon depending upon the relation between the velocity of light and the velocity of the earth in its orbit. A man walking with an umbrella provides what is perhaps the best illustration. If he wishes to shelter

himself from vertically descending rain, he has to hold the umbrella before him at an angle which varies with his own pace and also with the downward speed of the rain. If his own rate is slow and the rain is descending swiftly, the umbrella is held fairly upright; but a brisk walk through slowly falling rain necessitates inclining the umbrella well to the front. Now consider the case of an observer looking at a star through a telescope. The rays of light come from the star with a velocity of 186,330 m. a second, whilst the observer himself with his telescope is travelling along the earth's orbit. In order to catch the rays proceeding from the star in the telescope tube, the instrument has to be tilted away from the direction of the light, just as the umbrella has to be inclined away from the true direction of the rain. The slope of the telescope therefore indicates as the position of the star a point which is somewhat in advance of its true position. The path of the earth around the sun is elliptical, so that, in the course of a year, the successive points to which the telescope has been directed will be found to be on the circumference of a small ellipse, with the true position of the star as the point of intersection of the axes. The minor axis of this ellipse depends upon the latitude of the star, because if it be near the plane of the earth's orbit it will appear flattened out; but the major axis is the same for all stars and is found to be approximately 40". This means that the maximum apparent deviation of the star from its true position is 20" (more exactly, 20.45") in each direction. As A. depends upon the ratio between the velocity of light and the velocity of the earth, the determination of this 'constant of A.' provides a method of calculating one of these velocities if the other be known.

**A. in Optics—Chromatic A.**—When ordinary white light passes through a lens with thin edges, the violet rays are most refracted, and tend to come to a focus before the red rays. If a screen be placed so as to intercept the rays, in one position the image will be found to have a red border, owing to the red rays not yet having converged; whilst, on moving the screen a little further from the lens, the border becomes violet, because the violet rays are now diverging again. A. of this kind, called chromatic (Ch. chroma, colour), interferes with the usefulness of optical instruments. It may be remedied by coupling 2 lenses made of different glass, so that the difference in refracting power may lead to an adjustment, bringing all the coloured rays to the same focus.

**Spherical A.**—Even when the light passing through a lens is monochromatic, the focusing is never quite exact. The image of a point is shown as a small circle, so that objects perceived are blurred in outline. This is not so serious a fault in lenses as chromatic A., and can be avoided to some extent by the use of diaphragms limiting the used area of the lens.

**A.** is also occasioned by mirrors of spherical form. A parabolic mirror, however, gives an exact focus, which is the reason why such mirrors are used when a parallel beam of light is required. the source of light in this case being placed at the focus.

**Abershaw, Louis Jeremiah, or 'Jerry'** (1773-95), celebrated highwayman mentioned by Borrow in his *Laurel* as *Jemmy Abershaw*.

**Abersychan**, a tn. in Monmouthshire. Its position near a large coalfield makes it a centre for iron and steel works. Pop. 12,300.

**Abertillery**, a tn. in Monmouthshire, noted for its collieries and tin-plate works; pop. 22,800.

**Aberystwyth**, a municipal bor., mrkt. tn., and seaside resort of Cardiganshire, Wales, on Cardigan Bay. It is the seat of the Univ. College of Wales and of the National Library of Wales. Its fine situation has made it a popular holiday centre. There are good beaches for bathing and facilities for every kind of sport, including deep-sea and fresh-water fishing. There is a pier, and an extensive promenade. Some ruins of the twelfth-century castle remain. Pop. 9500.

**Abeshir**, cap. of Central Sudan, on the caravan route from Khartoum to Kuka; pop. about 25,000.

**Abettor**, a term used both in a legal and general sense, indicates a person who instigates or encourages an offence, without taking any active part in it. See also **ACCESSORY AND ACCOMPLICE**.

**Abeyance**, a legal term derived from the O.Fr. *beer*, to gape after. The term is used to imply the state of suspense of the rights in a freehold or a title of honour. It is a maxim of Eng. law that freehold cannot be put in A. by any action of the owner, the underlying idea being that some person should be in existence for the discharge of feudal duties. Where, however, a life interest only exists in lands, such, for example, as is the case of a bishop, that interest is said to be in A. until the appointment of his successor. In the same way where a title can be held only by male heirs that title may be in A. if the persons next in inheritance to the last possessor are females. The title is not extinct, for the birth of a son to any of the female heirs can revive it.

**Abgar**, name of a line of rulers of Edessa in Mesopotamia. They were 28 in number, the best known being the fourteenth. He it was who is said to have written to Jesus asking him to come and cure him of a disease. Eusebius of Caesarea trans. this letter and the reply of Christ, promising to send a disciple after his ascension, from the Syriac to Gk., but their authenticity was discredited by Pope Gelasius in 494.

**Abhorers**, the court party in the reign of Charles II. who were opposed to and 'abhorred' the views of the rival party, led by Shaftesbury, who were opponents to the royal prerogative. The former party were subsequently called **Tories** and the latter **Whigs**. See also **TORY**.

**Abiathar**, high priest in the reign of

the Heb. kings David and Solomon. Escaping from the massacre by Saul of the sons of Ahimelech (his father, also high priest), he joined David at the cave of Adullam, and remained faithful to David during the life of the latter. He was deposed by King Solomon for his participation in the rebellion of Adonijah and banished.

**Abib**, or **Nisan**, formerly the first month in the Jewish calendar, but according to present-day reckoning the seventh. Corresponds to part of Mar. and part of Apr. In it is celebrated the feast of the Passover.

**Abies**, see **FIR**.

**Abies**, in fossil botany, is the name given to the *A. laricioides*, a single incomplete specimen of a fruit resembling the spruce fir (*A. excelsa*), by Brongniart. Its locality is unknown.

**Abietinæ**, a genus of the Conifere, with perfect cones, the seed hidden between scales, hard testa, and no aril. The cones are usually monocious.

**Abigail**, the wife of Nabal, the churlish rich man who refused hospitality to King David when he had to flee his kingdom. Intercepted David when later he returned to punish her husband, and so won his heart that not only did he forgo his chastisement of Nabal, but after the latter's death he took A. to wife. Another A. was the sister of David. The name abigail is used for a waiting-maid or female domestic from the style of 'hand-maid' which A. used to designate herself when speaking to David.

**Abijah**, name of more than one biblical character, of whom the chief was the son of King Rehoboam. He was engaged in war with and defeated Jeroboam, the other king of the then divided kingdom of Palestine.

**Abila**, see **ABYLA**.

**Abilene**, co. seat of Taylor co., Texas, U.S.A., 160 m. W. of Fort Worth; has flour and planing mills, and deals in cotton. Pop. 26,600.

**Abimelech**. (1) Name of two Philistine kings, father and son, who, taking the wives of Abraham and Isaac to be their sisters, married them. Both were restored to their former husbands with reparation on their true relationship being revealed. (2) Natural son of Gideon, the Heb. judge, who, by the murder of his 70 brothers (except the youngest, Jotham, who escaped), made himself king of Shechem. Jotham later appeared and propounded to the subjects of A. the parable of the bramble-king, the first recorded biblical parable. A. was killed by a woman while besieging the rebel city of Thebez.

**Abingdon**, an historic tn. on the Thames, 6 m. S. of Oxford, formerly the co. tn. of Berkshire; now a flourishing residential and mrkt. tn. with some light industries (motor cars, leather works). Many interesting buildings include remains of the Benedictine abbey (founded seventh century), the Guildhall, the former co. hall (1677), a fine par. church (c. 1450), and the Elizabethan schoolroom of what is now a boys' public school. Pop. 11,250.

**Abingdon**, the co. seat of Washington co., Virginia, U.S.A., near Walker's Mt., on the Norfolk and Western railroad. It has sev. educational institutions—the Martha Washington College, 1858, and Stonewall Jackson Institute, 1869 (both for women), and A. Academy. There are manufs. of tobacco, bricks, and wagons; flour and planing mills, and trade in live stock. Pop. 3000.

**Abingdon**, Earl of, *see* BERTIE, WILLOUGHBY.

**Abinger**, a vil. near Dorking, Surrey. It has an observatory, to which, in 1925, was transferred from the Royal Observatory, Greenwich, the work of recording earth magnetism.

**Abinger**, Sir James Scarlett, first Baron (1769–1844), Eng. politician and judge, b. in Jamaica, studied in the Inner Temple, and called to the bar in 1791. In 1791 entered parliament as Whig member for Peterborough, was knighted and appointed attorney-general in Canning's ministry (1827), and in Wellington's (1829–30). Successfully carried through a Bill to amend the administration of justice (1830), but opposed the Reform Bill of 1831. Was returned as a Tory for Cokerborough (1831), and then Norwich (1832), and was elevated to the bench by Peel (1834) as lord chief baron of the Court of Exchequer.

**Abington** (or **Habington**), Edward (1553–86), a conspirator in the Catholic plot of Babington against Queen Elizabeth. Although protesting his innocence, he was sent to the Tower and hanged and quartered, Sept. 20, 1586.

**Abington**, Mrs. Fanny (1737–1815), celebrated actress, b. in London. Début at Haymarket, 1755, as Miranda in *The Busybody*. Created 30 original characters, including Lady Teazle (1777), and impersonated many of Shakespeare's heroines.

**Abington** (or **Habington**), Thomas (1560–1647), brother of Edward (*supra*), and like him imprisoned for complicity in Babington's plot, 1586. The letter to Montague warning him of the Gunpowder Plot is attributed to A.'s wife.

**Abiogenesis**, the supposed production of living from non-living matter. The more popular term is spontaneous generation, and under this name the possibility of the phenomenon was generally believed in until recent times. The ancients supposed that bees and flies were generated in putrefying carcasses, and that mud and filth brought forth such creatures as eels, frogs, and mice. The growing knowledge of the life hist. of those animals gradually dispelled the belief, but at a later period it was held that the bacteria of fermentation and putrefaction owed their origin wholly to the substances in which they were found. Pasteur was to a great extent responsible for the conclusion that if a substance has been sterilised, only infection from outside sources can re-introduce bacteria. Complete sterilisation, however, is difficult to obtain, for some bacteria survive the temperature of boiling; and the presence of germs, too, is so widespread

and their multiplication so rapid that workers before the time of Pasteur had found it difficult to establish a direct refutation of the theory. The mere fact that the earth must have been at one time a molten mass of inorganic matter is sufficient to encourage many in the belief that it may yet be possible to produce life from non-living matter. On Pasteur's work are based all the modern methods of food preservation by canning, bottling, etc., including the pasteurisation of milk, named after him. *See* ANTI-SEPTICS.

**Abipones**, formerly a fine race of S. Amer. Indians inhabiting Paraguay who by their courage proved very formidable opponents to the Spaniards. Now incorporated with other tribes.

**Abishai**, King David's nephew, a man of great courage and prowess in battle. Accompanied David on the night expedition to camp of Saul (1 Sam. xxvi. 6–9). On one occasion with 2 others he broke through the Philistine ranks, and on another slew 300 men. Was faithful to David during Absalom's revolt. *See* Chronicles and Samuel *passim*.

**Abjuration of the Realm**. By the old common law of England if a person accused of any crime other than treason or sacrilege took sanctuary in a par. church or churchyard, and within 40 days went in sackcloth to the coroner and confessed his guilt, he was allowed to take the oath of A. of the R., i.e. he would leave the country forthwith and never return without licence from the king. All his property was forfeited, and the penalty for returning without leave was hanging. By a statute of Elizabeth (35 Eliz. c. 2), Rom. Catholics and Dissenters might be required to abjure the realm. The privilege of sanctuary was abolished in the reign of James I.

**Abjuration, Oath of**. An oath taken by holders of public office, such as members of parliament, clerics, and lawyers, originally imposed in the reign of William III., and requiring the taker of the oath (juror) to abjure the claims of the Stuart pretender or his heirs to the throne. It also rejected the opinion that the pope of Rome had any jurisdiction in England, or that princes excommunicated by him could be deposed or murdered. After many modifications with a view to relieving Jews, Catholics, etc., the various statutes were consolidated in the Promissory Oaths Act, 1868. The famous Bradlaugh case (*q.v.*) arose from Bradlaugh's objection to the final wording of the oath, 'so help me God.'

**Abkhazia**, or **Abasia**, an autonomous S.S.R. of Georgia comprising about 2500 sq. m. on the S. slope of the Caucasus. Successively under Persian, Georgian, and Turkish control. It was annexed by Russia in 1809, but not pacified till 1864. The people are occupied in agriculture, cattle-raising, and lumbering. The cap. is Sukhumi. Pop. (estimated) 200,000.

**Ablancourt**, Nicolas Perrot d' (1608–1664), Fr. translator of Gk. and Rom. writers. He trans. the whole of Tacitus

and 4 of Cicero's orations, but his versions, being somewhat paraphrastic, have long been superseded.

**Ablative Case**, see under DECLENSION.

**Ablaut** is a Ger. term used by philologists to signify a relation existing between the vowels of certain series of related words in Indo-European languages, caused by the Indo-European system of accentuation. It is most clearly shown in the strong verbs, where it is still to be found in modern Eng. The relation of *i, a, u* in the verb *drink, drank, drunk* is an A. relation, the vowels themselves forming an A. series.

**Able-bodied Seaman (A.B.)**. In the R.N. a youth about 18 years on for 12 years, and after attaining proficiency in gunnery, or any other specified branch or trade, becomes an A.B. In the merchant service, the term is used for any man who has had 2 years' experience before the mast.

**Ablution**, or Purification, a rite of the ant. Jewish and other churches by which the purification of the soul was symbolised by the washing of the body. The Mosaic law has a very elaborate code of rules for this ceremony. The term is also used to indicate the washing of the chalice and the priest's hands after mass.

**Abner**, a cousin of the Heb. king Saul, and captain of his army. After the death of Saul he proclaimed Ishbosheth king. Seeking to reconcile the rival claims of Ishbosheth and David, he visited the latter at Hebron, where, to David's great sorrow, he was treacherously slain by David's captains, Abishai and Joab.

**Abney Park**, a dist. in N. London. It is in the bor. of Stoke Newington, and has a large cemetery, dedicated in May 1840 and notable for its old trees and arboretum. The dist. is named after Sir Thomas Abney, who lived here.

**Abney, Sir Thomas** (1610-1722), one of the original promoters and directors of the Bank of England. Benefactor of St. Thomas's Hospital; lord mayor of London, 1700-1.

**Abney, Sir William de Wiveleslie** (1844-1921), Eng. physicist and astronomer; *b.* in Derby, educated Royal Military Academy, Woolwich. Captain in Royal Engineers, 1873; president Royal Astronomical Society, 1893-95; president Physical Society, 1895-97; prin. assistant secretary Board of Education (Science Dept.), 1899-1903. Thenceforward adviser to the Board of Education and to the War Office. Pub. important works on photography, especially stellar photography, and wrote valuable treatises on spectroscopy. *Instruction in Photography*, 1870; *Treatise on Photography*, 1875; *Colour Vision, Colour Measurement and Mixture*, 1893; *Researches in Colour Vision*, 1913; *Trichromatic Theory of Colour*, 1914. He also wrote *Thebes and its Five Great Temples* (1876), and with C. D. Cunningham *The Pioneers of the Alps*, 1887.

**Äbo (Turku)**, important tn. in Finland, and formerly cap., situated on the Åra-

joki R. not far from its mouth. Its univ., founded in 1640, was removed to the present cap., Helsinki, after the disastrous fire which destroyed its buildings and most of the tn. in 1827. Important shipbuilding and timber trade. Pop. 74,000.

**Äbo, tn.** in S. Nigeria at head of Niger Delta. Palm oil largely exported. In 1930 Ä. (and also Opofo) was the scene of rioting, in which native women took a leading part, the cause of the unrest being the uneconomic prices obtained for palm kernels. In the restoration of order, more than a score of women were killed by the rifle fire of native police. Pop. 8000.

**Abolitionists**, name of party in the U.S.A. who demanded the abolition of slavery. Although many individuals had held opinions hostile to slavery, especially among the Quakers, it was not until 1774 that Benjamin Franklin presided over their first congress in Philadelphia. Towards the end of the third decade of the nineteenth century the movement against slavery began to make great headway, and in 1831 one of its chief leaders, William Lloyd Garrison (q.v.), began to pub. its organ, the *Liberator*, in Boston. The New England Anti-Slavery Society, formed in 1832, became the nucleus of a great political party which influenced and finally (1856) merged with the Republican party. The feeling against the A. was naturally very strong in the S. or slave-owning states, the Legislature of Georgia even going the length of offering a reward of 5000 dol. to any one who could secure the conviction of Garrison. Even in his own city of Boston, Garrison was severely handled by the mob. No doubt much of the unpopularity incurred by the A. was due to the practical assistance rendered to runaway slaves by an organisation called the 'Underground Railway.' The A. ideals finally triumphed when President Lincoln proclaimed the freedom of the slaves on Jan. 1, 1863.

**Abomy**, a walled city, formerly the cap. of Dahomey, the negro kingdom of W. Africa, about 70 m. from the present cap., Porto Novo. It was occupied by the Fr. when they conquered Dahomey in 1892. Has an extensive trade in palm oil, gold, and ivory. Pop. 20,000.

**Aborigines**, formerly the name given by Gk. and Rom. writers, who treated of the earliest period of Rom. hist., to a tribe who occupied, with their allies the Pelagi, the dist. of Latium. Now used to denote the original inhab. of any country, and more particularly the natives found in a country conquered or colonised by Europeans. The term is also used to denote the original fauna and flora of a place. The Aborigines' Protection Society, founded in 1833, has been instrumental in securing the framing of regulations designed to secure the natives of Brit. and other colonies from ill-usage by white officials or colonists. In 1872 and 1875 Acts were passed for the protection of the Pacific islanders, more especially in relation to their

Importation as labourers into the Australian colonies. The dominion of Canada has exclusive control over its aboriginal tribes, but for other colonies special protection is afforded the natives by the imperial gov. In 1890 the General Act of the Brussels Conference was signed, by which the adhering powers agreed to certain restrictive measures concerning the sale of drink to natives, etc.

AUSTRALIAN ABORIGINE

**Abors**, savage race of hillmen inhabiting the hinterland of Burma, against whom a punitive expedition was despatched by the Indian Gov. in 1911 to avenge the death at their hands of Mr. Williamson, an Anglo-Indian official.

**Abortion** (*aboriri*, to miscarry), the premature expulsion of the foetus from the womb before the seventh month. Later, such an occurrence is called premature labour. The term *A.*, however, is often restricted to cases where such expulsion is deliberately contrived: either by doctors as a measure calculated to save the mother from death or serious illness, or by persons who desire to evade the responsibilities, or perhaps (in the case of illegitimacy) the shame, of motherhood. Cases of *A.* due to accidental or pathological causes are frequently known simply as miscarriages.

The expulsion of the foetus is by no means rare, and may be the result of a salutary effort of nature to get rid of diseased matter within the womb, or may be due to preventable causes. The malformed or diseased condition of the womb may lead to the death of the foetus,

when any further association with the mother is fraught with grave dangers to her health. In this case the body makes its own preparations for getting rid of the dead matter and miscarriage takes place. Abnormal excitement during pregnancy, sudden shock, a fall, over-reaching, or over-straining are all liable to cause *A.*, and should therefore be avoided by a woman about to become a mother. In general it may be said that in the upper classes persistence in the more exciting forms of society pleasures provides a cause; whilst among women of the labouring classes the necessity for somewhat severe manual work is frequently responsible for miscarriage.

The symptoms comprise pains in the loins and a sense of bearing down, accompanied by a discharge of blood. The discharge, if continued, results in the expulsion of the foetus, and it is advisable that the matter discharged should be kept for examination by a medical man, as the treatment depends upon the possibility of preventing the miscarriage altogether. The patient should be kept quiet in a recumbent position, and the abdomen kept cool. If it be impossible to prevent the occurrence, the treatment then aims at bringing about the expulsion as quickly as possible, and with a minimum amount of derangement.

*A.* has naturally a weakening effect upon the system, and complete rest for some time is imperative. One of the most important after-effects is the liability to the establishment of a 'habit'; that is to say, a miscarriage may take place at the corresponding period in a subsequent pregnancy. In this connection it may be noted that tendency to miscarriage is often aided by what would be in point of time the menstrual period.

The procuring of *A.* by a pregnant woman, by taking drugs or using instruments, is a felony, and any person who endeavours to procure the miscarriage of any woman by administering drugs, or using any instrument or other means with the same object, is guilty of a felony. The penalty is penal servitude for life or not less than 3 years, or imprisonment not exceeding 2 years with or without hard labour. To supply or procure drugs or instruments, knowing that they are to be used with the object of procuring a miscarriage, is a misdemeanour. The penalty in this case is penal servitude not exceeding 5 nor less than 3 years, or imprisonment not exceeding 2 years with or without hard labour. Persons tried under the Offences against the Persons Act, 1861, for administering drugs or using instruments to procure *A.*, may be convicted of the felony of child-destruction under the Infant Life (Preservation) Act, 1919. An *A.* brought about artificially to save the mother's life or health is not a crime; but the burden of proof is on the person bringing about the *A.*

**Abou-hannes** (*Ibis religiosa*, Cuvier; *Tantalus æthiopicus*, Latham), an Egyptian word meaning Father John, is a

bird which in anct. times was regarded with great veneration by the Egyptians. It is no doubt the white or sacred ibis mentioned by Herodotus (il. 76).

**Abou-harb**, the Arabic name of the *Leucoryx antelope*.

**Abou-hossein**, the Arabic name of a species of fox (*Canis pallidus*), found in Darfur and Kordofan. Rüppel, *Zool. Atlas*.

**Aboukir**, a vil. on Aboukir Bay, 13 m. N.E. of Alexandria, Egypt. Its historical connections make it famous. The battle of the Nile was fought in Aboukir Bay, 1798, when the Fr. were completely defeated by Nelson. In 1799 Napoleon defeated the Turks with an army of 18,000 men there, and in 1801 Sir Ralph Abercrombie defeated the Fr.

**Abousambul**, **Abu Simbel**, or **Ebsambul**, see **IPSAMBUL**.

**Abou-schom**, the Arabic name of a species of fox (*Canis variegatus*), found in Nubia and Upper Egypt. It does not burrow, but resides among rocks.

**About**, Edmond François Valentin (1828-85), a distinguished Fr. author, was b. at Dieuze, Lorraine, and educated at the Ecole Normale, Paris, and at Athens. In 1854 he wrote *La Grèce contemporaine*, which was a great success, and *Tolla*, a novel, 1855. Then followed *Les Mariages de Paris*, and by this time his reputation was estab. His other works are: *Le Roi des montagnes*, 1856; *Germaine*, 1857; *Madelon*, 1863; *La Question romaine*, *Le Nez d'un notaire*, 1862; *L'Homme à l'oreille cassée*, 1862; *Le Cas de M. Guérin*, 1862, 3 fantastic tales; *Trente et quarante*, 1865; *L'Infâme*, 1867; *Le Progrès*, a study of social reforms, 1864; *Le Turco*, 1866; *Les Mariages de Provence*, 1868; and *Le Roman d'un brave homme*, 1880. He contributed to the journals and founded *Le XIX<sup>e</sup> Siècle* in 1871, and wrote political pamphlets. As a dramatist, however, he was not successful, although he wrote *Gaetano*, 1862, and *Guillery*, 1856, a comedy. He was elected a member of the Fr. Academy, 1884. See *Life* by M. Thiébaud, 1936.

**Abraham**, see **ABARBANEL**.

**Abacadabra**, a magical word, written in the form of a triangle, and used by anct. as a spell to overthrow evil spirits, to cure fever and other maladies.

A

According to Serenus Sammonicus, a doctor and poet, at the commencement of the third century, the letters of the word must be written in the form of a triangle so that it can be read in different ways. It was often written on a piece of paper, folded, and worn round the neck.

**Abraham**, the great patriarch of the Heb. race with whom the hist. of Israel begins. Born in Ur of the Chaldees, the son of Terah, an idolater (Joshua xxiv. 2), he set out with his father, his wife, Sarai, who was also his half-sister (Gen. xx. 12), and Lot his nephew, and settled for a time in Haran, where Terah d. (Gen. xi. 31). Thence, at the call of God, he went into Canaan, taking his wife and nephew, with his household and property (Gen. xii. 1). At Shechem A. first received the promise of the land. There he built an altar to the Lord; a second he built at Bethel, as he journeyed S. (Gen. xii. 7-9). Dearth in Canaan drove A. to Egypt, where, calling Sarai his sister, he brought her into grave danger. God protected her, and A. returned to Canaan with the reproach of Pharaoh, whom he had deceived (Gen. xii. 10; xiii. 1). A. and Lot separated at Bethel, and A. moved to Hebron (Gen. xiii.). He defeated Chedor-laomer, who had taken much plunder and many prisoners, including Lot, and both booty and captives were rescued. Melchizedek, king of Salem, met A., and blessed him. A. now an old man and childless, doubted the promise to his seed, but God renewed the promise (Gen. xv.). His first son Ishmael was b. to him by Hagar, the Egyptian maid (Gen. xvi. 1). In his hundredth year, God changed the name of Abram, 'exalted father,' to Abraham, signifying that he would be the father of many nations (Gen. xvii. 5), and in her ninetieth year Sarai's name was changed to Sarah, and she was assured of a son, whereat A., incredulous, laughed. This suggested the son's name Isaac, from the Heb. verb 'to laugh.' When A. was told by the Lord of the impending destruction of Sodom, he interceded, and going up to the scene of the intercession, he saw the smoke of the burning cities ascending like that of a mighty furnace (Gen. xix. 27). At the appointed time Isaac was b. (Gen. xxi. 1), and Ishmael and his mother were driven away (Gen. xxi. 8). At Beer-sheba an alliance was arranged between A. and Abimelech, the Philistine king (Gen. xxi. 22). While sojourning in the Philistine country, A.'s faith endured its sternest test by the command to slay in sacrifice his son Isaac (Gen. xxi.). Sarah d., and A. bought the cave of Machpelah as a burying-place; and realising his approaching end sent for Rebekah as a wife for Isaac (Gen. xxiv.). A.'s second wife was Keturah, by whom he had 6 sons (Gen. xxv. 1). At the age of 175 he d., and was buried by Isaac and Ishmael in the cave of Machpelah (Gen. xxv.). A. is known as 'The Friend of God,' and ranks not only as the great ancestor of many peoples, but as the 'prophet' (Gen. xx. 7) through whom the revelation was begun; as the founder of that religion which was to gather all nations within its scope.

**Abraham**. Altar of the black stone 'given by Gabriel to Abraham,' in the kaaba or sacred shrine of the Mohammedan religion in Mecca. It is placed in

the S.E. wall of the kaaba at such a height that it may be kissed by the devout pilgrim.

**Abraham, Plains of, or Heights of,** near Quebec, Canada. Here was fought the battle of the Heights of Abraham, 1759, between the Fr. under Montcalm, and the Eng. under Wolfe. The Fr. were defeated and Canada became a Brit. possession.

**Abraham a Sancta Clara** (1644-1709), whose real name was Ulrich Mejerle, was b. near Moskirch, Swabia, Germany, and d. at Vienna. He was a very popular Ger. preacher, joined the Augustinians, became court preacher at Vienna, went to Craz, but afterwards returned to Vienna. His sermons are full of imagination, but nevertheless contain sound doctrine. Schiller's *Wallenstein's Lager* was inspired by his sermon, 'Up, up, ye Christians!'

**Abrahamites:** (1) a sect of Syrian heretics, said to be allied to the Paulicians, who denied the divinity of Christ. Their founder was Ibrahim, or Abraham, of Antioch. (2) A sect of Bohemian deists, who claimed the original religion of Abraham. They denied the Trinity, and accepted from the Bible only the Ten Commandments and the Lord's Prayer, declaring themselves followers of John Huss. Joseph II. transported them to Transylvania in 1783.

**Abraham-men,** a cant term used for hoggars who wandered about the country. They existed from the time of Shakespeare, and in order to excite pity or fear appeared to be lunatics, dressed themselves in rags, and made themselves appear ridiculous. They called themselves 'Poor Tom,' and when caught pilfering claimed to be 'Tom o' Bedlam.' (See Dekker's *Belman of London*, 1608.) One of the wards in Bethlem Hospital, London, was for lunatic beggars, and was named after Abraham.

**Abraham's Bosom,** a metaphorical expression to denote the abode of bliss for the soul after death, used by Christ in the parable of the Rich Man and Lazarus. At the time of Christ it was the custom for the Jews to recline on couches during meals, so that necessarily the head of each guest lay towards the breast of his neighbour, and the expression was derived from this custom as denoting absolute repose.

**Abbranchiata** (from Gk. *ἀ-, without*, *βράχια, gills*), several different groups of animals which either have no gills or have them hidden. Among vertebrates it distinguishes mammiferous animals, birds, and reptiles from fish and amphibious animals.

**Abrantes,** a tn. near the banks of the Tagus, in Estremadura, Portugal. It was taken by Junot in 1807, and is strongly fortified. It trades in corn, oil, and fruits. Pop. 7215.

**Abrantes, Duc and Duchesse d',** see JUNOT.

**Abrasives** (from Latin *ab, away*, *radere, to scratch*), mineral substances used for polishing and grinding, e.g. emery, sand, pumice, grindstone, millstones, corundum, rouge, and garnet.

**Abraxas,** a name devised by the heretic Basilides, containing those Gk. letters which, according to the numeral system then in use, stood for 365, and expressing the all-pervading spirits of the universe. The word was engraved on gems among the ancients, and the term is also used for a stone or gem thus engraved.

**Abrazite,** see PHILLIPSITE.

**Abrogation:** (1) In canon law the annulling of any previous law either by decree or disuse. (2) In Eng. law the reversion or repeal by a higher legislative authority of the order of a subordinate court.

**Abrus,** a genus of shrubs of sub-order Papilionaceae of order Leguminosae, growing in Egypt and India. *A. precatorius*, wild liquorice, is a W. Indian plant, the seeds of which are scarlet tipped with black. They are used as weights, and are strung together into necklaces and rosaries, whence they obtain the name of 'prayer-beads.'

**Abruzzi, Luigi Amadeo Giuseppe Maria Ferdinando Francesco di Savoia-Aosta, Duca di** (1873-1933), son of Amadeo, Duke of Aosta, was b. at Madrid. He ascended Mt. St. Elias, in Alaska, in 1897; beat Nansen's record in his polar expedition of 1900; ascended highest peaks of the Ruwenzori Mts. in Central Africa, in 1906; Mt. Kenya in Brit. E. Africa in 1909. He commanded an It. squadron during the Tripolitan war of 1912 and sank the Turkish torpedo boats off Epirus. In 1913 he was made commander of the It. Navy, and assumed active command in 1915 when Italy intervened in the First World War, his navy comprising 4 dreadnoughts, 10 older battleships, and numerous smaller craft. He continued in command till 1917, when he retired through disagreement with his staff. His writings include *The Ascent of Mount St. Elias*, 1900; *Farther North than Nansen*, 1901; *On the 'Polar Star' in the Arctic Sea*, 1903; *Ruwenzori*, 1908.

**Abruzzi e Molise,** a group of provs. of S. Italy, including the central portion of the Apennines, area 5951 sq. m. The highest peaks are covered with snow for most of the year; they culminate in the Monti Sibillini (8130 ft.), the Gran Sasso d'Italia (9560 ft.), and the Maiella (9120 ft.), and abound in fine scenery. The valleys are fertile and watered by numerous streams flowing into the Adriatic. They produce corn, rice, oil, almonds, and wine, and there are many flocks of sheep. The extensive woods have large herds of swine and the hams and sausages are famous. The coast on the Adriatic is flat and monotonous and there are no good harbours. There are no large tns. Pop. 1,600,600.

**Absalom,** the third son of David and Maacah, daughter of the king of Geshur, compassed the death of his brother Amnon, but was, after a long exile, pardoned by his father. He was able, ambitious, and much praised for his beauty. He provided a bodyguard for himself (cf. Pisistratus, Herodotus i. 59); and prepared the way for a revolt by cunningly cultivating the goodwill of

the people. After 4 years he raised his standard at Hebron, and had great success. Even David of the lion-heart fled to Mahanaim beyond Jordan. In his revolt against David, A. was aided by Ahithophel; but Hushai, David's friend, joined A. to defeat the plan of Ahithophel. Ahithophel, seeing his counsel ignored, hanged himself. David sent a force to meet A., who was routed in the Forest of Ephraim, caught by the head in the branches of a terebinth, and was slain by Joab, in spite of the king's order to 'deal gently' with him. David's lament for his son is one of the most pathetic in all hist. See 2 Sam. iii. and xlii.-xlviii.

**Absalom** and Achitophel, title of a political satire by Dryden (1681).

**Absalon**, or Axel (1128-1201), was b. in the is. of Seeland, Denmark, became archbishop of Lund (1178), and minister to Waldemar I. and Canute VI. of Denmark. He took an active part in helping with the legislation of Waldemar, and drove the Wendish pirates from the country. Under Canute he helped to overthrow Bogislaw of Pomerania. Besides a great statesman and general, he was a lover of art and learning, assisting Saxo Grammaticus with his great hist. of Denmark. He built a castle which was the nucleus of the city of Copenhagen.

**Abscess**, a collection of pus or matter as the result of bacterial inflammation. When injurious germs gain access to any part of the human body, the white blood-corpuscles rush to engage in a struggle with the invaders. If the blood is not in good condition, the hostile germs are not quickly destroyed and multiply at a great rate. The contest then proceeds until there is formed a creamy mass of dead corpuscles and bacteria which is known as *pus*. This may be absorbed into the blood stream by other corpuscles, but is more frequently discharged by the disintegration of the covering tissue.

The usual treatment consists in promoting the discharge of pus by poulticing and lancing, or, in the case of a deep-seated A., by draining through a tube.

**Abscissa**, the distance of a point from some fixed line, measured horizontally. With rectangular co-ordinates, it is the distance of a point from the Y or vertical axis measured parallel to the X or horizontal axis. See CO-ORDINATES.

**Absconce** (from Lat. *abscondere*, to hide), a small lantern, of anct. origin, used in the Rom. Catholic Church during the performance of the night offices.

**Absentee**, a term applied to one who receives rent from an estate which he spends in another country. Also sometimes applied to one who draws a salary from an office without performing its duties. The effect of absenteeism is twofold, moral and economic. With regard to the former there can be very little doubt that the introduction of middlemen, or agents, tends to lessen the sense that property owners have obligations as well as privileges. Also the property owner by absence loses that personal touch between owner and tenant which tends to promote community of interest.

The economic result of absenteeism has been the subject of much debate among political economists, but there seems to be a general consensus of opinion among them, as there certainly is in the popular mind, that the A. by spending his money abroad is depriving the industries of his own country of support. On the other hand, it is argued that the A. still indirectly supports the industries of the homeland, for there must be an export of goods from his native country equivalent to the amount of goods he consumes, otherwise his remittances could not be made to him. To absenteeism much of Irish poverty has been attributed, and Acts were passed in the reigns of Richard II. and Henry VIII. to check it.

**Absinthe** (from the Gk. *ἀψινθιον*, wormwood), the name of a spirit, chiefly manuf. and consumed in France, but also distilled in Switzerland (especially in Nouchâtel). It is a sort of cordial, and on the average contains sometimes as much as 80 per cent of alcohol. Its distinctive flavour comes from the bitter essential oil of wormwood (*Artemisia Absinthium*), which is the chief among other essential oils, such as those of angelica root, star-anise, of which it is compounded. A. is green in colour, which is due to the maceration of the liquor with spinach, parsley, or other herbs. The naturally deleterious effects of A. are heightened by the adulteration of the liquor by indigo. Absinthism, or the physical derangement induced by excessive indulgence in the liquor, was formerly common in France. The symptoms include horrible dreams, hallucinations, and other nervous disorders, and if indulgence is persisted in, end in idiocy or paralysis. Emile Zola in *L'Assommoir* gave a terrible and realistic account of the evils of A. poisoning. A. was formerly used in the Fr. Army, especially during the campaign in Algeria, for its supposed efficacy in cases of fever, but its use has now long been discontinued, and both the manuf. and sale of A. are now forbidden by law in France.

**Absolute**. Its adjectival signification is opposed to relative, contingent, or conditioned; the result of the highest abstraction. Thus it has come about that in its substantial sense it has been regarded by some as the fundamental principle and cause of all being, *τὸ ὄν*, while others (notably Hamilton and Renouvier) regard it as a fantastic conception—a pseudo-idea. These differences of opinion arise from the fact that our minds can only regard anything relatively which is opposed to the principle of the A. That the A. is the all-pervading, unconditioned, and necessary principle of all things is the basis of the philosophy of Descartes, Spinoza, Schelling, and Hegel, while Kant holds that the mind cannot form an idea of the A. Perhaps it is best to regard it as what is constant, invariable, and necessary in the relation between one idea and another—as that which could not be other than what it is whether regarded subjectively or objectively.

In physics *A.* velocity is rate of motion through space as opposed to relative velocity, which is the rate with which 2 objects approach or recede from each other. In grammar *A.* signifies independent of any other part of the sentence, as nominative *A.* *A. gravity* is the gravity of a body viewed apart from all modifying influences, as, for instance, of the atmosphere; and, to ascertain its amount, the body must, therefore, be weighed *in vacuo*. *A. motion* is the change of place on a body, produced by the motion so designated, viewed apart from modifying influence arising from disturbing elements of another kind. *A. numbers* are those which stand in an equation without having any letters combined with them; thus, in the following equation

$$5x + 11 = 31$$

11 and 31 are *A. numbers*, but 5 is not so.

**Absolute Alcohol**, see ALCOHOL.

**Absolute Magnitude**, in astronomy, a term applied in contradistinction to the 'apparent' size of stars viewed from the earth. In other words, it implies the luminosity of the star irrespective of its distance, and, mathematically, it is the number expressing, in accordance with the usual system of stellar magnitude, the brightness of the star as it would be if it were at the distance of 10 parsecs—parallax 0.1". If the distance of any given star be known, its *A. M.* can be calculated from its apparent magnitude; or, again, if the *A. M.* and apparent magnitude be known, the actual distance of the star can be determined; the numerical relation between the absolute (*M*) and the apparent (*P*) being  $M = P + 5 + 5 \log_{10} r$ , where  $r$  is the decimal fraction of a second of arc that indicates the parallax. The nearer stars are not necessarily the brighter, nor are the apparently bright stars necessarily very bright intrinsically. A star of *A. M.* emits as much light as the sun; one of *A. M.* 0, a hundred times as much, and one of -5, ten thousand times as much. For the various magnitudes of Ptolemy and the cataloguing of stars according to magnitude, see under MAGNITUDE.

**Absolute Monarchy**, see ABSOLUTISM.

**Absolution**, a religious ceremony by which the Christian priest declares an individual, on repentance and submission to the requisite penance, to be absolved either from his sin or from the eccles. punishment to which it rendered him liable. Since the twelfth century the formula used in the Rom. Catholic Church has been: 'Ego te absolvo a peccatis tuis' (I absolve thee from thy sins), accompanied with the sign of the cross. The Council of Trent has expressly condemned (Session xiv. Canon 4) the doctrine that the priest has not power of himself to absolve from the guilt of sin. The Church of England also holds, as may be seen in the Order for the Visitation of the Sick, that power has been left with the Church to absolve repentant sinners, and the words that

the minister uses are the same as those employed in the Catholic communion: 'I absolve thee from thy sins.' In the Protestant Church of Scotland, the term *A.* is commonly used to denote simply the declaration of the Kirk session, or other judicatory, expressed by the mouth of its president, that the party is released from the eccles. interdict to which his delinquency had subjected him; this approaches the original use of the word with the early Christians.

**Absolutism**, the form of gov., as opposed to constitutionalism, in which the king or ruler is the supreme head, responsible to no parliament and having no constitutional check. But *A.*, as it existed in the Middle Ages, did not exist in modern times until its reappearance with the dictatorial or 'leader' states of Germany and Italy. In the Middle Ages *A.* was a necessity in order to centralise the strength of a nation for self-defence, and to remove the power of the feudal lords by turning them from autocrats into courtiers. A typical absolute monarch was Louis XIV. Continental *A.* of the seventeenth century had not the anti-democratic character of modern Fascism; it buttressed the central power at the expense of the nobility. Indeed, it styled itself 'benevolent' or 'enlightened' *A.* See GOVERNMENT.

**Absolutists**, a Sp. political party opposed to the constitution of 1812. They wished to restore to the Crown its lost absolute powers, and were opposed by a party called the Exaltados. Subsequently the *A.* supported the pretensions of Don Carlos against Queen Isabel.

**Absorption**, the process by which one substance is sucked up by another. When a liquid is absorbed by such a substance as blotting-paper, the action depends on capillarity (q.v.). Plants are enabled by their root fibres to absorb liquid matter into their tissues. In the process of digestion, the intestines absorb compounds necessary for the nutrition of the body. Cutaneous *A.* means the sucking up by the skin of oily materials; this occurs when ointments are used. The term *A.* has also some special applications in physics.

*A. of gases by liquids*.—Gases may be absorbed or dissolved by liquids. The solubility of different gases in water varies considerably. One vol. of water at 0° C. and atmospheric pressure absorbs only .02 vol. of nitrogen, whilst ammonia at the same temp. and pressure dissolves to the extent of 1050 vols. to 1 vol. of water. The weight absorbed increases in proportion to the pressure (Henry's Law), but decreases as the temp. increases, though not in exact proportion.

*A. of gases by solids*.—Some solids also have the property of absorbing gases, the best known example being charcoal, which can absorb large quantities of ammonia, chlorine, phosgene, and other gases. To this power of absorbing gases charcoal owes its efficacy as a deodorant. After heating in superheated steam, charcoal becomes even more efficient and

absorbent, and is said to have been 'activated.' Active charcoal is used in gas masks. Platinum black, if surrounded by a mixture of hydrogen and oxygen, absorbs so much of the gases, and therefore brings them into such intimate molecular contact, that sufficient heat is given out to ignite the rest of the gas. Scientifically, A. is distinguished from adsorption, the 2 together being known as sorption. Adsorption implies the taking up of a gas by the surface layers of a solid, while A. implies the taking up of the gas by the interior of the solid. Hence adsorption always precedes A.

**A. of light and heat.**—Wave motion in the ether, certain kinds of which produce the sensations of light and heat, is liable to be interrupted by intervening substances. Some rays may be transmitted with more or less disturbance of direction, some may be reflected, and some may be absorbed; that is, work is done on the particles of the intervening substance, and its temp. rises. A particular substance may absorb rays of certain frequencies, allowing the others to be transmitted or reflected. The long, slow waves produced by electrical methods can pass through thick, opaque obstacles without being absorbed. The quicker heat waves are absorbed readily by dark substances such as lamp black, whilst the various wave-lengths which correspond to the different colour sensations are variously affected by different substances, the result determining the colour as seen by transmitted or reflected light. In green glass, for example, only green rays are allowed to pass through, the other components of the white light which enters the substance being absorbed and converted into heat. What light is reflected is white, so that if green glass be ground up it reduces to a white powder; similarly, the foam of a transparent green liquid is white. Even reflected light penetrates the surface to some extent, and the amount of penetration has an effect on the character of the A., and consequently on the colour of the reflected light. Gold, for instance, reflects white light at the surface, and also light which by A. before it comes to the surface is orange. In the interior of a gold vessel we get repeated reflection, which means repeated A., and the resultant colour is a deep orange.

**A. bands** are dark lines in the spectrum of light transmitted through gases. They indicate the absence of the particular wave-lengths absorbed by the gas, and may vary with the temp. and thickness of the same gas.

**Abstinence**, see TEMPERANCE; **BAND OF HOPE MOVEMENT**.

**Abstract.** In law, the brief statement of the prin. fact in a document—used now generally with relation to the purchase of land—the A. being furnished by the vendor to the purchaser; in time, it now extends back 30 years, and traces the devolution of title, legal and equitable, of the land in question. If not satisfactory, the purchaser must object

within a certain period. See further *under* VENDORS AND PURCHASERS.

An A. thought or term has regard only for qualities or essences without reference to individual or particular things, *e.g.* wisdom.

Abstraction is an act of the mind by which it directs its attention to particular attributes of an object or objects without regard for the other attributes which the object may possess. Thus in the objects *coal, pitch, negro*, we see the quality of *blackness*, and this we may abstract from the other qualities or attributes in the objects and consider it independently. All names of classes, inasmuch as the individual members cannot be identical, are formed by a process of abstraction—thus the word *ship* connotes a certain number of attributes, and all objects possessing these attributes fall under the heading ship. The higher the abstraction the greater number of objects embraced. Thus the term *object* includes a multitude of abstractions. Abstraction, then, is formation into classes and species. The highest abstractions are *time, space*, and *being*. Abstraction involves such generality that A. reasoning is apt to be fallacious if attention is not held continually to concrete objects. See GENERALISATION.

**Absurdum, Reductio ad**, the argument which proves not the thing asserted but the absurdity of everything that contradicts it: used in geometry to demonstrate the converse (see CONVERSE) of a proposition already proved. It is perhaps not so satisfactory as the direct proof and certainly not so elegant, but it is obvious that if everything which contradicts a proposition is false, the proposition itself must be true.

**Absyrtus**, or **Apsyrtus**, son of Æetes, king of Colchis, who with his sister Medea fled with Jason. Medea killed her brother and strewed his dismembered limbs on the road so that the pursuing Æetes might be delayed gathering them.

**Abt, Franz** (1810–85), Ger. composer of song-music, who wrote upwards of 200 songs, the most celebrated being *When the swallows homeward fly*.

**Abu Abdullah Mohammed**, see IBN BATŪTA.

**Abu-Bekr**, father-in-law of Mohammed, first caliph of Islam, *b.* at Mecca circa 572, *d.* and buried at Medina, 634. The beginning of his caliphate was beset with trouble, as he had to overcome the opposition of the partisans of Ali, the prophet's son-in-law, and also bring back to the faith some of the tribes who had relapsed into heathenism. In addition, he had to suppress numerous pretended prophets, notably Mosaylima. This he did with the able assistance of his 2 lieutenants, Omar, who succeeded him, and Khalid. After a victorious campaign against the Byzantine emperor Heraclius, in which he added Syria and part of Persia to his dominions, he *d.* on the day of the fall of Damascus. It was A.-B. who first collected the oral and written precepts of Mohammed and

embodied them in the Moslem sacred book, the Koran.

**Abu Klea**, Sudan, vii. on the route from Korti to Metemma, where an Eng. army under Sir H. Stewart defeated the forces of the Mahdi, Jan. 17, 1885.

**Abulfaraj**, or **Abulpharagius** (1226-86), a celebrated oriental writer; b. at Malatlia in Armenia of Jewish parents, he early embraced Christianity. Became bishop of Gubos at the age of 20, and later of Aleppo. In 1266 was elected primate of the Jacobite Christians. A. was a great linguist, and himself trans. many of his works. He wrote a commentary on the Syriac version of the Bible, but his chief title to fame rests on his general hist. of the world from the creation down to his own time. It was called *The History of the Dynasties*, and the parts dealing with the Mogul Tartars and the conquests of Genghiz Khan are of great value.

**Abulfeda** (1273-1331), Moslem prince, b. at Damascus, and while a youth distinguished himself in the campaigns against the crusaders and the Tartars. The Mameluke sultan Nasir raised him to the rank of king in 1310 by conferring on him the kingdom of Hama, which he ruled as an independent ally of Nasir. Of his numerous works the 2 best known are a universal hist. and a treatise on geography. The hist. is of special value, and one of the chief sources of information concerning the Saracens. Part of the work which treats of the hist. of Islam was trans. into Lat. by Reiske and ed. by Adler (Copenhagen, 1789-91) in 5 vols.

**Abul Majd Majdud ben Adam**, see SANA'I.

**Abu-Maaschar**, see ALBUMAZAR.

**Abu Nuwas** (c. 760-810), lyric and erotic Arabian poet of partly Persian descent. Educated at Basra, he spent 1 year in the desert among the Arabs, and later lived under the protection of Caliph Harun al-Rashid in Bagdad. The *Divan des Abu Nuwas*, trans. by A. von Kremer, was pub. in Vienna in 1855; in the original in Cairo in 1860, and in Beyrout in 1884.

**Abu Ul-Maarri** (973-1057), Arabian poet, letter-writer, and lecturer. Attended the lectures of the best contemporary teachers at Aleppo, Antioch, and Tripoli. Developed advanced views on vegetarianism and cremation. Works include poems under the title *Saqi uz-Zand*; later poems, the *Luzumiyat*; and a collection of letters ed. and trans. by D. S. Margoliouth (1898).

**Abuse**, a legal term. *A. of Distress*, i.e. in an irregular manner to make use of goods distrained on, as, for example, working a horse, which is an offence which makes the offender liable to an action for damages. *A. of Process*, i.e. the bringing of vexatious actions, is guarded against by certain rules of the Supreme Court, notably Order XXV., Rule 4, and by the Vexatious Actions Act, 1896. By the former rule a court can dismiss an action which appears to be of a frivolous nature, and by the

latter Act, on an application made by the attorney-general, any person who habitually institutes legal proceedings without reasonable cause may be restrained from so doing by an order of the court. By the common law of England any sufferer from a malicious action either in the criminal or bankruptcy court has the right to bring an action to recover damages.

**Abushehr** or **Abushire**, see BUSHIRE.

**Abu-Simbel**, see IPSAMBUL.

**Abutilon** (Arabian *aubutilun*), or Indian mallow, a genus of plants belonging to the Malvaceæ, of which 80 species are known. They are tropical or semi-tropical, but during the warmest part of the year may be grown in the open air in England. *A. Avicennæ*, or velvet-leaf, is grown largely in China for jute.

**Abutment**, a technical term used in architecture to denote that part of an arch which receives the lateral pressure, and in machinery to indicate that point at which resistance is obtained. Thus the breech of a gun, the end of a steam cylinder, are the As. to the explosive or expanding force.

**Abutials**, the buttings or boundaries of land or of a parish. The ceremony of 'beating the bounds' sometimes performed consists in a priest making a tour of his par. and striking each abutial with a wand.

**Abydenus**, Gk. historian whose hist. of Chaldaea, or Assyria, has been lost except for some fragments quoted by Eusebius and other of the early Fathers of the Church. The time at which he lived is uncertain, but certainly not anterior to 250 B.C.

**Abydos** (1) anct. tn. on the Asian shore of the Hellespont, or Dardanelles. Facing it on the European side was Sestos. Here it was that in 480 B.C. the Persian monarch Xerxes built his famous bridge of boats to enable his immense army to cross. The bridge was described by Herodotus, and was nearly a mile long. A. will always be remembered for its association with the legend of Hero and Leander. Byron in his poem *The Bride of Abydos* recalls this story. See Herodotus, II. 134-39, 261. (2) Next to Thebes the most important tn. in the anct. kingdom of Upper Egypt. Here in a small ruined temple was discovered in 1817 the 'Table of A.', so important to Egyptological research. This contained a genealogy of the early kings of Egypt. (See illustration, p. 34.)

**Abya**, or **Abila**, one of the Pillars of Hercules on the African shore of the Straits of Gibraltar.

**Abyssal** (from Gk. *a-*, without, *βυσσός*, bottom) Fauna is one of the 3 divs. of marine fauna, the others being littoral or shallow-water, and pelagic or surface fauna. They exist in the greatest depths of the ocean, and when brought to the surface their bodies are always shattered owing to the diminution of pressure. The uniform coldness of temp., the total absence of light, and the enormous pressure of water naturally cause great

modifications among them. Many are blind, while others see by means of the phosphorescent glow emitted from their own bodies and those of other fish. Their organs of touch are frequently highly developed. As no plants

colony of Eritrea, on the W. the Sudan, on the S. Kenya and Uganda, and on the E. Fr. and Brit. Somaliland. Its N. and E. neighbours cut it off from access to the Red Sea, from which it is distant some 40 m. along the greater part of the

THE TABLE OF ABYDOS IN THE TEMPLE OF SETI

W. L. Mansell

can grow in the abyssal depths because of want of light, the fauna are carnivorous, catching in their wide jaws the falling debris of the organisms which exist above them. In colour they are very vivid; scarlet, violet, orange, and purple being the predominant colours, but not blue. The chief A. F. are echinoderms and sponges, while there is a noticeable scarcity of crabs, molluscs, corals, and annelids.

In their discovery, the researches of H.M.S. *Challenger*, sent out 1872-76 by the Brit. Gov., are invaluable. See H. N. Moseley, *Notes by a Naturalist on the Challenger*, 1879; Sir Chas. Wyville Thomson and Sir John Murray, *Reports on the Scientific Results of the Voyage of H.M.S. Challenger 1880-96*; F. B. Sumner, *Intensive Study of Fauna and Flora of Sea Bottom*, 1908; J. Murray and J. Hjort, *The Depths of the Ocean*, 1912; J. A. Thomson, *Haunts of Life*, 1921.

Abyssinia, an independent inland country of N.E. Africa (forming, between 1938 and 1941, part of It. E. Africa). It is situated between 5° and 15° N. lat. and 35° and 42° E. long. Its boundaries are, on the N. the It.

Eritrean boundary. Its area is estimated at 350,000 sq. m., with an estimated pop. of 7 to 8 millions, of whom less than one-half are Abyssinians and the remainder Gallas (q.v.)—negro tribes on the W. and S. frontiers—and on the E. Danakils and Somalis. The name A. is derived from *habesh*, meaning mixed, on account of the varied nature of its peoples; but, among the inhab., the whole country used to be called Ethiopia.

A. is a vast plateau intersected by deeply running rivs., whose beds have been worn to considerable depth, and in this way is shaped masses of land have been formed called *ambas*. A feature of these *ambas* is their almost perpendicular ascent, a characteristic which marks almost the whole of the plateau. The region owes its formation practically to volcanic origin, but, save for a few hot springs, the volcanic action is now extinct. The highest peaks are found in the Simen and Golan ranges. As the slope of the country is least steep towards the W., the majority of the rivs. empty themselves in the Nile. Many, however, of lesser significance, lose themselves in the sand. The Hawash is the chief riv. It rises in Shoa and flows into

Lake Aussa, where further trace of it disappears. This remarkable phenomenon is partly explained by the great depth below sea level of the lake. Compared with smaller and neighbouring lakes the Aussa is almost fresh, while salt is present in the others to such a degree that it deposits a crust round the edges. The R. Abai, which forms the Upper Blue Nile, reaches that riv. through Lake Tsana. The Takazzé joins the Nile, changing its name, on nearing the confluence, to that of Atbara. The Moreh flows into Nubia, but disappears later in the sand. Of all the physical features of A. the Lake Tsana is the most arresting. It is 60 m. long and presents a most striking picture. A new lake, some 9000 ft. above sea-level, in the crater of an extinct volcano, was discovered in 1931 by Amer. surveying engineers and named Lake Southard in honour of the Amer. minister to Addis Ababa.

Generally speaking, the climate of A. is temperate and fairly salubrious, owing to the practically uniform elevation, though in some parts a very wide range of temp. is covered during the day. The weather conditions may be divided into 3 periods, the cold season, from Oct. to Feb.; the hot, dry season till June, and the rainy season for the rest of the year. Rain is an important factor in A., as the Nile depends for its flood entirely upon its Abyssinian tribes. The climate is conducive to the luxuriant growth of the following trees: date-palm, mimosa, giant sycamore, gum (in many varieties), pine, fig, orange, pomegranate, peach, apricot, and banana. Among the smaller plants, cotton, indigo, and the sugar-cane grow in profusion. In the Kaffa country coffee is indigenous, and is believed to take its name from that region. The staple food of the community is to a large extent dependent upon a regular supply of honey, a fact which gives bee cultivation much impetus. Abyssinian crops suffer considerably from swarms of locusts which visit the country periodically.

After incorporation of A. within the It. Colonial Empire, It. E. Africa was divided into the following separate provs., each of which included a part of A.: Eritrea, which extended to Danakil; Amhara (cap. Gondar), which comprised Amhara, Gojam, and a part of Shoa; Galla and Sidama (cap. Jimma), which included the W. part of A. as far as the Sudan; Harar (cap. Harar), which includes the Moslem pop. of Harar, Arussi, and Bali. In 1938 a royal decree estab. the new Gov. of Shoa, but in 1941 the Ethiopian Gov. returned to Addis Ababa. Prior to the It. conquest in 1936 the political divs. of A. comprised a number of provs. and dependent states. The former contained Tigré in the N.E., Amhara in the centre, Gojam enclosed in a great sweep of the Abai, and Shoa on the E. of the Abai; while among the many dependent states were the Wallagas, Harar, Kaffa, Gallaland, and Central Somaliiland. After the It. annexation

had removed the Abyssinian throne as an object of the ambition of the rival chiefs, an increasing measure of Abyssinian unity, hitherto rendered impossible by the relationship between the emperor and the great chiefs, might have been expected in course of time. The emperor was restored by the Brit. in 1941 and now rules under Brit. advice, with the result that the Amharas will no longer exercise oppression over their former subject peoples of the S. and W., and those of non-Amharic race will have equal opportunities with those traditionally accustomed to rule, and the people as a whole will no longer be divided into warriors and slave-owners on the one side, and serfs and slaves on the other. The only large tn. of A. is Harar, of Arab origin. Periods of incessant warfare, and the frequent exhaustion of natural productions, account for the non-existence of large tns. The cap. of A. is Addis Ababa, in Shoa; other tns. are Adua or Adowa (the cap. of Tigré), Adigrat, Macalle, and Antah, in Tigré; Dire-dawo, Goré, Jimma, and Debra Markos (the cap. of Gojam); Magdala, Debra-Tabor, and Sokota (at the confluence of the old trade routes), in Amhara, and Dire-dawo, Debra-Derhan, Aliu-Amber, and Ankober, in Shoa; Leika in Gallaland, and Bonga in Kaffa; and Gondar, Aksum, Antalo, and Ijube. There are ant. architectural remains at Aksum, Gondar, and Ankober. Most of the transport of A. has hitherto been carried on by means of pack animals, so few of the roads are fit for wheel traffic. Many m. of macadam road were constructed in the neighbourhood of the cap. a few years ago. A railway links Addis Ababa, via Dire-dawo, with Jibuti (Fr. Somaliland), 488 m. away. Telegraphs and telephones connect the cap. with Harar and other places. The soil is extremely fertile. In fact Egypt owes all the richness of its own soil to the sediment brought down by Abyssinian rivs. Agriculture is followed on a large scale. In the hotter regions sugar-cane and coffee flourish: in the middle zone, maize, wheat, barley, wild oranges, potatoes, and tobacco are grown, and, above 6000 ft., there are good mules, donkeys, goats, oxen, sheep, and pastures and corn cultivation. Horses, camels are a large part of the wealth of the people. The chief exports are coffee, civet, hides, gold, and wax. A. is reputed to contain some mineral resources; iron is found, and gold is washed in various streams; while salt, saltpetre, platinum, and sulphur are to be procured. Commercially, A. remained for a long time in a backward state, and not until the twentieth century, under the enlightened and wisely directed energy of Menelik II., was any effort made to advance its interests. Foreign undertakings gradually obtained a footing in the country in the cultivation of coffee. The annual value of Abyssinian trade is estimated at approximately £2,500,000. A big trade is done with the Sudan,

principally in hides, coffee, and shea butter.

The former Gov. of A. was feudal in its methods of administration. The princes possessed powerful influence, and formed a council in an occasional meeting called by the emperor. Two consultative organs of gov. were set up by the Its.; the General Assembly and the Council (*Consulla*), of which 6 native chiefs were members. The Abyssinians, properly so called, number less than 4 millions, and inhabit Tigré, Gofam, Amhara, and part of Shoa. The Gallas, mixed Christians, Pagans, and Muslims, number over 5 millions. In character the Abyssinians as a whole are indolent, easily appeased when offended, vain, and selfish. Morally they are lax, and marriage laws are lightly regarded. Indeed, polygamy is a common practice. Their religion consists of a less enlightened Christianity, and since their conversion in the fourth century they have kept their connection with the Alexandrian Church through a Coptic head bishop. The Danakil profess Mohammedanism.

In early times A., or more correctly Ethiopia, was closely connected with Egypt. Legends trace their origin so far back as a descent from the tribe under the queen of Sheba, their ruler. The kingdom was subjected to the sway of the Hebs. and the Gks. successively. Christianity was introduced about A.D. 330. The actual hist. begins with the kingdom of Axum. Relations with the civilised world were severed after a Mohammedan conquest of the country in the middle of the seventh century. In A.D. 1000 a general massacre was carried out by Princess Judith of all the royal family. The infant king, however, was safely conveyed to Shoa. Here he was welcomed, while the rest of the country was ruled by Judith. In 1268 the country was regained by the royal house, the reigning monarch being Tekunō Amtak. Portuguese attention was directed to A. in the fifteenth century. A settlement resulted, and lasted 6 years, the royal family accepting the Roman Church. In 1634 a rising against Rom. dominance resulted in the resignation of the negus (king) in favour of his son. A state of general confusion followed, no emperor being recognised. In 1769 Michel Sobul, the king of Tigré, installed himself as Ras (Prime Minister) over A., after assassinating Joas, the reigning monarch. A Galla chief soon overthrew him and assumed the position of sovereign, a dignity which eventually reached his grandson, Ras Ali. In 1850 a native of Amhara named Kassai, afterwards Theodore, defeated the Ras, and, marrying his daughter, proclaimed himself governor. Three years later he conquered all opposition and installed himself as negus of A. He received assistance in governing from 2 Englishmen, who were killed in a rising in 1860. His rule now developed a tyrannical character, and so severe became his administration that a general

rebellion spread all over the country. It was put down with merciless cruelty. Failure to secure European aid aroused a violent antipathy to Europeans, and Brit. and foreign envoys and missionaries were imprisoned. Peaceful overtures to obtain their release proved futile, and an expedition under Napier landed in 1868. The ill success of Theodore compelled him to treat for peace. He refused personally to surrender, and committed suicide within the fort he had failed to defend. No sooner had the Brit. left, than renewed strife broke out among the various chiefs for the crown. Prince Kassai of Tigré was successful in proclaiming himself emperor, though he failed to control insubordination among the various states. Meanwhile the Egyptians had become his enemies. An engagement resulted in such terrific slaughter that the parties mutually retired, and till 1882, when the Sudan was abandoned by the Egyptians, the difficulties of demarcation proved very troublesome. The Its. in 1885 occupied Massowah, and afterwards estab. friendly relations. Four years later Negus John II. died, and Menelik of Shoa became emperor. In a treaty Italy assumed control of Abyssinian affairs, the empire becoming an It. protectorate. In 1893 a rising under Menelik resulted in Abyssinian independence. Following the ratification of the treaty, European missions were dispatched, and an agreement was concluded with the Brit. With the exception of Somaliland, however, the question of frontier was judiciously avoided. In 1899 a rebellion under Mahomed Abdullah (the 'Mad Mullah') caused co-operation with the Brit., and although little practical help was rendered, the significance cannot be disregarded of the readiness of A. to accept and request Brit. aid. In 1908 an Anglo-Fr.-It. alliance agreed to protect their individual interests and ters. in the event of further disturbance. (See A. B. Wyld's *Modern Abyssinia*, 1901; Bruce's *Travels*, 1801; Mountnorris's *Voyages*, 1809-11). King Menelik d. in 1913, and was succeeded by Lij Yasu, his grandson, who, coming under Ger. influence in the First World War, was deposed by public proclamation in 1916, and Walzeru Zauditu, a daughter of Menelik, was nominated and subsequently crowned empress. At the same time Ras Tafari, a great-nephew of Menelik, was proclaimed heir to the throne, and for some time acted as regent to his aunt. In polity, the Gov. remains essentially feudal in character, but in 1919 a tentative step in the direction of Cabinet Gov. was taken. In 1923 A. became a member of the League of Nations. In 1924 a royal edict was promulgated to provide for the gradual manumission of slaves. The Empress Zauditu d. in Apr. 1930, from Lent fasting following paratyphoid. Her death ended the dual form of gov. of empress and regent, which had never been a success, especially as King Tafari, supported by the more

educated elements in A., had always wanted to develop A. on modern lines. In 1927 he had been proclaimed emperor or king of kings (*negus negusti*) and late in 1930 was proclaimed Emperor Haile Selassie I.

In 1935 Italo-Ethiopian relations began to deteriorate rapidly. It. claims to spheres of influence in A. were put forward half a century ago, but came to nothing after their disastrous defeat at Adowa (Adua) in 1896. At that time the Brit. Gov. recognised the It. zone of influence as extending virtually throughout modern A., but the treaty or accord of 1891 had been superseded

only on certain specified and special conditions, and that in 1935 she might be regarded as no longer possessing the status of a League member, inasmuch as she had ceased to fulfil the conditions (chiefly relating to traffic in arms and slavery) to which her membership was indissolubly linked. (See on this *Documents relating to the Dispute between Ethiopia and Italy*, 1933, Cmd. 5044.) In the previous Dec. (1934) the undefined and contested frontier between It. Somaliland and Ogaden had led to difficulties, particularly the Wal-Wal incident, in which Brit. Somaliland was also involved. On Dec. 5 Ethiopian

HAHAR

A wood market outside the main gate.

by later agreements, and the whole position politically was then governed by a tripartite treaty made in 1906 between Great Britain, France, and Italy—a treaty which, in the It. view, recognised certain territorial adjustments in her favour in exchange for territorial cessions to A. in the region of the Somaliland coast. But the It. defeat at Adowa, coupled with the treaty Italy concluded with A. in 1896 at Addis Ababa recognising Abyssinian independence, excluded, in the view of the other European powers concerned, the possibility of an It. sphere of influence over the whole of A., and determined the basis of the tripartite treaty of 1906. This basis remained unaltered in the view of Great Britain and France in 1935, though Italy had never really relinquished her claims. (See on this G. A. Rossi, *Diritti d'Italia (Ultramar)*, 1916.) A. confirmed her independence by being admitted a member of the League of Nations, and Italy was a consenting party to her admission. Italy's contention, however, was that A. was admitted to membership

troops, which had been in touch with an It. frontier garrison for some days, attacked the It., who withdrew. Later, It. reinforcements, supported by aeroplanes and tanks, repulsed the Abyssinians with severe loss. The It. Gov. sent a note of protest to Addis Ababa, while Haile Selassie, for his part, demanded arbitration in accordance with Article 5 of an Italo-Ethiopian treaty of Aug. 2, 1928. On the refusal of the It. Gov., A. submitted the dispute to the League of Nations. On Jan. 29 a sanguinary encounter took place between It. and Abyssinian patrols at Afdub, S. of Wal-Wal. The It. Gov. again protested and mobilised 2 divs., the one for Somaliland and the other for Eritrea. Further incidents occurred and the Abyssinian Gov., in face of the It. mobilisation, now (Mar. 1935) demanded the application of Article 15 of the League Covenant (q.v.). In May, Mussolini, in the Senate, spoke of the dangers threatening Somaliland and Eritrea and declared that Italy was ready to assume 'even the supreme

responsibility.' Meanwhile, Brit. public opinion, which was overwhelmingly hostile to an It. expedition against A., aroused in Italy both apprehensions and irritation. The compromise proposed by Mr. Eden to Mussolini—a rectification of frontiers to the advantage of Italy, and the annexation of Ogaden, the right to construct a railway between Somaliland and Eritrea, and the cession by Britain to Italy of a passage giving access to the sea and of the port of Zella—was rejected by Italy as wholly inadequate (June). Later (Aug.), Italy rejected proposals put forward by France and Britain following a conference in Paris between Mr. Eden, M. Laval, and Baron Aloisi. In Sept., Baron Aloisi deposited with the League Council a memorandum demanding the exclusion of A. from the League as a country barbarous, disunited, and countenancing slavery; he justified the use of force in order to repress Abyssinian aggression and to establish civilisation in A., and refused even to discuss the memorandum with the Ethiopian delegates to the League. Mussolini was now plainly advertising his intention to invade A.—a move which had been obvious since the grand It. manoeuvres in the Upper Adige of the previous month. Whether Britain and France would have been able and justified in preventing by force this aggressive move by Italy must be left to the verdict of hist., but, at the time, it was generally believed in those countries that neither was sufficiently prepared to risk a major war in Europe, and this in spite of the threat by Italy to Brit. interests in the Mediterranean. Meanwhile a committee of the League was strenuously working to find some solution acceptable to Mussolini. One plan, involving an international police force to organise A., and territorial rectifications in favour of Italy, was accepted by Haile Selassie but rejected by Italy, which was again demanding that A. should be deprived of its domination over various subject peoples which were living on the frontiers of the empire 'under inhuman conditions.' On Oct. 2, the It. troops in E. Africa crossed the Ethiopian frontier and hostilities had begun. The council of the League declared Italy to be the aggressor and this imposed on each Member State of the League the obligation to apply the sanctions laid down in Article 16. (Austria and Hungary refused to join in the sanctions.) Italy protested against the economic and financial sanctions and decided to resort to counter-sanctions (Nov.). Later (Dec.) came the eleventh-hour effort by Sir Samuel Hoare and M. Laval to avert the war. The Hoare-Laval pact was a plan by which Italy was to receive Tigre without Aksum, and the country of the Danakils and Ogaden, while A. was to obtain an outlet to the sea; and a zone for economic expansion and settlement was offered to Italy to the N. of Kenya. The Council of the League and Mussolini alike rejected the plan. The military opera-

tions which had begun on Oct. 3 on the Tigre front had in a week, almost without fighting, estab. 3 It. corps on the positions Aksum-Adova-Adigrat. By early Nov. the It. had reached Makale and the Takazze Riv. After Dec. 15 partial Abyssinian offensives took place, causing the It. troops to fall back on Aksum and Adua. By the end of 1935 the It. front passed through Selaklaka-Aksum-Abbis Adale-Makale. But before that Gen. de Bono had been superseded by Marshal Badoglio, Mussolini being dissatisfied with the slow progress made by the former in the N. Badoglio pursued the campaign in the N. with redoubled vigour, having learned from the fighting at Tembien (Jan. 20-26) that the only way to meet the superior Abyssinian mobility was to attack on a wide front with all the modern essentials of mechanised warfare, including bombing from the air. Graziani's advance in the S. was hampered by the difficulty of bringing up supplies. Demoralisation set in by the end of Apr., and many Abyssinians returned to their agric. pursuits regardless of the campaign, while a great many deserted. Before the end of May, the emperor, Haile Selassie, fled from his cap. to Jibuti, embarking for Palestine, where he sought Brit. protection, and the It. Gov. announced that it had annexed A. (The full details of the Italo-Abyssinian War will be found under ITALO-ABYSSINIAN WAR, 1935-1936.) In this manner the last independent state of the African continent (apart from Egypt), excepting Liberia, lost its sovereign status, though, by the prowess of Brit. arms, it was destined to be restored 5 years later. A. was consolidated with Eritrea and It. Somaliland into the colony of It. E. Africa. The annexation was recognised by the W. European powers a year later; but the Brit. Gov. only recognised It. sovereignty over A. in 1938. The It. did not make substantial progress either in the development of the country or in its colonisation, though it was proposed to spend a large sum on rebuilding Addis Ababa and in opening up roads. Military roads were constructed, but the It. probably never achieved actual control much outside the garrisons and in air communications. For the conquest of A. by the Brit. forces in the Second World War, see ITALIAN EAST AFRICA, SECOND WORLD WAR CAMPAIGN IN (1941). See also ETHIOPIA.

Newman, *The War in Abyssinia*, 1936; Macartney and Cremona, *Italy's Foreign and Colonial Policy, 1914-1937*, 1938; D. Mathew, *Ethiopia*, 1947; M. Ferham, *The Government of Ethiopia*, 1948; C. Sandford, *Ethiopia under Haile Selassie*, 1946.

**Acacia**, a genus of trees and shrubs, usually thorny, belonging to the sub-order Mimoseae of the order Leguminosae. The hardy tree commonly known as A. is false A. or robinia (*q.v.*). The true genus comprises over 400 species, found chiefly in the equatorial zone and the sub-tropical regions of Australia and Africa. The *A. Julibrissin*, however, is grown in the open air in some parts of France and the warmer European countries, and is remarkable for its clusters of beautiful pink flowers. The leaves of the genus are normally bipinnate, but are subject to modification, and the flowers grow in a head. The Australian 'wattles' are As. in which the leaf blade is absent, but the leaf-stalk has flattened into a phyllode with the edge presented to the light, and a thick epidermis which prevents transpiration. In America the fruits of the edible A. are used as food; in the Is. of Mauritius and Réunion the leaves of *A. Lebbek* serve as soap. *A. arabica* is used in tanning and gives gum arabic, while gum senegal comes from *A. Senegal*. The drug catechu is prepared from *A. Catechu*.

**Acacia**, False, see **ROBINIA**.

**Acacia**, Three-horned, see **HONEY-LOCUST TREE**.

**Acacius** (340-365), bishop of Caesarea, surnamed Monophthalmus (Gk., 'one-eyed'), founded an Arian sect known as the Acacians. His doctrine was that Christ is not of the same substance as God, but merely resembles Him.

**Acacius** (d. 489), patriarch of Constantinople from 471. He attempted to make Constantinople the chief of the E. churches, and was excommunicated by Pope Felix III.

**Academic Committee** (London), see **ROYAL SOCIETY OF LITERATURE**.

**Academic Legion**, an armed troop of Viennese students who joined in the revolt of 1818.

**Academus**, a mythical Attic hero who was supposed to have revealed to Castor and Pollux the hiding-place of their sister Helen. The *academia* in which Plato used to teach his pupils was named after him.

**Academy** (Gr. *Ἀκαδημία*), a garden in the Ceramicus, a W. suburb of Athens, so called after the hero Academus; a gymnastic school was held there; purchased by Cinon, son of Miltiades, who adorned it with statues and olive plantations and left it to the public; a favourite walk of Socrates and his disciples, but now famous because Plato, whose home was in the neighbourhood, taught there; his followers soon came to be called *Academick*, and *Academic philosophy* was synonymous with that of Plato. There was after Plato's death some variation in the philosophy, which

caused the following distinctions to be made: Platonio A. under Plato, 398-348 B.C.; the Ancient A. under Speusippus, Xenocrates (*q.v.*), and Polemo; the Middle A. under Arcesilaus (*q.v.*); and the New A. under Carneades (*q.v.*). Two more As. were founded after these: the Fourth A. by Philo of Larissa, and the Fifth A. by Antiochus of Ascalon, which terminated 79 B.C. Ptolemy Soter (*q.v.*) had endowed a museum essentially an A. at Alexandria, 314 B.C.; Charlemagne, at the suggestion of Alcuin, a school or institute resembling essentially an A. in 796 A.D. at St. Martin's, Tours. Until the time of the Revival of Learning most of the learning was to be found in the monasteries, some of which might be regarded as As. After the Revival of Learning most learned bodies were called As. The following is a list of As. arranged alphabetically, with the dates of their establishment: Ancona, Caliginosi, 1642. Berlin, Akademie der Wissenschaften, 1700, founded by Frederick I.; of Architecture, 1799. Bologna, Eccles., 1687; Mathematics, 1690; Sciences and Arts, 1712. Boston, Amer., A. of Arts and Sciences, 1780. Brescia, A., 1801; Erranti, 1626. Brest and Toulon, Military, 1682. Brussels, Académie Royale, 1773. Bucharest, Rumanian A., 1866. Cuen, Belles Lettres, 1705. Chicago, U.S.A., Sciences, 1865. Copenhagen, Sciences, 1712; Beaux Arts, 1751. Cortona, Antiquities, 1726. Dublin, Royal Irish A., 1792; Royal Hibernian A., 1803. Edinburgh, Royal Scottish A., 1826. Erfurt, Saxony, Sciences, 1754. Faenza, Philoponi, 1612. Florence, Fine Arts, founded by Brunetto Latini, 1270; Platonica, founded by Lor. de' Medici, 1474 (dissolved 1521); Della Crusca or Furfuratorium, 1582; Del Cimento, 1637; Georgioli, 1752 (agric.); Antiquities, 1807. Geneva, Medical, 1715. Genoa, Painting, etc., 1751; Sciences, 1752. Göttingen, Gesellschaft der Wissenschaften, 1752. Haarlem, Sciences, 1760. Helsinki, Societas Scientiarum. Istanbul, A., 1851. Leipzig, A., 1768. Leningrad, A. of the U.S.S.R., formerly known as the Imperial, 1728. Lisbon, Portuguese A., 1779. London, Royal Soc. 1662; Royal A. of Arts, 1768; Royal A. of Music, 1823; Br., 1902. Lyons, Sciences, 1700. Madrid, Royal Sp., 1713; Hist., 1730; Painting and the Arts, 1753. Mannheim, Sculpture, 1775. Mantua, Vigilanti (Sciences), 1704. Marseilles, Belles Lettres, 1726. Massachusetts, Arts and Sciences, 1780. Milan, A., 1838; Architecture, 1880; Sciences, 1719. Modena, Società Italiana delle Scienze. Munich, Arts and Sciences, 1759. Naples, Rossana, 1540; Secretorum Naturae, 1560; Sciences, 1695; Hercolaneum, 1755; Nuova Società Reale, 1808. Newhaven, U.S.A., Connecticut A. of Arts and Sciences, 1799. New York, Amer. Geographical Society, 1852; Literature and Philosophy, 1814; Sciences, 1876 (founded as Lyceum of Natural Hist., 1818); National A., 1863; Lyceum of Natural Hist., 1824. Nîmes, Royal A., 1682. Oslo, A., 1837. Padua, Poetry

1610; Sciences, 1792; A., 1779. *Palermo*, Medical, 1646; Fine Arts, 1300. *Paris*, Académie Royale de Peinture et Sculpture, 1648; Académie Royale d'Architecture, 1671; Académie Française, 1635; Académie des Inscriptions, 1663; Académie Royale des Sciences, by Colbert, 1666; Académie de Peinture, by Le Brun, 1648; all suppressed in 1793; in 1795 Institut National was founded. This was divided into 3 then 4 parts in 1803, and in 1816 the original names were restored to these 4 parts by Louis XVIII.: (a) Académie Française; (b) Académie des Inscriptions et Belles Lettres; (c) Académie des Sciences; (d) Académie des Beaux Arts; and in 1832 Académie des Sciences Morales et Politiques. *Parma*, Innominati, 1550. *Pennsylvania*, A. of Fine Arts, 1805. *Perugia*, Insensati, 1561; *Philadelphia*, U.S.A., Natural Sciences, 1812; Philosophical Society for Promotion of Useful Knowledge, 1743. *Rome*, Lincei, 1609; Umanisti, 1611; Fantastici, 1625; Infeccondi, 1653; Painting, 1656; Arcadi, 1656; Eng., 1752; Nuovi Lincei, 1847. *St. Louis*, Miss., A. of Science, 1857. *Stockholm*, Sciences, 1741; Belles Lettres, 1753; Agric., 1781. *Toulon*, Military, 1682. *Trondhjem*, A., 1760. *Turn*, A. of Sciences, 1757; Royal Institute, 1783; Fine Arts, 1778. *Upsala*, Royal Society, 1720. *Venice*, A., 1831; Medical, 1701. *Verona*, Music, 1543; Sciences, 1780. *Vienna*, Sculpture and Arts, 1705; Surgery, 1783; Oriental, 1810; Kaiserliche A., 1487. *Warsaw*, Language and Hist., 1753. *Washington*, D.C., National Geographical Society, 1888; International A. of Sciences, Arts, and Letters, 1910; Smithsonian Institution, 1846.

The word A. is also used to signify: a school or college; a drawing, usually in black and white chalk, from the living model.

**Academy, British** (London), for the furtherance of hist., philosophy, philology, archaeology, etc., Burlington House, Founded 1902.

**Academy (Royal) of Arts** (London). When George III. came to the throne of Great Britain in 1760 he commenced to encourage the cultivation of the arts. Attempts had previously been made by the prin. artists to form a permanent A. for the cultivation of painting, sculpture, and architecture, but they had failed. In 1760, however—with the assistance of 'The Society for the encouragement of Arts, Manufactures, and Commerce, in Great Britain,' which was estab. in 1754—the artists opened the first public exhibition which attracted public attention. In 1765 a charter was obtained from the king, and the society became 'The Incorporated Society of Artists.' This, however, was not entirely successful, and a memorial signed by 22 artists was presented to the king asking for his sanction and encouragement for a gratuitous national school of art. The king approved, and 'The Royal Academy of Arts in London, for the purpose of Cultivating and Improving the Arts of Painting, Sculpture and Architecture,'

was founded, Dec. 10, 1768. Sir Joshua Reynolds was appointed president; G. M. Moser, keeper; F. M. Newton, secretary; K. Penny, prof. of painting; T. Sandby, prof. of architecture; J. Wall, prof. of perspective; Dr. William Hunter, prof. of anatomy. Its first quarters were in Somerset House, but when old Somerset House was purchased by the nation a part of the new building was given to the society. It took possession of its new quarters in 1780, and the first exhibition was held in 1781. In 1836 it was removed to Trafalgar Square, and it was afterwards removed to Burlington House, Piccadilly, its present quarters. It consists of 40 academicians, painters, sculptors, engravers, and architects; 30 associates; and sev. honorary members. An exhibition of works by living artists is held every summer from the first Monday in May to the first Monday in Aug., and an exhibition of works by old masters every winter from the first Monday in Jan. for ten weeks. There are schools which give instruction in art, and all persons who have passed the required examination are admissible as students of the A. See Graves's *Royal Academy Dictionary*, 1769–1906; Hodgson and Eaton's *Royal Academy and Members*, 1768–1830 (1905); Laidlay's *Royal Academy* (1898); *Academy Notes*, Blackburn, 1878–1900. The corresponding Amer. A. is the National A. of Design, founded 1826; it admits 125 painters, 25 sculptors, and 25 architects and engravers.

**Academy of Arts and Letters (America)** is a select body of men distinguished in the realms of literature, painting, and music. It had its origin in the National Institute of Arts and Letters, and its object was the furtherance of all 3 of these arts. The first 7 members of the A. elected in 1904 were William Dean Howells, Augustus Saint-Gaudens, Edmund Clarence Stedman, John Le Farge, Samuel Langhorne Clemens (Mark Twain), John Hay, and Edward A. MacDowell. The head offices are in 633 West 155th Street, New York.

**Academy, The.** Once a well-known literary and artistic journal; defunct in 1915. Founded by C. E. C. B. Appleton, who otherwise remained inconspicuous in the world of letters. He had received his education at Oxford and the Ger. univ., and, having completed his studies, he saw an opening for a new journal of a high standard in England. The first number of the A. appeared on Oct. 9, 1869, and had as its subtitle the words *A monthly record of Literature, Learning, Science, and Art*; the publisher was John Murray, and its price was 6d. The aim of the founder was expressed in the quotation he chose from Horace, *Inter sylvas Academici querere verum* ('To seek for truth in the groves of Academus'). Appleton acted not only as editor of his journal, but also as its business manager, and for 10 years he maintained it at a high level of excellence. Among the many famous men who contributed to its early pages were Matthew

Arnold, Sidney Colvin, T. H. Huxley, John Lubbock (Lord Avebury); Mark Pattison, W. M. and D. G. Rossetti, R. C. Jebb, F. T. Palgrave, J. A. Symonds, Wm. Morris, Michael Foster, W. W. Skeat, and Max Müller. From its position as a monthly it changed to that of a fortnightly and finally a weekly periodical priced at 3d. It incorporated *Literature* in 1902.

Acadia or Acadie, see NOVA SCOTIA.

Acajutla, chief seaport of El Salvador, Central America, on the Pacific Ocean; pop. 1100.

Acalephæ (from Gk. ἀκάληφη, a sea-nettle, a name given by Aristotle to the jelly-fish tribe because of their stinging properties. Cuvier covered with the term the Acraspeda, Lucernarida, and Ctenophora, but the nomenclature has since been altered.

Acampichili (Aztec, 'handful of reeds') (d. probably in 1403), the first king of the Aztecs of Mexico. He constructed canals and built stone edifices, and generally improved the conditions of his kingdom.

Acanthaceæ (Gk. ἀκανθα, a thorn), an order of dicotyledonous, monopetalous plants, allied to the Labiata and Scrophulariaceæ. The plants are herbaceous or small shrubs, with a gamopetalous corolla in 5 divs., a convex receptacle, bifid ovary, leaves without stipules, brilliant flowers nearly always solitary in the axil of a leaf or a bract. Many of the plants have medicinal properties.

Acanthus (from Gk. ἀκανθα, a thorn), generic appellation which was applied by Cuvier to some porcupines (Rodentia). The typical species is *A. Javanicum*.

Acanthocephala (Gk. ἀκανθα, a thorn, κεφαλή, a head), a class of parasitic worms of which the *Echinorhynchus* is the chief genus. The largest species, *Gigantorhynchus*, is found in the pig, and may attain a length of more than a yard, but most species are less than 1 cm. in length. It has a cylindrical body with a proboscis furnished with many hooks by which it attaches itself to the intestine of its host. When the embryo is born it is ejected from the body of the host and depends for its further development on being swallowed by an intermediate host, which in the case of *E. gigas* of the pig is the larva of a particular beetle. It continues in these surroundings for a time, but only reaches adult proportions if the intermediate host is eaten by a pig, its permanent host, when the cycle begins again.

Acanthodes (from Gk. ἀκανθα, a thorn, ὀδούς, a tooth), genus of fossil Ganoid fishes established by Agassiz. They are found in carboniferous strata near Edinburgh.

Acanthophis (from Gk. ἀκανθα, a thorn, ὄφις, a serpent), a genus of venomous snakes of small size, which feed on mice and frogs, and have the tail ending in a horny little spike. The typical species is the *A. cerastes*.

Acanthopterygii (from Gk. ἄκανθα, a thorn, πτέρυξ, a wing), one of Cuvier's 3 primary divs. of fish, those in this

section having bony skeletons with prickly spinous processes in the dorsal fins.

Acanthurus (from Gk. ἀκανθα, a thorn, οὔρα, a tail), a genus of Acanthopterygii found in tropical seas. *A. chirurgicus*, vulgarly termed Doctors, is a well-known species, having on each side of the tail a sharp movable spine like a lancet.

Acanthus (Brankursine or Bear's breech), the term applied to a plant by the Gks. and Romans, and adopted by Linnæus, which gave the generic name to the Acanthaceæ.

Acanthus, in architecture, is the sculptured leaf which is the distinguishing characteristic of a Corinthian capital. The *A. mollis* growing on a tomb suggested this ornamentation to Callimachus in the fifth century B.C.

Roman ACANTHUS Greek

A capella (It., 'in church style'), a musical term used in reference to compositions in which the vocal parts have either no instrumental accompaniment or else one in which only octaves and unison are employed. In time it is equal to *alla breve*.

A capriccio (It., 'capriciously'), a musical term which indicates that the composition may be played in time and expression according to the will of the instrumentalist.

Acapulco, the most important seaport on the Pacific coast of Mexico, 180 m. from the cap. The harbour is deep and capable of containing 500 ships, but the climate is unhealthy and the tn. subject to frequent earthquakes. That of 1909 practically destroyed the tn. Exports chiefly consist of hides and fruit. Pop. 6000.

Acarides (from Gk. ἀκαρίς, small, εἶδος, form), or Acarina, are a low order of the Arachnida, vulgarly known as mites. The body is usually globular and presents no exact div. between the abdomen and cephalo-thorax. The organs are simple, and the mouth is adapted for biting or sucking. The *Sarcoptes scabiei* produces gall. *Tyroglyphus siro* is the cheese-mite. See also MITES.

Acarman, son of Alcmaeon and of Callirrhoe, daughter of the R. Achelous. Following tradition, he avenged his father's death by immolating the sons of Phereus. He became the eponymous hero of the Acarnanians.

Acarnania, a country of anct. Greece, bounded on the N. by the Ambracian Gulf, now the gulf of Arta, and Ætolia,

and on the W. and S.W. by the Ionian Sea. It was inhabited by a piratical race, which formed a league and had for its cap. Stratus, a tn. situated on the R. Achelous. It was subdued by the Macedonians in 225 B.C. In 146 it became part of the Rom. prov. of Achæa, and to-day it forms with Etolia a prov. of modern Greece.

**Acastus**, king of Iolcus, one of the Argonauts. On his return from Colchis he instituted funeral games in honour of Pellas, his father, whom his sisters had killed, in accordance with the advice of Medea, who had promised to revivify him as a young man. He was dethroned and killed by Peleus. See Ovid, *Metam.* vii. 297-349.

**Acatalectic** (the opposite of catalectic; Gk. *καταληκτικός*, to leave off), a term in prosody, meaning that the metre does not allow of the omission of an unaccented syllable at the end of the line. 'Catalectic' is applied to verse in which the normal metrical pattern lacks a syllable at the end of the line. The familiar trochaic metre of, e.g. Longfellow's *Psalm of Life*, is alternatively acatalectic and catalectic, thus:

Tell me not 'in mournful numbers  
Life is but an empty dream.'

**Acatepsy** (Gk. *ἀκατεψία*, without, *κατα-λειτουργία*, to seize), the name of the doctrine of Arcesilaus, the Gk. philosopher, who maintained, in opposition to the Stoics, that there can be no criterion of truth. The Sceptics apply the term to incomprehensibility.

**Acateango**, a volcano of Guatemala, Central America, 12,810 ft. high. Near it is a tn. of the same name with a pop. of 3000.

**Acatlan**, a tn. and div. of Mexico, in the prov. of Puebla, on the R. Acatlan, a trib. of the Río de las Balsas or Mexcala; pop. about 46,000.

**Acatus** (dimin. *acatium*), a small boat, swift and light, propelled by wind or oars, used by the ant. Gks., particularly by pirates. It bore a spike in the front and was curved at the prow.

**Accad**, or **Akkad**, the northern of the 2 provinces into which ancient Babylonia (q.v.) was at one time divided, the other being Sumir, the biblical Shinar. One of the 4 cities mentioned in Gen. x. a- having been founded by Nimrod with Babel, Erech, and Calneh in the 'land of Shinar.' The sacred texts of Assyria and Babylonia were written in the Accadian language.

**Acca Larentia**, or **Laurentia**, a Rom. deity, fabled to be wife of Faustulus, shepherd of Numitor, and foster-mother of Romulus and Remus. According to another legend, she was a courtesan who married a rich Etruscan named Tarrutius, and left her wealth at her death to the Rom. people.

**Accalia**, often called **Larentalia** or **Larentinalia**, funeral festival celebrated in Rome on Dec. 23 in honour of Acca Larentia (q.v.).

**Accelerando**, a musical term to indicate the quickened movement of a passage.

**Acceleration**, increase of velocity. According to Newton's first law of motion, a body persists in a state of rest or uniform motion in a straight line unless acted upon by some force. The force therefore tends either to increase the speed of a moving body or to retard it. The former effect is called positive A. and the latter negative A., or retardation. As long as the force acts the A. is produced. A good example is the action of gravity on a falling body. Starting from rest it gives the body a motion of 32 ft. per second at the end of the first second (the average velocity therefore being 16 ft. per second), 64 ft. per second at the end of the next, 96 the next, and so on. See MECHANICS.

**Accensi**, a Rom. name used with sev. meanings. It denoted citizens added to the fifth class of Servius Tullius, also reserve soldiers whose only weapons were sticks and stones (*A. velati*), and inferior officers attendant on magistrates and consuls.

**Accent**. In modern languages there is a tendency to distinguish one syllable in every word by a more impressive utterance; this is called A. In a long word there are frequently two As., but they need not be equally emphasised; as in the words *manufacture* and *independent* and in the phrase 'on the top of the hill' the first A. is comparatively faint. For ant. A., especially the Gk., see METRE. The A. of words is variable and has undergone some changes. Thus we say *triumph*, while Milton said *triumph*, the noun and the verb being distinguished by him as we distinguish nowadays *produce* the noun and *produce* the verb. Comparatively recently *advertisement* has become *advertisement*. The tendency, due to a desire for rapid speaking, is to throw the A. back. The symbols used in Gk. to denote A. are three: the acute (´), the grave (`), and the circumflex (˘). So far we have only spoken of the first: the second denotes the opposite to the acute, or perhaps the absence of it; the circumflex marks a compound of the two first, a rising then a falling of the voice in the articulation of the syllable. These symbols are used in the Fr. language with quite a different meaning. The Fr. language, like all other languages, has been found deficient in the number of characters used to mark vowel sounds, and the three symbols above are used for this purpose. Thus the sounds of *e*, *é*, *e*, *è* in point of A. differ not so much as in point of articulation.

**Accent** (in mathematics): (1) A mark placed at the right hand of a letter and a little above it to signify different magnitudes of the same kind by means of the same letter with different As., e.g. *a*, *a'*, *a''*, *x*, *x'*. (2) In trigonometry to express the minutes and seconds of a degree, e.g.  $8^{\circ} 10'' = 8$  minutes 10 seconds. (3) To express feet and inches, e.g.  $2^{\circ} 6' = 2$  ft. 6 in.

**Accent** (in music) is the regular emphasis occurring in a series of notes. It is usually placed on the first beat after the bar-line, and in any music divided

into bars of more than 3 beats there is usually a secondary A. less strongly stressed.

**Accentor** (Lat. *ad*, to; *cantor*, singer), a sub-family of small birds, probably related to the thrushes. Usually found in thickets in hilly dists. Represented in Great Britain by the hedge-sparrow.

**Acceptance, Acceptor**, see **BILL OF EXCHANGE**. For acceptance in the law of sale of goods see **SALE**.

**Acceptilation** in Rom. and Scots law meant the remission of a debt by a creditor giving a receipt for money never actually paid. The word was used in theological controversy by the Armenians for the doctrine that the sufferings of Christ were not sufficient atonement for man's sins, albeit graciously accepted by God.

**Accession, Deed of**. In Scots law, the creditors of a bankrupt or other insolvent person can by a deed approve of, and bind themselves to concur in, the administration of his estate in trust for the general good.

**Accession of Property**. In the law of England and Scotland, derived from the Romans, property added to either naturally or artificially is said to be acquired by A. All accretions to property naturally added belong to the owner of the nuclear property; thus the offspring of animals, the produce of the soil, the increase of land due to alluvial deposits belong to the owner whose land has been added to or whose fields or cattle have been fruitful. Property acquired artificially, as, for example, when a man builds a house on another's land or embellishes or works on another's material, was generally under the Rom. law held to be the property of the owner of the prin. thing, provided compensation was made for improvement. An exception was made in cases where as the result of labour (which, of course, is a form of property) a totally new thing was produced. Thus the man who made wine from another's grapes or painted a picture on another's canvas retained the picture and the wine and compensated the owners of the canvas and the grapes, thereby reversing the usual rule. In the U.S.A. all A. or accretion is, in the absence of any agreement to the contrary, the property of the owner of the prin. materials.

**Accessory**. In Eng. law, an A. is one who, though not the prin. in a felony and even absent at the time of commission, has nevertheless been concerned with the crime, either *before* or *after* the fact. An A. *before* the fact has been defined by a dictum of Lord Hale as one who, 'being absent at the time of the crime committed, doth yet procure, counsel, or command another to commit a felony.' An A. *after* the fact is one who, knowing that a felony has been committed, assists, relieves, or protects the felon. The mere knowledge that a felony is about to be committed or the omission to apprehend or report the felon does not constitute accession, and a distinction must be made between As.

and prins. in the second degree who are present aiding and abetting. There are no As. in a case of misdemeanour or of treason; all persons concerned are held as prins. and generally receive the same punishment. In Scots law, except for treason, accession after the crime is not recognised, and in the United States the distinction of the Eng. common law between prin. and accessor has by statute been abolished, every person concerned being liable to punishment as a principal.

**Accho**, see **ACRE**, **ST. JEAN D'**.

**Acciacatura** (from It. *acciacare*, to crush), in music, a short *appoggiatura* or grace-note played almost at the same time as the prin. and accented note.

**Acciajuoli, Donato** (1425-78), Italian scholar, b. in Florence, who wrote lives of Hannibal, Scipio, and Charlemagne, and commentaries on Aristotle's *Ethics* and *Politics*.

**Accidence**, a corruption of accidents, signifying the properties and qualities of the parts of speech, as gender, number, and case; originally a small book containing these, but now used to express that part of grammar which deals with inflections (*q.v.*).

**Accident**, in logic, a property or quality of a thing which is not essential or inherent to it, as whiteness in paper. The word is applied to all qualities in distinction from substances (*q.v.*).

**Accident**, means any extraordinary or unforeseen event. In the law of torts 'inevitable accident' is the antithesis of negligence, and, generally speaking, involves no liability in damages. The word, however, varies in its legal connotation according to the context: thus, in the criminal law, it means an act done unintentionally and in such circumstances that no person of common prudence could very well have avoided it.

In insurance practice, however, the word A. includes occurrences brought about by the negligence of the insured or assured and of other or third parties. See **INSURANCE**, *Casualty and Contingency Insurance*. In the law of Workmen's Compensation the word is also loosely used to include not only events accidental in a popular sense but, for the purposes of statutory compensation, others which are in no sense fortuitous. See also **ACCIDENTS**, **MOTORING**; **WORKMEN'S COMPENSATION**.

**Accidental Colour** is the name given to an imaginary complementary colour seen when the attention is fixed on a white surface after it has been concentrated on a bright colour. The complementary colour to yellow is blue, and red to green.

**Accidentals**, in music, are signs occurring before a particular note, not in the signature, which change the pitch during the course of a bar. These signs are the flat, double-flat, sharp, double-sharp, and the natural.

**Accidents, Motoring**. In the case of an accident causing damage to any person, vehicle, or animal, the driver of the motor vehicle must stop, and on request

of any person having reasonable grounds for so requiring, give his name and address and identification of his vehicle. If this is not done on the spot, then the accident must be reported at a police station or to a constable as soon as possible, and in any case within 24 hours. Hospitals now have a right to claim the reasonable expenses of hospital treatment from the insurance company which is meeting claims under a Third Party insurance policy (Road Traffic Act, 1930 sec. 36). Doctor's fee (12s. 6d.)—plus 6d. per m. (over 2 m.)—is now recoverable for treatment to an injured motorist (Road Traffic Act, 1934, sec. 16).

**Accipitres** (Lat. *accipiter*, hawk), Raptures, or Rapaces, the common name for all birds of prey. They appear by day and by night, and are recognisable by their crooked and powerful beaks and talons.

**Accius** or **Attius**, a Rom. tragic poet, was b. 170 B.C. and lived to a great age. Some of his works were on Rom. subjects (*præciata*), but the majority were imitations from the Gk. Only fragments of his works survive.

**Acclimatisation** is the adaptation of plants, animals, and mankind to the difference in climate experienced in some place other than the native country. It differs from *domestication*, which implies protection, and from *naturalisation*, which implies mere residence in another country, by the fact that it requires adaptation. It is made difficult of study in that many other factors are present which would bring about or prevent any change in the original nature of the plant or animal under observation, e.g. changed conditions in food, increase of enemies, and in man intermixture of races. One of the common products of A. in all kinds of organic life seems to be fertility, which can be seen in many cases; in others, however, the reproductive element is limited, as in some plants which lose all power of sexual reproduction when transferred to varying climates, and propagate only vegetatively. The fertility of adapted animals has sometimes proved a great disadvantage to the adopted country, the introduction of rabbits into Australia and their subsequent degeneration into a pest being a case in point.

It has been maintained by some scientists that man is incapable of adaptation, but there are many evidences to the contrary. The universality of the Jewish race is well known, and though they originally dwelt in a warm country, they now swarm over Europe in its temperate and cold climates, their numbers in Russia being enormous. As they largely marry among themselves and keep the purity of their race, it is evident that A. has been successfully accomplished in this instance. Again, the Dutch colonists who have settled in various parts of the globe where the climate is tropical, and who have not mixed with other races, are a strong and healthy people. The contention that Europeans who have

emigrated to India and S. America deteriorate in health and have delicate offspring does not disprove the A. theory; the delicacy is due to the self-indulgence and indolence of the European races, who will not observe the abstemious habits necessary to the changed conditions of life. It is almost essential that the change of climate should be gradual, for where it is violent the human body has not grown accustomed to its new sphere, and diseases which are comparatively harmless to natives of a country frequently prove fatal to strangers, e.g. malaria and liver complaints affect Europeans in the tropics, while lung troubles are common in Africans transferred to colder climates. Those races which inhabit the temperate regions, such as the Eng., Fr., and Ger., are best able to adapt themselves to new climatic conditions.

In France a society was founded in 1854 by Isidore Geoffrey Saint-Hilaire for the practical and theoretical study of this subject, and the Société Nationale d'Acclimation has adapted species and receives assistance from the Jardin Zoologique d'Acclimation. London has the Zoological Gardens and Kew Gardens, in which A. can be seen in animals and plants, respectively. See I. G. Saint-Hilaire's *Acclimation et domestication des animaux utiles*, 1861; Chas. Darwin's *The Variation of Animals and Plants under Domestication*, 1868; J. Hann's *Handbuch der Klimatologie*, 1897; B. E. Livingston: *Climatic Areas of the U.S. related to Plant Growth*, 1913.

**Acce**, or **Aecho**, in anct. geography a tn. of Phoenicia, later called Ptolemais, now Saint Jean d'Acre (see *ACRE*).

**Accolade** (Fr., from It. *accollare*, to embrace, from Lat. *ad*, to, and *collum*, neck); 1. An anct. ceremony, used in conferring knighthood. It was supposed that it consisted of an embrace, but is now believed to have been a slight blow on the cheek or shoulder. 2. In music, a brace used to join sev. parts.

**Accolti**, **Benedetto** or **Benedict** (1415-1466), an It. jurist and writer, b. at Arezzo. He became chancellor of the republic at Florence in 1459, and held this office until his death. His poem of Godfrey of Bouillon's conquest of Palestine, the *De Bello a Christianis contra Barbaros gesto pro Christi Sepulchro*, 1432, was the basis of Tasso's *Gerusalemme liberata*, 1576.

**Accolti**, **Bernardo** (c. 1465-c. 1535), It. poet, son of the jurist Benedetto Accolti, was b. at Arezzo and was known as *l'Unico Areentino*. He owed his fame to his powers of poetical improvisation, and when he announced that he would recite his poems, tradesmen closed their shops and flocked to hear them; unfortunately they have hardly survived him.

**Accolti**, **Pietro** (1455-1549), It. cardinal, brother of Bernardo Accolti, was b. and d. at Florence. As cardinal of Ancona he had a large share in drawing up the bull against Luther in 1520.

**Accommodation**, a term used for a method in Scripture by which the truth is modified in order to bring the divine revelation within the reach of human understanding. In the N.T. this is done by means of parables, and in the O.T. the application is frequent.

**Accommodation Bill**, a bill of exchange to which a party has put his name without consideration (*q.v.*), and for the accommodation of another; the latter should find the funds for payment when the bill becomes due, but the holder for value (*see* BILL OF EXCHANGE) is entitled to sue the accommodating party, though he knows of the want of consideration. The fact that an acceptor is an 'accommodation party,' though no defence to an action by another party, entitles the acceptor to what he would not usually have, a recourse to the drawer he accommodated. The defence of an 'accommodation bill' or 'accommodation party,' therefore, is very rarely one which gets beyond the solicitor or counsel when they are first consulted, because it is seldom any use to bring such a defence into court.

**Accompaniment**, in music, is the assistance given to a solo part by subordinate parts either vocal or instrumental. Thus a song or a violin solo may have a pianoforte A. in order to bring out and emphasise the beauty of the primary music. A. is also the harmony of a figured bass.

**Accomplice**, a person associated with another in committing or attempting to commit a crime. An A. may give evidence in court, *i.e.* turn king's evidence, but, although there is no exact rule to this effect, the general practice is to discount its value unless supported by independent testimony.

**Accoramboni, Vittoria** (d. 1585), duchess of Bracciano, a woman celebrated for her beauty and tragic history. Married to Francesco Peretti, nephew of Pope Sixtus V., she instigated his murder, then married his murderer, the duke of Bracciano. On his death she was involved in a lawsuit with Luigi Orsini regarding the inheritance, and murdered by him at Padua. Her story has been written in novel form by Tieck in 1840, and she figures as the heroine of Webster's *White Devil*, 1612.

**Accord and Satisfaction** may be pleaded by a defendant in a civil action in an Eng. court, viz. that he has agreed with the plaintiff, and has acted upon the agreement, to pay money or perform some action in satisfaction of the plaintiff's demand.

**Accordion**, a musical instrument invented by Damian of Vienna, 1829. It is in the form of a small oblong box, consisting of a row of very small elastic metallic springs, fixed at one end in a plate of metal, so that they may vibrate freely, and a bellows to put the springs into vibration. The instruments vary in size and in capabilities, and 2 or more notes can be played at once.

**Accorso, Francesco** (Latinised *Accursius*) (c. 1180-c. 1260), It. jurist, b. at Florence. He wrote glosses on

Rom. law, and his chief work, the *Great Gloss*, was long a standard authority.

**Accorso, Mariangelo** (c. 1490-c. 1550), It. writer and critic, b. at Aquila. He pub. in 1521 the *Diatribe in Ausonium, Solinum et Ovidium*.

**Accosted**, *see under* HERALDRY.

**Accoucheur**, *see under* OBSTETRICS.

**Account**, general term for a statement of pecuniary transactions between two parties. According to Eng. law, an *A. stated* is one in which both debtor and creditor have agreed to the balance. The debtor is, however, not precluded from showing, if he can, the existence of error, but if the A. has been actually settled by payment it can only be reopened upon proof of fraud. A *settled A.* is a written statement, agreed to by both parties as correct, of the final position of 2 As.

All modern commerce is conducted by keeping records of As. (*see* BOOK-KEEPING), and public bodies and companies, such as town councils, limited liability companies, friendly societies, also executors and trustees, or administrators of estates and similar officers of the court, are all bound by statute to keep As., and provision is made for audit and inspection. It is also a criminal offence under the bankruptcy laws for the bankrupt to have failed to keep such books as the usage or importance of his business would seem to warrant.

**Account, or Accompt, Writ of**, a form of legal action now rarely resorted to, but which was much used in early times, for the recovery of money wrongfully retained.

**Account, Account Current, Account Sales**, *see* BOOK-KEEPING.

**Accountant**, a person skilled in the practice of keeping books of accounts and generally with a knowledge of bankruptcy and mercantile law. The name is applied to officials, such as employed by banks, insurance companies, railways, and other large businesses, whose duty it is to supervise the keeping of accounts and to prepare balance sheets, etc. An *A. of Court* is an officer of the Scottish court of session, whose duties are defined by the Judicial Factors (Scotland) Act, 1889, part of which include bankruptcy affairs. The profession of accountancy is generally more of a consultative nature, and an A. one who is called in from outside to audit and investigate books, to give advice as to how they should be kept, and to make reports as to solvency. Their status has been regularised and their standard of efficiency maintained by societies of As., some incorporated under royal charter, and a member of one of these societies is called a *Chartered A.* The Institute of Chartered As. of England and Wales was founded in 1880. In the U.S.A. is an Association of Public As.

**Accountant-General**, title of 2 officials in the chancery court and exchequer court whose offices were abolished in 1872, and whose duties were transferred to the paymaster-general. The former was appointed in 1726 to

manage the moneys of the suitors in the court, and more particularly in connection with the depositing of them in the Bank of England.

**Accous**, a tn. of France near Oloron in the Basses-Pyrénées, containing medicinal springs; pop. 900.

**Accra**, a seaport in, and cap. of, the Brit. W. African colony of the Gold Coast. It has sev. churches, a bank, club-house, European shops, many schools and hospitals; 5 m. N. is Achimota College, the chief educational establishment on the Gold Coast. Cocoa is the chief export, and the prosperity of A. is largely dependent on the crop and its world price (as was proved by the inquiries of the cocoa commission in 1938, which was sent out by the Brit. Gov. owing to the refusal of the cocoa farmers to sell cocoa at all at the price—about £18 a ton, as against threefold that price in previous years). Other exports are gold, ivory, and palm oil. It is the terminus of a railway to Kumasi. A. is lighted by electricity and has pipe-borne water supplies. There are wireless posts there for inland communication. Considerable damage was done by an earthquake which occurred not long before the Second World War. Pop. about 75,000.

**Accrington**, a manufacturing tn. and municipal bor. in Lancashire, about 22 or 23 m. N. of Manchester. It is noted for its cotton manuf., calico-printing, machinery, and weaving, and possesses a town hall and market hall. Coal and iron are worked in the neighbourhood; pop. 44,000.

**Accum**, Friedrich (1769–1838), Ger. chemist, b. at Bückeburg in Sch-Lippe, crossed to England in 1793, and became prof. of chem. in London in 1802. He introduced illumination by gas into England by his *Practical Treatise of Gaslight*, 1815. He was appointed prof. in Berlin in 1822, and d. in that city. His other chief works are: *An Essay on Chemical Reagents*, 1816, and *A Treatise on the Adulteration of Food*, 1820.

**Accumulation**, see CAPITAL.

**Accumulation**, a legal term implying the A. of income from an estate that has been bequeathed by will or deed, during which time the legatee might not enjoy the estate. The *Thellusson's Act*, 1800 (40 Geo. III. c. 98), which imposed certain restrictions on A., provided that it could only continue during the life of the settler plus 21 years, or during the period of legal minority of the legatee. Where A. has been directed contrary to the provisions of this Act, the direction as to A. is null and void, but not the settlement, and the property passes to such person or persons as would have been entitled to it had A. not been directed. Certain exceptions, such as the provision for payment of debts and for raising portions for children, etc., are made in Section 2 of the Act. The Act at first applied only to England, but it was extended to Scotland in 1848 (12 Vict. c. 36).

**Accumulation of Power**, see *Hydraulic Accumulator*, *infra*.

**Accumulator**, a term applied to any device for storing energy so that machinery may be worked when the actual engine supplying the motive power is at a standstill. The most common applications of the term are in hydraulics and electricity.

**Hydraulic A.**—Lord Armstrong's A. consists of a large cylinder in which a piston works through hemp or leather packing. The piston is driven up by the pressure of water forced in at the bottom of the cylinder by successive strokes from a small engine. When the top of the cylinder is reached a catch operates which automatically stops the engine. The piston is usually weighted so as to provide a pressure of about 700 lb. to the sq. in. The energy accumulated may be used to work cranes, dock gates, or any machinery where intermittent power only is required. There are varieties of the machine where pistons of different diameters are employed to give differences to pressure, and others where steam pressure is accumulated.

**Electric As.**—The term is applied to contrivances which are more appropriately known as secondary or reversible batteries. The principle upon which they are constructed is derived from the working of a voltmeter, an instrument in which water is decomposed by the electric current. It consists of a glass vessel fitted with two platinum plates connected with wires passing through the glass. When the platinum plates are covered with acidulated water and the wires connected up with a battery, an electric circuit is estab. of which the water forms a part. This causes the phenomenon known as *electrolysis* (*q.v.*), the effect of which is that minute bubbles of oxygen collect at the positive plate or electrode and hydrogen at the negative electrode. These gases are collected in receptacles adjusted to receive them. If, whilst the bubbles still adhere to the plates, the outer current is cut off and the two electrodes connected through a galvanometer, it is found that a reverse current is indicated, the gases recombining through the liquid. It is evident that if the products of electrolysis could be kept in contact with their respective plates, it would be possible to recover during their recombination a large proportion of the electrical energy which caused the decomposition. For such a purpose the electrolysis of water is obviously unsuitable, as the hydrogen and oxygen quickly escape.

**Planté's Cell.**—Gaston Planté (1834–1889) devised a cell in which the products of electrolysis remained in connection with the plates. He used lead instead of platinum, so that the oxygen might combine with the positive electrode to form lead dioxide ( $PbO_2$ ). Two lead plates, about one-twentieth of an inch thick, are placed upon each other, but insulated by means of india-rubber strips. They are then rolled into a cylindrical form and placed in a vessel containing water diluted with sulphuric acid. A cell is thus provided having lead electrodes

of considerable surface. Before the cell is ready for use as an A. it has to undergo a somewhat lengthy preparatory process known as 'forming.' On a current being passed through, the water is decomposed, the oxygen separating out at the positive plate and the hydrogen at the negative. The positive plate becomes oxidised and is covered with a thin coating of lead dioxide. When the current is cut off and the plates connected, a secondary current is set up in the reverse direction and the dioxide is reduced to lead, whilst the other plate becomes oxidised. This process of charging and discharging is repeated many times until one plate has a spongy deposit of lead dioxide and the other is covered with lead, also in a spongy condition, owing to its having been reduced from lead dioxide. It is necessary that both substances should be in this porous state in order that the acid may reach as large a surface as possible. It is obvious that the successive chargings and dischargings will take longer and longer as more of the lead becomes oxidised. Planté recommended an ever-increasing period of repose between the steps of the process, so that some months elapse before the cell is ready for use.

An improvement in the preparation of the secondary cell was instituted by Camille Faure, who coated both plates before rolling them up with a paste made of red oxide of lead, which contains a smaller proportion of oxygen. The current has now only to complete the formation of dioxide on the one plate and to reduce the oxide on the other. Thus a good amount of the active material is produced with a great saving of time.

**Modern types.**—Storage batteries composed of Planté or Faure cells have many disadvantages: they are cumbersome and heavy, the spongy material has a tendency to drop off the conducting backing, and they buckle easily and so cause internal short-circuiting. Many improvements have been devised to obviate these difficulties. The positive and negative plates are now made flat, and are arranged alternately in the box facing one another. The positive plates are all joined together to form one large positive electrode, and all the negatives are joined in the same way. Usually the outside plates are both negatives and can be distinguished by their grey colour, whilst the positive plates are brown. Each plate consists of a framework of a solid alloy of lead and antimony, with grooves or perforations in which the spongy active material is held. There is a space between the floor of the cell and the plates, so that any active material which becomes loosened drops clear and so does not produce short-circuiting. In some types of A. chonite separators are used between the positive and negative plates to prevent any contact. Such separators are perforated to allow of the free circulation of acid between plate and plate. The majority of modern

secondary batteries utilise the same chemical reaction as in Planté's cell, but in the Edison A. nickel plates are used in a solution of caustic potash. The advantage gained is the saving in weight.

A normal A. working under ideal conditions has an efficiency of 90-98 per cent, i.e. 90-98 per cent of the energy used in charging the A. is recovered in the form of a secondary current. In ordinary use the efficiency of an A. varies from 60-90 per cent, depending on the usage of the cell and the length of its service. The smallness of the space between the plates has the effect of reducing the internal resistance. They therefore compare favourably with other forms of storing energy. When bent steel springs are used to store energy, it is found that one kilogramme of steel is capable of storing about 4000 megergs (units of energy). One kilogramme of air compressed to one-sixth contains 2,250,000 megergs, of which about 450,000 can be recovered in the form of work. Secondary batteries are capable of storing about 500,000 megergs per kilogramme, of which about 450,000 units can be recovered.

As. can be used for any purposes for which primary batteries are usually employed. The disadvantage of the latter is the comparatively high cost for materials when much power is required, whereas As. are charged by the more economical D.C. generator (or A.C. generator with rectifier), and their maintenance, under favourable conditions, is not an expensive matter. Where current cannot be taken directly from the mains, therefore, As. may be used with advantage.

There are a few applications of As. where their use has contributed greatly to the economy and efficiency of electrical service dependent upon generators. A generator driven by a gas engine is affected by the alternately quick and slow stroke, with the result that the light flickers. An A. connected with such a generator has an equalising effect, because it takes up current during the quick stroke and gives it up during the slow stroke. In systems where electrical power is distributed from a central station, the demand for current varies naturally from time to time. The As. then serve to equalise the load; they absorb power when demand is small, and assist the generator during the busy hours. When the load is lightest they may be used to supply the whole demand made upon the station. The cells used for this purpose contain numerous plates and are massive in construction to meet the heavy discharges which may be called for; this naturally entails comparatively great size and weight, and consequently considerable expense in erection and maintenance. They are liable to rapid deterioration in process of time, especially if they are not intelligently looked after and periodically tested.

The traction type of A. has been greatly improved, and is used extensively for the transporting of light loads on

small trucks. The cases of the As. in this instance are made of a fibre compound and sealed with bitumen: the plates are also packed very tightly, and they are supported at the bottom by ridged ebonite strips placed edgewise. The electrical equipment now consists of 6 or 7 lamps, self-starter, windscreen wiper and many other devices, all of which depend on the A. for their supply of current; thus the A. has to be one which will stand rough usage in the running of the car coupled with occasional heavy discharge and little attention. Most of these difficulties have been overcome, and the car A. runs for many months without other attention than that of keeping the level of the electrolyte right in the cell. The modern A. has developed with the increased use of electricity, both for power-house and wireless work. Wireless calls for a small, cheap, and reliable A. Many modern wireless As. are sent out from the works in a state of dry charge, so that when the A. is filled with acid for the first time it is already charged and ready for use. There is also on the market a type of A. in which the electrolyte is in the form of a jelly.

**Accursius**, see ACCORSO, FRANCESCO.

**Accusative Case**, see under DECLENSION.

**Aeldama** (R.V. *Aeldama*), the Aramaic for field of blood, was the name used for the field bought by Judas (Acts i. 18), or by the chief priests, 'to bury strangers in' (Matt. xxvii. 6). It is also called 'the potter's field' (Matt. xxvii. 7, 10). By tradition this field is situated S. of the lower part of the Vale of Hinnom.

**Acephali** (Gk. ἀκεφαλος, headless), a name given to sev. religious bodies who rebelled against their bishops and other heads of the church. It was particularly applied to the Egyptian Monophysites, who declared themselves free from the authority of Peter Mongus, patriarch of Alexandria, in 482.

**Acephalus**, a hexameter line beginning with a short syllable.

**Aceraceæ**, or **Acerinææ**, a small order of plants which has for its distinguishing characteristics regular, polygamous or dioecious flowers; 5 to 12 stamens; 2 ovules in each carpel. The fruit is double, and has 2 winged samaras; the seed is exalbuminous. Plants of this order are arborescent or shrubby, nearly all contain saccharine substance, and are found in the N. of Asia, Europe and America.

**Acerbi, Giuseppe** (1773 - 1846), It. traveller and naturalist, b. near Mantua. He journeyed through Lapland to Cape North in 1799, and pub. an account of his travels in Eng. in 1802 under the title *Travels through Sweden, Finland, and Lapland*. He founded a journal, the *Bibliotheca Italiana*, at Milan in 1816. Later, as consul-general of Austria to Egypt, he collected many antique objects which he gave to It. and Austrian museums.

**Acerenza**, the anct. *Acherontia*, an It. city on the R. Bradano in the prov. of Potenza. It contains a cathedral built in the Norman style. Pop. 4780.

**Acerinææ**, see ACERACEÆ.

**Acerria** (*Acorrie*), an anct. tn. near Naples, in Campania, Italy, has a cathedral which was rebuilt after the earthquake, 1783, and sulphur springs. It was an old Rom. tn. was burnt by Hannibal, rebuilt and besieged by the Italians during the Social war. Pop. 16,700.

**Acestes**, a mythical king of Sicily, son of a Trojan woman, Egesta or Segesta, who was sent by her father to Sicily that she might not be devoured by the monsters which infested the ter. of Troy. The river-god Crimisus begot by her a son Acestes, who was afterwards regarded as the hero who had founded the tn. of Segesta, and who hospitably received Æneas on his arrival in Sicily.

**Acetabulum** (Lat., chalice), a cup-shaped socket of the innominate bone into which the head of the femur fits.

**Acetaldehyde**, see ALDEHYDE.

**Acetamide** (CH<sub>3</sub>·CO·NH<sub>2</sub>), a solid, crystalline compound produced by distilling ammonium acetate in a stream of dry ammonia. As usually prepared, it has a strong odour suggestive of mice, but this is due to impurities. It is soluble in water and alcohol, melts at 82°, and boils at 222° C.

**Acetate Silk**, see under ARTIFICIAL SILK.

**Acetic Acid** (CH<sub>3</sub>·CO<sub>2</sub>·OH), the earliest known acid, formed when wines and beer turn sour through exposure to the air. The change is brought about by the agency of bacteria (*Mycoderma aceti*). The bacteria find their way into the liquid from the atmosphere, are nourished by the food contained in the wine, rapidly multiply, and by means of an enzyme they contain cause the oxygen of the atmosphere to react with the alcohol, forming A. A. The sour liquid, or impure acid, is known as vinegar, and is usually prepared from wine that is otherwise unmarketable.

In the Ger. process, the wine is allowed to percolate slowly through beech shavings smeared with a culture of *Mycoderma aceti*, meeting a current of air on its downward path. This is known as the 'quick vinegar' process, and requires only three days or so to go to completion.

Commercial A. A. is obtained by the dry distillation of wood in iron retorts at as low a temp. as possible. The products of the distillation are gases, an aqueous liquid, and tar. The liquid contains A. A. mixed with methyl alcohol, acetone, and other impurities. It is treated with quicklime, which causes the A. A. to be converted into calcium acetate. This solution is then evaporated, the tarry products being skimmed off. The acetate is then distilled with concentrated hydrochloric acid and the A. A. is separated. It is mixed with potassium permanganate to oxidise impurities and distilled once more, after which the product is sufficiently pure for commercial purposes. A. A. is also manufactured by passing a mixture of oxygen and acetaldehyde vapour over heated manganese dioxide or granular quartz.

When quite pure, A. A. is a colourless

crystalline solid, with a pungent smell, a blistering action on the skin, and a sour taste. A 50 per cent solution of the acid has the same sp. gr. as the anhydrous acid, and addition of water to a certain point causes the sp. gr. to rise, although the acid is denser than water. This circumstance renders it impossible to determine the strength of the substance by the use of the hydrometer.

The salts of A. A. are known as acetates, and some of them are of considerable commercial importance. Basic copper acetate, or *verdigris*, manufactured by leaving sheet copper in contact with vinegar, is used as a pigment. Lead acetate, commonly known as sugar of lead, is used in the manuf. of the basic carbonate of lead (white lead). Ferric acetate and aluminium acetate are both used as mordants to fix the colours in dyeing and printing calico.

Acetic Ether, or Ethyl Acetate ( $\text{CH}_3\text{CO}\cdot\text{OC}_2\text{H}_5$ ), a colourless liquid prepared by adding a mixture of alcohol and acetic acid to a mixture of alcohol and strong sulphuric acid, the whole being heated to  $140^\circ\text{C}$ . Ethyl acetate is characterised by a pleasant fruity odour, which has led to its being used for flavouring sweets, wines, perfumes, etc. It is also a useful solvent.

Acetone ( $\text{CH}_3\text{CO}\cdot\text{CH}_3$ ), or Dimethyl Ketone, a colourless mobile liquid produced when isopropyl alcohol loses two atoms of hydrogen by oxidation. It is the simplest member of the fatty ketones.

A. occurs in small quantities in normal urine, but in far greater proportion in cases of *diabetes mellitus* and *acetonuria*. It is produced during the dry distillation of wood and other organic bodies, such as sugar and gum. Crude wood spirit consists mainly of acetic acid, methyl alcohol, and A. After the acetic acid has been removed by the action of lime, the methyl alcohol and A. are separated by fractional distillation. A. is also prepared by the dry distillation of calcium acetate, but the modern method of manufacture consists in passing the vapour of acetic acid over heated catalysts, e.g. alumina, thoria, or finely divided copper.

A. is miscible with water, alcohol, and ether in all proportions, and is an excellent solvent for many organic compounds, which renders it useful in the manuf. of cordite. It is also used in the preparation of sulphonal, trional, tetronal (drugs), chloroform, iodoform, and artificial silk.

Acetophenone ( $\text{C}_6\text{H}_5\text{CO}\cdot\text{CH}_3$ ), Phenyl Methyl Ketone, or Acetylbenzene, a crystalline substance melting at  $20^\circ$  and boiling at  $202^\circ\text{C}$ . It is a typical member of the aromatic-aliphatic ketone class of compounds. It is most conveniently prepared by treating benzene with acetyl chloride in the presence of aluminium chloride. It is employed as a soporific under the name of hypnone.

Acetyl, the organic group which would result by the elimination of hydroxyl from acetic acid; it therefore corresponds to the formula  $\text{CH}_3\text{CO}$ . It is unknown

in the free state, but is looked upon as the radicle of such compounds as A. chloride  $\text{CH}_3\text{CO}\cdot\text{Cl}$ .

Acetylbenzene, see ACETOPHENONE.

Acetylene ( $\text{C}_2\text{H}_2$ ), a colourless gas of disagreeable odour (when impure), formerly used as an illuminant, but now important as an 'intermediate,' i.e. a compound manufactured as a stage in the manuf. of other compounds. It is also used in the oxyacetylene blowpipe for welding, etc. It can be synthesised from its elements by an electric-arc discharge between carbon poles in an atmosphere of hydrogen, but this synthesis, though very interesting chemically, is of no commercial importance. A. occurs in small quantities in coal-gas, and is produced during the incomplete combustion of many organic substances, such as coal-gas, methane, ethyl alcohol, etc. The most important method of preparation is by the action of water on calcium carbide ( $\text{CaC}_2$ ).

Calcium carbide is prepared by heating carbon with quicklime in an electric furnace. Under the influence of the high temp., the quicklime is converted into calcium, which combines with the excess of carbon, forming calcium carbide, a white solid when pure. It is difficult to eliminate all the impurities from the substance, and the dangers attending the use of A. were formerly due to the presence of impurities as well as to ignorance of the properties of the gas itself.

The method of preparation of A. from calcium carbide consists simply of bringing it into contact with water. The reaction is somewhat violent and accompanied with the evolution of a considerable quantity of heat. Many types of generators have been invented in which the two substances are brought gradually into contact, either by allowing water to drip slowly upon the carbide, or by throwing small quantities of carbide into the water.

A. burns with a brilliantly luminous flame equivalent to about 240 candles for 5 cub. ft. of gas consumed. The quality of the light approximates to that of sunlight and renders its use advantageous when colour work has to be done by artificial light. It forms with air an explosive mixture which is much more dangerous than a mixture of coal-gas and air. The violence of the explosion is much greater and the limits of explosion much wider, as an explosive mixture is formed by mixing any quantity from 3 to 82 per cent of A., while for coal-gas the limits are from 5 to 28 per cent. Copper combines with A. to form an explosive compound, so that if copper gas fittings are used they must be kept well greased to prevent contact. The flame of A. burning in oxygen reaches a very high temp. (about  $3000^\circ\text{C}$ .); the oxyacetylene blowpipe is therefore extensively employed in engineering and metal-working.

Apart from the use already mentioned, A. finds some application as an anæsthetic (under the name of *narcylene*), and is

also the source of valuable non-inflammable solvents such as westrosol (CO<sub>2</sub>, CHCl<sub>3</sub>).

Its principal use is in the manufacture of acetaldehyde (q.v.) and acetic acid.

**Achæa**, one of the auct. great divs. of the Peloponnesus, now the Morea, extending from the R. Larissus along the coast of the Corinthian Bay to Sicronia. It is a narrow strip of land bounded on the S. by the Arcadian Mts., and watered by numerous small streams, many of which are dry in summer. The coast is low and has few good ports. It was originally called *Ægiale*, afterwards *Ionis*, sometimes *Ægialeian* *Ionis*, and was subsequently occupied by the Achæi, consisting of 12 cities or states. After the Rom. conquest of Greece, Achæa comprised all Peloponnesus with N. Greece, S. of Thessaly.

**Achæan Confederation or League**, see **ACHÆI**.

**Achæi** (Achæans), one of the chief Hellenic races, originally dwelt in Thessaly, and thence migrated to Peloponnesus, the whole of which became subject to them with the exception of Arcadia, and the country afterwards called Achæia. Homer frequently calls the whole Gk. race A. When the Heraclids and Dorians conquered Peloponnesus, many of the A. under Tisamenus, son of Orestes, went to the N. coast of Peloponnesus, expelled the Ionians, and called the country Achæia. The A. settled in the twelve cities Pellene, Egira, Egæ, Bura, Helice, Egium, Rhyte, Patræ, Pharæ, Olenus, Dyme, and Tritea, which formed a league for mutual protection, but they played but a small part in affairs until c. 251 B.C. In 281 B.C. they renewed their league to shake off the Macedonian yoke under which they had been subject. Thus began the famous Achæan Confederation or League. In 251 B.C. Aratus united to it his native tn., Sicyon. Corinth, Megaris, Epidaurus, Trezen, and Sparta also joined, and the league became the chief political power in Greece. It was, however, destroyed by the Romans, who under L. Mummius defeated Diæus, the Achæan general, and burned Corinth (then the chief tn. of the league) to the ground, 146 B.C. S. Greece then became the Rom. prov. of Achæa.

**Achæmenes**, the first independent king of a Persian prov., until then beneath Median authority, and founder of the dynasty of Achæmenidæ, to which belonged Cyrus, Cambyses, Darius, Xerxes, Artaxerxes, and others.

**Achæmenidæ**, or **Achæmenidæ**, the name of the dynasty of Persian kings founded by Achæmenes.

**Achard, Franz Karl** (1754-1821), Ger. author of Fr. origin, wrote works on experimental physics, chem., and agric.; was the first to manuf. sugar from beet-root; and became director of the physical class at the Academy of Sciences, Berlin.

**Achates**, accompanied *Æneas* in his wanderings after the siege of Troy. In Virgil's *Æneid* he is called *Fidus Achates*, which is now the term used for any

faithful companion. A. is also the name of a riv. in Sicily.

**Achelous** (or **Aspropotamos**), the largest riv. in Greece, rises in the Pindus Mts. and flows S. into the Ionian Sea, its length being from 120 to 140 m. At its mouth are the Echinades Is., mentioned by Homer, Herodotus, and Thucydides. The god of this riv., the son of Oceanus and Tethys and the eldest of his 3000 brothers, fought with Hercules for Delanira, was conquered, took the form of a bull, again conquered, Hercules taking one of his horns, which, however, he recovered by giving up the horn of Amalthea. The Naiads changed the horn taken by Hercules into the horn of plenty (Ovid, *Metam.* ix. 87). A. was considered to be a great divinity throughout Greece.

**Achenbach, Andreas** (1815-1910), a Ger. painter, was b. at Kassel, Sept. 29, and studied at Düsseldorf, and under Schadow, becoming one of the most remarkable representatives of the school formed by that master. His work consisted almost entirely of landscape paintings—sites in Holland, especially on the canals, the North Sea, the Alps, Norway, Italy, and the Rhine. The titles of some of them are: 'Hardanger Fjord,' 1843; 'Pontine Marshes,' 1846; and 'Fish Market at Ostend,' 1866.

**Achenbach, Oswald** (1827-1905), the brother of Andreas A., was also a landscape painter, his works consisting almost entirely of lt. scenes. Most of his pictures are in the Ger. museums, but the Luxembourg Palace, Paris, possesses his 'Pier of Naples.'

**Achensee, Lake**, the largest and most beautiful lake of the N. Tyrol. It gives rise to the R. Achen, and on its banks are the vils. of Achensee and Achenthal. Its length is 5½ m.

**Acheron**, the name of sev. rivs.: 1. A trib. of the Alpheus in Elis. 2. A riv. in Thesprotia, Epirus, flowing through Lake Acherusia into the Ionian Sea (Liv., bk. viii. ch. xxiv.). 3. A riv. in Bruttii, S. Italy, on which Alexander of Epirus perished (Liv., bk. viii. ch. xxiv.). 4. A riv. in the lower world, round which the shades hover (Virgil's *Æneid*, bk. vi.).

**Acherontia**, see **ACERENZA**.

**Acherusia**, a name given by the Gks. and Roms. to different lakes, marshes, and caverns which were supposed to be connected with the lower world. The Acherusian Marsh in which Acheron finds its source is in Epirus; the Lago di Fusaro into which Acheron is said to throw itself is in Campania.

**Achéry, Jean Luc d'** (1609-85), a Fr. Benedictine monk, b. at St. Quentin. His chief work is a collection of documents concerning eccles. history entitled *Spicilegium*, 1653-77. Also collaborated with Mabillon in the *Acta Sanctorum* of the Benedictines, pub. 1733-8.

**Achi Baba**. A hill in Gallipoli, 709 ft. high, 6 m. from Cape Helles. In the Gallipoli campaign 1915 it marked the limit of the Brit. advance. On its slopes Turkish forces numbering 200,000 men, protected by masses of artillery and

machine guns, in an elaborate trench-system easily withstood repeated attacks by the Brit. 29th and the Anzac divs., notwithstanding supporting fire from the Brit. ships.

**Achiet-le-Grand**, a vil. and railway junction, in Somme dept., France, which, in the First World War, was taken by Gen. Byng's army in 1917; recaptured by the Gers. in the Somme battle of 1918, and finally retaken by Gen. Byng on Aug. 21, 1918. Near it is A.-le-Petit, also hotly contested in the Somme battles.

**Achievement**, see under HERALDRY.

**Achill**, or **Eagle Island**, off W. coast of Mayo, Eire (Ireland). The soil is little cultivated, and the is. is mountainous. Pop. 5260.

**Achillas**, minister of the Egyptian king, Ptolemy XII., with Lucius Septimius murdered Pompey, and was himself put to death by Arsinoë, Ptolemy's sister, in 47 B.C. See Caesar, *De bello Civili*, iii. 4.

**Achillea** (from Achilles, who received knowledge of the properties of plants from Chiron), a genus of plants belonging to the Compositæ. *A. millefolium*, or common milfoil, is found only in colder climates of the N. hemisphere.

**Achilles**, the hero of Homer's *Iliad*, was the son of Peleus, king of the Myrmidones in Phthiotis, Thessaly, and of the Nereid Thetis. He was educated by Phoenix in eloquence and the art of war, and by Chiron, the centaur, in the healing art. He was the bravest of the Gks. in the Trojan war, leading his troops of Myrmidones, Hellenes, and Achæans in fifty ships against Troy. His quarrel with Agamemnon about the beautiful Briseis caused him to discontinue his part in the war. Patroclus, however, persuaded A. to allow him to go to the war with A.'s men and armour, and it was not until Patroclus was slain by Hector, the Trojan commander, that A. returned to the war. He then killed many Trojans, including Hector, whose body he gave up to Priam, the father of Hector. The *Iliad* closes with the burial of Hector; but A. was killed in the battle at the Scaean gate before the capture of Troy. In character he was gentle towards his friends, obedient towards the gods, fierce in battle, and unrelenting in his anger and revenge when roused. There are many other traditions with regard to his hist., but Homer's account is the best known.

**Achilles Tatius**, Gk. poet, b. in the fourth century A.D. at Alexandria, wrote *Leucippe and Clitophon*, a romance in 8 vols. He later became a Christian bishop.

**Achilles' Tendon**, see TENDON.

**Achilleum**, a tn. on the promontory of Sigæum in the Troad which was said to contain the tomb of Achilles.

**Achillini**, Alessandro (1463-1512), surgeon and philosopher, b. and d. at Bologna, was one of the first to dissect the human body. His chief works are: *Corporis humani anatomia*, Venice, 1516, and *Anatomicæ annotationes*, Bologna, 1520.

**Achillini**, Giovanni Filoteo (1466-1538), It. poet, brother of Alessandro, was

also b. at Bologna. Among his works, all pub. at Bologna, are: *Il Viridario*, 1513; *Il Fedele*, 1523; *Annotazioni della lingua volgare*, 1536.

**Achimenes** (from Gk. *â-*, without, *χεῖμα*, winter), a genus of plants of the order Gesneraceæ much cultivated for their flowers. Sev. species are found in tropical America and W. Asia. They grow by means of their rhizomes, the leaves are variegated, and the flowers are various-coloured.

**Achin**, see ATCHIN.

**Achish**, a Philistine king of Gath who sheltered David when he fled from Saul. He was put to death by the latter. See 1 Sam. xxi.

**Achitophel**, the same as Ahitophel, a native of Gilead, Judea, and one of the most prominent counsellors of King David. Later he assisted Absalom in his rebellion (2 Sam. xv. xvi.). He committed suicide by hanging, owing to the failure of his plans through the advice of Hushai (2 Sam. xvii.). The name is used by Dryden to denote the Earl of Shaftesbury in his famous political satire, *Absalom and Achitophel*, 1681-82.

**Achondroplasia**, rickets (*rachitis*) in the newly born; some derangement in the tæxus of the nutritive process resulting in a retardation or abnormality of the development of bone. Many cases are still-born, and those that outlive childhood are peculiarly dwarfed. The cause is insufficiency of lime salts in the cartilaginous tissues, the ends of the bones being particularly affected. This condition may be brought about by insufficient or unsuitable feeding of the mother, or possibly by the action of micro-organisms. See RICKETS.

**Achromatism**, the condition of a lens in which chromatic aberration is absent; that is, where the object as seen through the lens has no coloured border. See ABERRATION; LENS.

**Achromatopsia** (from Gk. *â-*, without, *χρῶμα*, colour, *opsis*, sight), or colour-blindness, is the result of some defect in the retina or the nerve centres causing the person affected to be unable to distinguish between various colours. Sometimes there is one colour sensation alone; in Daltonism, or red-green blindness, red or green is the unseen colour. Ill health at times occasions a temporary state of colour blindness.

**Acid**, in chemistry, a substance capable of splitting off protons (*g.v.*), or which yields hydrogen ions when dissolved in water; or alternatively (but less comprehensively) a substance containing hydrogen which can be replaced by metals with the formation of salts. The earliest A. known to man was vinegar or dilute acetic A., whence the notion of acidity (*acidus*, acid) was bound up with that substance (*actus*, vinegar). Nitric A. and sulphuric A. were known to the alchemists of the Middle Ages as being capable of dissolving substances otherwise insoluble. In 1668 Tachenius observed that all As. could combine with alkalis to form salts. Boyle was therefore enabled to assert the following

properties of As. : 1, they act as solvents; 2, they precipitate sulphur and other bodies from their solutions in alkalis; 3, they turn blue vegetable colouring matter red, which can be turned blue again by addition of an alkali; 4, they react with alkalis to form neutral salts. Lavoisier divided all substances into As., bases, and salts, the chemical characteristic of As. being that they were produced by oxygenation. It was pointed out by Berthollet that prussic A. and hydrogen sulphide acted as As., but did not contain oxygen, and Davy in 1808-10, by investigating the nature of hydrochloric A., helped to overthrow the oxygen theory, which gave place to a dualistic conception by which As. were divided into two classes, oxyacids and hydracids, their salts being known as amphot salts and haloid salts. Later, Berzelius enunciated his electrochemical theory that in chemical combination there is neutralisation of opposing electricities. Every compound is thus divided into 2 parts, 1 positive and 1 negative. Sodium sulphate, for instance, was looked upon as soda and sulphuric A., each of these being again divisible into 2 parts. The effects of electrolysis, however, did not confirm this theory. In 1838 Liebig investigated organic As., and as a result propounded the theory that As. were simply compounds of hydrogen, the replacing of which produced salts. Further, some As. contained more than 1 atom of replaceable hydrogen, so that the formation of different salts of the same metal was explained. As. containing 1 replaceable atom of hydrogen are known as monobasic; those containing 2, dibasic; those containing 3, tribasic; and so on.

The great majority of organic As. are characterised by the presence of a carboxyl group,  $\text{CO-OH}$ , and their basicity is determined by the number of carboxyl groups. The principal groups of organic As. are the aliphatic and aromatic As. The aliphatic As. may be looked upon as derivatives of the paraffins, the alcohols, and the aldehydes; the aromatic As. are derivatives of benzene. Organic As. yield metallic salts with bases, and esters (formerly known as ethereal salts) with alcohols.

Some As. are used in medicine in a dilute form; when strong many of them are powerful poisons. They enter largely into manufs., over two million tons of sulphuric A. alone being produced every year. For the properties and uses of particular As. the separate headings may be consulted.

The chief inorganic As. are: Boracic, carbonic, chromic, hydrochloric, hydrobromic, hydrosulphuric, nitric, nitrous, phosphoric, phosphorous, sulphuric, sulphurous, and hydrogen sulphide.

Organic As.: Acetic, benzoic, citric, formic, gallic, lactic, malic, oxalic, palmitic, salicylic, stearic, tartaric.

Among organic As. not containing a carboxyl group may be noted hydrocyanic (prussic) A. ( $\text{HCN}$ ), cyanic A.

( $\text{HO-CN}$ ), thiocyanic A. ( $\text{HS-CN}$ ), picric A. ( $\text{C}_6\text{H}_2(\text{NO}_2)_3\text{OH}$ ), and uric A. ( $\text{C}_5\text{H}_4\text{N}_2\text{O}_3$ ).

The strengths of As. are compared by measuring their hydrogen-ion concentrations at equivalent dilutions.

The acidity of a liquid is often represented in terms of the symbol  $\text{pH}$ , which stands for  $-\log. (\text{H}^+)$ , where  $(\text{H}^+)$  is the hydrogen-ion concentration in gramme-equivalents per litre. A knowledge of the  $\text{pH}$  of liquids is often very important in medicine, agriculture, biology, food analysis, etc.

Acidalius, Valens (1567-95), commentator and Lat. poet, b. at Wittstock, Brandenburg, wrote excellent commentaries on Quintus Curtius and Plautus, but his poetry is of little worth.

Acid-amides, compounds which may be regarded as being derived from ammonia by the substitution of the acid or acyl groups for atoms of hydrogen. They are called primary, secondary, tertiary, etc., according to the number of atoms of hydrogen displaced. The chief are *acetamide* and *formamide* (q.v.).

Acid Carbonate, see BICARBONATE.

Acilia gens, a famous plebeian house of the Romans, of which the different branches bore special surnames; the three chief names were Glabrio, Balbus, and Aviola.

Acilius, Manius Glabrio, Rom. general, of the Acilia gens, became consul in 191 B.C. During this consulship he subdued Antiochus of Syria at Thermopylae, and also the Ætolians and Bœotians. He celebrated his triumph in Rome in 190 B.C., and a golden statue was erected in his honour.

Acipenser, see STURGEON.

Acì Reale, a tn. of Catania, Sicily, at the foot of Mt. Etna, and at the mouth of the R. Acis. It contains mineral springs, and trades in linen, silk, wine, fruit, sulphur, and wax. In the Second World War damage was done to the roof of the cathedral and also to the dome of S. Sebastiano. Pop. 35,000.

Acis, a Sicilian shepherd, was the son of Faunus and the nymph Symethis. He was killed by a rock from Etna by Polyphemus, the Cyclop, his rival in the love of Galatea. Neptune changed him into the stream Acis at the prayer of Galatea. See Ovid, *Metam.* xiii. 750-968.

Ackermann, Louise Victorine Choquet (1813-90), a Fr. poetess of strength and originality, but of pessimistic philosophy. Her chief works are: *Contes*, 1855; *Premières poésies*, 1863; *Poésies philosophiques*, 1874; *Pensées d'une solitaire*, 1883. See Anatole France, *La Vie littéraire*, 1892.

Ackworth, see PONTEFRACT.

Acland, Sir Henry Wentworth Dyke (1815-1900), Radcliffe librarian, Oxford, for over forty years, and had much to do with the founding of the Oxford Univ. Museum. Pub. a memoir on cholera at Oxford, 1854, and sev. works on health and medicine. Collaborated with John Ruskin in *The Oxford Museum*, 1859.

Aclinic (Gk. ἀ-, without κλίσις, to

bend) Line, known also as the magnetic equator, is an imaginary line passing round the earth where there is no inclination of the magnetic needle.

**Acne**, a common usually chronic inflammatory disease of the sebaceous glands associated with the hair follicles, occurring mostly about the face, chest, and back. The lesions may be papular (consisting of hard pimples), or pustular (containing matter). The disease occurs usually between the ages of puberty and 24 years, is usually worse in winter, and is associated with menstrual and gastro-intestinal troubles. The individual lesions consist of pink, pointed pimples in the centre of which there is a black-topped comedo, or blackhead. Occasionally a parasite, *Demodex folliculorum*, is found in each comedo. Treatment consists in steaming the face and then expelling the blackhead by the use of a small tube. Gentle friction is helpful, and irritation should be allayed by the application of cold cream.

**A. rosacea** is a distinct disease from the above. It is marked by great redness of the nose accompanied by the formation of pimples. Although often called 'brandy nose', it may occur in connection with any derangement of the general health in quite abstemious persons, and is often associated in women with the period known as 'change of life.' Treatment usually depends on the predisposing cause, but local applications of soothing ointments are beneficial.

**Acoemete** (Gk. *ἀκοιμάσαι*, to sleep), an order of Gk. monks founded about the middle of the fifth century who divided among themselves their service in such a manner that it was continuous and unceasing. A Rom. named Studius founded their famous monastery at Constantinople in 471. Pope John II. excommunicated them in 533 for denying the suffering in the flesh, and consequently the incarnation, of one of the Trinity.

**Acolhuas**, **Acolhuans**, or **Alcolhuas**, a tribe of Central Mexico which is said to have founded the settlement of Tezcoco. They were a peaceable people, second in greatness only to the Aztecs.

**Acolytes** (from Gk. *ἀκολουθεῖν* to follow) were youths—in holy orders—who assisted and waited on the bishops and priests, performing such offices as lighting the candles, and carrying the bread and wine at communion. These services are now performed by laymen and boys.

**Aconcagua**: 1. A prov. in Chile, S. America, the cap. of which is San Felipe. It is very mountainous, being bounded on the E. by the Andes. Area about 6000 sq. m.; pop. 480,678. 2. A mt. peak of the Andes, on the frontier of Mendoza, Argentina, and Chile. It is an extinct volcano 23,081 ft. high, and is the highest peak in S. America. First climbed in 1897. See E. A. FitzGerald, *The Highest Andes*, 1899.

**Aconito**, **Giacomo** (c. 1500 - c. 1566), Lat. **Jacobus Aconitius**. It. theologian, was b. at Trent and d. in London. He

became a convert to Protestantism, and dedicated his *Stragemata Salanz*, 1565, to Queen Elizabeth.

**Aconite**, **Winter**, the *Eranthis hyemalis*, a species of Ranunculaceæ common in England. The pale yellow flowers, each growing on a single stalk, appear early in the year before the leaves.

**Aconitin**, a vegetable alkali found in aconite which is one of the most powerful poisons known. It is inodorous, intensely bitter, and produces a tingling sensation which causes it to be useful in the treatment of neuralgia, gout, rheumatism, and heart affections. As a poison it causes death by asphyxiation.

ACONITUM (MONKSHOOD)

**Aconitum**, **Monkshood**, or **Wolf's-bane**, a genus of plants belonging to the Ranunculaceæ, all species of which are poisonous. They are hardy, herbaceous plants, many of them of great beauty, and may be recognised by the galeate, or helmet-shaped posterior sepal. *A. napellus*, the monk's-hood, a common Brit. flower, whose blue helmet-shaped flowers appear in summer, is one of the most deadly species; *A. ferox*, the *bikh* or *bish* of Nepaul, contains the fatal bikh poison in its root. In England *A.* is often called wolf's-bane, and in France *tue-loup*, or kill-wolf.

**A.**, *Properties of*. As plants of this genus are of a poisonous character and contain the alkaloid *aconitin*, great care must be taken to use only *A. napellus* in medicine. The leaves, when chewed, produce a tingling sensation, but the root causes numbness as well as tingling. It diminishes the rate of the pulse and the heart-beats when taken internally, but leaves the brain unaffected. For internal use it is in the form of tincture or extract, and is employed as a sedative to the stomach, and as a relief in fevers and nervous diseases; for external use it is formed into ointments or liniments, and relieves neuralgia. In cases of aconite poisoning, the stomach must be immediately emptied, until when no stimulants

should be given; artificial respiration and application of hot-water bottles to the extremities will also probably be necessary.

**Acontius**, a beautiful youth of the is. of Ceos. In order to gain the love of Cydippe, the daughter of a noble Athenian, he threw before her, while she was sitting in the temple of Diana, an apple, on which he had written: 'I swear by the sanctuary of Diana to marry Acontius.' Cydippe read aloud the words, and threw the apple away; but the goddess had heard her vow, and when she was about to marry another man she fell so ill that her father gave her in marriage to A. Ovid, *Heroides*, 20, 21.

**Acontius**, **Jacobus**, see **ACONCIO**, **GIACOMO**.

**Acorn** is the fruit of the *quercus*, or oak (*q.v.*). It is a nut, being a large, dry fruit, which does not break open to free the seed, and its base is enclosed in a cupule. The A. of *Q. agrifolia* is used, when unripe, for tanning.

**Acorn-shells** is the popular name of the crustacean *Balanus*, of the order Cirripedia and family Balanidae. The testa is white and consists of six pieces; the animals exist in all seas and are attached to rocks, shells, and floating bodies.

**Acorus** is a genus of plants of the Araceae, belonging to the Spadiciflorae, which has two species, *A. calamus*, the sweet flag, and *A. gramineus*, a Japanese flower. The symphydial rhizome has a sweet-scented oil, and by its branching reproduces the plant vegetatively.

**Acosta, Gabriel, or Uriel d'** (c. 1594-1647), a Portuguese, was b. at Oporto of a noble birth. He was brought up as a Catholic, but adopted the Jewish faith, and went to Amsterdam, where he opposed the Jewish teaching. For his *Examen dos tradicoes phariseus*, 1624, he was charged with atheism, punished, and excommunicated. He shot himself in 1647.

**Acosta, Joaquin** (1799-1852), S. Amer. traveller, explored the valleys of the Andes and Socorro to the Magdalena in 1834, and studied Indian tribes in 1841. Chief work, *Compendio histórico del descubrimiento y colonización de la Nueva-Granada en el siglo XVI.*, 1848.

**Acosta, José de** (1539-1600), a Sp. writer, was b. at Leon, was a Jesuit, and became prof. of theology at Ocaña. From 1571 to 1588 he lived in S. America as a missionary; and during that time he wrote a hist. of that continent, which was pub. at Seville in 1590 under the title of *Historia natural y moral de las Indias*. An Eng. translation of this work by E. Grimston was pub. in 1604. He became a great favourite with Philip II. and held various dignities.

**Acotyledones**, or **Acotyledonae**, the name of the first class in Jussieu's natural system of botany, is derived from the circumstance that its plants vegetate without cotyledons, or seed-leaves. It included plants which do not produce seeds, as ferns, mosses, *Selaginella*, and *Equisetum*, and is now called *Cryptogamia* (*q.v.*).

**Acouchi**, popular name of the *Dasyprocta acouchi*, found in Guiana and the is. of St. Lucia and Granada. It differs from the other agoutis (*q.v.*) in possessing a tail of about 2 in. in length instead of a mere tubercule.

**Acoustics**, a term formerly applied to that branch of physics which deals with phenomena associated with sound waves. In recent years, however, there is a tendency to restrict its use to those properties which make a room or hall suitable or otherwise for hearing music and oratory. Sound waves are movements in the air which proceed in all directions from the source. The quality of the sound as heard by the audience is affected by reflection from the surfaces of objects in the building. It may be thought that the larger the number of objects the greater the disturbance will be, but the fact is that with small objects the wave-length is not small in comparison with the apertures through which they pass, the surfaces by which they are reflected, and the obstacles round which they flow. The bad A. of a building are due to large surfaces and large apertures. In a large, bare hall, for example, there is considerable reflection from the roof and walls, so that the sounds heard are mingled with the echoes of those gone before. If the hall is large and has no peculiarities of structure, these echoes may be dissipated into negligible small waves by breaking up the surfaces with drapery, and by the floor being well occupied with chairs and people. All auditors of a concert ought to be in view of the performers to get the right effect, because if the sound waves have to flow round obstacles the small waves are cut off so that the quality of the music is changed. Every one has experienced the change in the effect of the music when a band comes round the corner. At first one hears the drums and heavy instruments; the lighter clarinets, piccolis, etc., contributing their proper effect only when the band comes in full view.

The difficulty from echoes arises only with large halls. It may become pronounced in the presence of smooth concave surfaces; hence it is important that such reflecting surfaces should be rendered absorbent and broken up so that the sound becomes weakened and dispersed. One way to bring about this result is to cover the ceiling and walls and to render the coffers or sunk panels absorbent. As a complete determination of the three dimensions of the possible echoes and focusing effects in an auditorium presents a complicated problem, it is in most cases sufficient to study the sections, and there are several methods of studying the reflecting characteristics of sections. Thus, the necessity for imitating buildings of good design has disappeared with the modern practice of calculation from drawings combined with tests on a model with the aid of ripple-tank and sound-camera.

A common method of locating echoes is by means of the 'echo-spotter,' a

device for projecting a parallel pencil of sound waves of high frequency. The echo-spotter is not used for hall acoustical determination where it is possible to obtain accurate drawings of the auditorium.

The whispering gallery, which is such an interesting feature of some churches, illustrates the effect of echoes; a whisper at one focus of an ellipsoidal roof is reflected at all points in the roof, bringing all reflections to a focus at one point, with the result that the whisper appears magnified many times. The problem of constructing a building with good A. is somewhat difficult to solve, because the building must be up before its qualities in that respect can be demonstrated. Sensitive flames may be used to distinguish the effect of large obstacles and apertures, but experiment in these matters has led to no very satisfactory results. Consult W. C. Sabine, *Collected Papers on Acoustics*, 1927; A. H. Davis and G. W. C. Kaye, *The Acoustics of Buildings*, 1927; H. Bagenal, *Practical Acoustics and Planning against Noise*, 1942.

**Acquapendente**, a tn. in Viterbo, Italy, built on a precipitous mass of rock. It was the native place of Girolamo Fabrizio (Hieronymus Fabricius), an anatomist and prof. of the sixteenth century; and has been the seat of a bishopric since 1650. The portal and roof of the upper church of S. Sepolcro were destroyed in the Second World War. Pop. 7000.

**Acquaviva**, a tn. in Bari, S. Italy, at the foot of the Apennines. Pop. 12,800.

**Acqui**: 1. A prov. in N. Italy, producing corn, fruit, and wine. 2. The chief tn. of the prov. of A. It contains a fine old cathedral, churches, convents, and other buildings, and is the see of a bishop. Its hot sulphur springs are famous (known to the Romans as *Aque Statiellæ*). Here Napoleon defeated the Austrians, 1796. Pop. 15,250.

**Acquati, Luigi** (1744-1824), It. sculptor, was b. at Forlì. The scenes of his labours were Bologna, Rome, and Milan, and his masterpiece is a group of 'Venus and Mars.'

**Acquittal** (from O.Fr. *aquiter*, to free or discharge), the setting free by a court of a person charged with a crime. In an Eng. court there must first be a verdict of 'Not guilty,' in a Scotch court of 'Not guilty' or 'Not proven.' A. by a jury must, however, be confirmed by the judge. If after an A. the person is again charged with the same offence, and if he can prove that he has been formerly acquitted (or pardoned) he is entitled to be discharged.

**Acrolein**, see ACROLEIN.

**Acre** (A.-S. *æcer*, Ger. *acker*, Dutch *akker*, Dan. *ager*, Lat. *ager*, Gk. *ápos*), originally meant an open, ploughed, or sowed field. In England it also meant an open field until the times of Edward I. and Edward III., when an Eng. statute A. consisted of 4840 sq. yds. A chain is 22 yds. long, so that 1 sq. chain = 22 × 22 or 484 sq. yds., i.e., one-tenth of an A. An A. is divided into 4 roods, a rood into 40 perches, and each perch

contains 30½ sq. yds. In the reign of George IV. the A. was fixed for all land measurements throughout the United Kingdom. This is also used in the U.S.A. The old Scotch A. is larger than the Eng. A., and the Irish is larger than the Scotch.

**Acre**, St. Jean d', or Akka (ancient name Acco or Acocho), called Ptolemais during the sovereignty of the Gks. in Syria), a tn. on the coast of Palestine, built on a small promontory which, with Mt. Carmel to the S., forms a circular bay. It was taken by the crusaders, 1104; retaken by Saladin, 1187; taken by the crusaders under Philip Augustus of France and Richard I. of England, 1191, and given to the Knights of St. John; fell into the hands of the Egyptians, 1291; taken by the Turks, 1517; besieged by Bonaparte for 61 days, 1799, but was saved from assault by Jezzar Pasha and Sir Sidney Smith; taken by Ibrahim Pasha, 1832; taken by the Eng., Austrians, and Turks, 1840, Ibrahim Pasha returning to Egypt. Afterwards it was restored to the Turks. In the combined Brit. and Arab offensive against the Turkish armies which was begun on Sept. 19, 1918, under General Allenby, A. was seized, together with Haifa, on Sept. 23. A. is one of the most picturesque places in Palestine. The walls and earthworks—a perfect example of the late eighteenth-century fortress—are almost intact. From the direction of Haifa a good view is obtained of the S. battlements, the ruins of the 'Tower of Flies,' and the remains of the Phœnician breakwater. The tn. itself is entered by an archway in which stand the original iron-plated gates. Within the gate is the 'White Market,' with its curious vaulted roof, and the general markets and bazaars extend along towards the harbour. Among its khans, the most notable is the Khan Shalwarda, which contains old cannon of the time of Sir Sidney Smith. Of its 6 mosques, that built by Jezzar Pasha at the close of the eighteenth century is the most graceful, with its colonnaded courtyard. Under the citadel, which was either built or reconstructed by Abdallah Pasha in 1820, and is now used as a prison, and under the girls' school opposite, are the crypts of the residence of the Knights of St. John. In an adjoining part of the citadel is a small museum containing Phœnician glass and treasures unearthed in the castle of Montfort. About half a m. to the E. of the walls is Tel el Fuhkar, where Richard I. pitched his tent in 1190; and from this place, too, Napoleon directed operations in 1799. A. is connected with Haifa by a narrow-gauge railway which crosses the rivs. Kishon and Belus. The latter still provides the murex, from which the Phœnicians extracted the famous Tyrian purple. See Luke and Keith Roach, *Handbook of Palestine and Transjordan*.

A. is a seaport and exports grain, oil-seeds, olive-oil, and wool. Pop. 6400.

**Acrel, Olof** (1717-1807), Swedish surgeon, who was b. and d. at Stockholm. He entered the Fr. army in 1743 in the

capacity of army doctor. He wrote several surgical works.

**Acrelius**, Israel (1714-1800), Swedish clergyman, was *b.* at Osteraker and *d.* at Fellingsbro. He was educated at Upsala and became a pastor in America; in 1759 he pub. a history of the Swedish colonies in America.

**Acre Territory**, W. Brazil, on the borders of Peru and Bolivia. Famous rubber dist. Pop. 115,000.

**Acri**, a tn. in Calabria Citra. S. Italy; pop. 12,686.

**Acridine**,  $C_{12}H_8N \cdot 2H_2O$ , an organic compound found in crude coal-tar anthracene and utilised in the manuf. of dye-stuffs. It is a crystalline solid, melting at  $108^{\circ}C$ .

**Acrodus** (from Gk. *ἀκρος*, at the top, *ὄδους*, tooth), a fossil fish found in the Triassic system.

**Acrogaster** (from Gk. *ἀκρος*, at the top, *γαστήρ*, belly), a genus of fossil fish of the Beryclidae, found in the Cretaceous system.

**Acrolein**, or **Acraldehyde** ( $CH_3 \cdot CH \cdot CHO$ ), a colourless liquid formed during the partial combustion of fats. The disagreeable smell produced when a tallow candle is extinguished is due to the formation of A. It is an unsaturated aldehyde, boils at  $52^{\circ}$ , has an irritating action on the skin, and its vapours cause a copious flow of tears.

**Acrolepis**, a genus of fossil fish found in the Permian system.

THE ACROPOLIS, ATHENS

**Acrisius**, son of Abas, king of Argos, grandson of Lynceus, and great-grandson of Danaus. He kept his daughter Danaë shut up in a subterraneous apartment, or in a brazen tower, because it was declared that her son would kill his grandfather. When Danaë became the mother of Perseus, A. ordered them both to be put in a chest on the sea. They were rescued by Dictys near the is. of Seriphus.

**Acrobat** (from Gk. *ἀκρος*, tip, and *βαίνειν*, to go), literally means one who walks on tiptoe, but it is the name given to one who performs such dangerous feats as vaulting, tumbling, and walking or dancing on a slack or tight rope. As. were known to the Gks. and Romans, especially for the performance of feats on the rope. In recent times great skill has been exhibited in this art, and Fariolo, Madame Saqui, Diavolo, Blondin, and Con Colleano have achieved fame as As. **Acrocerania**, a promontory in Epirus, jutting out into the Ionian Sea, traversed by the Ceraunil Montes and ending in the present Capo Glossa. The coast of A. was dangerous to ships, whence Horace speaks of 'infames scopulos Acrocerania,' the rocks of ill fame (*Odes*, l. 3).

**Acro-Corinthus** (Gk. *ἀκρος*, a peak), a steep rock, about 1900 ft. high, which is near the city of Corinth, in Greece. It contains the ruins of the acropolis, ancient fortifications, a temple of Aphrodite, and the famous well, Pirene.

**Acromegaly** (from Gk. *ἀκρος*, extreme, *μέγας*, great), a rare disease for which no cure is known, occurring in adults, characterised by the enlargement of the soft tissues and bones of the extremities. See PITUITARY BODY.

**Acromion** (from Gk. *ἀκρος*, extreme, *ὤμος*, shoulder), the apophysis which terminates in man the spine of the scapula, or shoulder-blade; articulates with the extremity of the clavicle, or collar-bone, and gives attachment to the trapezoid and deltoid muscles. See SHOULDER.

**Acon**, a celebrated physician of the fifth century B.C., who was *b.* at Agrigentum in Sicily.

**Acropolis** (from Gk. *ἀκρος*, highest, *πόλις*, city), a fortified hill, rock, or elevation of ancient Greece. Among these strongholds were the A. of Corinth, called Acro-Corinthus; that of Larissa, called Argos; of Mt. Ithome at Messene; of Thebes, called Cadmea; but the chief was the A. of Athens. This (called also Cecropia) was a rock about 150 ft. high, 1150 long, and 500 broad, which in early times had been partially surrounded by the Polagial wall. Here the first kings of Athens built their palace, and a temple before the Persian invasion, existed edifices were the Parthenon, the Propylæa, designed by Mnesicles 437 B.C., a temple of Nike Apteros, the Erechtheum, the sanctuary of Artemis Brauronia, and the Pinacotheca. Many of

the sculptures from the A. were brought to London by Lord Elgin in 1816. See C. E. Beulé, *L'Acropole d'Athènes*, 1853; C. G. W. Bötticher, *Bericht ü. d. Untersuchungen auf d. Akropolis*, 1862; F. C. Penrose, *Principles of Athenian Architecture*, 1888; M. L. D'Ooge, *Acropolis of Athens*, 1908; W. Hege, *Die Akropolis*, 1930; H. Payne and G. M. Young, *Archaic Marble Sculpture from the Acropolis*, 1936.

**Acrostic** (from Gk. *ἄκρος*, at the end, *στίχος*, a line or row), a verse or set of verses whose initial letters form a word, a phrase, or even a sentence. In the *Spectator* Addison notes compound As. in which the end letters have formed the same word as the initial one, and sometimes the same letters have run like a seam through the middle of the verse; it has been found possible to form a pentacrostic even, in which the same name occurs 5 times in so many columns. This poetical conceit is of anct. date. Bishop Eusebius (d. 340) giving in his *Life of Constantine* a set of Gk. verses, said to have been composed by the Erythraean sibyl, of which the initial letters formed the words *Iesous Christos Theou Uios Soter*—Jesus Christ, the son of God, the saviour—the word itself formed the A. *ichthus*, a fish, which thus came to have a mystical meaning. Each div. of Psalm cxix. contains 8 verses, each set of 8 beginning with the same letter, *aleph, beth*, etc. The comedies of Plautus are each preceded by an argument, the initial letters of which, when joined, read as the title of the play, and the Fr. poets from Francis I. to Louis XIV. partook of this literary trifling. The best-known Eng. As. are contained in Sir John Davies's *Hymns to Astraea*, in praise of the queen, which consists of 26 poems, each of 16 lines whose first letters form the words *Elisabetha Regina*.

**Acrotatus** (d. 264 B.C.), son of Areus, succeeded to the throne of Sparta in 265 B.C. Before his accession he successfully combated Pyrrhus, king of Epirus, in the siege of Sparta, 272 B.C.; in the year following his accession he was killed in battle against Aristodemus, tyrant of Megalopolis.

**Acroterion** (from Gk. *ἀκρωτήριον*, extremity), in architecture, a statue, vase, or other ornament placed on the apex or a lower angle of a pediment. The term is sometimes applied to the pedestal on which the ornament stands.

**Act**. In drama, that portion of a play which is divided from other portions by an interval, or *entr'acte*. In the Gk. drama there was no such div. of play, for if the prin. actors were not on the stage the chorus was, but the Rom., like the present-day dramatists, utilised the break in presentation to imply passage of time. Rom. dramatists like Plautus and Terence always wrote their comedies in 5 As., as in later times did Shakespeare and some other Elizabethans, but modern writers often content themselves with three or four—exposition, development, and conclusion.

**A. OF BANKRUPTCY**, in law, denotes an A. the commission of which by a debtor renders him liable to be adjudicated bankrupt if a creditor presents a petition against him within three months of such A. Such As. include assignment of his property to trustees for the benefit of his creditors generally; fraudulent transfers of his property; charges on his property by way of fraudulent preference; departing out of the country or leaving his dwelling-house so as to defeat or delay his creditors; filing a declaration of his insolvency or presenting his own petition; notifying any of his creditors that he is about to suspend payment of his debts; or various other acts described in the Bankruptcy Act, 1914.

**A. OR CONGRESS**.—A bill or resolution which has been passed by both the Senate and the House of Representatives becomes an A. of Congress if accorded the consent of the President. If vetoed by the President and returned for reconsideration, a bill may then become an A. only on being passed a second time by a two-thirds majority in each House. As. of Congress are of two kinds, either public or private, the first being concerned with law and revenue. All resolutions are presented privately by individual members; they may originate in either the Senate or the House of Representatives, except those concerned with revenue, which must be initiated in the latter.

**A. OF GOD** is the term used in law for any untoward occurrence not arising from human cause or negligence, but from natural causes such as could not have reasonably been expected to be foreseen and guarded against. Damage by storms, lightning, floods, or exceptionally high tides or sharp frosts, etc., may be attributed to the A. of God, and in the absence of any contract to the contrary, no person can be held liable for it. Nearly all insurance forms and shipping charter-parties, and most contracts, have a clause relating to non-liability in the case of an A. of God.

**A. OF GRACE**. An A. of the Scottish Parliament which compelled creditors to provide food for their imprisoned debtors who were without means of support. It was amended in the reign of George IV., and since the abolition of imprisonment for debt (1880) it has necessarily lapsed.

**A. OF PARLIAMENT**.—A law made by the joint action of the three estates of the realm—the lords spiritual, the lords temporal and the Commons; in other words, by the king in Parliament. The draft copy of a proposed A. is called a 'bill,' and a bill only becomes an A. when it has received the royal assent. This may be given either by the sovereign in person or by lords commissioners. A bill may be introduced into either House of Parliament with the exception of what are known as money bills, which the House of Lords may neither initiate nor amend. This practice is based upon the resolutions of the Commons of 1671 and 1673, and until the rejection by the Upper House of the famous Lloyd-George budget

of 1909 it was generally assumed that the rejection of a money bill was a breach of the privileges of the Commons. The Parliament Act of 1911 definitely laid down this principle by statute, leaving to the Speaker of the House of Commons the decision as to what constituted a money bill, and in the case of other bills provided for joint sittings of both Houses in case of dispute and for the final passage of a bill into law without the assent of the Upper House if for three successive sessions it had obtained a majority in the Commons. No bill can be introduced more than once in a session, and it has sometimes been necessary to prorogue parliament in order that a bill which has been rejected may be again reintroduced without delay. A bill may be either private or public. A public bill may be introduced by any member of parliament, but nowadays only gov. bills have much chance of passing into law. Public bills are debated in principle on the first, second, and third reading, and in detail in committee or on report. A private bill, i.e. a bill in the interest of some individual or corporation, is introduced by the petition of the parties concerned, and passes through the same stages. If, however, the preamble of a private bill is not 'proved,' i.e. if the special committee to which it is referred after its second reading finds that there is no *prima facie* cause for it, it is thrown out. All As. are public unless otherwise stated, they are binding on all, and do not need to be publicly promulgated, every citizen being presumed to know what is in them. The public As. of the United Kingdom do not apply to the Crown, the Isle of Man, or the Channel Is. An A. may be temporary, and many temporary As. (100 or so) are renewed from year to year by the Expiring Laws Continuance Act. An A. remains in force in England until repealed, but in Scotland As. that have never been repealed are sometimes held to have lost their force owing to lapse of time. In citing an A. the name is given of the sovereign in whose reign it was passed, the year of his reign, and the chapter, i.e. the number of the A. among the other As. of the same session. Thus 6 Geo. IV. c. 62 would be cited for the A. passed in the sixth year of King George IV. to amend the A. of Grace (*supra*).

**A. OF SEDERUNT.**—An ordinance or enactment made by the judges of the Scottish supreme court, the court of session, mainly directed to the end of regulating procedure in the courts and expediting the administration of justice. This power was conferred on the judges by King James V. in 1532, and at one time had wide scope, approaching legislative power, but no such power is now claimed by the Scottish judges. A quorum of 9 judges was necessary to pass an A. of Sederunt.

**A. OF SETTLEMENT.**—An A. passed by a Tory Gov. in 1701 in the reign of William III. which had for its object 'the further limitation of the Crown, and better securing the rights and liberties of the subject.' It was of great

importance in settling the modern constitution of the country and arose out of the need for securing the Protestant succession to the throne. King William and his consort, Mary, were childless, as was also Anne, the heir presumptive, the elder branch of the Stuarts were dead or Rom. Catholics, so the succession was settled on the Electress Sophia of Hanover, a grand-daughter of James I., and her heirs, 'being Protestants.' Her son became George I. In addition to arranging for the succession by a series of 8 important articles, the power of the throne was restricted and certain abuses guarded against. Perhaps the two most important were those relating to the appointment of judges (making them practically irremovable), and asserting the right of parliament alone to declare war.

**A. OF SUPREMACY.**—An A. of 1559, providing that the sovereign should be the supreme head of the realm in all spiritual matters. This confirmed the A. of 26 Henry VIII. c. 1, repealed in Queen Mary's reign.

**A. OF TOLERATION.**—An A. passed in the first year of William III. (1689), and confirmed by 10 Anne c. 2, by which religious freedom (denied by the A. of Uniformity and the Five Mile Act, etc.) was granted to all dissenters from the Estab. Church except Catholics and Unitarians. The civil disabilities of the latter were not removed till the reign of George III., whilst the former were relieved by the Roman Catholic Emancipation Act (10 Geo. IV. c. 7).

**A. OF UNION.**—Although the kingdoms of Scotland and England came under one crown when in 1603 James VI. of Scotland became James I. of England, and although Ireland had come effectively under Eng. dominance about the same time, it was not until 1707 that the Scots and 1801 that the Irish parliaments were merged with the Eng. by the 2 As. of Union. The earlier A. provided that 16 elected peers and 45 members of the House of Commons (now 74) should represent Scotland at Westminster, and the latter A. secured for Ireland a representation in the Brit. parliament of 32 peers and 100 members. The Irish representation was subsequently increased to 103; but, from the creation of the Irish Free State, only N. Ireland was represented, namely by 13 members.

**A. OF UNIFORMITY.**—An A. passed in 1662, in the reign of King Charles II., requiring all ministers to declare their unfeigned assent to the Prayer Book. For failing to do so 2000 were on Aug. 24, 1662, deprived of their livings.

**Acta Diurna** ('Transactions of the Day') was the title of an official journal pub. daily in republican and imperial Rome. It was the nearest approach in ant. times to the modern newspaper, for in addition to official announcements it contained the results of chariot-races, notices of births, marriages, and deaths, etc. During the consulship of Julius Cæsar, 59 B.C., there was pub. for the first time the *Acta Senatus*, an official report

of the proceedings of the Senate. This was discontinued under the empire, but the speeches of the emperor were often so reported.

*Acta Eruditorum*, pub. at Leipzig from 1682 to 1782, was a scientific and literary monthly printed in Lat. The first editor, Otto Mencke, was a prof. of the univ., and his son and grandson succeeded him in the editorial chair. Among its many able contributors was Leibnitz, who first announced in it his method of differential calculus.

*Acta Sanctorum* (Acts of the Saints) is the title of a series of vols., begun in 1643 and still going on, devoted to recording the lives of the saints and martyrs of both branches of the Catholic Church. The work was projected by a Flemish Jesuit, Heribert Rowweyde, in 1607, but it was not till 1643 that John Bolland (*q.v.*) pub. the first vols. Other members of the Jesuit Order who aided or continued the work were named Bollandists after their leader. Sixty-five vols. have already appeared, dealing with the saints in the calendar. At one time the Bollandists received an ann. grant from the Belgian Gov.

*Acta Senatus*, see under ACTA DIURNA.

*Actæa* (from Gk. *ἄκτις*), by which was designated the medicinal plant *Sambucus ebulus*, the dwarf elder. Linnæus transferred the name to some plants belonging to the Ranunculaceæ, which are found in America, Europe, and the N. of Asia. *A. spicata*, the haneberry or herb Christopher, well known in England, has a poisonous purplish-black fruit.

*Actæon*, son of Aristæus, and of Autonoe, a daughter of Cadmus, was a famous huntsman trained by Chiron. Having surprised Artemis bathing with her nymphs, he was changed by the goddess into a stag and devoured by his own pack of 50 dogs. Euripides' version is that he rendered the goddess irate by boasting that he excelled her in hunting. See Euripides' *Bacchæ*, l. 330, and Ovid's *Metamorphoses*, iii. 131-232.

*Actinism* (from Gk. *ἄκτις*, a ray), a term formerly used to express the property supposed to belong to certain rays of light—chiefly solar and lunar—by which chemical changes are produced as in photography.

*Actinium* (Ac), a metal separated out from pitchblende by Doberne. It is radio-active—that is, it emits energy in virtue of its chemical identity, not of any physical relationship to anything else. Its atomic weight is about 230, and its atomic number is 89. See RADIO-ACTIVITY.

*Actinometer*, an instrument invented by Sir John Herschel in 1825 to measure the amount of heat received from the sun upon a given surface in a given time. It consisted of a thermometer with a large cylindrical bulb. Readings were taken in sun and shade, which by subtraction gave the amount of expansion due to direct sunlight. The term *A.* or actinograph is now applied to many types of instruments used by photo-

graphers to estimate the actinic power or sunlight on any given occasion.

*Actinomyces* (Gk. *ἄκτις*, ray, *μύκης*, fungus), an infectious, inoculable, parasitic disease, commonly known as 'lumpy jaw' or 'big jaw,' first observed in cattle, and also sometimes occurring in man, characterised by chronic inflammation, and often resulting in tumours about the jaws.

Bollinger in 1877 gave a description of the ray-fungus (*Actinomyces bovis*), to which he had discovered the disease in cattle was due. One year later, Israel of Berlin discovered the same disease in man. Infection generally takes place through the mouth, teeth, and pharynx, the microbe generally being introduced with food. From an examination of 32 cases Bostrom concludes that the organism enters in association with certain cereals, chiefly barley; and it is noteworthy that those infected have generally been concerned in occupations dealing with cereals.

Most cases of *A.* have occurred in connection with the oral cavity. The patient complains of toothache and of difficulty in opening the jaw. A swelling appears at the angle of the jaw, which passes into suppuration, pus being discharged externally and into the mouth. From this the disease may spread downwards into any organ. Pulmonary *A.* is characterised by a cough and fœtid expectoration, which on examination reveals the presence of the *Actinomyces*. The organism may also infect the intestines, where it grows upon the mucous membrane, leading to ulceration. Perforation of the serous coat of the bowel may occur, leading to peritonitis.

The diagnosis of the disease rests solely upon the discovery of the *Actinomyces*. The hardness of the borders of the ulcers and of the neighbouring muscles in oral *A.*, and the yellow granules in the pus are indications, but must not be considered conclusive until the identification of the microbe.

The course of the disease is chronic. Mild cases may recover in from 6 to 9 months, oral *A.* being the most favourable. Pulmonary *A.* is usually fatal, death resulting from pyæmia.

The treatment is mainly surgical, the part involved being excised, with a free use of disinfectants. Potassium iodide is used internally, often with success, and treatment with penicillin has recently given good results.

*Actinozoa*, in zoology, a class of the Coelentera, animals of a low type of organisation, distinguished by conspicuous radial symmetry, hence the name, from Gk. *ἄκτις*, ray, and *ζῷον*, an animal. They are divided into 2 sub-classes, *Zoantharia* and *Alcyonaria*, the former including sea anemones, stony corals, and black corals, and the latter the precious red coral, sea fans, and sea pens.

The sea anemone, which may be taken as a typical example, has a broad base by which it attaches itself to a rock, a cylindrical column beset with warts or tubercles, and an upper disc which is encircled by numerous tentacles. In the middle of the disc is the mouth, which

leads to a gullet communicating with the stomach cavity, from which other cavities radiate. The animal partly paralyzes its prey (small fishes, sea urchins, etc.) by the use of stinging capsules, and ingests it whole. The corals are distinguished by the formation of a calcareous skeleton.

The class is sometimes known as Anthozoa.

**Action at Law.** In the limited legal acception of the term the word signifies a proceeding in a civil court of law with the object of ascertaining and fixing the rights and duties of two parties. Every person, other than a felon, outlaw, or foreign enemy, has the right to bring an A., either directly or, in the case of legal minors or lunatics, indirectly through their guardians, against any other person except the sovereign, foreign sovereigns, and their representatives. The proceedings in the various courts are different, and certain As. can only be brought in courts for that specific purpose, but the main features are substantially the same in the courts of England and Scotland. The defendant is served with a summons directing him to appear in court, next an attempt is made to ascertain the facts of the question at issue, and when this is determined to endeavour by argument, either supported by evidence or without, to settle which of the parties is in the right. On matters of fact the verdict of a jury is generally considered final, but a judgment on a question of law is generally open to appeal. The expenses or *costs* (q.v.) of an A., though sometimes shared, are usually ordered to be paid by the loser of the A., but in order to prevent abuse the loser may submit these costs to an officer of the court, called a taxing master, who, for a fee, audits or 'taxes' the costs. Either party has the right to demand trial by jury, common or special, except in causes assigned to the Chancery Div., or where the judge by Order 36 of the Supreme Court Rules decides otherwise. Formerly the word suit was used instead of A. when the case was one for *equity*, i.e. in the Chancery Div. The word suit has now been abolished, the powers of equity (q.v.) being conferred on the High Court by the Judicature Acts of 1873-5, but certain As., such as those for the execution of trusts and specific performance of contracts, can only be brought in the Chancery Div. The Scots law never recognised a formal distinction between law and equity, so it is competent to bring all As. before the court of session, if we except certain applications which must be made to the inner house. The old Eng. common law used to divide As. into 3 classes, *real*, *personal*, and *mixed* As., but the modern classification is now into As. for breach of contract (*ex contractu*) or for torts (*ex delicto*). An A. founded on a tort, i.e. any wrong done that is not in the nature of a breach of contract, falls broadly under one of three headings, *non-feasance*, the omission to do what one ought to do, *misfeasance*, the improper

performance of a lawful act, *malfeasance*, the performance of an unlawful act. Scottish As. are also broadly divided as follows: declaratory, to define the nature and extent of the rights of the pursuer; rescissory, to set aside or rescind a fraudulent or erroneous document; petitory, to sue for debt or damages for breach of contract; and possessory, for an injunction restraining from interference with property—in other words, for the maintenance of the *status quo*. An A. upon the case signifies an A. under the common law prior to which particulars of the wrong complained of, or the case, were set down in detail.

As in Eng., so in Amer. practice and procedure, fixed forms of A. have been abolished by the majority of jurisdictions. For these, there is now one single form for all causes. This is the outcome of what is called the Field Code of 1848, so called because it was framed principally by the labours of David Dudley Field (q.v.), who was appointed in 1847 to revise practice and procedure in New York State. This code was subsequently adopted by a large number of other jurisdictions, and its simplicity, free from the inherited jargon of legal pedantry or outworn Lat., is pre-eminently in accord with Amer. ideas. This reform also abolished the distinction between common law forms of A. and other forms, and, like Eng. procedure after the Judicature Act of 1873, it enabled equitable and legal remedies to be provided by one and the same court. But there is no actual fusion of law and equity any more than there is in Eng. procedure. (See under *Equity*.) For the rest, though Amer. procedure is so largely derived from the Eng., there is considerable difference arising from the fact that the Federal and States courts still follow their several systems of procedure.

**Action Française**, a Fr. political right-wing anti-semitic group formed in 1898 during the Dreyfus affair (q.v.) to restore the monarchy under the Bourbon-Orléans family, and having as its organ the paper *L'Action française*. Its political leader was Léon Daudet, its sole deputy in the House of Representatives, and its chief publicist, Charles Maurras, who advocated provincial autonomy, a corporate state and a privileged position for the Church. In 1926 the pope formally condemned the movement, but a reconciliation was effected in 1939. The group, while exercising small direct political influence, has had some considerable influence on other political movements, especially Syndicalism and Fascism.

**Action, Least, Principle of**, see MAXIMA AND MINIMA.

**Action and Reaction** (Motion, Laws of), see NEWTON, MOMENTUM.

**Actisanes**, an anct. king of Ethiopia, who conquered Egypt in the reign of Amasis.

**Actium**, now Akri, tn. and promontory at the entrance of the Ambracian Gulf on the W. coast of Greece. It is celebrated

as the scene of the final overthrow of Antony and Cleopatra by Augustus, on Sept. 2, B.C. 31. Apollo, from his temple on the promontory, received the title of Actius or Actiacus. For description of battle see Dion Cassius, bk. 1.

**Active or Living Force** (*vis viva*). See ENERGY.

**Acton**, municipal bor. of Middlesex, 9 m. W. of St. Paul's. It was a seat of Puritanism at the time of Cromwell, and was the place of residence of Richard Baxter. Henry Fielding, the novelist, and Mrs. Barry, the actress, also resided here. Pop. 57,200.

**Acton**, John Emerich Edward Dalberg-Acton, first Baron (1834-1902), Eng. historian, grandson of Sir J. F. E. Acton, was b. at Naples on Jan. 10, 1834. He studied under Dr. (afterwards Cardinal) Wiseman at Oscott, but received chief teaching from Dr. Dollinger, and became leader of Eng. 'Liberal Rom. Catholics.' In 1895 he was appointed regius prof. of modern hist. at Cambridge, in which year he pub. his *Lectures on the Study of History*. On Newman's retirement in 1859 he ed. the *Rambler*; in 1862 the *Home and Foreign Review*. His *History of Freedom in Antiquity* appeared in 1877, and he projected, but did not live to see the accomplishment of, the *Cambridge Modern History*, 1902-10. He was a devoted admirer of Gladstone, and his *Letters to Mary, Daughter of the 1st Hon. W. E. Gladstone*, were ed. by Herbert W. Paul with an introductory memoir, 1904. See also *Lord Acton and his Circle*, ed. by Abbot Gasquet, 1908; and D. Mathew, *Acton: the Formative Years*, 1946.

**Acton**, Sir John Francis Edward (1736-1811), was b. at Besançon, the son of an Eng. physician. He entered the Tuscan Navy, and reorganised the Neapolitan Navy, becoming generalissimo, minister of finance and Prime Minister at Naples. In 1791 he succeeded to his cousin's title. In 1798 he fled with the king and queen of Naples to Palermo on account of Fr. invasion, but resumed his power on the king's restoration in 1799. In 1806 he again fled with the royal family, and d. at Palermo on Aug. 12, 1811.

**Acton Burrell**, Statute of, passed in 1283 by a parliament which assembled in the par. of this name in the eleventh year of King Edward I. The passing of this statute was indicative of the growing importance of the mercantile class, and its object, as set forth in the preamble, was to make provision for the more speedy recovery of debts. *Inter alia* the statute made arrangements for the distraint of the debtor's goods. Acton Burrell is about 8 m. from Shrewsbury, and it is said that the parliament which assembled there met in a barn.

**Actor**, son of Deion or Myrmidon, was the grandfather of Patroclus, and his descendants were called the Actorides.

**Acts of the Apostles**, The, title of the fifth book of the N.T., the authorship of which is attributed to St. Luke, the physician, the writer of the third Gospel.

The A., like that Gospel, are dedicated to one Theophilus, reference being made to him in the first verse of each book. There is an identity in literary style between the Gospel and the A., and early tradition, nowhere contradicted, assigned the authorship of the Gospel to a companion of St. Paul. It was probably written between 63 and 69 A.D., for the author records the arrival of St. Paul in Rome, but not his death. The A. form the chief source of early Christian hist., their authenticity has never been seriously questioned, and they were recognised by all parties in the early Church as canonical. The book was written in Gk., and is divided into 2 parts, the first 12 chapters dealing with the church in Jerusalem and Judea, with St. Peter as the central figure, and the second, written often in the first person plural, treating of the church among the Gentiles and the journeys of St. Paul. Baur, the most considerable critic of this work, has seen in it support for his theory that the early Church was divided into two factions, the Judaistic, or followers of Peter, and the more liberal or Pauline party. He has even gone to the length of suggesting that the A. of the A. was intended to be an eirenicon between the school of Paul and that of the older apostles. Peter, says Baur, is made to speak the language of Paul, and Paul's attitude to the Judaizers appears much more conciliatory than it really was. Perhaps the most considerable supporter of the traditional authorship of the A. is Sir Wm. M. Ramsay, whose scholarly work *St. Paul the Traveller* has done much to redress the balance of criticism. A. was not quoted often, nor very early, but Papias, who was bishop of Hierapolis in Phrygia in the earlier half of the second century, probably was acquainted with it, as he refers to Philip the Deacon and his daughters (Acts xxi. 9), and Justus Barsabas (Acts i. 23). On the other hand, Eusebius, the biographer of Papias, does not report him as quoting A. Irenæus, Tertullian, Hippolytus, and Clement of Alexandria quote the A. frequently, and echoes of it are to be found in the writings of Ignatius, Polycarp, and others.

**Actuarius**, John, a Gk. physician and writer who lived about the thirteenth century. He is said to have introduced certain drugs into Europe.

**Actuary**, from Lat. *actuarius*, which signified the clerk or shorthand writer who in auct. Rome recorded the *acta* (proceedings) of the Senate or other public bodies. The word passed into England and came to mean the secretary or accountant of a public company, or the clerk or registrar of a court. In the latter sense it is still used for the officer who keeps the minutes of the Lower House of Convocation in the prov. of Canterbury. Now the word is used in a more restricted sense, and practically only applied to an official of a gov. dept. or an insurance company or friendly society whose duty it is to make the calculations

on which are based the premiums or charges made for all forms of insurance. From the foregoing it follows an A. will be skilled in the mathematical laws of probability, and he generally has some legal knowledge, also a certain amount of medical knowledge, to enable him to benefit to the full by the advice tendered by the company's medical officers as to 'good' and 'bad' lives. In 1819 the Gov. created the post of A. to the commissioners of the National Debt, and the Friendly Societies Act of the same year attempted a legal, albeit somewhat vague, definition of an A. in the words, 'a person skilled in calculation.' The number of gov. As. was naturally greatly increased by the National Insurance Act, 1911, and the work of an A. becomes increasingly more onerous. Many As. have consultative practices, and the affairs of the profession are managed by 2 incorporated societies. The more important, the Institute of As., was founded in 1848 and incorporated in 1884; the other body, the faculty of As. in Scotland, founded in 1856, was incorporated in 1868. Both bodies grant diplomas, and their members are respectively entitled to the letters F.I.A. and F.F.A.A. after their names.

**Acuña, Cristóbal de** (1597-c. 1650), Jesuit missionary, was b. at Burgos and d. in Peru. He wrote an account of a journey of exploration down the Amazon, which appeared in 1641 as *Nuevo descubrimiento del gran río de las Amazonas*.

**Acupressure** (from Lat. *acus*, needle, *primere*, to press), a method formerly used of compressing an artery with a needle to arrest a hæmorrhage. The needle is placed perpendicularly to the artery near its opening, crossing over it firmly, and thus stopping the flow of blood.

**Acupuncture** (Lat. *acus*, a needle, *pungere*, to prick), in surgery, puncture of the skin with a needle for the exit of fluid, the relief of pain, etc. It was long used by the Chinese, who believed that by such an operation the harmful vapours which gave rise to certain disorders were exuded from the body.

**Adachev, Alexis** (d. 1561), chamberlain to Tsar Ivan IV., the Terrible, whose violent passions he influenced beneficially. He distinguished himself at the taking of Kazan, 1552, but later fell into disgrace and died in prison at Dorpat.

**Adagio** (from It. *adagio*, leisurely), in music, a term indicating that the movement is slow. It is also used as the name of a piece of music, or as the distinguishing title of a single movement.

**Adair, James** (fl. 1775), trader and historian of the Amer. Indians, emigrated to America in 1735. He adopted the theory that the Amer. Indians, among whom he lived for 40 years, came from the lost 10 tribes, a theory subsequently elaborated by Dr. Boudinot in his *Star of the West*, 1816. His *History of the American Indians*, dealing with their language, habits, and character, is a valuable and interesting work.

**Adalbert**, archbishop of Hamburg-Bremen (c. 1000-72), declined the

papacy offered by Henry III. and desired to found a patriarchate in the N. He exercised great power over Henry IV., whom he educated, and though the nobles accomplished his expulsion from court in 1066, he was recalled in 1069. He assisted in the conversion of the Wends. See *Adam of Bremen's Gesta Hammaburgensis Ecclesie Pontificum*.

**Adalbert, St.** (fl. 700), an Eng. saint, traditionally claimed to have been first archdeacon of Utrecht, and patron saint of Egmont.

**Adalbert, St.** (c. 939-97), b. of a noble Bohemian family, was created bishop of Prague in 982. He preached Christianity to the Hungarians, then to the Prussians and Poles, and was murdered by an unbelieving Prussian priest. He is called the Apostle of Prussia, and his feast is celebrated on Apr. 23. His bones were reinterred in Prague Cathedral in 1880.

**Adalia, Attalíyeh, or Satalíeh**, the anc. Attalia, is a seaport of Asia Minor on the gulf of A. Built on the slope of a hill, the streets rise in tiers above one another, facing the harbour. It exports fruit, timber, and wheat. Its former importance as a port has been greatly lessened by the extension of railways and the unsuitability of its harbour for modern steamers. Pop. about 28,000.

**Adam**, the first created man, or type of man. The word is probably connected with the Heb. root *adam*, red, and is used as a generic name for man in the Heb. and Assyrian languages. In Gen. the article is sometimes prefixed and sometimes not, giving us 2 renderings: 'the man' as the first created individual, and 'man' as a species. It is generally recognised that 2 dissimilar accounts of the creation of A. are amalgamated in the Bible. Gen. i.-ii. 3 designates the Deity as Elohim, whilst from ch. ii. 4 the combination *Yahweh - Elohim* is used, rendered in the Eng. version as 'the Lord God.' The story of A. as narrated in the portion characterised by the term *Elohim* describes his creation as taking place on the sixth day, after the plants and animals had already been made. The more detailed narrative starting at ii. 4 tells of the formation of man from the substance of the earth, and his installation in the Garden of Eden, in the midst of which grew the tree of life and the tree of knowledge of good and evil. The fruit of the latter tree was strictly forbidden him, but he was enjoined to cultivate the other plants and enjoy their fruits. The animals were then formed from earth-substance, and were named by A. God afterwards caused a deep sleep to fall upon him, during which Eve was made from his own flesh. Being induced by the tempter to eat of the forbidden fruit, Eve persuaded A. to eat also, and for this transgression of the law of God both were expelled from paradise to become the progenitors of the human race.

Much has been written in discussion of the question whether the story of A. was intended as hist. or allegory, and on its relationship to the theories of

modern science. In the first place, it is well to point out that a scientific inquiry like that carried out by Darwin aims at classifying facts in order to arrive at the 'laws' or uniformities of nature, leaving out the questions of creation and the ultimate destiny of man. The Genesis account, on the other hand, is an attempt to describe the relationship of God and man, to indicate the hist. of the human race in terms of such facts as may be available; with a direct view to formulating a religious code. As the purpose of the writer is the spiritual elevation of mankind, the facts of creation must be looked upon as typifying spiritual forces, so that hist. and allegory are blended. Man has his origin in inorganic matter; his very existence therefore depends upon the directing power of an Almighty Being; he is, however, given dominion over the animals, which expresses the separation of species, not as a scientific fact, but as a moral necessity (Lev. xviii. 23). The prohibition of the tree of knowledge of good and evil indicates the distrust of culture characteristic of the Jehovistic writers. The introduction of sin by way of the sex element paves the way for much of the teaching of the Pentateuch. Death as the consequence of sin may also be taken fairly literally as the tendency to physical deterioration following upon transgression of the law. The narrative of A. in this way becomes the introduction to the compilation of historical narrative and moral adjuration which we know as the Pentateuch. Many accounts of the creation from other sources contain some of the elements of the Bible story, and it is probable that the original writer selected such items as best illustrated his view of the moral growth of man. Amongst the ancients, Egyptians, for instance, it was believed that men were produced from the mud of the Nile under the influence of the sun-god. Babylonian inscriptions describe a garden with 4 rivers as being connected with an early state of innocence, and there are also indications that the serpent story is of Babylonian origin.

In many versions of the Eng. Bible dates are appended to the different chapters. When dealing with the monarchical period of Jewish hist. it is possible to give dates with a fair amount of certitude, and by adding together the years in the generations of the patriarchs, as given in Gen. v., Bishop Ussher arrived at the date 4004 B.C. as the time of A.'s creation. The value of such a method of computation is now understood to be nil; the beginnings of life must have taken place many millions of years ago, and man has been differentiated from the other animals probably for at least 100,000 years.

Later Jewish stories introduced fanciful accounts of A., as that he was of huge proportions, covering the earth completely. His first wife was Lilith, who fled from him and became a demon when Eve was created. In the Manichean mythology, A. is not represented as a creation of God at all, but as the son of

Satan, prince of darkness, by 'Sin' or 'desire.' Satan had stolen light from heaven, which passed into A., and by diligent fostering by the spirits of good the prospect of light finally overcoming the power of darkness in man was held out as the great hope of the Manichean religion. Eve was given to A. by Satan, and represents the sensual element. She, however, was seduced by Satan; thus Cain and Abel were said to be the sons of Satan and Eve, the offspring of A. and Eve being Seth, who thus carried forward the tradition of light.

A Mohammedan account states that A. performed a penance lasting 1000 years in Ceylon. Augustine suggested that the cause of A.'s expulsion from Eden was not that he was tempted by Eve and fell, but that, after Satan's victory over Eve, A. was led by the power of love to share her shame and punishment. This idea is adopted in *Paradise Lost*; Milton also used the Rabbinical accounts of the celestial hierarchy, Satan being identified with Lucifer, 'son of the morning,' who had fallen from heaven. Another tradition of the Rabbinical writers is that A. was the author of Psalm xcii., the 'Sabbath Psalm.'

An attempt has recently been made to prove that A. was a so-called palæolithic man, to whom the Creator added pre-natally the moral and spiritual qualities which differentiated neolithic man from his immediate forerunners. M. Morris's *New Light on Genesis*, 1926, and *Man Created during Descent*, 1928.

Adam, Adolphe Charles (1803-56), Fr. operatic composer, studied composition under Boieldieu and wrote many comic operas. Among his best works are *Le Châlet*, 1834; *Le Postillon de Longjumeau*, 1838; *Le Roi d'Yvetot*, 1842; *Cagliostro*, 1844; *Le Tordador*, 1849; and the ballet of *Giselle*, 1841. See A. Pougin, *Adolphe Adam, sa vie, sa carrière, ses mémoires artistiques*, 1877; *Souvenirs d'un musicien*, 1901.

Adam, Albrecht (1786-1862), lithographer and one of the finest painters of Ger. battle-scenes, was b. at Norwillingen. He followed Beauharnais in Russia and Italy, and accompanied Radetzky in 1848. Among his best works are 'The Battle of Moscow' and 'The Battle of Leoben.'

Adam, Alexander (1741-1809), Scottish grammarian and teacher of Lat., was b. in Morayshire of humble parents. After a successful career at Edinburgh Univ., he was appointed assistant to the rector of the High School in 1767, and became rector in 1771. Among his students were Walter Scott, Jeffrey, and Brougham. He received his honorary degree of LL.D. in 1780. His *Principles of Latin and English Grammar*, 1772, was rejected by the school patrons, but his *Roman Antiquities*, 1791, obtained continental fame. He also pub. a *Dictionary of Classical Biography* in 1800, and in 1805 a *Lexicon Lingue Latine Compendiarium*. See A. Henderon's *Account of the Life and Character of Adam Alexander*, 1810.

Adam, James (d. 1794), an architect,

is known only in connection with his younger brother, Robert A. (q.v.). He is believed to have designed Portland Place.

**Adam, Jean** (1710-65), Scottish poetess b. near Greenock, is famous as reputed author of *There's Nae Luck about the Hoose*. From being prin. of a girls' school she sank into utter poverty, and d. in a Glasgow workhouse.

**Adam, John** (1779-1825), an Anglo-Indian statesman, son of William A. (q.v.). He became secretary to Lord Hastings in India, and acting governor-general in 1823. He suppressed the freedom of the Eng. press in India, provoking a storm by cancelling the licence of James Silk Buckingham. See *Asiatic Journal*, Nov. 1825.

**Adam, Juliette** (pseudonym of Juliette Lamber) (1836-1936), b. at Verberie, Oise. Married to a lawyer, La Messine, she pub. under that name *Blanche de Coucy, l'Enfance*, in 1858, and followed it up with *Idees antiproudhoniennes sur l'amour, la femme et le mariage*. After her second marriage, in 1863, with Edmond A., prefect of police, she pub. largely under her maiden name, among her later works being the *Siège de Paris*, 1873; *Laide*, 1878; *Greceque*, 1879; *Païenne*, 1883. She founded *La Nouvelle Revue* in 1879, and her salon was politically influential. Works: *Le Roman de mon enfance et de ma jeunesse*, 1902; *Mes premières armes littéraires et politiques*, 1904; *Mes sentiments et nos idées avant 1870* (1905); *Mes illusions et nos souffrances durant le siège de Paris*, 1906; *Mes angoisses et nos lutes*, 1907; *La Vie des ames* (sketches of European War), 1919; *L'Angleterre en Egypte*, 1922; *L'Egypte: une leçon diplomatique*, 1924.

**Adam, Paul Auguste Marie** (1862-1920), Fr. novelist, b. in Paris. His father was 'directeur des postes' under the Second Empire. A. was a Boulangist in the later eighteen-eighties, and an unsuccessful candidate for deputy. His first book was the Zolaesque *Chair molle*, 1885; the second, *Soi*, 1886, a study of feminine egoism. He devoted himself to historical investigation—distinguishing between stories of his own day (*L'Époque*) and those of a former time (*Le Temps et la vie*). He wrote: *Robes rouges*, 1891; *Le Mystère des foules*, 1895. Then came 4 romances of the Napoleonic time—*La Force*, 1899; *L'Enfant d'Austerlitz*, 1902; *La Ruse*, 1903; and *Au soleil de juillet*, 1903—in which he was greatly assisted by the recollections of his grandparents. Other works: *Le Trust*, 1910; *La Ville inconnue*, 1911; *Sûphanie*, 1913. He d. in Paris, Jan. 2, 1920.

**Adam, Robert** (1728-92), Scottish architect, was b. at Kirkcaldy, the son of an architect. He had three brothers, John, James, and William. With C. L. Clérissieu, the Fr. architect, he visited Italy in 1754, and subsequently wrote *Ruins of the Palace of Diocletian in Dalmatia*, 1764. On his election as M.P. for Kinross in 1768, he resigned his office of architect to the King and queen, but still

pursued his professional career. With his brother James he built the Adelphi, which is thus named after them (from Gk. ἀδελφοί, brothers). Other examples of their work, recorded in their *Works in Architecture*, 1773-78, are the screen to the Admiralty Office; Lord Mansfield's house at Kon Wood; the Register Office, Edinburgh; Lansdowne House, London; Glasgow Infirmary, and part of the buildings of Edinburgh Univ. See P. H. Fitzgerald, *R. Adam, Artist and Architect*, 1904; J. Swarbrick, *Life, Work, and Influence of R. Adam*, 1903; A. T. Bolton, *The Architecture of Robert and James Adam*, 1922; J. Lees-Milne, *The Age of Adam*, 1848.

**Adam, William** (1751-1839), politician and lawyer, son of John A. and nephew of Robert and James A. (q.v.). He entered parliament in 1774, and attached himself to Lord North's party. In 1779 he fought a duel with C. J. Fox, wounding him slightly, and later becoming his firm friend. He assisted in the impeachment of Warren Hastings in 1788, took silk in 1790, and was appointed lord commissioner of Scottish Jury Court, 1816. His friendship with Sir Walter Scott is chronicled in Lockhart's *Life*.

**Adam de la Halle** (b. 1240, d. 1285-88), a native of Picardy, known as the Hunchback of Arras, a celebrated trouvère. He wrote *Le Jeu Adam*, or *Le Jeu de la feuillée*, the first Fr. comedy, and at the court of Naples he composed the first known comic opera, *Le Jeu de Robin et de Marion*, c. 1283. A complete ed. of his works, by Coussemaker, appeared in 1872.

**Adam of Bremen**, the Ger. historian and geographer, was b. in the eleventh century, but the dates of his birth and death and definite particulars of his life are unknown. In 1068 he was made canon of Bremen cathedral under Archbishop Adalbert (q.v.), and prin. of the cathedral school. In the years 1072-76 he was engaged in writing the *Gesta Hammaburgensis Ecclesie Pontificum*, his hist. of Hamburg and the spread of Christianity in the N.; the best ed. of this book is by Lappenberg, 1876. He d. on Oct. 12, probably in 1076.

**Adam** (sculptors), a famous Fr. family of sculptors, comprising Jacob Sigisbert A. (1670-1747), an executor of religious subjects, and his 3 sons, all natives of Nancy. Lambert Sigisbert (1700-59) went to Paris in 1719, and after 4 years' study gained the *prix de Rome*. At the command of Pope Clement XII. he executed a design of the Virgin appearing to St. Andrew Corsini, and became subsequently academicien of St. Luke. His other great works are 'La Seine et la Marne,' at St. Cloud; 'Neptune et Amphitrite,' 1740, at Versailles; 'Vénus au bain,' 1742, for the château de Choisy; and 2 marble groups, 'La Chasse' and 'La Pêche,' now at Potsdam. He pub. in 1754 a *Recueil de sculptures antiques grecques et romaines*. Nicolas Sébastien (1705-78) went to Rome with his brother, and was elected academicien for his 'Prométhée déchiré par un vautour,' 1762, now in

the Louvre. Other works are 'Le Martyre de Saint Victor', 1743, and the tomb of Catherine Opallinska, 1749, at Nancy. François Balthazar Gaspard (1710-61) also obtained the *prix de Rome*, and afterwards lived in Berlin as sculptor to the king of Prussia from 1747 to 1750. His works were of mythological subjects, such as 'Apollon', 1748, and 'Diane au bain', 1750. All 4 d. in Paris.

**Adamant** (Gk. *adámas*, unbreakable), now used only poetically for a hard substance, was formerly synonymous with a diamond, and also by false etymology connected with the lodestone.

**Adamantine Spar**, or **Corundum**, an aluminium oxide, the mineral substance ranking second to the diamond in hardness, is found in various coloured and colourless forms. Some coloured varieties used as gems are the sapphire, oriental ruby, oriental topaz, oriental amethyst, oriental emerald, while emery is a dull granular specimen. It is found in China, India, Canada, and some parts of Europe.

**Adamawa**, or **Fumbina** region, W. Africa, lying partly in Nigeria and partly in the Cameroons. It is included in the N. areas of the mandated ter. of the Cameroons. It has a good climate and, apart from the scrub-lands, a fertile soil rich in many tropical products, but it is mainly a cattle-rearing country. The N. part of A. is traversed by sev. trade routes connecting Bornu and Dikwa with Yola and Garua. Over these routes go the natron and black salt from the N. to Benue, and in addition to this through traffic, is carried a large tonnage of ground nuts and locally woven textiles. Iron ore is smelted in the country. It is watered by the Benue Riv., a trib. of the Niger. Exports hides and skins, ground nuts and shea nuts. It is named after a chief Adama, who founded the Yola emirate. The chief tn. is Yola (Brit.), and other tns. are Nauman and Jalingo (Brit.) and Garua, Ngaundéré, and Lame (Fr.). Pop. 400,000.

**Adamites**, the name of a Gnostic sect of the second century in Africa, who sought to re-establish the innocent state of man at the time of the creation, going naked and rejecting marriage. The doctrine was prevalent among some of the Beghards or Brethren of the Free Spirit in the fourteenth century, and a similar sect appeared in Bohemia and Moravia in the fifteenth century. They were massacred by Ziska in 1421.

**Adamnan**, or **Adomnan**, famous as the author of the *Life of St. Columba*, was b. about 623, of a race called Hy-Neill, in Ulster. He received his education at the monastery of Clonard. In 679 he was appointed abbot of the Columban brotherhood at Iona. While visiting his pupil Aldfrid, King of Northumbria, he became converted by the Venerable Bede to an acceptance of the Rom. observances at Easter, and to the adoption of the regulation tonsure. He endeavoured to inculcate the same change of view among the brotherhood,

but failed, although some success attended similar efforts in Ireland. In 704 he d. Among his works is a Lat. discourse entitled *On the Holy Places*. Another work is *Adamnan's Vision*. The work that stands out as the most significant, both in its value in literature and for its enlightenment, is his *Biography of St. Columba*. The best ed. is by Dr. Reeves, for the Bannatyne Society, 1874.

**Adams, Charles Francis** (1807-86), Amer. diplomatist, son of John Quincy A. (q.v.), b. at Boston, Massachusetts. Studied diplomacy under his father at an early age in Russia and England, and returning to Harvard graduated in 1825. Studied law, and sat in the Massachusetts House of Representatives and Senate. Sat as a Republican in Congress; was appointed minister to Great Britain in 1862. He opposed the sailing of the *Alabama*, and succeeded in influencing Lord John Russell in stopping the *Alexandra* and 2 ironclads intended for the Confederate states. He left England in 1868 and sat at the Geneva Conference (1871-72). He ed. the works of John A. (1850-56) and the memoirs of John Quincy A. (1874-77). See *Life* by his son, C. F. Adams, jr., 1900.

**Adams, Charles Francis** (b. 1866), great-great-grandson of John A., second president of the U.S.A. Educated at Harvard, and then practised law. Mayor of his native city 1896-97. Treasurer Harvard Univ. Corporation 1895-1929. Was amateur navigator on the yacht *Resolute* when it won international yacht races 1920. Appointed by President Hoover to Cabinet post of secretary of the navy, 1929. Was one of the Amer. delegates to the London Naval Conference in Jan.-Mar. 1930.

**Adams, Clement** (c. 1519-37), author and schoolmaster, was b. in Warwickshire, educated at Eton and Cambridge. He pub. an account of Richard Chancellor's voyage to Russia in his *Anglorum Navigatio ad Moscovitas*, 1599, the first Eng. venture into that country.

**Adams, Francis** (1796-1861), an Aberdeenshire physician and classical scholar. His chief publications are: *Hermes Philologus*, 1826; translations of Paulus Aegineta, 1844-47, Hippocrates, 1849, and Aretaeus, 1856.

**Adams, Henry Brooks** (1838-1918), Amer. historian, grandson of sixth president of the U.S.A.; b. Boston. Graduated Harvard, 1858. Travelled in Europe 1858-60; in England 1861-68 as secretary to his father, Chas. Francis A., the Amer. minister. His *History of the United States from 1801 to 1817* (pub. 1889-90) is a standard treatise. Wrote, besides many essays and studies, *Life of George Cabot Lodge* (1911), and an autobiography called *The Education of Henry Adams* (1918). D. at Washington.

**Adams, John** (1735-1826), second president of the U.S.A., was b. at Quincy, Norfolk co., Massachusetts. Educated at Harvard (1755), he was called to the bar in 1758. He was one of the Massachusetts representatives in the Congress in 1774, and a promoter of the

Declaration of Independence, 1776. He became ambas. to Holland, 1782; to Great Britain, 1785; President of the U.S.A., 1797-1801. He pub. a *Defence of the Constitution of the U.S.* in 1787. See also *UNITED STATES, History*. See bibliography to *Works*, ed. by C. T. Adams, 1850-56; *Letters of Abigail and John Adams*, 1840-41; *Familiar Letters of J. Adams to his Wife*, 1870; M. Chamberlain's *John Adams*, 1898; J. T. Morse's *John Adams*, 1885.

Adams, John Couch (1819-92), astronomer, was b. near Launceston. He and Leverrier share the honour of having discovered Neptune in 1846 after noting the irregularities in the motion of Uranus. In 1860 he was appointed prof. of astronomy at Cambridge.

Adams, John Quincy (1767-1848), sixth president of the U.S.A. and eldest son of John A. (q.v.), second president, was b. at Quincy, Norfolk co., Massachusetts. He studied diplomacy in Europe under his father in 1778; returning to America he graduated at Harvard, 1787. He became ambas. at The Hague, 1794; to Prussia, 1797; to Russia, 1809; in London, 1815; secretary of state of the U.S.A., 1817; President, 1825-29; defeated by Jackson in 1829, he returned to Congress in 1830. See *Memoirs of J. Q. Adams*, ed. by C. F. Adams, 1874-77; *J. Q. Adams*, by J. T. Morse, 1883; *The Adams Family*, by Jas. Thurlow Adams, 1930. See also *UNITED STATES, History*.

Adams, Maude (b. 1872), b. in Salt Lake City, Utah. Her mother being an actress in a stock company, Maude began playing child parts at a very tender age, becoming in her young womanhood one of America's favourite actresses. Created for the first time in America many of the star parts in plays by Barrie and Edmond Rostand. Was an intimate friend of Sir James Matthew Barrie.

Adams, Samuel (1722-1803), an Amer. statesman, was b. at Boston, Massachusetts, U.S.A., and graduated at Harvard College, 1740. He took the popular side in the disturbances caused by the Stamp Act, 1765, and in the same year was made a member of the legislature of Massachusetts. He signed the Declaration of Independence, 1776, became lieutenant-governor, 1789-94, and governor until 1797, of Massachusetts. He devoted his life to the cause of the independence of America, and wrote political essays. He was called the American Cato.

Adams, Thomas, a Puritan preacher who fl. from 1612 to 1653, was called by Southey 'the prose Shakespeare of Puritan theologians'. He wrote sermons and theological works, and from 1612 to 1623 held the positions of preacher at Willington, Bedfordshire, vicar of Wingrave, Buckinghamshire, and preacher at St. Gregory's under St. Paul's Cathedral.

Adams, William (1576-1620), an Eng. navigator, was b. at Gillingham, near Chatham, and was apprenticed as a sailor when 12 years old. He became pilot-major to a fleet from Rotterdam

which, though bound for India, reached Japan, where A. lived until his death, becoming second in command of an Eng. settlement founded 1613, and making voyages to Siam and Cochin China.

Adams, t.n., Berkshire co., Massachusetts, U.S.A.; manufs. cotton, wool, and paper. Pop. 12,700.

Adam's Apple. 1. In common parlance, the boss or projection caused by the thyroid cartilage of the larynx, chiefly marked in the male. 2. In botany, is the *Citrus limetta*, or sweet lime, a pale yellow, roundish fruit with a boss at the point. Its name, *pomo d'Adamo*, was given by the Italians, who thought the depressions on the surface resembled the mark of Adam's teeth. It belongs to the Rutaceæ, the orange and lemon family.

Adam's Bridge, Indian Ocean, is a chain of sand-banks which with the is. of Manaar and Rameswaram extend from Ceylon to the S. coast of India. It has sev. navigable channels for small boats. In the *Ramayana* it is said to have been constructed by the monkey-god Hanuman for the passage of Rama from Madras to Ceylon.

Adam's Needle, see YUCCA.

Adam's Peak, the highest point of Ceylon, is 7420 ft. high. It obtains its name from the popular Mohammedan belief that Adam's penance took place here after his expulsion from Eden.

Adamson, John (d. 1653), was prin. of Edinburgh Univ., 1625-53; prof. of philosophy at St. Andrews Univ., and prof. at Edinburgh, 1589-1604. He became vicar of N. Berwick and of Liberton; ed. *The Muses' Welcome to James VI.* on his return to Scotland, 1617, and was the author of sev. poems and theses.

Adamson, Patrik (1537-92), a Scottish prelate, was b. at Perth, graduated M.A. at St. Andrews, 1558, and became minister of Ceres in Fife, 1563. In 1566 he went to France, returning about 1572, when he became minister of Paisley, chaplain to the regent, and archbishop of St. Andrews, 1576. He came into conflict with the Church, was sent as ambas. to Elizabeth by James VI., 1583, was charged with heresy and excommunicated, 1585. He was afterwards pardoned, but again excommunicated, 1588. He was the author of many theological works in Lat., both prose and verse.

Adamson, Robert (1852-1902), was prof. of philosophy at Manchester, 1876, and of logic at Aberdeen, 1893, and Glasgow, 1895. Among his works on philosophical subjects are: *Roger Bacon: The Philosophy of Science in the Middle Ages*, 1876; *On the Philosophy of Kant*, 1879; and *The Philosophy of Fichte*, 1881.

Adamson, Thomas, a master-gunner, wrote *England's Defence, a Treatise concerning Invasion*, 1680.

Adana (Seyhan), a vilayet (pop. 383,700) and city in Turkey. The city is situated on the Sihoon about 30 m. from the coast of the Mediterranean. It exports wool, cotton, and grain, and is a railway station. Pop. 76,500.

**Adanson, Michel** (1727-1806), a Fr. naturalist, was b. at Aix, and d. at Paris. He was destined for the Church, but gave up the study for that of natural hist. In 1748 he went to Senegal, where he made collections in every branch of natural hist. His *Natural History of Senegal* was pub. in 1757; he became a member of the Academy of Science, 1759; and his *Families of Plants* appeared 1763. He then commenced to compile an *Encyclopædia of Natural History*, but was reduced to misery and poverty during the Fr. Revolution. He was, however, invited to become a member of the Institute of France, and received a small pension from the Fr. Gov.

**Adansonia**, see BAOBAB.

**Adapis**, a mammiferous fossil found in the plaster-of-Paris quarries of Montmartre, given this name by Cuvier. The bones are incomplete, the dentition is reduced, and the animals, which belonged to a family of extinct lemurs, were about the size of a rabbit.

**Adaptation** (Lat. *adaptare*, to fit to), the process of acquiring a fitness for new circumstances or new purposes. In literature and music, the term is used to denote the modification of some form of art to allow or its suitable expression in another form. Thus we speak of the A. of a play from a novel; or of a poem to music, where certain stanzas are omitted to suit the considerations of length usually called for in a song.

In biology, A. means the variations in the structures of animals occasioned by the necessity for continuing to live or procreate under somewhat altered circumstances. The term is sometimes carelessly used as if it meant a kind of conscious striving after fitness, but when we say that a frog is adapted to its surroundings, we simply mean that it cannot live the life, say, of a cod-fish. In the process of evolution of a species, variation in characteristics occurs in 2 ways. First, there is the influence of heredity, which tends to perpetuate certain characteristics, perhaps in the direction of the parent away from the type, or as reverting to the type away from the parent. If the direction taken is one that leads to survival, the animal lives to carry on what is perhaps a long process of A. But every individual has a certain power of reacting to its environment, and tends to alter itself in its own life-hist. If the variation achieves the object of survival, it may be called an A. Thus we may say that every distinctive characteristic originated in an A., even when it is being slowly modified in the direction of extinction, for such modification is the response to the demand for an economy in which all that is useless must be abandoned.

**Adar**, the last month of the Heb. year, corresponding to our Feb. **Veadar** (lit. 'and Adar') was the intercalary month introduced into 7 of the cycle of 19 years.

**Adda** (Rom. *Addua*), a riv. in Lombardy, rises in the Rhaetian Alps, near Bormio, enters Lake Como, traverses the plain of Lombardy, and flows into the

Po about 8 m. above Cremona. Length, 182 m.

**Addams, Jane** (1860-1935), Amer. sociologist, b. at Cedarville, Illinois. Studied economic questions in Europe and America; in 1889 she helped to found in Chicago Hull House, a social settlement. She shared the Nobel peace prize in 1931, having done much to relieve post-war distress in Europe. (See her work, *Twenty Years at Hull House*, 1910.) For 3 years she held the post of inspector of streets and alleys. See *Democracy and Social Ethics* (1902); *New Ideals of Peace* (1907); *The Spirit of Youth and the City Streets* (1909).

**Addax**, a genus of antelopes belonging to the Hippotraginae and allied to the oryx, found in N. Africa and Arabia. The *A. nasomaculatus* is a large animal with a white band round its muzzle, called by the Arabs *Abou-Addas* and by Pliny *Strepsiceros* on account of its twisted horns.

**Adder** (A.-S. *nædre*, serpent), a name applied to sev. poisonous snakes of the Viperidae and to some non-poisonous Colubridae. *Vipera* (or *Felias*) *Berus*, the European A., attains a length of 28 in., and its bite is seldom fatal. Wycliffe applies the term to the serpent in the Garden of Eden.

**Adder's Tongue**, the popular name for the fern *Ophioglossum vulgatum*, which belongs to the Ophioglossaceae and is found in Britain. It develops only 1 leaf each year, and reproduces vegetatively by means of buds on the root.

**Addington, Henry**, see SIDMOUTH, VIS-COUNT.

**Addis Ababa**, or **Addis Abeba**, a tn. of Shoa and cap. of Abyssinia, containing the palace of the wife of Menelik, who here signed a treaty with Italy on Oct. 26, 1896. Bombed and taken by the It. in Apr. 1936, when the emperor's palace was sacked and the tn. given over to a pillaging mob. Pop. (estimated) 100,000.

**Addiscombe**, a district of Croydon, Surrey, contained the college for cadets of the E. India Company, in which were trained sev. notable men, among others Sir Henry Lawrence, Lord Napier, and Lord Roberts. Pop. 14,000.

**Addison, Christopher**, first Baron (b. 1869). Brit. politician and medical prof. After a period as medical prof. at Sheffield he was elected Liberal member for Hoxton, 1910, becoming first parl. secretary to the Board of Education and then minister of munitions. Minister for health, 1919-21, when he inaugurated the medical panel in the National Health Insurance scheme and organised the Coalition Gov.'s housing scheme. He resigned during disputes over the latter scheme and joined the Labour party. M.P. for Swindon 1929, but was defeated in 1931. Minister of agriculture and fisheries, 1930-31; re-elected 1934 but again defeated in 1935. Raised to the peerage in 1937. Ex-chairman of Marketing Re-organisation Commission. Secretary of state for dominion affairs, 1945-47. Lord Privy Seal and leader of the House of Lords, 1947.

**Addison, Joseph** (1672-1719), essayist, poet, and statesman, was b. May 1, 1672, at Milston rectory, near Amesbury, Wiltshire, the son of Lancelot A., who was dean of Lichfield, 1683. He was educated at Amesbury, Lichfield, and Charterhouse, where he was a fellow pupil with Richard Steele. At the age of 15 he went to Queen's College, Oxford; but 2 years later he obtained a scholarship and went to Magdalen College, where he obtained a demyship, 1689, and his M.A. degree, 1693. His facility in writing Lat. verse first brought him into notice, and his verses addressed, in 1694, to Dryden procured him the friendship and interest of that distinguished poet. He became acquainted with Lord Somers and Mr. Montagu, afterwards Lord Halifax, and it was through the influence of the former that he obtained, in 1699, a pension of £300 to enable him to travel on the Continent to qualify for diplomatic service. On the death of William III. he lost his pension, and returned to England late in 1703. In 1704, after living for some time in London in a state of poverty, he was appointed by the Gov. to write a poem to celebrate the victory of Blenheim. This poem, entitled *The Campaign*, was so successful that he was appointed a commissioner of appeals, and held sev. appointments, 1704-10. He became under-secretary of state, 1706, accompanied Halifax to Hanover, 1707, and was appointed secretary to Lord Wharton, lord-leutenant of Ireland, 1708. In 1709 Steele began the *Tatler*, and A. soon became a contributor, taking a leading part in its production. The first number of the *Spectator* appeared 1711, and it was continued until Dec. 1712 by A. and Steele. Then followed the *Guardian*, the first number of which was pub. in Mar., and the 175th and last in Oct. 1713; Steele was the editor, and A. a contributor. In the same year A. brought out his celebrated tragedy of *Cato*, which procured for him still greater fame than any of his former productions had done. In June 1714 appeared the first number of a continuation of the *Spectator*, to which A. contributed until its termination in Dec. 1714. His prose comedy *The Drummer* was pub. 1715, but it was not a success. He then commenced a periodical publication in support of the Gov. under the title of the *Freeholder*. It consisted of 2 papers a week, and was continued until June 1716. In the same year he married the dowager Countess of Warwick, and was appointed secretary of state, 1717. However, he retired from office, 1718, on the ground of ill health, but really in consequence of his entire inaptitude for debate in parliament, and for the ordinary business of his office. His health soon began to fail, his domestic life was not happy, and he d. at Holland House, Kensington, June 17, 1719.

As a poet and dramatist A. formerly held a much higher place than he now does; his greatness lies in the fact that he is one of the most famous of all Eng.

essayists. His style is easy, polished, and graceful, and his essays are characterised by a delicate sense of propriety, a lively fancy, and a most original and exquisite humour. He was the founder of a new school of popular writing, and his works had the object of raising the manners and standard of life of the people, and of forming a good taste and sound opinion. Although many have attempted to imitate him, none have surpassed him, and his contributions to the *Tatler*, *Spectator*, and *Guardian* are both amusing and instructive, and suited alike to the gay and the serious. In character he was supposed to have been somewhat cool; nevertheless he was kind and magnanimous; and the ease and grace of his manners and conversation made him both popular and admired.

Eds. of works are: Tickell's, 4 vols., 1721; Baskerville's 4 vols., 1761; Hurd's, 6 vols., 1811, reissued in Bohn's Brit. Classics, 1856; Greene's, 1856; Dent's *Spectator*, 1907. Lives in *Biographia Britannica*, *Dict. of Nat. Biog.*, Johnson's *Lives of the Poets*, by Lucy Aikin (1843), W. J. Courthope (1884), and by B. Dobree, *Essays in Biography*, 1925; Macaulay's *Essay*; Drake's *Essays Illustrative of Tatler, Guardian, and Spectator*; Pope's and Swift's *Correspondence*, etc.

**Addison's Disease**, a constitutional disease characterised by degeneration of the suprarenal capsules, discoloration of the skin, and progressive anaemia and asthenia.

It was discovered by Thomas Addison of Guy's Hospital, who described it in 1855 in his book, *The Constitutional and Local Effects of Disease of the Suprarenal Capsules*.

The suprarenal capsule is a small triangular organ situated above the kidney; its function is doubtful, but it is believed to have some relation to pigment production, owing to the peculiar influence of the disease on the coloration of the skin. A substance whose active principle is adrenalin is secreted by the glands, and it is thought that the perversion or inadequacy of this substance is the cause of the disease.

The most marked symptom is the gradual bronzing of the skin, particularly where pressure is customarily brought to bear on the body, as by garters, braces, etc. The discoloration is not conclusive evidence, for it may be due to one of many other causes; but progressive asthenia, lowered blood pressure, unaccountable vomiting and diarrhoea, and mental weakness are confirmatory symptoms. The disease usually lasts about a year, and death has occurred in the majority of cases. Some hope has been raised that the administration of the extract of the suprarenal glands may effect a cure, many cases having been notified where great improvement in general vigour has followed upon that treatment.

**Addison's Walk**, in Magdalen College grounds at Oxford, a walk which Addison is said to have frequented.

**Addition** (Lat. *addere*, to put to) is the

putting together of 2 or more magnitudes.

In arithmetic and algebra it is the first rule denoting the putting together or adding of sev. numbers or quantities of the same kind into 1 number or quantity, called the sum or total. The sign of this operation is +, pronounced plus, the Lat. for more. Thus 2+3 means the number 2 added to the number 3, and  $a+b$  means the quantity  $a$  added to the quantity  $b$ , and represents the sum of  $a$  and  $b$ .

**Addled Parliament.** The, the nickname of James I.'s second parliament, which sat in 1614, and did not pass a single Act. The king wished to obtain supplies without settling the question of imposts, but to this the members—among whom were Pym and Wentworth—would not agree, and James therefore dissolved it.

**Address, Forms of.** The form of A. to and between persons has lost much of the ceremony that characterised the custom a few generations ago. Many of the methods and terms used to-day would then have been serious breaches of etiquette, but are adopted now with a great freedom from the ceremony. The forms of A. should be as follow:

**Ambassador, British.**—Address: 'His Excellency (according to rank), H.B.M.'s Ambassador and Plenipotentiary,' then 'Sir,' or 'My Lord,' etc., according to status. In conversation use 'Your Excellency.' Respecting the ambas.'s wife, the form 'Your Excellency,' though not correct, is often used.

**Archbishop.**—His Grace the Lord Archbishop of —, My Lord Archbishop. Later references in the same communication, 'Your Grace.' In formal documents to the Archbishop of Canterbury the following is used: 'The Most Reverend Father in God, Geoffrey Francis Fisher, by Divine Providence Lord Archbishop of Canterbury, Primate of All England and Metropolitan.' To the Archbishop of York: 'The Most Reverend Father in God, Cyril, by Divine permission Lord Archbishop of York, Primate of England and Metropolitan.' Irish archbishops are 'The Most Reverend the Archbishop of —,' but if the archbishop is a temporal peer 'The Right Hon. and Most Rev. is used.

**Archdeacon.**—The Venerable the Archdeacon of —, Venerable Sir. Afterwards the same.

**Baron.**—The Right Hon. Lord —, or 'The Lord —, My Lord.' Refer to 'Your Lordship.'

**Baron's daughter.**—If unmarried, 'The Hon. (Christian name and surname).' If married, 'The Hon. Mrs. (husband's surname).' Begin 'Madam.' If married to a baronet or knight, 'The Hon. Lady (husband's surname).' Begin 'My Lady.' If married to a peer, or the son of a duke or marquess, A. accordingly.

**Baron's son.**—The Hon. (Christian and surname). Begin 'Sir.' In Scotland the eldest sons of Scottish peers are addressed, 'The Hon. the Master of (peerage title).'

**Baron's son's wife.**—The Hon. Mrs. (husband's surname). Begin 'Madam.' If the daughter of an earl, marquess, or duke, A. accordingly.

**Baroness, in own right or husband's.**—The Right Hon. the Baroness —, 'The Right Hon. Lady —,' or 'The Lady —,' Begin 'My Lady.' Refer to 'Your Ladyship.'

**Baronet.**—Sir (Christian name and surname), Bart. Begin 'Sir.'

**Baronet's wife.**—Lady (surname). Begin 'Madam.' Reference 'Your Ladyship.'

**Bishop, abroad.**—See Bishop, Scottish. **Bishop, English.**—The Right Rev. the Lord Bishop of London, or 'The Lord Bishop of London.' Commence 'My Lord Bishop.' Refer to as 'Your Lordship.' A bishop is addressed in formal documents as 'The Right Rev. Father in God, Arthur, by Divine permission Lord Bishop of London.'

**Bishop, Irish, consecrated before 1868.**—As Eng. Bishop.

**Bishop, Irish.**—'The Right Rev. the Bishop of Ossory,' or referring to the Bishops of Meath and Tuam, 'The Most Rev.' Commence 'Right Rev. Sir,' or 'Most Rev. Sir.'

**Bishop, retired.**—The Right Rev. Bishop —, or 'The Right Rev. —, D.D.' Begin 'Right Rev. Sir.'

**Bishop, Scottish.**—The Right Rev. the Bishop of St. Andrews, Dunkeld, and Dunblane, 'The Bishop Primus is usually addressed, 'The Right Rev. the Primus.'

**Bishop, Suffragan.**—The Right Rev. the Bishop Suffragan of Bedford. Commence 'Right Rev. Sir.'

**Clergy.**—The Rev. (Christian and surname). Begin 'Rev. Sir.' If the son of a duke or marquess, 'The Rev. Lord.' If the son of a viscount or baron, 'The Rev. the Hon. (Christian name and surname).'

**Companion of an order of Knighthood.**—The ordinary form is used with the addition of the initials C.B., C.M.G., C.I.E., as the case may be.

**Consul, British.**— —, Esq., 'H.B.M.'s Agent and Consul-General,' or 'Consul-General,' or 'Consul,' or 'Vice-Consul,' according to rank.

**Countess.**—The Right Hon. the Countess of —, Commence 'Madam.' Refer to as 'Your Ladyship.'

**Dean.**—The Very Rev. the Dean of —, Begin 'Very Rev. Sir.'

**Doctor.**—The ordinary form of A. is used with the addition of the initials D.D., M.D., LL.D., Mus.D., etc.

**Dowager.**—The widow of the holder of a peerage becomes a dowager on the marriage of her son. She is addressed as 'The Dowager Lady —.' The same title can be held by more than one person, hence the term is used less frequently today, and an alternative form, e.g. 'The Right Hon. Helen, the Countess of —,' is used, distinction being made by the use of the Christian name.

**Duchess.**—Her Grace the Duchess of —, Begin 'My Dear Madam.' Refer to as 'Your Grace.'

*Duke.*—‘His Grace the Duke of —.’ Commence ‘My Lord Duke.’ Further reference, ‘Your Grace.’

*Duke's daughter.*—‘The Right Hon. Lady (Christian name and surname),’ or ‘The Lady (Christian name and surname).’ Commence ‘Madam.’ A. later as ‘Your Ladyship.’ If married to a peer, A. in husband's rank.

*Duke's eldest son and his children.*—The courtesy title is treated as if it were an actual peerage. The eldest son takes the grandfather's third title and is addressed as a peer.

*Duke's eldest son's wife.*—As if she were the wife of an actual peer.

*Duke's younger son.*—‘The Right Hon. Lord (Christian name and surname).’ Commence ‘My Lord.’ Refer later to as ‘Your Lordship.’

*Duke's younger son's wife.*—‘The Right Hon. Lady,’ or ‘The Lady (husband's Christian name and surname).’ Commence ‘Madam.’ Later refer to as ‘Your Ladyship.’

*Earl.*—‘The Right Hon. the Earl of —,’ or ‘The Earl of —.’ Commence ‘My Lord.’ Refer later to as ‘Your Lordship.’

*Earl's daughter.*—See Duke's daughter.  
*Earl's eldest son, and eldest son's wife.*—Regard the title, which is by courtesy, as an actual peerage.

*Earl's younger son and his wife.*—See Baron's son and his wife.

*Governor-General of Dominion or Colony, Governor of Colony.*—‘His Excellency the Governor-General (or Governor) of —.’ Rank will determine the beginning. Refer as ‘Your Excellency.’

*Judge, English or Irish.*—‘The Hon. Sir —,’ if a knight, or ‘The Hon. Mr. Justice —.’ Commence with ‘Sir.’ He is only addressed as ‘Your Lordship’ on the bench.

*Judge of County Court.*—‘His Honour Judge —.’ Refer to, when on bench, as ‘Your Honour.’

*Judges, Scottish.*—Same as Lord of Session.

*Justice of Peace, in England only.*—When on bench only use ‘Your Worship.’

*King.*—‘The King's Most Excellent Majesty.’ Commence ‘Sir,’ or ‘May it please Your Majesty,’ or in the case of a Lord, ‘Lord —’ presents his duty to Your Majesty.’ Reference, ‘Your Majesty.’  
*King's Counsel.*—Ordinary A. with K.C. added.

*Knight Bachelor.*—Same as Baronet with Bart. omitted.

*Knight of the Bath, of St. Michael and St. George, or of the Star of India.*—‘Sir (Christian name and surname),’ with the initials G.C.B., K.C.B., K.M.G., or K.S.I., according to designation. Commence ‘Sir.’

*Knight of the Garter, or of the Thistle, or of St. Patrick.*—Ordinary Knight A. with initials K.G., K.T., or K.P. added.

*Knight's wife.*—See Baronet's wife.

*Lord Advocate of Scotland.*—‘The Right Hon. the Lord Advocate.’ Begin ‘My Lord.’

*Lord Chancellor.*—‘The Right Hon. the Lord High Chancellor.’ Rank will determine beginning.

*Lord Chief Justice.*—‘The Right Hon. the Lord Chief Justice of England.’ If a peer commence according to status, otherwise, same as Judge.

*Lord High Commissioner to the General Assembly.*—‘His Grace the Lord High Commissioner.’ Commence according to peerage rank. Reference, ‘Your Grace.’

*Lord Justice-Clerk.*—‘The Right Hon. the Lord Justice-Clerk.’ Commence ‘My Lord,’ and refer to ‘Your Lordship.’

*Lord Justice-General of Scotland.*—‘The Right Hon. the Lord Justice-General.’ Begin with ‘My Lord,’ and refer to ‘Your Lordship.’

*Lord Justice of Appeal.*—‘The Right Hon. the Lord Justice —,’ or ‘The Right Hon. Sir —.’ Begin and refer to as for Judge.

*Lord Mayor of London, York, or Dublin.*—‘The Right Hon. the Lord Mayor of London,’ or ‘The Right Hon. —,’ Lord Mayor of London.’ Commence ‘My Lord,’ and refer to ‘Your Lordship.’

*Lord Mayor's wife.*—‘The Right Hon. the Lady Mayoress of —.’ Commence ‘Madam.’ Refer to ‘Your Ladyship.’

*Lord of Appeal in Ordinary and wife.*—See Baron and Baroness. (Children do not take any title.)

*Lord of Session in Scotland.*—‘The Hon. Lord —.’ Commence with ‘My Lord,’ and refer later to ‘Your Lordship.’ The wife has no title.

*Lord Provost.*—‘The Right Hon. the Lord Provost of Edinburgh,’ ‘The Hon. the Lord Provost of Glasgow,’ ‘The Lord Provost of Aberdeen or of Perth.’ Commence with ‘My Lord Provost,’ or ‘My Lord.’ Refer to ‘Your Lordship.’ Wife has no title.

*Maid of Honour.*—‘The Hon. Miss —.’ Commence ‘Madam.’

*Marchioness.*—‘The Most Hon. the Marchioness of —.’ Commence ‘Madam.’ Refer to ‘Your Ladyship.’

*Marquess.*—‘The Most Hon. the Marquess of —.’ Commence ‘My Lord Marquess.’ Refer to ‘Your Lordship.’

*Marquess's daughter.*—See Duke's daughter.

*Marquess's eldest son.*—See Duke's eldest son.

*Marquess's younger son.*—See Duke's younger son.

*Mayor.*—‘The Right Worshipful the Mayor of —.’ Begin ‘Sir.’ Refer to ‘Your Worship.’

*Member of Parliament.*—M.P. is added to the usual form of A.

*Minister Resident.*—Esq. (or according to rank), H.B.M.'s Minister Resident.

*Officers in the Army and Navy.*—The professional is prefixed to any other rank, e.g. ‘Admiral the Right Hon. the Earl of —,’ ‘Lieut.-Col. Sir —,’ ‘K.C.B.’ Officers below captain in the Army or commander in the Navy are usually addressed by their civil rank with the initials of their corps, e.g. R.A., R.E., added.

*Premier.*—According to rank.

*Prince.*—‘His Royal Highness the Duke of —,’ if a duke. Otherwise

'His Royal Highness Prince (Christian name).' In both cases commence 'Sir.' Refer to 'Your Royal Highness'

*Princess.*—If a duchess 'Her Royal Highness the Duchess of \_\_\_\_.' Otherwise 'Her Royal Highness the Princess (Christian name).' Commence 'Madam,' and refer to 'Your Royal Highness.'

*Principal of a Scottish Univ.*—If a clergyman 'The Very Rev. the Principal of \_\_\_\_,' or 'The Very Rev. Principal (surname).'

Correspondence between equals loses much of its formality, e.g. 'My dear Lord,' Persons of no superior rank usually adopt 'Sir,' 'Dear Sir,' or 'My dear Sir,' according to the degree of familiarity existing between them. To a firm 'Gentlemen' or 'Sirs' is usually the form.

In the U.S.A., the President, Governors, and all Ambassadors are addressed as 'His Excellency.' The Vice-President, heads of Executive Depts., Justices of the

Fox Photos

#### ADELAIDE: NORTH TERRACE EAST

On the left is the national war memorial, the three buildings to the right are the circulating and public libraries and the museum.

*Privy Councillor*—'The Right Hon.' followed by name and title. Rank will determine beginning and reference.

*Queen.*—'The Queen's Most Excellent Majesty.' Commence 'Madam' or 'May it please Your Majesty.' Otherwise, 'Lord \_\_\_\_ presents his duty to Your Majesty.' Reference 'Your Majesty.'

*Recorder.*—'Sir,' 'Your Worship,' 'The Worshipful' (London only), 'Right Worshipful.'

*Secretary of State.*—'His Majesty's Principal Secretary of State for the \_\_\_\_ Department.'

*Sheriff of London*—'The Right Worshipful.'

*Viscount.*—'The Right Hon. the Lord Viscount \_\_\_\_,' Commence 'My Lord.' Refer to 'Your Lordship.'

*Viscountess.*—'The Right Hon. the Viscountess \_\_\_\_,' or 'The Viscountess \_\_\_\_.' Begin 'Madam.' Refer to 'Your Ladyship.'

*Viscount's daughter, son, and son's wife.*—See Baron's daughter, son, and son's wife.

Superior Courts, Mayors of towns, Senators, Congressmen, Consuls, and Lieutenant-Governors, and heads of State depts. are addressed as 'The Hon.'

Adelae, Curt Siwertsen (1822-75), a Dutch admiral of Norwegian birth, who assisted Venice against the Turks, and was so successful in many naval battles that Frederick III., king of Denmark, made him admiral of the Dan. fleet, 1863, and gave him the title of Curt. He became admiral-general, and was in command of the Danish fleet in the war against Sweden, when he died suddenly.

Adelaide, the cap. of S. Australia, on the Torrens R., 7 m. by rail from Port Adelaide on the gulf of St. Vincent. It was founded in 1837, and named after the queen of William IV.; and owing to the discovery of gold soon became an important city. It is situated on a large plain, bounded on the S. and E. by the Mt. Lofty Range, and is the one Australian city planned at the outset with some coherent regard for principles. There are no slums. Modelled on the Gk. ideal,

A. is commonly named 'the Athens of the S.' Admirable foresight was shown in the laying out of the city, which is square in form and divided by the R. Torrens into 2 parts, the N. being the residential, the S. the business centre; the suburban area, however, has expanded considerably all around the city. The belt of park lands encircling the city, preserved in the original plans, has been maintained and now provides A. with one of its notable charms. Bridges communicate between the N. and S. parts, and the

public buildings are those of the univ., which plays a large part in the cultural life of the city and the state; the Anglican cathedral of St. Peter's; and the Rom. Catholic cathedral. The botanic gardens and park and zoological gardens are 120 ac. in extent. A. is connected by rail with Sydney, Melbourne, Perth, Brisbane, and other important tns. and is the terminus of the overland telegraph from Port Darwin. There are also trolley and motor buses, and the tramway systems' metropolitan and suburban routes

Belford Lemaire

ADELPHI TERRACE (OLD)

streets are wide and well paved. The chief business dists. are Rundle and Hindley, Currie and Grenfell Streets, while King William Street, about a m. long, is one of the finest traffic avenues in Australia. Four roadways facing the cardinal points of the compass, known as North, South, East, and West Terraces, are in the S. part. The classic *pièce de résistance*, approached from the new railway station, is North Terrace, which is planned like a Parisian boulevard with lawns and flower-beds. Here are situated the museum, art gallery, parliament house (built of S. Australian marble), Gov. House, the hospital, and the leading clubs. A. is rich in marble statues. The national war memorial of marble, very large in scale, representing the Prologue and Epilogue of War, stands in front of Gov. House. A bronze equestrian statue at the corner of King William Street commemorates the S. Australians who fell in the S. African war. There is also a bronze in Creswell Garden near the A. Oval to the memory of Sir Ross Smith, K.B.E., M.C., the aviator. Other notable

cover 149 m. of single track. The water supply is good and is obtained from the catchment areas of the Onkaparinga and Torrens, and is stored in 5 reservoirs. A. is the emporium for S. Australia, exporting through Port A. wool, wheat, flour, and silver and copper ore. There are hardware, sheet-metal, and motor body building works. Pop. 370,000.

Adelaide, Queen (1792-1849), the eldest daughter of George, Duke of Saxe-Meiningen; married William, Duke of Clarence, 1818 (afterwards William IV. of England). She helped to raise the standard of life at court. See M. Hopkirk, *Queen Adelaide*, 1946.

Adelard, Eng. philosopher of twelfth century and one of the greatest savants of medieval times. His *De Eodem et Diverso* (On Identity and Differences), in which he represents philosophy and the world as being in conflict for the soul of man, establish him as the founder of the doctrine of indifference, according to which genus and species retain their identity in the individual.

**Adeler, Max** (Charles Heber Clark) (1841-1915), an Amer. author and journalist, on the editorial staff of the *Evening Bulletin*, Philadelphia, and ed. the *Manufacturer*. Among his works—mostly humorous—are: *Out of the Hurly-Burly*, which procured him world-wide fame in 1874; *Elbow-Room*, 1876; *Random Shots*, 1879; *An Old Fogey*, 1881; *Fortunate Island*; *Captain Bluit*, 1901; *In Happy Hollow*; and *The Quakeress*, 1905. Though in literature the most irresponsible of jesters, he was a very serious politician—a high tariff protectionist.

**Adelie Land**, a portion of Antarctica, or piece of coastal land in what is known as the Victoria quadrant of the Antarctic continent. It lies on long. 140 E. and, according to the principle on which land in Antarctica is allocated among different claimants, would no doubt extend southward indefinitely. It was first visited by Dumont d'Urville (q.v.) in 1840, Charles Wilkes (q.v.) landing on the same coast in the same year. It is now a dependency of the Fr. colony, Réunion.

**Adelphi**, a London purlieu in the neighbourhood of Charing Cross. A Terrace, one of the thoroughfares, for long remained partly a residential quarter, owing its popularity to the fine view of the Thames. George Bernard Shaw resided there for some years. A street in the dist. was named after each of the four brothers Adam (see ADAM, ROBERT), the founders of the Adam style of architecture; but the former William Street is now Durham Street. Many of the Adams' buildings, including the terrace, were demolished in 1936 under a reconstruction scheme.

**Adelsberg**, a tn. in Carniola, Yugoslavia, situated to the N.E. of Trieste. It is famous for the caves in the neighbourhood. The chief, the A. Cave, about 8000 ft. long, consists of sev. grottoes with enormous stalactites. The R. Poik, or Puika, flows through the cavern, forms sev. cascades, and disappears through a fissure in the rock. In parts of this riv. the tailed amphibian *Proteus* is found. Pop. commune, 7090.

**Adelung, Johann Christoph** (1732-1806), a celebrated Ger. linguist and grammarian, was b. at Spantekon, Pomerania, and d. at Dresden. He devoted his time to translation work, philology, and languages, and was librarian to the electoral library, Dresden, from 1787. His works include: *Deutsche Sprachlehre für Schulen*, *Umständliches Lehrgebäude der Deutschen Sprache*, *Grammatisch-kritisches Wörterbuch der Hochdeutschen Mundart*, and *Mithridates oder allgemeine Sprachkunde*.

**Ademption** means the revocation or taking away of a grant or legacy. Thus if a testator leaves a specific article in his will, and before his death the nature of the article or property bequeathed is entirely changed, or the property is destroyed, the legatee is said to suffer from A., i.e. he gets nothing. The word

is also used in the legal sense of 'satisfaction,' e.g. if a testator owing money make a creditor a beneficiary under his will to the same amount as the debt, or more, then the legacy is held to have extinguished the debt.

**Aden**, a Brit. tn. and Crown colony, which also gives its name to the gulf of the same name and to the adjoining protectorate. It is the most populous and important port of Arabia, and the total pop. of the colony is 47,000 in an area of 75 sq. m. The tn. stands at the end of a rocky peninsula (which is joined to the mainland—Yemen—by a narrow sandy isthmus not 1 m. wide), and is heavily fortified, being indeed the only fortified point between Egypt and Bombay, and therefore regarded as an outpost of the Indian Empire. The Camp, as it is called, or A. proper, stands in the crater of an extinct volcano. Arid rocks surround it, rising at the highest point to 1776 ft., and the mean annual temp. is 83° in the shade. The other 2 centres of pop. are Steamer Point and Shaikh Othman, towards the interior. A., a most prosperous tn. under medieval Turkish rule, was, at the time Captain Haines annexed it after an almost bloodless coup (1839), inhabited by only 600 Arabs. The magnificent system of rain-collecting cisterns built by the Turks have been repaired by the Brit., and are the chief source of water supply. By the convention with Turkey the old boundary delimited in 1905 was extended to a point on the coast opposite Bahrein (q.v.) on the Persian Gulf. Administrative control used to be exercised through the Gov. of India, the Colonial Office being responsible for political questions. In 1932 it was separated from the Bombay Presidency and formed into a prov. under a chief commissioner under the direct control of the Gov. of India. But it ceased to be a part of Brit. India in 1937, and is now a crown colony under a governor, who is assisted by an executive council. In the First World War, A. was attacked by the Turks in July 1915 (Action of Lahaj), in Dec. 1916 (skirmish at Jahir), and Oct. 1918 (skirmish at Imad), but successfully defended throughout. A railway was constructed for military purposes to Lahaj, and has now been extended to Habi, the total length being 34 m. The chief industries are salt and cigarette manuf., and the total sea-borne trade is worth any amount over £6,000,000. The trade of A. decayed after the Portuguese discovery of the Cape route, but with the opening of the Suez Canal A.'s old importance revived, and it is now a most important oil bunkering and coaling station and port of call, besides being an emporium for the trade of the adjacent African and Arabian coasts. The Brit. Gov. has treaty engagements with, and subsidises, the neighbouring Arab tribes from the strait of Bab-el-Mandeb to Muscat ter. at Ras Dharbat. There is a court of unlimited civil and criminal jurisdiction, called the Supreme Court, from

which certain appeals lie to the High Court at Bombay.

Perim, a small unfortified is. of 5 sq. m. (pop. 1700), is administratively attached to A. The is. of Kamaran on the Red Sea about 200 m. N. of Perim, taken by Britain in 1915, is also under the control of the gov. of Aden. It is 22 sq. m. in extent (pop. 2200), and is chiefly important as a quarantine station for pilgrims from farther E. to Mecca, the station being (1947) under the joint control of the Gov. of India and that of the Netherlands E. Indies.

to Ras Dharbat 'Ali, where it meets the sultanate of Muscat. The Mahri sultanate of Qishn and Socotra is the most easterly part of the A. protectorate, being bounded on the E. by Muscat and Oman. The sultan of Qishn resides on Socotra Is. (1400 sq. m.), which lies 150 m. from Cape Guardafui. This is. was occupied by the E. India Company in 1834 and came under Brit. protection in 1886.

Adenitis (Gk. *αδην.* a gland), a term used in medicine to indicate inflammation of the glands and ganglia, but especially

ADEN HARBOUR

Fox Photos

**4. Protectorate.** A protectorate of approx. 112,000 sq. m. with an estimated pop. of 600,000, divided into a W. part, consisting of a score of sultanates, the chiefs of which are in protective treaty relations with the Brit. Gov., they include the sultan of Lahej (who came over to represent his country at King George VI's coronation in 1937); and an E. part, comprising the Hadhramaut (consisting of the Quaiti state of Shihir and Mukalla, whose chief also came to London for the coronation, and the Kafiri state of Seyun), the sultanate of Qishn and Socotra, and the Wahid sultanates of Bir 'Ali and Balhaf, all of which enjoy protective treaty relations with Britain. The Hadhramaut is the most important and best organised of the areas of the E. protectorate. The whole protectorate to the W. of about 46° long, is bounded on the E. by the Qara country, which is part of the ter. of the sultan of Muscat and Oman, and on the N. and W. by the Great Desert and the kingdom of the Yemen, whose S. boundary was provisionally fixed by the treaty of Sanaa (1934), by which the Brit. Gov. and the Imam Yahia of the Yemen agreed to maintain the *status quo* frontier as it was at the date of the treaty. The coast-line of the protectorate, which is about 600 m. long, begins in the W. from Husn Murad, opposite Perim, and runs eastward

of the lymphatic glands. It may be either acute or chronic; in the former case it generally comes from a skin wound or sore, the glands swell and are extremely painful; in the latter case the cause may be syphilis or tuberculosis, in which the glands swell and symptoms of both diseases are generally found. The treatment for acute A. is absolute rest, and the use of antiseptic lotions; for chronic A. strengthening diet, sea air, and local applications are most beneficial.

**Adenoids, or Adenoid Growths,** enlargement of the lymphatic tissues at the back of the nose and throat. The condition occurs mainly in young children, and may be discovered by laboured breathing, liability to catarrh, obstruction in speech, and a characteristically stupid and apathetic expression. The growth lessens in size as the child grows older, but as it involves a grave danger in the event of any acute respiratory trouble, it is often advisable to remove it by a simple operation.

**Aderno, a Sicilian tn.,** about 20 m. N.W. of Catania, which stands on the site of the anct. tn. of Hadranum, noted for its temple of Hadranus. It is situated on the slopes of the volcano Etna, has sev. fine churches and an anct. Norman tower and monastery built by Roger I., 1157. Pop. 26,000.

**Adersbach Rocks** are made of sandstone and are found in the vicinity of 2

vils. of the same name in Bohemia. They are 4 m. in length and of grotesque shapes. The pop. of the vils. is 1500.

**Adhesion**, in physics, the molecular force between masses or particles of different substances, as distinct from cohesion, the force between parts of the same substance. In botany, it is also used to denote the union of dissimilar parts. In pathology, it denotes the union of 2 surfaces by the production of lymph after inflammation. It causes trouble after pleurisy or peritonitis and also in burns, when the fingers or toes may become united. It is beneficent when the edges of a wound are united, thus constituting 'healing by first intention.'

**Adiabene**, a region of Assyria E. of the Upper Tigris, conquered by Trajan. In the Christian era it was trib. to the Parthians.

**Adiantum**, a genus of ferns of the Polypodiaceae, which usually inhabit damp tropical woods. *A. Capillus-Veneris*, the maidenhair fern, is found rarely in Europe. About 180 species of *A.* are known.

**Adiaphora** (Gk., indifferent things), a word signifying such actions as the Stoic philosophers held lay in the border region between good and evil. What is known as the Adiaphoristic controversy at the time of the Ger. Protestant Reformation arose from a dispute over certain Catholic tenets. Seeking to reconcile his Catholic and Protestant subjects, the emperor Charles V. in 1548 drew up a temporary ritual and rule of faith pending the settlement of the matter by a general council. The *A.* were those customs and tenets declared in the Leipzig Interim by Melancthon and his followers to be indifferent. Luther and his supporters were bitterly opposed to this suggestion.

**Adige** (*Ger. Etsch*), a riv. rising in the Rhaetian Alps in Italy and flowing into the Adriatic not far N. of the Po. It is, next to the Po, the largest riv. of Italy, having a length of 250 m. It is deep, and below Verona has a width of about 500 ft., but its rapid current makes navigation difficult. Many important battles have been fought on its banks.

**Adigherat**, or **Adigrat**, a small tn. of Tigré, Abyssinia, which, prior to the It. invasion of 1936, had an important market. Near it is Mt. Aleghia.

**Adi Granth**, the sacred book of the Sikhs, was ed. by Arjun Mal (the fourth *guru* or chief priest from the founder of the sect) about the end of the sixteenth century.

**Adipic** (Lat. *adeps*, thick) **Acid**, a crystallised solid acid, obtained by the oxidation of certain fatty or waxy bodies. It is a dibasic acid, akin to oxalic and succinic acids.

**Adipocere**, a wax-like substance produced by the exposure of fleshy tissue to moisture with the exclusion of air, as in the earth or under water. Human bodies in moist burial-places often undergo this change.

**Adipose Tissue**, a collection of fat

within the body of an animal. It consists of minute cells containing a secretion of oily matter. *A.* substance is what is known as a connective tissue, that is, it constitutes a sort of packing material between the harder tissues which form the framework of the body. Its uses are to protect the organs from external changes of temp., and to constitute a reservoir of material which may serve as food when other supplies fail. An excessive amount of *A. T.* is developed in the course of some diseases.

**Adirondack Mts.**, a very beautiful group in the N. of New York state, U.S.A. They may be regarded as the continuation of the Alleghenies, and they terminate abruptly in sheer cliffs on the shore of Lake Champlain. They stand on a plateau 2000 ft. above sea level, cover an area of 5000 sq. m., and their highest peak, Mt. Marcy, or Tawahus, has an alt. of 5345 ft. The dist. abounds in lakes and waterfalls, and here are the head streams of the Hudson. A forest reserve of 4375 sq. m. is owned by the state. A certain amount of lumbering is carried on, but the region is principally noted for being a favourite summer resort.

**Adit**, a horizontal entrance to a mine, sometimes called a drift. See MINING.

**Adjective** (Lat. *adjectivum*, neuter of *ad-jektivus*, that is, added) is the name of one of the parts of speech used with a noun, or substantive, to express a quality of the thing named; something attributed to it; to limit or define it, or to specify or describe a thing, as distinct from something else. Thus in the phrase 'a good man,' 'good' is the *A.*, and expresses the quality of the man.

**Adjudication**, An order of, in Eng. law, and a decree of sequestration in Scots law, is the order of a court adjudging a debtor a bankrupt and appointing a trustee to administer his estate. In Scots law *A.* means a process to attach the heritable property of a debtor—not necessarily a bankrupt. See BANKRUPTCY.

**Adjustment of Average**, a term used in marine and fire insurance, but mainly in the former, to denote the settling of the amount to be paid by the underwriters to the insured person and each underwriter's share of the loss. The rules relating to the amounts to be made good vary in different countries. In the absence of agreement, adjustment of the amounts to be contributed in respect of general average will take place at and according to the law of the port of discharge, i.e. in general, the place to which the vessel is destined, unless the voyage is justifiably terminated at an intermediate port. See INSURANCE.

**Adjutage**, or **Ajutage**, a tube attached to an orifice through which water is discharged. See HYDRAULICS.

**Adjutant**, an army officer, not above the rank of major, often a captain, and sometimes a subaltern, who assists the officer commanding a battalion or regiment, particularly in the carrying out of the detail work. His duties are

multifarious and include that of al-de-camp in the field. He has charge of the correspondence and official records, he keeps the accounts. The officers' duty roster is prepared by him, he issues by the authority of the commanding officer the daily orders, and generally is responsible for the discipline and efficiency of the corps. He supervises the drilling of recruits, and acts as prosecutor in all courts martial that concern his men. The appointment is held for about 4 years; in the auxiliary forces for 5 years. The *A.-General*, who is the second military member of the Army Council, has duties toward the Army as a whole somewhat similar to those of the A. to his corps, i.e., he is entrusted with all matters pertaining to discipline and efficiency of the troops.

Adjutant (*Leptopithecus argala*), a bird of the stork family found in various parts of India, but more especially in the N. and near water. It resembles somewhat the marabout stork of Africa, but is larger, and when erect it stands about 5 ft. high and measures from tip to tip of its extended wings about 15 ft. With its almost bald head and neck and its pouch (sometimes 16 in. in length), which hangs like a dewlap from the lower part of its neck, the bird presents an uncouth appearance. It has a voracious appetite, no carrion or offal or putrescent matter apparently being distasteful to it.

Adler, Herman (1839-1911), son of Nathan Marcus A. (q.v.), and succeeded his father on his death, 1891, in the chief rabbinate of the Jews of the Brit. Empire; b. in Hanover, became prin. of Jews' College, 1863, and in 1879 became coadjutor to his father as delegate chief rabbi. He broke a lance in defence of Judaism with Professors Goldwin Smith and Max Müller, and upheld the Pentateuch against the criticisms of Bishop Colenso. In addition to his more controversial works he pub. (1864) *Ibn Gabirol, the Poet-Philosopher*.

Adler, Nathan Marcus (1803-90), chief rabbi of the Jews of the Brit. Empire, b. at Hanover, educated at Göttingen, Erlangen, and Würzburg. He was chief rabbi at Oldenburg, 1829, at Hanover, 1830, and appointed to the chief rabbinate in London, 1844, in which capacity he did much to reunite the various Jewish congregations. Pub. sermons and other works, including one on the Pentateuch.

Ad libitum (or *ad lib.*, at discretion, at pleasure), in music, denotes that the part so marked need not necessarily be played strictly to time, but that the performer may pause, or introduce any cadenza or addition of his own. An accompaniment is said to be *A. l.* when it is not essential, and may be either played or omitted.

Adlington, William (fl. 16th century), Eng. author, known for his *Golden Asse of Lucius Apuleius* (1566). A. as a translator ranks with John Florio, or Philemon Holland; yet nothing is known of him. Inasmuch as he dedicated his work to the Earl of Sussex from Univ. College, Oxford, in 1566, it

is evident that he was at Oxford, probably in a tutorial capacity. It is said by some that he was the 'W. A.' who in 1579 pub. a verse tract, *A Speciall Remedy against the Furious Force of Lawlesse Love*. (Consult Charles Whibley's introduction to the 1893 ed. of *The Golden Asse*.)

Administration. Of the two functions of gov., legislation and A., the latter is by far the larger and more important, and in recognition of this fact the Gov. of a country is often termed the A. or ministry. In modern constitutional states this A. must be in accordance with the law, and in this country, in addition to being responsible to the legislature, the ministers are as liable as ordinary persons for maladministration.

Administrative Counties are those cos. or parts of cos., including the co. of London and the co. bors., which, under the Local Gov. Acts, 1888-1933, form separate A. C. of themselves for the purpose of managing, through co. councils, the administrative business of their respective areas. Yorkshire has 4 administrative headquarters (excluding co. bors.), and Lincolnshire, Suffolk, and Sussex 2 each.

Administrator, a person appointed by authority to dispose of or administer the estate of an intestate deceased, or of a deceased who has made a will but named no executor, or if an executor dies before the distribution of the property. Such a person is now appointed by the probate division of the High Court, but prior to the creation of this court in 1858 an A. was appointed by the bishop of the diocese. Letters of administration are generally granted by the court to the next of kin, or in default a creditor may obtain them. An A. can charge upon the estate he administers his actual expenses but no more, and he is usually required to give some guarantee for faithful and competent administration. In all the Eng.-speaking provs. of Canada, the A. is allowed a commission—usually 5%—on the amount of money passing through his hands. Letters of administration must be applied for within 6 months of the death of the deceased, and a person performing the functions without this licence may be mulcted in £100 fine, plus an additional fine equal to 10 per cent of the value of the estate. The essential difference between an executor and an A. is that the latter can do nothing without the assent of the court appointing him.

Admiral, the title of the chief naval officers and the equivalent in rank in the marine forces to a general on land; in fact, the 4 classes of A.s. (As. of the Fleet, A., vice-As., and rear-As.) are equal in precedence with the 4 divs. of generals (field marshal, general, lieutenant-general, and major-general). The word is derived from the Arabic *amir* or *emir*, meaning a 'lord' or 'commander' (cf. *amir-al-bahr*, commander of the sea), and found its way into European tongues, like many others of E. origin, during the holy wars of the twelfth and thirteenth

centuries. The office is, however, considerably older, and before the word became used in this country under Edward III., the chief naval officer was known as the 'guardian of the sea' (*custos maris*). The early Eng. form of the word was *amiral* or *ammiral*, the latter form being used by Milton, Cromwell's secretary of state. The present spelling of the word probably arose from the belief that it was an abridged form of *admirable*, or that it was a compound with the Lat. *ad*. The office of Lord High A., which subsisted with breaks from 1405, when it was created by Henry IV., till 1828, when its administrative functions were vested in the present Board of Admiralty, was of great importance and carried with it certain judicial functions, which, since 1875, have been exercised by the Probate, Divorce, and Admiralty Division of the High Court (*q.v.*). The first Lord High A. was the Earl of Somerset, and from his time onward the duties were exercised by an individual until 1632, when for the first time the office was put into commission, all the great officers of state being commissioners. During the Commonwealth naval affairs were at first directed by a parl. committee, but afterwards Cromwell himself took control of them. When Charles II. was restored he appointed his brother James to be Lord High A., which office he retained till 1683, when Charles himself assumed it. On James's accession to the throne the next year he resumed his former office, but at the revolution of 1688 the office was again put into commission, in which position it has remained till this day if we except the 3 years 1707-9, and the 16 months (1827-28) when the 'sailor prince,' afterwards William IV., was Lord High A. Eng. As. are divided into the classes above mentioned. Formerly the As. of all grades were subdivided into As. of the Red, of the White, and of the Blue Fleet, but this is now abolished, as is also, owing to the entire structural alteration in the form of war-vessels, the old practice of an A. flying his ensign at the main, the vice-A. at the fore, and the rear-A. at the mizzen masthead. There are at present about 110 As. on active service. In the U.S.A. there are, at present, 2 grades—A. and rear-A.—estab. respectively in 1866 and 1862. The grade of vice-A. was estab. in 1864, but was allowed to lapse in 1890. Captain Farragut (*q.v.*) was the first to hold each of these ranks, which indeed were created in turn by Congress in his honour. The grade of A. was allowed to lapse on the death of Farragut's successor in 1891, but was re-estab. in 1899 in favour of Commodore Dewey (*q.v.*). Officials of the navy dept. hold, during the term of their office, the rank of rear-A.

'Admiral Graf Spee,' Ger. 10,000-ton pocket battleship, which was fought and chased in Dec. 1939 by a Brit. cruiser squadron into Montevideo and, on emerging again, was scuttled. A sister ship of the *Deutschland* and *Admiral*

*Scheer*, the *A. G. S.* carried 6 11-in. guns and 8 5.9-in. guns, besides anti-aircraft armament, and had a speed of 26 knots. Her armament was superior to the combined power of the 3 attacking Brit. cruisers, *Exeter* (6 8-in. guns), *Achilles* (New Zealand) and *Ajax* (each 8 6-in. guns), and her combined broadside was 4708 lb., as against a combined broadside of 3136 lb. of the 3 cruisers. Against their more heavily armed adversary the Brit. cruisers achieved their victory by superior speed and manoeuvrability and, by making ample use of smoke screens, which confused the enemy's aim, were able to approach near enough to the Ger. ship to bring her within range of their guns. The *Exeter*, after suffering a number of hits, had to drop out of the battle, while the 2 other cruisers continued the pursuit until the battleship took refuge in Uruguayan territorial waters. The *A. G. S.*, which had been acting in the Atlantic Ocean as a commerce raider since the war began, had on board 62 survivors of 9 Brit. merchantships which had been sunk by her previously. These survivors were released after the *A. G. S.* had put into Montevideo. The Uruguayan Gov., conformably to international convention, allowed the *A. G. S.* 72 hrs., expiring on the night of Dec. 16, in which to effect such repairs as were necessary to render her seaworthy again, after which she could either put to sea or be interned. Capt. Hans Langsdorff, commander of the *A. G. S.*, here attributed his defeat to the rapidity of manoeuvre of the Brit. cruisers, the great accuracy of their gunfire, and to the 'inconceivable audacity' of the *Achilles* and *Ajax*, who, though outgunned, twice dashed through the *A. G. S.*'s smoke-screen and poured shells into her from a range of less than a m. The *A. G. S.* put out to sea again at 6.30 p.m. on Dec. 17, shortly before the expiration of her time limit. 700 of her crew and most of her stores had been transferred to the Ger. cargo-boat *Tacoma*, which was later interned. Seventy min. later she blew herself up and sank 5 m. outside Montevideo harbour in the fairway used by shipping in the estuary of the L. Plate. Capt. Langsdorff and the remainder of the crew left the ship in boats before destroying her. The officers and crew, numbering 1039 men, landed at Buenos Aires, where they were interned by the Argentine Gov. Capt. Langsdorff committed suicide, an inglorious end to an inglorious fight. The *Exeter*, which led the attack and suffered a loss of 64 killed and 21 wounded, had fought on until only 1 8-in. gun remained in action, and that could only be fired by hand. The casualties of the *Ajax* were 7 dead and 5 wounded. The commander of the Brit. squadron, Commodore Harwood, was knighted and promoted to rear-admiral. An Uruguayan business man bought the wreckage of the *A. G. S.* for £1000. See also NAVAL OPERATIONS IN SECOND WORLD WAR.

Admiralty, the name given to the gov. dept. administering the Brit. Navy.

Formerly responsibility for maritime affairs was entrusted to the Lord High Admiral, one of the great officers of state; but to-day his functions are discharged by 'Commissioners for executing the office of Lord High Admiral,' commonly called the Lords Commissioners of the Admiralty. The growth in importance of the A. as a military arm has been accompanied by a shedding of other of its functions and some of its privileges. Thus its judicial function, except in matters of naval discipline, has been transferred to other courts, notably the Probate, Divorce, and A. Court (*q.v.*), while the A. Droits (*q.v.*) are now collected by the Board of Trade and their proceeds paid into the public exchequer. The office of Admiral of England, with its variant terms Lord Admiral, High Admiral and Lord High Admiral, dates certainly from 1360, but its origins are earlier. The office was first placed in commission in 1628 upon the assassination of the Duke of Buckingham. The executive authority remained with the political Lords Commissioners, but the administrative work was transacted by a subordinate board of technical officials called the Navy Board, consisting of the prin. officers of the Navy. The Navy Board had been constituted by Henry VIII. in 1546 from existing officials whose origin developed out of the office of keeper of the king's ships, first created by King John on the appointment of William of Wrotham, arch-deacon of Taunton, in 1214. Samuel Pepys was one of the principal officers of the Navy from 1660 to 1673, holding the office of clerk of the acts, and wrote his famous diary in the old Navy Office.

The A., sometimes in commission, and at times held even by the king himself, had no permanent quarters till the reign of William III., when Walkinford House, the old residence of the Duke of Buckingham in Whitehall, was rebuilt and occupied in 1695. The office was again rebuilt 1723-25, from designs by Thomas Ripley; and the screen erected in 1760 from designs by Robert Adam. The old board room contains some fine carving, and sev. historic items. With the expansion of business, a separate residence was erected, 1786-91, for the First Lord, adjoining the A. office. Reorganisation in 1832 abolished the Navy Board, which since 1786 had occupied Somerset House; and in 1869-73 the staff there was transferred to Spring Gardens till an extension of the A. buildings should be built. The new building (erected 1891-1906) was extended in 1910 by the erection of the memorial arch across the Mall, which commemorates Queen Victoria. In the archway block is the residence of the First Sea Lord. On the new buildings is erected the A. wireless station, by means of which direct communication with war vessels is maintained with headquarters. A large fortress-like bomb-proof extension was built during the Second World War as alternative accommodation for head-

quarters staff and for communications. The last Lord High Admiral, 1827-28, was the Duke of Clarence, who afterwards became William IV. The members of the Board of A. are denominated lords commissioners. Formerly the whole board changed with the gov., but normally only the political members change nowadays. The board is appointed by royal letters patent, and any change necessitates the issue of a fresh patent. The number of commissioners has varied with the amount of business, having reached 12 in 1918. To-day there are 8; their titles and present duties are as follows: 1st, FIRST LORD OF THE A., who is a member of the Cabinet and a Privy Councillor, and resigns when the Gov. does; he presides over the deliberations of the board and has the general direction and supervision of all business relating to the Navy, controls all appointments to the higher posts, and at board meetings he has the casting vote. Personal responsibility for operations of war falls on the shoulders of the First Sea Lord, because *ex officio* he is also the chief naval adviser to the Gov. 2nd, FIRST SEA LORD AND CHIEF OF NAVAL STAFF, is an officer of the R.N. and deals with questions of naval policy and maritime warfare, is responsible for efficiency of the Fleet, and controls the work of the naval staff. 3rd, SECOND SEA LORD AND CHIEF OF NAVAL PERSONNEL, is an officer of the R.N. and is responsible for the manning of the Fleet, mobilisation, and medical arrangements and discipline. 4th, THIRD SEA LORD AND CONTROLLER, is an officer of the R.N. and is responsible for the provision of all kinds of material, including ships, machinery, guns, ordnance and stores, controls design, manufacture and maintenance, inventions, and research. 5th, FOURTH SEA LORD AND CHIEF OF SUPPLIES AND TRANSPORT, is an officer of the R.N. and is responsible for coaling, victualling, transport, pay and allowances, clothing, and medals. 6th, DEPUTY CHIEF OF NAVAL STAFF, is an officer of the R.N. and is responsible for the collection of intelligence, co-operation with aircraft, land and wireless telegraphy; deals with questions of maritime international law. 7th, PARLIAMENTARY AND FINANCIAL SECRETARY (political; first included in the patent in 1929), is a M.P. and resigns his appointment when the Gov. does; is in charge of all questions concerning finance, expenditure, estimates, accounts, and contracts. 8th, CIVIL LORD (also political), is a M.P. and resigns when the Gov. does; he superintends all works services, general labour questions, and schools. If the Civil Lord is a member of the House of Lords he deals with all A. questions in that House. The PERMANENT SECRETARY of the A. is a not a lord commissioner of the A. He is a member of the civil service, is in charge of the secretariat, has financial control of the A., is accounting officer for navy votes, and is responsible for A. procedure, organisation, and discipline of the civil branches of the A. (Samuel Pepys,

as stated above, held a similar post in the old Navy Office in 1660.) The coast-guard service, which was formerly under the admiral - superintendent of naval services—called in more modern days 'Admiral Commanding Coast Guard and Reserves'—came to the A. in 1858 and, in 1923, was transferred to the Board of Trade. The older part of the A. contains some fine mahogany panelling and marine paintings by eminent artists. In the Ger. blitz on London the A. sustained 3 direct hits on the night of Apr. 16, 1941, which damaged the fine old board room, and cut a great slice out of the S. front facing the Horse Guards Parade. The most serious consequence was the interruption of communications by the flooding of the basement. Hence was built the fortress-like extension at the corner of the Mall and St. James's Park, a building which has the appearance of some oriental mud fort or citadel. Inside, air-conditioned and lit by daylight lamps, is accommodation for the board and for every one who might be needed for the world-wide control of the Brit. fleets under continuous attack in London. During the war naval ratings there ran a score of lines of air & high-speed transmission to naval wireless stations all over the world. There were also 80 girls in this fort working teleprinters to all the naval headquarters in Britain and the Continent. The complexity of modern warfare is truly reflected in the naval communication system, and this citadel is veritably a maze of machinery and conveyor belts. For details of U.S.A. see NAVY, DEPARTMENT OF THE U.S.A.

**Admiralty Court.** The function of this court, formerly exercised by the Lord High Admiral, or by a judge holding a patent from him, is to try and to give judgment in maritime causes. Since the Judicature Acts of 1873 and 1875, which estab. the Probate, Divorce, and A. Division of the High Court, these functions have been discharged by 2 judges, who, in addition to giving judgment in probate and divorce matters, exercise the jurisdiction of the old A. C. Its duties are twofold, as an instance court and as a prize court, functions which in former days were discharged by 2 separate courts, albeit the judge of the instance court was usually appointed to preside over the prize court. In its capacity as a prize court the court has jurisdiction in matters of capture in port or on land if the capture has been effected by a naval force, or a mixed naval and military force. The court can also try any questions referred to it by the Privy Council concerning booty of war, i.e. property captured by land forces. As an instance court it originally dealt with both criminal and civil causes, but a series of statutes transferring the criminal side of its work to other courts has rendered this branch of its jurisdiction practically obsolete. When the Central Criminal Court was estab. in 1838, A. criminal causes were transferred to it, and the A. Offences Act, 1844, provided that in cases where A.

jurisdiction would have applied, they should be treated as if they were offences committed in the country where the offender was apprehended. The Naval Discipline Act, 1866, transferred to naval courts-martial the authority hitherto possessed by the A. C. in the matter of discipline in the Navy. In civil cases again part of the work of the A. C. has been entrusted to the co. courts. The more important questions that the A. C. has to decide comprise those arising from disputes between part-owners of vessels, suits by seamen for wages, where not within the jurisdiction of other courts, cases of salvage, including A. Droits (q.v.), and actions for damages arising out of collision of ships, etc. There is a separate A. C. for Ireland, but matters of prize are vested in the Eng. court. The court of A. for Scotland was abolished in 1831, and its jurisdiction transferred to the ordinary courts—session, justiciary, and sheriff—and the maritime law of Scotland is the same as that of England. Courts of vice-A. exist in many Brit. colonies. Appeals from the A. C. lie to the House of Lords, and from vice-A. Cs. to the judicial committee of the Privy Council.

**U.S.A.**—By the U.S. constitution, as interpreted by the U.S. Supreme Court, A. jurisdiction extends not only to the high seas but to the great lakes and rivers, connecting them and to all public navigable waters in the U.S.A. The States long ago delegated the jurisdiction of their old vice-A. Cs. to the Federal Gov. This jurisdiction comprises all maritime contracts, torts, injuries, or offences. The Supreme Court has no original jurisdiction in A. cases, all suits being in the first instance brought in the U.S. dist. courts. An appeal both on law and fact lies from the latter courts to the circuit court of appeals, and this appeal is final except in cases touching the jurisdiction of the court, the construction of a treaty, cases of prize, the constitutionality of a State or Federal law, and cases of infamous crime, when the right of appeal is direct to the Supreme Court. The A. Cs. have jurisdiction also in cases of piracy and collision and over crimes and offences committed upon the sea within the administration and maritime jurisdiction of the U.S.A.

**Admiralty, Droits of.** These are certain perquisites that formerly appertained to the Lord High Admiral, chief among them being the right to property of an enemy seized at the beginning of a war, and derelict ships at sea. In the case of the latter the finders of the abandoned vessel were entitled to nine-tenths of its value, the A. D. being the remainder.

**Admiralty Island,** a large is. off Alaska, about 80 m. long, well wooded; discovered by Adm. George Vancouver about 1793.

**Admiralty Islands,** in the Pacific Ocean, form part of the Bismarck Archipelago. The largest is about 50 m. long. Discovered by the Dutch in 1616, they came under Ger. protection in 1885. They were

occupied by the Australian forces in 1914 and after the First World War were placed under Australian mandate. Seized by the Jap. in the Second World War, they were recaptured by the Allies in Mar. 1941. Pop. 15,000.

**Adobe**, a Sp. term for sun-dried bricks made from any substance which hardens in the sun; also used of the buildings made with the bricks. They are manufactured largely in Peru, and also in Egypt, Asia, and N. America.

**Adolphus**, John (1768-1845), an Eng. lawyer and writer of Ger. extraction. His chief success as a lawyer was in his defence of Thistlewood, the Cato Street conspirator, in 1820. He pub. a *History of England from the Accession of George III. to the Conclusion of Peace in 1783* (1802), also a *History of France from the year 1790 to the Peace at Amiens in 1802* (1803). See *Recollections of the late J. Adolphus*, by his daughter, Emily Henderson, 1871.

**Adolphus**, John **Leycester** (1795-1862), lawyer and writer, son of John A. (q.v.), called to the bar in 1822, and judge of Marylebone Co. Court, 1852. His *Letters to Richard Heber, Esq.*, pub. anonymously in 1821, demonstrated that Sir Walter Scott was the author of the *Waverley Novels*; the *Letters from Spain in 1836 and 1837* appeared in 1838. At the time of his death he was engaged in the completion of his father's *History of England*. See J. G. Lockhart's *Life of Sir Walter Scott*, 1837.

**Adonai**, a Heb. word for the Supreme Being. The singular form is Adon, meaning lord, and the final *i* is the possessive 'my.' The Jews pronounced JHVH Adonai, and from the consonants Jhvh and the vowels of Adonai the name Jehovah has arisen.

**Adoni**, a tn. in the Bellary dist., Madras, formerly a stronghold of the Vijayanagar kings. It manufs. cotton very largely, especially cotton carpets. Pop. 31,600.

**Adonis**, a mythological Gk. hunter, son of Cinyras and Myrrha, beloved of Aphrodite. He was slain by a boar, and descended to the lower world; Aphrodite sprinkled nectar on his blood and from it sprang the anemone. Persephone refused to give him up to Aphrodite, and Zeus settled the dispute by allowing him to spend one-third of the year with each goddess in turn, while one-third belonged to himself. He is represented as the type of masculine beauty, and as such appears in poetry. See Ovid's *Metamorphoses*, x. 298-739; also Shakespeare's *Venus and Adonis*.

**Adonis**, in botany, is a genus of plants belonging to the Ranunculaceae, found in Europe and N. America. The *A. vernalis* is a spring flower of a brilliant yellow; *A. autumnalis*, or pheasant's-eye, is found in wheat-fields in the autumn; *Flos A.* has scarlet petals fancifully connected with the blood of the mythological hero.

**Adoptionism**, an heretical doctrine which originated in Spain at the end of the eighth century. Elipandus, arch-

bishop of Toledo, and Felix, bishop of Urgel, declared that Christ in His divine nature was the Son of God by nature and generation, in His human nature He was the Son of God by adoption and grace. Charlemagne condemned the 2 bishops at the synods of Ratisbon in 792 and Frankfort in 794; Felix recanted, but Elipandus adhered to his views. See C. W. F. Walch, *Historia Adoptionum*, 1755; A. Harnack, *Grundriss der Dogmengeschichte*, 1889; R. L. Ottley, *Doctrine of the Incarnation*, 1896.

**Adoption** is a custom widely prevalent and legally regularised in many countries, both anct. and modern, though until recent legislation it had no place in Eng. law. Broadly, the term is used for the act of taking a person into a family with the intention of conferring on that person the rights and duties of his new family. The theory of A. is generally traced to 2 motives: first, the desire to increase the strength of the family or clan, and second, to ensure, as in anct. Athens and modern India, the performance of sacred funeral rites. It follows naturally that where parental rights are strong, A. assumes its greatest importance, and in anct. Rome, where the relationship of father and son was akin to that of master and slave, the law of A. played an important part. There were 2 forms of A. in Rome: one, by a fictitious or formal sale of the child by its natural parent before a magistrate, and two, by abrogation, i.e. by a vote of the people in the *comitia curiata*, or, at a later period, by imperial rescript. In the case of abrogation it was necessary for the person adopted to be *sui generis* (his own master). A woman, having no parental power (*patria potestas*) over her own children could not adopt a child. Considerable changes were introduced by the *Institutes* of Justinian, chief among them being that parental authority did not pass to the adoptive father.

Previous to the Act of 1926, A. in the United Kingdom was no more than voluntary guardianship. Under that Act, the proposed adoptive parent must not be under 25 years of age and must obtain the sanction of a court to the A. When legal sanction has been given, the natural parent loses all rights in the person adopted and the adoptive parent takes his place in all respects. The Adoption of Children (Regulation) Act, 1939, was aimed at abuses in connection with the informal A. of children; made it necessary that A. societies be registered with the local authority; and imposed restrictions on A. abroad.

**Adour**, called by Rom. writers *Atur*, *Aturis*, and *Aturus*, is a riv. of France which rises in the Pyrenees, and after a course of 200 m. flows into the bay of Biscay. On its banks are Bagnères-de-Bigorre, Tarbes, Aire, St. Sever, Dax, and Bayonne, and some of its affluents are the Gabas, Luy de Franco, Luy de Béarn, Gave de l'Au, and the Bidouze on the left; the Midouze on the right.

**Adowa** or **Adua**, the cap. of Tigré,

**Abyssinia**, is a well-built tn. 6000 ft. above sea-level with a pleasant climate. The Abyssinians here severely defeated the Its. under Gen. Baratieri on Mar. 1, 1896. In Oct. 1935, the Its. launched an air attack on A., and the tn. surrendered after a few days. Pop. 5000.

**Adoxa Moschatellina**, the moschatel, is a spring flower with a small like that of musk. Belongs to the order of Ivy-worts. A. M., the Brit. species, is small in its inflorescence and is found in moist, shady places.

**Adra**, a tn. of Andalusia, Spain, near which is anct. Abdera, founded by the Phenicians. The chief occupation is lead-mining. Pop. 4800.

**Adrar** (Berber for highlands), an oasis of the Sahara, with Wadan for cap. Its products are dates, grain, melons, and salt. Pop. 7000.

**Adrar**, Sp. N. Africa, see RIO DE ORO AND ADRAR.

**Adrastus**, king of Argos, a legendary Gk. hero, waged war on behalf of Polyneices, his expedition being known as the Seven against Thebes. A. alone escaped alive. The Epigoni, or descendants, later destroyed Thebes, and the son of A. alone fell. A. d. of grief for the death of his son. See Herodotus, i. 41-45; 67-68.

**Adrenalin** ( $C_9H_{17}O_3N$ ), a compound prepared from the suprarenal capsules of the horse and other animals. It is used in medicine to arrest hemorrhage, and in the treatment of Addison's disease.

**Adria** (anct. Hadria, Hatria, or Atria), once a seaport of the Adriatic, is now 14 m. inland in Rovigo, Italy, near the Po and the Adige. The remains of the old city are buried near the present one. It is the seat of a bishopric. The exports are cattle, grain, silk, flax, leather, and pottery. Pop. 31,000.

**Adrian**, see HADRIANUS.

**Adrian**, the name of 6 popes.

**Adrian I.** was pope from 772 to 795. He received aid from Charlemagne during an invasion of his realms by the Lombards. Some dispute arose concerning image-worship, without, however, disturbing the friendliness of the Frankish alliance. He d. before the dispute was settled.

**Adrian II.**, pope from 867 to 872. During his occupation of the papal chair trouble arose over the subject of his power over Bulgarian converts. He was compelled to submit.

**Adrian III.**, who was pope from 884 to 885, was succeeded by

**Adrian IV.**, the only Englishman to enjoy papal control. His name was Nicholas Breakspear, and he was b. about 1100 at Langley in Hertfordshire. His father was a priest of Bath, who abandoned his son, entering a monastery. Nicholas went to Paris and became a monk at St. Rufus near Arles. In 1137 he was elected abbot. He was summoned to appear before the pope at Rome as a result of a conspiracy to overthrow him, because of a strongly developed disciplinarian attitude towards his monks. At the inquiry he distinguished himself by his successful

defence, and moreover won approval from the pope. In 1146 he was appointed cardinal-bishop, and in 1154 was elevated to the papal chair. He d. in 1159, after causing a long contest between the popes and the house of Hohenstaufen, which dynasty was finally overthrown long after A.'s death.

**Adrian V.** became pope in 1276 and d. in the same year.

**Adrian VI.** was pope from 1522 to 1523. His administration was actuated by a desire to sweep away all existing abuses, but met with much opposition.

**Adrian**, a tn. in Michigan, U.S.A., 211 m. E. of Chicago, with a college and an industrial home, railway shops, and manufs. Pop. 13,000.

**Adrian de Castello** (c. 1460-c. 1521), It. scholar, statesman, and ecclesiastic, was b. of humble parents in Tuscany. As servant of Pope Innocent VIII. he was sent to England in 1488, and became Henry VII.'s agent at Rome. In 1502 he was appointed bishop of Hereford, in 1503 Pope Alexander VI. created him cardinal, and in 1504 he became bishop of Bath and Wells. In 1517 he was accused of being accessory to the plot to poison Pope Leo X. and stripped of all his offices in 1518, Cardinal Wolsey being his successor at Bath. He fled to Venice, and is thought to have been murdered on his return journey to Rome when Leo X. d. His writings consist of a poem entitled *Venatio*, 1505, and 2 treatises.

**Adrian, Edgar Douglas** (b. 1889), Eng. physiologist; educated at Westminster School and Trinity College, Cambridge Univ. Appointed prof. of physiology, Cambridge Univ., 1937. Fellow of Trinity College, Cambridge. Oliver Sharpey lecturer, Royal College of Physicians, 1925. Foulerton Research prof. of the Royal Society, 1929-37. Pub.: *The Basis of Sensation*, 1918; *The Mechanism of Nervous Action*, 1932; papers on the physiology of the nervous system in *Journal of Physiology*, *Brain*, etc. Jointly awarded Nobel prize for medicine, 1932. Appointed to Order of Merit, 1942.

**Adrian's Wall**, see ROMAN REMAINS.

**Adrianople**, see EDIRNE.

**Adriatic Question**, The. The question of the control of the Adriatic, involving, more or less, all the 4 littoral States, Italy, Yugoslavia, Albania, and Greece. The question of the control of the Dalmatian coast of the Adriatic, apart from the necessity for securing her N. frontier, was that which primarily determined Italy's policy towards the belligerents in the First World War. The whole future development of the country was involved in the solution of the problem of Italia Irredenta, and Italy's participation in the conflict was to be obtained only on consideration that an appreciable guarantee was afforded of redeeming peoples traditionally regarded as It. in sympathy and blood. In 1915 Italy signed with Great Britain and France the secret pact of London, by which it was agreed to give to Italy Trieste, Pola, and part of

**Dalmatia.** The negotiations were necessarily of a delicate nature, for opposition was to be expected from the Slavs and, through them, Russia. It is not surprising in all the circumstances that the price demanded by Italy for her active intervention on the side of the Entente met with a formal protest from the Serbs against any such concession being made. The Adriatic littoral is almost exclusively populated by the Croats and Serbs, and the fact that the principle of the liberation and unification of the nations—one of the predominant factors in the European crisis of 1914—and in particular the Slav nation, would be violated by any such arrangement, was of itself enough to enlist against Italy the sympathies of the Russian Gov. It may be assumed that the prevailing opinion in Russia, while against the cession of the Dalmatian coast, was still more averse from any action which would result in a new Macedonian problem. It was pointed out in Russian political circles that the immediate origin of the Macedonian problem was the treaty of Bucharest (1913), which destroyed the Balkan Alliance and in a sense led indirectly to the First World War. A similar state of things was being created by the conclusion of the It. agreement, but in the result the Croatian and Slav claims were ignored and the alliance of Italy was purchased at the price asked by that power.

(See also Fiume: LONDON, FACT OF; TRIPLE ALLIANCE.)

**The Adriatic Considered Strategically.** An examination of the strategic position in the Adriatic as in the early months of 1916 will readily show why Italy failed to save Montenegro, and it will likewise explain why Italy deemed it prudent to occupy Valona in the very early stages of the war and long before the Ger. armies entered the Balkans. Italy's E. shore possesses no harbours suitable as naval bases for a modern squadron (except Taranto, which is outside the Adriatic). The opposite coast contains many of the finest natural harbours in the world, like Pola, Sebenico, Cattaro, Durazzo, Trieste—flanked for the most part with an amphitheatre of hills, capacious enough to accommodate a large fleet, and the whole Dalmatian coast is thickly studded with sheltering is. Cetinje was therefore deemed almost from the commencement, for it lies at no appreciable distance from Cattaro. Durazzo, though seized by the Its., had to be given up as Austrian power spread southward. For the previous 40 years and more Italy's position in the Adriatic had always been precarious from a strategic standpoint; and this danger became accentuated when Austria took possession of Bosnia and Herzegovina. It was therefore hardly from imperialistic motives that the Its. then coveted Adriatic control, or a greater measure of control. The intolerable character of the position had given rise to one of the fundamental doctrines of modern It. statesmanship, and leading It. politicians consistently

held that until the equilibrium of the Adriatic—which in old It. documents is significantly spoken of as *il golfo di Venezia* and by masses of its people to-day as *il mare nostro*—could be restored, Italy would never be in a position of adequate security to act from the point of view of national independence. This doctrine unquestionably influenced It. statesmen at the time of Italy's intervention in the First World War, and throughout it lent to It. action much of its initiative, enthusiasm, and driving force. In 1939 Mussolini, by seizing Albania, secured virtually absolute control of the Adriatic. In the Second World War It. control was first weakened by the torpedoing of half the It. battle fleet at Taranto (Nov. 11, 1940) by the R.A.F. and by the Brit. naval victory off Cape Matapan (Mar. 28, 1941). Later, the successful operations of Marshal Tito in Yugoslavia further jeopardised It. control, which was lost entirely when the Anglo-Amer. armies invaded Italy. In any case the phenomenal development of aircraft rendered the strategic control of the Adriatic impossible without control of the air.

**Adriatic Sea, or Gulf of Venice,** is a large arm of the Mediterranean into which the Po and Adige empty themselves. It is about 500 m. long, and its average breadth is 100 m.; the water is very salt. In summer navigation is safe, but the S.E. winds make sailing dangerous in winter. It probably derives its name from the ant. city of Adria. See C. Yrlande's *Les Bords de l'Adriatique et le Monténégro*, 1878; G. L. Faber's *The Fisheries of the Adriatic and the Fish thereof*, 1883; F. H. Jackson's *Shores of the Adriatic*, 1908; R. W. Seton-Watson's *The Balkans, Italy, and the Adriatic*, 1916.

**Adua, see ADOWA.**

**Adula, the ant. name of Zulla or Thulla, on the coast of Abyssinia, near Annosley Bay.** It is interesting as the locality in which Cosmas, a Christian merchant, discovered the Gk. inscription known as the *Monumentum Adulitanum*—really 2 inscriptions united, one referring to Ptolemy Euergetes (247–222 B.C.), the other to an unknown Ethiopian king. It also describes the subjugation of the Abyssinians. See H. F. Clinton's *Fasti Hellenici*, part ii, 1824.

**Adullamites, a political term applied to the Liberals who voted against Gladstone's Reform Bill of 1866.** Bright compared the seceders to the fugitives who hid with David in the cave of Adullam (1 Sam. xxii.); Lord Eloho spoke of Gladstone as Saml and Bright as the armour-bearer. The Cave is another name of the group.

**Adult Education.** The Board of Education, in Apr. 1921, appointed a committee to promote the development of liberal education for adults, and, in particular, to bring together national organisations concerned in A. E., so as to secure mutual help and co-ordination. A. E. regulations were pub. by the board in 1921. In the ensuing 6 years the

more elementary and pioneer forms of A. E. came into prominence, with such names as preparatory classes, one-year courses, and terminal courses (all these being under the board's A. E. regulations), and evening classes for adults, study circles, and a multitude of other titles (these, not being organised so as to conform with the regulations, having a free choice of title). The growth of this type of work creates, in a sense, a new position in A. E.; it is a source of great satisfaction to those whose chief desire is the spread of education, but a source of some anxiety to those who see in it a danger of confusion of aims between different kinds of A. E. and of a decline in standard.

The position at the outbreak of the First World War was that the term adult education was commonly used to denote the activities of the Univ. Extension movement and the Workers' Educational Association; and that many other bodies and institutions which, in furtherance of religious or social aims, had, for many years past, undertaken educational work among adults, were examining the methods adopted by the Workers' Educational Association in conjunction with the univs., and were co-operating in certain areas with the association in the formation of classes. But the movement was still in an early stage of development, and the term adult education was not familiar to the man in the street.

In the session 1919-20, univ. tutorial classes in England and Wales numbered 226, or twice the number in 1913-14; in the session 1920-21, when this committee was first appointed, the number rose to 299. By 1921-22 the number was 353. But during the same period one-year courses had been growing yet more rapidly, numbering 329 in 1921-22, or 4 times the number in 1913-14. In 1923-24 the board undertook to include in their estimates a sum sufficient to provide for a 20 per cent increase in the number of classes, and the number rose to 393 univ. tutorial classes and 359 one-year classes. At this point new conditions were introduced.

The board then issued new regulations, and the number of classes at once showed a great increase. The maximum grant payable in respect of a univ. tutorial class was raised from £45 to £60, and in special circumstances £75. Univ. extension courses and preparatory classes, which had previously been aided under the regulations for technical schools at low rates, based on the number of students multiplied by the number of hours of attendance, were now brought under more rigorous standards of attendance and written work and were given a much higher grant. The chief distinction between preparatory classes and extension courses is that the former must give a suitable preparation for students intending to proceed to tutorial classes, while the latter are self-contained. Extension courses are usually organised in lecture periods, which may be attended by a general audience, followed by class

periods, attended by persons some of whom are willing to do written work. There are also grants in aid of terminal courses, which meet for not less than 1½ hours a week for 12 weeks, written work not being required, and of one-year courses meeting not less than 1½ hours a week for 20 weeks, written work being required.

In some areas authorities definitely assume financial responsibility for courses organised by voluntary bodies. Most authorities, however, are content to make a contribution in aid of courses organised by voluntary bodies. The majority of authorities are now interested in A. E. Certain organisations, such as the National Adult School Union and the Co-operative Union, which provide for A. E., do not seek public assistance, and prefer to pursue their aims and to organise their work free from any external control. There are many bodies with religious or social aims which promote some A. E. but cannot be said to have A. E. as their principal activity.

Univ. extension courses and univ. tutorial classes no longer exclusively represent A. E. in the eyes of the community; year by year they increase in numbers, but decrease in proportion to the whole. In 1913-14 univ. tutorial classes far outnumbered the other registered classes of the Workers' Educational Association. When account is taken of all classes for which local education authorities assume financial responsibility, it is clear that now classes of shorter duration far outnumber univ. tutorial classes.

The establishment by the London Co. Council of a number of literary institutes in 1919, after an interrupted period of experiment on a small scale, is one of the landmarks in the development of A. E. These institutes, some 10 in number, have about 5000 students enrolled in them, who are mostly men and women between the ages of 20 and 40, who have received a good elementary education followed often by some secondary or commercial education.

The courses recognised under the A. E. regulations include: Literature, Languages, Economics, Industrial Hist., Geography, Aesthetics, Music, Art, Natural Science, Biology, Sociology, Philosophy, Psychology, Mathematics. In the London literary institutes the subjects of study are differently distributed, Literature, Hist., and Aesthetics taking a much more prominent place. In the London men's institutes the curriculum is again of a very different character, handicrafts, hobbies, and physical exercises taking a prominent place.

Other associations engaged in A. E. besides those mentioned already in this article, include the British Institute of A. E. (29 Tavistock Square, London, W.C.1); Central Joint Advisory Committee on Tutorial Classes (38a St. George's Rd., Victoria, London S.W.1); Civil Service Council for Further Education (Parliament Mansions, Victoria St., Westminster, S.W.1); Delegacy for

Extra-mural Studies (Rewley House, Wellington Sq., Oxford); Educational Settlements Association (8 Endsleigh Gdns., London, W.C.1.); Joint Committee for Residential A. E. (8 Endsleigh Gdns.); National Adult School Union (30 Bloomsbury Street, London, W.C.1.); World Association for A. E. (16 Russell Square, London, W.C.1.); Y.M.C.A.; Y.W.C.A.

*A. E. in the U.S.A.* A. E. in the U.S.A. chiefly started during the middle decades of last century, in the evening schools founded by the Christian Churches and philanthropic persons. Presumably these were intended in the first place for children, and were somewhat similar in character to the Brit. Ragged Schools. In the course of time older scholars, anxious to improve themselves, took advantage of these institutions, and remained the only scholars after the children were nationally provided for. A stimulus was given to A. E. after the Slave war, through a public-spirited endeavour to deal with new problems. The desire of the Methodist Episcopal Church to improve the education of its Sunday school teachers, led to the formation of short settlements lasting a few days or weeks, during the summer. Very rapidly these summer schools developed in character and widened in the range and variety of subject-matter. The Chautauqua (*q.v.*) movement, as it is called, from the name of the first school, quickly spread through the U.S.A., and hundreds of summer schools came into existence, with aggregate scholars that are now numbered in millions. Very few of these are associated with the original Chautauqua school, and frequently they are financed by the tn. in which they are held, or by an interested committee. They are not run for profit, and are largely independent of each other or of any central body. The Young Men's and Young Women's Christian Associations of America have long made a special feature of A. E. in a great number of tns. and cities, carrying on work of a nature comparable to that of the London Polytechnic. In the great cities such bodies as the Pratt Institute, the Cooper Union, and the administrators of the Peabody and Slater funds still further assist A. E. Correspondence colleges probably exercise greater influence in America than in most other countries and perform especially useful service in remote and less populous districts.

**Adulteration** (Lat. *adullerare*, to defile or render impure), the act of mixing with a commodity some inferior stuff, or abstracting some material of value for the purpose of extra profit.

The practice of A. has been known from the earliest times. The merchants of the E. and of anc. Greece and Rome were in the habit of mixing inferior wines with good in order to enhance their own profit. Complaints are met with as early as the reign of King John of the roguery of brewers, bakers, and other tradesmen in England, and at the present time, despite all legislation, the A. of

various kinds of food-stuffs still exists. In earlier times the dishonest attempts of manufacturers were crude and fairly easy of detection, but in these days the adulterator has called chemical science to his aid, and so well is he able to counterfeited the genuine article that it is only by pitting against him the trained analyst that he can be brought to book. It is probable, fortunately, that the measures directed against A. are gradually taking effect, and, coupled with the greater desire of the consuming public for pure food, will do much to abolish a dangerous practice. It may at once be admitted that the fault is not all on the side of the vendor of the adulterated articles. His excuses are, no doubt, often specious, but the average customer demands an attractive appearance in the goods he buys, which can only be obtained by the addition of injurious matter. Preserved peas naturally lose their bright green colour, which, however, can be renewed by the addition of copper sulphate. Many people suppose that milk rich in cream has a yellowish tinge. Now pure milk is almost white, so that the milkman may colour his milk artificially to make it saleable. So much may be said for the difficulties of the tradesman, but when he protests that certain added materials are quite harmless, that they improve the flavour, or that the market price forbids a pure article, in the interests of the public health he should be repressed. Many adulterants may not be actively injurious and yet may do a great injustice to poor and ignorant people. They expect certain qualities in their food, and are defrauded if that standard is not reached. The practice of adulterating milk with water does not lead to poisoning, but it often means insufficient nourishment for the infants of poor parents.

Various Acts have been passed relating to the A. of food and drugs, the most important being those of 1875, 1887, and 1899. They provide that food and drugs must not be mixed, coloured, stained, or powdered with any material injurious to health. No person is liable to conviction if he can show that he did not know of the A., and that he could not by the exercise of reasonable diligence have ascertained the fact. No person may sell to the prejudice of the purchaser any article of food or any drug not of the nature, substance, or quality demanded. It is not, however, illegal to add any ingredient not injurious to health if required for the preparation of the food or drug as an article of commerce, provided the ingredient is not added fraudulently to increase the bulk or weight, or to conceal any inferiority in quality. Ingredients which are not of an injurious or a fraudulent character may also be added if the article is labelled to the effect that it is mixed. The penalties for infringement are limited to £50 for the first, and £100 for a subsequent offence. The Margarine Act of 1887 provides that all butter substitutes or mixtures of butter and substitutes are to be marked, when exposed for sale or

packed for storage or transport, with the word 'margarine' in large letters.

Many common food articles have been adulterated. For example, wheat flour can be adulterated with flour made from maize or rice, butter with margarine, milk with borax or soda as preservatives, jam with vegetable pulp, coffee with chicory, and cocoa with sago flour. Various Acts of Parliament have been passed to stop A., and inspectors are appointed by the co. and bor. councils to visit shops and examine the articles sold. An inspector can buy a sample of anything he thinks is adulterated and have it analysed. If the analyst finds it is adulterated the offender can be heavily fined.

All the states of the U.S.A. have passed laws for securing the purity and cleanliness of food. Most of these state laws adopt the general principles to be found in the Federal law as enacted in the Federal Food and Drugs Act, 1906, and amending Acts. This Act gives the Federal Gov. jurisdiction over all food intended for commerce, whether for foreign countries or as between state and state; but each of the states has control over all the food produced and consumed within its own border. The above Act provides that food shall be free from injurious ingredients, etc., and that packages shall clearly state the quantity of the contents. It also provides two remedies for infringement, namely criminal prosecution and seizure of the goods, and both may be exercised concurrently. The purity or freedom from adulterants of such important foods as meat and tea is safeguarded by special Acts, empowering inspection by the Federal authorities. Tea shipments for entry into the U.S.A. are inspected in order to secure that the tea as to quality conforms to the standard laid down by the secretary of agriculture; while under the Meat Inspection Act all animals intended for slaughter, all carcasses for food, and all meat for canning, curing, etc., are examined, the inspection thus beginning with the live animal and ending only when the finished product leaves for consignment, whether from state to state or to a foreign buyer.

Adultery means sexual intercourse contrary to the canon or civil law, and in auct. legal codes it was, in theory at any rate, harshly punished, in many cases the death penalty being prescribed. Some modern states still regard A. as a crime, and treat it as such, some of the states in the U.S.A., until recently, punishing it by fine or imprisonment. In England A. is subject to no penalty other than social ostracism, but is ground for a civil action for damages and for divorce. Formerly only the husband could petition for divorce on the sole ground of A., a wife's petition requiring some additional ground, such as desertion or cruelty, but since the passing of the Matrimonial Causes Act, 1923, both sexes are on an equal footing in this respect. A petitioner who also has committed A., must seek the court's discretion, whether his (or her) petition will fail. See further under DIVORCE.

Ad valorem (Lat., according to the value), a commercial term implying that calculations for stamp duty, etc., are made on the value of a bond or other article. In rules and orders fixing certain duties, A. r. duties, as opposed to specific duties, are those levied according to the value of the goods imported. A. v. stamp duties, e.g. in the case of a lease or a bill of exchange, are, under the Stamp Acts, payable according to the value of the subject-matter of the particular instrument.

Advancement, a legal term for money advanced to a minor or other beneficiary under a will or settlement with a view to the A. or benefit of that person. A common form of A. is that of finding the capital for setting a person up in business, but money expended on education or apprenticeship is not technically considered A.

Advent (Lat. *adventus*, the coming) is the season of 4 weeks preceding Christmas appointed in the Eng. and other Christian Churches for preparation for the festival of Christmas to celebrate the nativity or manifestation of Christ. In the same way Lent is the season of preparation for the festival of Easter, and formerly A. was kept almost as strictly as Lent, public amusements and festivities being prohibited, and fasts kept. The first Sunday in A., or A. Sunday, as it is commonly called, is the Sunday, whether before or after, which falls nearest to St. Andrew's Day (Nov. 30); and since the sixth century A. Sunday has been the commencement of the eccles. year, except in the Gk. Church, in which it begins on St. Martin's Day (Nov. 11). It was formerly the custom to regard the coming of Christ as fourfold: 1, at His nativity; 2, at the hour of death to receive His disciples; 3, at the fall of Jerusalem; 4, at the day of judgment. It is now usual to speak of His coming as twofold: His first coming at His nativity as the Saviour of the world, known as the 'first A.' and His second coming at the day of judgment, known as the 'Second A.' During the season of A. the lessons are chosen so as to exhort people to think of His second coming. In the Scriptures themselves the second coming of Christ is spoken of differently in different passages, and it has been a subject of much controversy amongst theologians as to its time and form.

Adventists (Lat. *adventus*, the coming), or Second A., is the collective name of 6 groups of religious sects in America: the Evangelical A., Advent Christians, Life and Advent Union, Age-to-Come A., Seventh-Day A., Church of God. They are Protestant sects, and all but the last 2 groups are congregational in gov. They had their origin in the agitation in 1831 of William Miller, who from his studies of the biblical prophecies deduced that the end of the world would come in 1843, and that Christ should then make His second appearance on earth. He soon gathered together a large following, who adored to him even after his prophecy failed; in 1844 they were

again disappointed in the millennium theory, but in 1845 they determined to look for the second coming of Christ at a near but indefinite date, and this is now the accepted belief.

*The Evangelical A.* (1845) believe in the resurrection of the soul, that the just will reign with Christ through the millennium, and the unjust shall be tortured in hell for ever. *The Advent Christians* (1861) hold that at the second coming the just will receive immortality, the unjust annihilation. *The Seventh-Day A.* (1845) is the largest group, holding the seventh day sacred as the Sabbath, believing in some mystic biblical prophecies, the triumph of the righteous and destruction of the unrighteous. *The Church of God* (1864-65) resembles the foregoing in all respects but in the application of the two-horned beast to the U.S.A., and in the acceptance of Mrs. Ellen J. White's writings as inspired. *The Life and Advent Union* (1860) believe that the wicked will remain asleep throughout eternity, while the good shall obtain everlasting life. *The Age-to-Come A.* (1831) maintain that eternal life is gained only through Christ. There are in the U.S.A. 30,000 church members of the Advent Christian Church and 120,000 members of the Seventh-Day A. See D. T. Taylor's *The Reign of Christ*, 1889; J. G. Wellcome's *History of the Second Advent Message*, 1874; Mrs. E. J. White's *Great Controversy*, 1870.

**Adventure Bay**, in Brunel Is., off the S.E. coast of Tasmania, was discovered by Captain Furneaux in 1773, and named after his ship, the *Adventure*, which was later used by Captain Cook on his visit to the bay in 1777. See Captain J. Cook's *Third Voyage*, vol. i., 1784; W. Bligh's *Voyage to the South Seas*, 1792.

**Adverb** (Lat. *adverbium*, from *ad* and *verbum*, word, verb) is the name of one of the parts of speech used with verbs, adjectives, or other As. to qualify their meaning, just as the adjective is used with substantives, e.g. in 'He sings well,' 'well' is the A. qualifying the verb 'sings'; and in 'An extremely delicate child,' 'extremely' is the A. qualifying the adjective 'delicate'.

**Advertisement.** The excavated ruins of lava-buried Pompeii and Herculaneum show that A. was employed in the time of the Cæsars. On the walls of what were presumably the most frequented thoroughfares were As. of various kinds of baths, announcements of gladiatorial shows, and notices of plays. In Rome at the same period a daily gazette called the *Acta Diurna* (q.v.) contained public notices and As., and among the Gks. a public crier was employed to announce the wares of the shopkeeper. The public crier, or bell-man, persisted through the Middle Ages, and is still to be found in small provincial towns. Nowadays public and official As. are made by posting them at church doors, as in the case of lists of parochial voters, or in the columns of the *London Gazette*, pub. by the Gov. twice weekly. Royal proclamations are made in this *Gazette*, and it is also the channel

by which announcements are made as to bankruptcies, Army commissions, Orders in Council, etc. Many other official announcements required to be made by statute or by an order of the court are pub. in the *Gazette*, e.g. notices by trustees; but as the *Gazette* has but a small circulation generally, an A. in it is not considered sufficient public notice of a dissolution of partnership. The popular supposition that an A. by a husband to tradesmen not to supply goods to his wife relieves him of his liability to meet their bills is erroneous; such intimation must be given to each individual tradesman. If in an A. for lost or stolen property the advertiser intimates that no questions will be asked as to how the person responding to the A. came by the missing property, then the advertiser commits a criminal offence, and is liable to a fine of £50, as are also the printer and publisher of such announcement. In some cases the publication of an A. is *ipso facto* considered as making a contract with the respondent to the A., as when a railway company or steamship line advertises for goods. Such advertisers are bound to accept the goods tendered for transport on the terms of A., provided, of course, in the case of the vessel, that it is not already booked up. An auction once begun and advertised as 'without reserve' must be proceeded with or a contract is broken.

Commercial advertising may be said to embrace 2 deplis.: A. by poster and otherwise in places of public resort, and A. in papers, books, and other reading matter. The first Eng. newspapers contained no As., but a journal pub. at the middle of the seventeenth century, the *Mercurius Politicus*, had small As. of the 'situations wanted' type. With the rise of newspaper advertising the character of the newspaper has undergone a profound change. The establishment of *The Times* in 1785 may be regarded as the commencement of the period of modern A. From 1712 to 1853 a varying revenue tax was imposed on As. The annual revenue derived from this was £170,000 in 1832, but the following year the duty was considerably reduced. Despite this the Treasury was receiving £180,000 when the duty was abolished. Among other forms of A. are those of hand-bills, sand-wichmen, illuminated sky-signs by night of various and varying colours, boards and metal sheets of all descriptions on rolling-stock, on railway stations, and at the railway and roadside. But most common of all forms of outdoor A. is the poster. Many of the posters of large firms contain pictures of high artistic merit. To the aid of A. have been called painters like Millais and Herkomer, black-and-white artists like John Hassall and Charles Harrison. One firm of soap merchants, Messrs. Pears, united the art of artist and poet in an A. which was the joint production of Walter Crane and Sir Theodore Martin. Advertising by poster and in newspapers continues to be developed to the utmost limits of ingenuity, and the literature on the art

grows correspondingly. Argument on the efficacy of the poster suggests that there is a danger of confusing its functions with those of the newspaper A. It is the function of the latter to attract attention and stimulate the wish to buy, whereas that of the poster is merely to act as a reminder, though it may indirectly lead to the desire to purchase. Changes in schools of painting, too, are reflected in the poster, though it is still maintained that the better the painter the better the poster. Some experts in advertising aver *e.g.* that Mauet and Bonnard were better poster artists than were Millais or Leighton, because they were better painters, but the point is obviously highly controversial. What seems clear is that the two arts are distinct, and that until the distinction is properly recognised, there will continue to be a compromise. The art of Brangwyn, as exemplified in railway company posters, offers, however, a high degree of symbolical skill and pictorial beauty which are not easily rivalled, lending, as they do, a genuine dignity to the subject with which the A. is associated. In recent years there has been a marked improvement in the use of boardings, though hostility has been aroused by a too liberal display of them to the detriment of rural beauty. The technique of poster design demands, according to some exponents, that the true individual note be sought and achieved at all costs, and that this is to be attained by avoiding as the main colour the colour which happens to be dominant at the time; and similarly, if much letterpress happens to be in vogue, this should be subordinated to concentration on pictorial work; while, again, if all advertisers of a particular thing, as *e.g.* sauce, favour a mammoth bottle, the individual note may be achieved by employing some other object altogether, provided it be striking and directly related to the subject advertised. It is probably becoming universally recognised that good taste in advertising pays. There is, at all events, a manifest striving after the ideal. A real or quasi-literary touch is given, *e.g.* to the numerous slogans which appear in public places, notably in the carriages of the London underground railways. Pictorial designs suggestive of vernal delights are introduced to attract the passenger to these railways, although at first sight he may not commonly associate such amenities with underground travel. Good slogans may well repay the ingenuity expended on them. Here again technique has evolved its principles. A good slogan should directly or by necessary inference apply to the article advertised, and not rely merely on the name being mentioned casually or in some other part of the A.; the slogan may be alliterative, but in any event should have a lilt or rhythm which compels recollection; and it must contain some one or more key-words upon which the full emphasis naturally falls. Examples are 'The Prudential has the strength of Gibraltar,' 'If it's Wolsey

It's Wool,' 'It's the Little Daily Dose that Does It,' 'Jovril Puts Beef into You,' 'These Hands may be Yours,' in all of which phrases some or all of the above desiderata are exemplified. The requirement of a good key-word is illustrated in the famous political slogan 'We will have a White Australia,' which had the effect of putting the protectionists in power in Australia and, incidentally, proved the important part mass suggestion may play in advertising. Related to poster advertising are scintillating signs, a form which has been greatly developed in recent years.

*Advertising Agencies.*—Advertising agencies in Great Britain are gradually acquiring a stronger position, but do not as yet enjoy the status of such agencies in the U.S.A. In America, the advertising agent is recognised by newspaper and advertiser alike as the chief factor in the practice or business of advertising, and in consequence the problem of commission has been solved satisfactorily long ago. In Great Britain, however, discussion is still heard on the position of, or even the necessity for, the agent. There is an Association of British Advertising Agents, to which most agents belong, but it is not necessary to be a member; and, generally speaking, the position of the agent in relation both to newspapers and advertisers stands in need of definition. In earlier days the agent had no part in the preparation of copy or layout, but to-day he vies with the advertiser and the advertising staff of a newspaper in the art. Sixty years ago, the agent merely sold newspaper space, but later he suggested the best use to which such space might be put. This change from the position of a mere canvasser was for the better, but the change could not be permanent while the impulse to advertising came from the manufacturer or trader; and it was only when the agent began to make use of propaganda in favour of advertising that the real change came. Rates remain a difficult question, because the large business concerns so frequently employ their own advertising managers, while again the newspapers also employ skillfully managed advertising departments.

*Newspaper Circulation and As.* Revenue from As. is and has long been the mainstay of newspaper enterprise in Great Britain; but the proportion of income which the newspapers derive from sales circulation as compared with that from As. varies greatly with different papers; and, in the case of a popular paper with a very large circulation, it may be assumed that the revenue from As. is about 20% higher than that accruing from sales, so that the latter covers more than half the cost of running the paper. Experts concede that A. revenue should cover about 60% of outlay and provide the profits as well. The importance, therefore, of the revenue from As. is palpable, though the effect on the editorial impartiality of some newspapers may be detrimental to the interests of many of

its readers. The largest circulations do not necessarily bring the highest advertising revenue. A newspaper's power to sell the goods advertised in its columns depends partly on the purchasing power of its readers. Again, advertisers who may be disposed to place undue reliance on a vast 'net sales' total should consider how far the total is artificially swollen by free gifts, insurance benefits, competition prizes, and the like. Conversely, a high-class newspaper or periodical may be better value for advertisers than its small circulation figures suggest: for a single copy, besides being read by a more influential class of persons, may often regularly pass through a great many hands. Most newspapers sell their advertising space at a discount of not less than 25% on their standard rates.

**Advertising in the U.S.A.**—America has so long been regarded as the home of advertising that until very recent years the whole world, including Great Britain, has been satisfied to accept her methods as a pattern and to measure success by the speed with which her newest ideas could be adopted. Although other nations are now striking their own characteristic notes, America still remains a leading force in advertising. Amer. advertising falls into 2 main groups, press and non-press. This clear div. should be recognised, in view of many modern movements and particularly in relation with the fact that the great advertising agencies of America, which are almost a close corporation, provide the main revenues of the newspaper firms, which are themselves closely knit corporations.

Press advertising falls into 2 depts., which appear to be worked on 2 entirely different principles: (1) general national advertising, and (2) mail-order advertising. In the first, of these, where goodwill is built up by a prolonged and persistent series of efforts, the very best available skill in art and writing is eagerly sought for, with results that are often highly pleasing. In the second, where immediate response is essential, every inch of space is crowded to capacity. Posters, sky-signs, cinema films, illuminations, letter-box publicity are among the leading methods outside the press. America is very susceptible to new fashions in advertising, and any idea that gains great prominence is swiftly followed. Thus the craze for aeroplane sky-writing of a decade or two ago has for many years been followed by great displays of floodlights and illuminated and flickering sky-signs. To such an extent has this been carried on that the brilliant illumination of Broadway at night has gained it the name of The Great White Way. The greatest extension of all in America has been in the setting up of special publicity staffs inside thousands of separate firms who were at one time content to employ agencies. A mail-order firm, for example, would regard the advertising dept. as the chief section of its business, and stand or fall by its own efforts. Special-

ists, too, have a vogue. Slogan-writing, form-letter writing, illustration, copy-writing, are not only undertaken by freelance workers, but also by firms that cater for special needs.

See Sir C. F. Higham, *Advertising: its Use and Abuse*, 1925; J. M. Allison, *First Essays in Advertising*, 1926; R. H. W. Cox, *The Lay-out of Advertisements*, 1931; F. B. Lane, *Advertising Administration*, 1931; R. Simmat, *Market Research*, 1931; H. W. Kley, *Advertising Media*, 1932; L. Richmond, *The Technique of the Poster*, 1933; A. P. Braddock, *Applied Psychology for Advertisers*, 1933; H. N. Casson, *A Complete Advertising Course*, 1937; W. G. Briggs, *The Camera in Advertising and Industry*, 1939; J. M. Higginson, *Practical Advertising Management*, 1940; H. W. Hepner, *Effective Advertising*, 1941; F. P. Bishop, *The Economics of Advertising*, 1944; C. K. Shaw, *Industrial Publicity*, 1944; E. A. Lever, *Advertising and Economic Theory*, 1947.

**Advocate** (*Lat. advocatus*, from *advocare*, to call to one's aid) is the name given in ant. Rome and in many modern states, including Scotland (*see* ADVOCATES, FACULTY OF), to a forensic orator. The Eng. term for this is barrister or counsel (*q.v.*). An A. of Aberdeenshire is not a barrister but a solicitor, it having been decided by *McPherson v. Watt*, 3 App. Cas. 254, that solicitors in that county had a right to the appellation. Prior to 1857, the name A. was given to those licensed by the archbishop in the Court of Arches, but since then barristers have been admitted to the eccles. courts.

**Advocate, Lord**, or, as he was called prior to 1598 and is still sometimes called, King's A., is the prin. law officer of the Crown for Scotland, his duties corresponding in the main to those of the attorney-general for England. His office was created by James III. in the year 1480, and his multifarious duties include that of public prosecutor. He has always played an important part in political affairs relating to Scotland, and for a long while was practically secretary of state for Scotland. He was *ex officio* a member of the old Scottish parliament, and after Walpole abolished the office of secretary for Scotland and before the revival of that office in 1885, his power in Scotland was of a most far-reaching nature. Nowadays he is always a member of the ministry, but not of the Cabinet, and he and his assistants, the solicitor-general and the 4 As.-depute, resign when the Gov. who appoints them resigns. A salary of £5000 (and perquisites) is paid to him, but he is not precluded from taking private practice. The L.A. is often, but not always, a member of the Privy Council, but while in office is invariably addressed as the Right Honourable.

**Advocates, Faculty of.** All members of the Scottish bar belong to this body and are called As. Although their name is derived from the Fr. *avocat*, in privileges and liabilities their position closely resembles that of an Eng. barrister. The faculty was founded in 1532, when James V. instituted the College of Justice,

of which it forms part. Limited in the first instance to 10, the members of this faculty now exceed 400, but it is computed that the members who practise are not half this number, and fewer still make a living by the profession. The fact of graduating in the 2 examinations set by the faculty is, however, considered most useful as leading to official or public appointments, and there is consequently no dearth of candidates for admission to the faculty. The first examination is in general scholarship, the second, after the lapse of a year, is in law. The fees payable by the would-be member amount to nearly £350, and include the subscription to the widows' fund of the body and to the As.' library (*q.v.*) maintained by the faculty. The dean, or chairman, of the faculty is elected yearly, and has precedence at the bar even over the crown law officers. The latter, together with the judges of the court of session and the prin. sheriffs, are always selected from the faculty, and only members of it are allowed right of audience in the above-named court. The faculty continues to this day the duty imposed on As. by a statute of 1424, viz. assisting poor litigants (Poor's Roll).

**Advocates' Library**, the largest library in Scotland, and exceeded in size only by the Bodleian library, Oxford, and the Brit. Museum library, London, is situated in the building of the Parliament House, Edinburgh. It was founded in 1682 by Sir George Mackenzie for the use of the Faculty of A., of which he was dean, and it has been maintained by them ever since. In 1692 the library had about 3000 vols., but at the present day the number exceeds half a million, including over 3000 MSS. Since the first Copyright Act, 1709, the A. L. has been one of the libraries entitled to receive a copy of every book copyrighted. It is now called the National Library of Scotland.

**Advocation**, the process by which, prior to its abolition in 1868, an appeal was made from the Scottish sheriff courts to the court of session.

**Advocatus Diaboli** (the devil's advocate), the name of one appointed in the Rom. Catholic Church to set forth possible objections to any person whom it is proposed to canonise, i.e. admit to the calendar of the saints. Opposing the devil's advocate was God's advocate (*A. Dei*). As the objections were generally not valid, and only made as a matter of form, the term A. D. has come to be applied generally to any person who knowingly puts forward arguments with which he himself is in disagreement.

**Adwoson**, the right of presenting an eccles. benefice or 'living' in the Church of England. Such right rests in those who have founded and endowed churches, their heirs or executors, and those to whom they have transferred the right. An A. is a form of real estate and, subject to certain statutory regulations designed to prevent simoniacal practices, may be freely disposed of. It may pass with the sale of a manor, in which case it is called

an *A. appendant*, or separately as an *A. in gross*. Where the patron is a Jew his right lapses to the archbishop of Canterbury, and if the patron be a Rom. Catholic the right of presentation goes to the univ. of Oxford or Cambridge, whichever is nearest to the benefice. When the monasteries were dissolved, the adwosons with great titles passed by Crown grant to some layman, called, in respect of tithes, an impropiator, and in respect of A., a lay rector or patron, but where no such separation has occurred, the living remains a rectory. Recent legislation has much curtailed the right of sale of As. and in time the right will cease altogether.

**Adye**, Sir John Miller (1819-1900), Brit. soldier, son of Major J. P. Adye, was b. at Sevenoaks, Kent, and educated at Woolwich. He served during the Crimean war and Indian mutiny as assistant adjutant-general of the Royal Artillery. From 1870-75 he was director-general of artillery, and in 1882 served in Egyptian campaign; from 1882 to 1886 he governed Gibraltar, retiring in the latter year. He unsuccessfully contested Bath in 1892. Publications: *The Defence of Camperdown*, 1858; *Recollections of a Military Life*, 1895; and *Indian Frontier Policy*, 1897.

**Aduym** (Gk. ἀδυτον), a place that may not be entered. In ant. temples it was the innermost and secret chamber, where oracles were delivered and mysteries performed, and only the priests were allowed to enter therein.

**'A.E.'** see RUSSELL, GEORGE WILLIAM. **Æacus**, the son of Zeus and Ægina, a daughter of the riv. god Asopus. He was king of the Myrmidons, and owing to his justice and piety was made, after his death, one of the 3 judges in Hades. See Horace, *Odes*, ii. 13; iii. 19; iv. 8.

**Æcidium** (Gk. αἰκία, injury), or Cluster Cup, a fruit of a parasite plant belonging to the Uredineæ. It is also the name of the genus of the fungi; *A. cancellatum*, the pear-æ., gives the pear-tree leaves a warty appearance in autumn; *A. berberidis*, the barberry blight, is responsible for the bright orange powdery-looking substance seen on the barberry, in reality the spores of the fungus.

**Ædiles** were Rom. magistrates, first appointed 949 B.C. and elected from the plebs. At first they were the officers of the tribunæ, and had to keep the decrees of the senate in the temple of Ceres (Livy, iii. 6, 55). The 2 curule or patrician Æ. were first elected 364 B.C. (Livy, vi. 42). They had the care of the temples, public buildings, the sanitation of the city, the roads, presided at religious celebrations, and inspected the markets, weights and measures. Julius Cæsar appointed 2 more plebeian Æ. 45 B.C. to look after the corn supply.

**Ædul**, or **Hædul**, a powerful Gallic race who lived between the Loire and the Saône, and were the first to form an alliance with the Romans. Their prin. tn. was Bibracte. See Cæsar's *De Bello Gallico*, l. 10 et passim.

**Ædwine**, see EDWIN.

**Æetes**, son of Helios and Perse, king of Colchis, was the father of Medea and Absyrtus. When Jason came to Æ. for the golden fleece, Medea fell in love with Jason, and after she had helped him to obtain the treasure fled with him to Iolcos, taking with her Absyrtus, whom she killed, and by strewing the pieces of his body on the road detained her father, who was pursuing her. She afterwards returned to her father. Ovid, *Heroides*, xii. 29.

**Ægadian Islands**, anct. **Ægades**, **Ægates**, or **Ægusse**, are 3 small is. off the W. coast of Sicily. In 241 B.C. the Romans here defeated the Carthaginians in a naval battle, and thus brought the first Punic war to an end. Pop. about 6000.

**Ægæ**: 1. A tn. in Achaia on the Crathis, with a celebrated temple of the god Poseidon, originally 1 of the 12 Achaean tns., but its inhab. subsequently removed to Ægira. 2. A tn. in Emathia in Macedonia, the anct. cap. of Macedonia, and the burial-place of the Macedonian kings. It was also called Edessa (q.v.). 3. A tn. in Eubœa with a celebrated temple of Poseidon, who was hence called Ægæus. 4. Also Ægæe, 1 of the 12 cities of Æolis in Asia Minor, N. of Smyrna, on the R. Hyllus. 5. A seaport tn. of Cilicia.

**Ægeon**, in Gk. mythology, son of Uranus (Heaven) by Gæa (Earth). Æ. and his brothers Cœus or Gyges and Cottus are known under the name of the Uranids, and are described as huge monsters with 100 arms and 50 heads. Most writers mention the third Uranid under the name Briareus instead of Æ., which is explained by Homer, who says that men called him Æ., but the gods Briareus (q.v.). According to the most anct. tradition, Æ. and his brothers conquered the Titans when they warred against the gods, and secured the victory to Zeus, who thrust the Titans into Tartarus and placed Æ. and his brothers to guard them. Other legends represent Æ. as one of the giants who attacked Olympus; and many writers represent him as a marine god living in the Ægean Sea.

**Ægagre**, a species of wild goat or ibex, found in the mts. of E. Europe and of Persia, where it is called *paseng*. The oriental bezoar, a stone once supposed to possess medicinal virtues, is sometimes found in its stomach.

**Ægean Sea and Islands**, the name used by the Gks. and Romans for that part of the Mediterranean Sea between Asia Minor and Greece. It is now called the Archipelago, containing, amongst many other is., the Cyclades and the Sporades and the Dodecanese group. The Dodecanese is.—Rhodes, Scarpanto, Kos, Astypalaia, Patmos, Kaxo, Kharki, Nisyros, Leros, Kalymnos, and Tilos—were in It. occupation up to late in the Second World War. Italy occupied some of the Dodecanese is. during the Tripolitan war, 1911-12, at a time when they belonged to Turkey. In the First World War, Greece, as the price of joining the Allies in the Dardanelles campaign, demanded the Æ. is., but further bargaining by Venizelos (q.v.) was

stopped by King Constantine, who dismissed his Premier. Later in the same year Italy demanded as compensation from Austria-Hungary the *de jure* sovereignty of the Æ. is. In the post-war settlement Greece was granted all the coasts and is. of the Æ. S., but after further negotiations in 1919-20 between Italy and Greece, Italy, by the treaty of Sèvres, abandoned her claims to most of the is. (except as to Rhodes) in favour of Greece, and Greece in return agreed to lease to Italy the site of a coaling station in the is. and to recognise an It. protectorate of most of Albania. After the treaty of Lausanne, 1923, Turkey denounced the treaty of Sèvres and ceded the is. to Italy. Greece, however, still claimed the Dodecanese is. On Sept. 16, 1943, following Italy's surrender, allied forces landed on Samos, Leros, and Cos, and joined the It. garrisons there. But on Oct. 3 the Gers. delivered a strong attack on Cos, which they took. They then turned to invade Leros which the Brit. held until Nov. 16; and as a result Samos was evacuated and the projected allied invasion of the Balkans had to be postponed. Had not the Its. surrendered Rhodes and its aerodromes to the Gers. without firing a shot, Cos and Leros might have been held, although in order to attack the is. the Gers. had to divert large land sea and air forces from Italy and Russia.

**Ægeus**, king of Athens, was the son of Pandion and father of Theseus. He was restored to the throne (from which he had been driven by the 50 sons of Pallas) by his son Theseus. Theseus went to Crete to deliver Athens from the tribute it had to pay to Minos, promising that he would hoist white sails on his return as a signal of his safety. He, however, forgot to do so, and Æ., thinking his son had perished, threw himself into the sea. From this event the Ægean Sea has received its name.

**Ægidius Romanus**, see COLONNE.  
**Ægina**, a small rocky is. and tn. in the gulf of Æ. or Saronic Gulf. On a hill in the N.E. of the is. was the temple of Zeus Panhellenus, the ruins of which still remain. It was occupied by the Achæi (Homer, *Iliad*, ii.) and afterwards by Dorians. It became a place of great commercial importance (Herodotus, ii. 178; vii. 147), and its silver coinage was the standard in most of the Dorian states. In the sixth century B.C. it was an independent and powerful state and the chief seat of Grecian art. In 429 B.C. the Athenians took possession of the is. and expelled the inhab. (Thucydides, ii. 27). Area 32 sq. m.; pop. (is.) 9000, (tn.) 5000.

**Ægis**, a representation of the storm-cloud with snaky lightnings twisting around, was the shield of Zeus, and a token of his power. Athena also wore the Æ. with the Gorgon's head (Horace, *Odes*, iii. iv. 57). It was a symbol of protection.

**Ægisthus** was the son of Thyestes, whom he placed upon the throne, driving away his uncle Atreus. According to Homer, Æ. took no part in the Trojan

war, and during the absence of Agamemnon he seduced his wife Clytemnestra (*Odyssey*, iii. 329). He murdered Agamemnon on his return home, and reigned for 7 years over Mycenæ (*Odyssey*, iii. 388). Orestes, the son of Agamemnon, then killed Æ. (*Odyssey*, iii. 242). Æschylus, Sophocles, and Euripides also give an account of this story.

**Ægium**, a tn. of Achaia, on the Corinthian Gulf, in anc. times chief city of the Achæan League. It was a legendary bp. of Zeus. Vostitza, the modern tn., exports currants.

**Ægospotamos**, a small riv. ('goat's riv.') flowing into the Hellespont and a tn. on it, in Thracian Chersonesus. Here Lysander utterly defeated the Athenians, 405 B.C. See Plutarch's *Alcibiades*, 36.

**Ægrotat** (Lat., he is ill), a medical certificate given to univ. students to explain their absence from lectures. An *Æ.* degree is sometimes given to students unable to sit for their final examination on account of illness, but whose known proficiency justifies the bestowal of a degree without examination.

**Ægyptus**, king of Egypt, son of Belus, and twin brother of Danaus. Æ. had 50 sons, and Danaus 50 daughters. Danaus, fearing the sons of Æ., fled with his daughters to Argos, where he was followed by the sons of Æ., who demanded his daughters in marriage. Danaus granted their request, but, giving each daughter a dagger, ordered them to murder their husbands on the wedding night. Thus all perished except Lynceus, the husband of Hypermetra, who did not obey her father's instructions.

**Aehrenthal, Alois L. B., Count Lexa von** (1854-1912). Austro-Hungarian diplomatist, foreign minister (succeeding Count Goluchowski) in 1906. He was son of Baron Johann Lexa von A., and was b. at Gross-Skal in Bohemia; studied law at Prague and Bonn; entered the diplomatic service 1877 as attaché to Paris embassy; at St. Petersburg 1878-1883; then chief of the Cabinet to Count Kalosky. At St. Petersburg as councillor of legation 1888-94; minister at Bucharest 1895-99; ambassador at St. Petersburg 1899-1906. Thenceforth he directed the foreign policy of the dual monarchy till his resignation on the day of his death. He was friendly to Italy; had no sympathy with Russian liberalism, and little belief in the disinterestedness of Ger. support of his annexation (in defiance of the treaty of Berlin) of Bosnia-Herzegovina Oct. 6, 1908: one link in the chain of causes of the First World War of 6 years later. He was very formal in his acknowledgment of the Emperor William's 'shining armour' assurance, made Sept. 21, 1910, at Vienna. A. was made a count (Graf) Aug. 18, 1909. All his efforts were for the aggrandisement of Austria-Hungary. In 1902 he married Pauline, Countess Széchenyi.

**Ælfrie**, a distinguished Saxon prelate, became abbot of St. Albans, bishop of Wilton, and archbishop of Canterbury from 995 until his death in 1005. He

was one of the most learned ecclesiastics of his time.

**Ælfrie**, an Eng. writer who lived at the end of the tenth century. He has been confused with Æ., archbishop of Canterbury from 995 to 1003, and with Æ., archbishop of York, but it is certain that he was a pupil of Æthelwold, and most probable that he was an abbot at Winchester. He afterwards became abbot of Cerne and of Emsham; but he is most celebrated for his 2 books of *Homilies*, trans. from the Lat., and ed. by Thorpe for the *Æ.* Society (1814-46). They are a good illustration of the doctrine of the early Eng. Church. Among his other works are: *A Latin and English Grammar and Glossary* (from which he is called (Grammaticus), first printed by Somner, 1659, and included in Prof. Zupitza's *Sammlung Englischer Denkmäler*, 1880; *Colloquium*, and *A Treatise on the Old and New Testaments*, besides translations, epistles, and other treatises.

**Ælia Capitolina**, a name given to Jerusalem by the emperor Hadrian when he had driven out the Jews and there established a Rom. colony c. A.D. 132.

**Ælianus**, Claudius, who lived at the end of the second century A.D., was a Rom. citizen and writer, and a native of Pheenoste (Paestrum). He was the author of *Varie Historie* (composed in Gk. in 14 books), and *De Natura Animalium* (also in Gk. in 16 books).

**Ælla** (d. 588) was the son of Iffa and grandfather of Oswald, and became first king of the Deirans, 559.

**Ælred, Aired, or Ethelred, St.** (1109-1166), historian, was b. at Hekham, and at an early age entered the household of David I. of Scotland. He refused a bishopric, becoming a monk in the Cistercian abbey of Rievaulx, but later was elected abbot of Rievaulx, Lincolnshire, in 1143, and of Eveshaux in 1146. He was noted for his gentleness, asceticism, and the piety of his life, and on a mission to the Picts of Galloway in 1164 he induced the chief to become a monk. His works, which have never been collected in a complete ed., include the *Vita et Miracula S. Edwardi Regis et Confessoris*, *De Bello Standardii* (waged in 1138), and *De Spirituum Amicitia*. See *Vita S. Ælredi* in the Bollandist *Acta Sanctorum*, Jan. ii., p. 39, and T. Tanner's *Bibliotheca Britannico-Hibernica*, 1748.

**Aeltre**, an industrial tn. of W. Flanders, Belgium, which manufactures canvas and exports oil; pop. 7000.

**Æmilian Way** (Lat. *Æmilia Via*), a famous highway of anc. Italy which continued the Via Flaminia from Ariminum (Rimini) through Bononia (Bologna) to Mutina, Placentia, and Mediolanum (Milan). It was constructed by Consul M. Æmilius Lepidus in 187 B.C.

**Æmilius Paulus, Lucius**: (1) was twice consul at Rome, the first time with Marcus Livius (Livy, xxi. 35), and was killed in battle near Cannæ, 216 B.C. (Livy xlii. 21). (2) The son of the above—became curule ædile, prætor, proconsul, and consul 182 B.C. and 168 B.C. He

commanded an army in Liguria, and completely defeated the Ingauni, 182-1 B.C. In 168 B.C. he was in command of the war against Perseus, who was finally defeated at Pydna in Macedonia. Æ. d. in 160 B.C. (Livy, xxxiv.-xl. and xlv.-xlv.).

**Æneas**, the hero of Virgil's *Æneid*, the son of Anchises and Aphrodite, was b. on Mt. Ida, and was, next to Hector, the greatest of the Trojan heroes. It was not until he was attacked by Achilles on Mt. Ida that he took part in the Trojan war, and led his Dardanians against the Gks. According to most accounts he withdrew to Mt. Ida after the capture of Troy, crossed over to Europe, and finally settled at Latium in Italy. The account of his wanderings is given in Virgil's *Æneid*. He left Troy carrying his aged father on his back, but in the confusion of the flight he lost his wife Creusa. He sailed to Thrace, and then, misinterpreting the oracle of Delphi, went to Crete, thence to Epirus and Sicily. He was then driven by a storm on to the coast of Africa, where he met Dido, with whom he tarried for a while and who vainly loved him. He then sailed to Latium, founded the tn. of Lavinium, and married Lavinia, daughter of Latinus, king of the Aborigines. Turnus, to whom Lavinia had been betrothed, made war on Latinus and Æ. Latinus was killed and Æ. became sole ruler of the Aborigines and Trojans, uniting both nations into one. Turnus was killed by Æ., and Æ. himself was killed whilst engaged in battle against the Rutulians.

**Æneas Silvius**, son of Silvius, and grandson of Ascanius, was the third of the mythical kings of Alba in Latium.

**Æneid**, the greatest work of Virgil, and the national epic of the Rom. people. It was completed in 12 books, but as it was not revised Virgil expressed a wish that it might be destroyed. It was, however, pub. after his death by Tucca and Varius. It contains an account of the wanderings and the settlement of Æneas after the siege of Troy. It has been trans. into Eng. prose by Conington (London, 1870) and by Mackail (London, 1885); and into Eng. verse by Gavin Douglas, 1553; Dryden, 1697; C. H. Kennedy, 1861; J. Conington, 1866; W. Morris, 1876; W. J. Thornhill, 1886; T. H. D. May, 1903; E. Fairfax Taylor, 1903; A. S. Way (1.-ix.), 1916-29.

ÆOLIAN HARP

**Æolian Harp**, a musical instrument consisting of a wooden box over which are stretched sev. patent strings of different thicknesses, tuned in unison. When exposed to the wind harmonious sounds are produced. It is supposed to have been invented by St. Dunstan, but the present Æ. H. was not known until about

the end of the sixteenth century. It is mentioned in Thomson's *Castle of Indolence*.

**Æolian Islands**, see LIPARI ISLANDS.

**Æolians**, one of the branches of the Gk. race, who originally dwelt in Thessaly. From there they settled in N. Greece and Peloponnesus. They also immigrated to the N.W. of Asia Minor, establishing 12 cities along the coast dist. known as Æolis, and to Lesbos and Tenedos.

**Æolina**, a very small musical instrument, consisting of short elastic metallic springs fixed in a frame, and acted on by the breath of the performer. Some comprise 3 octaves of diatonic sounds. Also the name given by Sir Charles Wheatstone in 1829 to the mouth-organ, or harmonica (U.S.A.), the invention of which is attributed to him.

**Æolipyle**, or **Æolipile** (from Lat. *Æolipyle*, the gates of Æolus), a metallic ball partly filled with water, and having tubes projecting horizontally. When heated steam rushes out of the tubes, setting the ball in motion. It was first described by Hero of Alexandria.

**Æolis**, see ÆOLIANS.

**Æolus**: 1. Ruler of Thessaly, and founder of the Æolic branch of the Gk. nation. 2. Son of Hippotes, or, according to others, of the god Poseidon. According to Homer he was the ruler of the Æolian Is., and was given power over the winds by Zeus. See also Ovid, *Heroides*, xi. 65-128.

**Æon** (αἰών), a word meaning age or eternity, denoting an infinite period of time, also a being that lives for ever. The Gnostics use the term to indicate manifestations from God, i.e. spirits which form a separate existence, having influence over phases of the world's progression.

**Æpinus**, Franz Ulrich Theodor (1724-1802), a Ger. natural philosopher. He is most widely known for his works on research in magnetism and electricity. He pub. *Tratamen Theoric Electricitatis* in 1759, and among other works memoirs on astronomy and its kindred subjects.

**Æpyornis**, a huge, wingless, and long-extinct bird, the existence of which may explain the fabled roc of Arab legend. It belonged to the family Æpyornithidae containing a number of allied forms, one class of which is as large as the dinosaurs. The former existence of the bird was inferred from the eggs found in the marshes of Madagascar, which were 36 in. in circumference, and from the later discovery of bones which showed that the Æ. was similar to, but much larger than, the apteryx. Ornithologists state that it resembled the ostrich, had long, thick legs, 4-toed feet, rudimentary wings, and stood over 7 ft. high.

**Æqui**, a tribe of anct. Italy. They waged incessant war against the young Rom. republic. Their great stronghold was Mt. Algidus. In 446 B.C. they made their last assault upon Rome. They were eventually subjugated by the Romans, after a great struggle which began in A.D. 301.

**Aerated Bread** is made from dough

prepared by mixing the flour with water strongly charged with carbon dioxide. This process produces the requisite degree of porousness in a few minutes, as compared with hours by the ordinary yeast method.

**Aerated Waters**, water artificially charged with more carbon dioxide than it would dissolve under atmospheric pressure, and often containing dissolved medicinal salts or flavouring matter. They were invented in the eighteenth century by the famous chemist Joseph Priestley (*q.v.*). The use of A. W. was suggested by the existence of mineral springs where water issues forth with considerable quantities of carbon dioxide in solution, causing effervescence when exposed to the ordinary pressure of the air. The term A. W. is not here applied to the natural products of springs (*see* MINERAL WATERS), nor to liquids like bottled beer, ginger beer, champagne, etc., where the carbon dioxide is produced by fermentation (*see* FERMENTATION).

There are many varieties of machinery for the manuf. of A. W., but they contain the same essential features. The gas is usually obtained by treating chalk with sulphuric acid; from the gas generator it passes into a washer, where it is purified by passing through water. It is then stored in a gasometer, whence it issues to the condensing apparatus together with the water or liquid with which it is to be incorporated. Here it is thoroughly mixed and then bottled under pressure. The bottles are often closed by stoppers held in place by internal pressure, but screw stoppers are also used. Larger bottles have what is called a siphon arrangement. A tube passes nearly to the bottom of the vessel and communicates with a spout by a spring valve; on operating the valve the pressure of the gas drives the liquid out with some force. The *seltzogen* is a simple arrangement for home use. It consists of 2 globes connected by a wide tube reaching nearly to the top of the smaller or upper globe. A narrow tube passes from the bottom of the larger globe through the connecting wide tube to a spring valve communicating with the spout. A mixture of tartaric acid and bicarbonate of soda is placed in the smaller globe, and sufficient water tilted from the larger globe to fill about one-third of the upper globe. Gas is produced when the mixture is moistened; it dissolves under its own pressure in the water in the reservoir, and on operating the spring valve can be withdrawn as in the ordinary siphon. Carbon dioxide is also supplied in a greatly compressed form in little steel capsules which are introduced into a specially constructed siphon. On screwing in the top a sharp point pierces the capsule, liberating the gas and supplying the necessary pressure.

A. W. used for medicinal purposes contain potassium bicarbonate (*potash*), sodium bicarbonate (*soda*), citrate of lithia (*lithia*), or compounds corresponding to some of the well-known continental mineral waters. Those used purely as beverages contain a very small

proportion of fruit syrup and occasionally colouring matter to give an attractive appearance.

**Aerial (or Antenna)**, in radio communication, the conductor or group of conductors, usually raised above the earth's surface, by means of which electric waves are emitted or radiated when high-frequency oscillatory currents are sent into the wires. A similar A. is employed at the receiving station to convert the arriving electric waves into oscillatory currents which actuate the receiving apparatus. The simplest A. consists of a single vertical wire supported by and insulated from a suitable mast. When the available height of mast is small compared with the wavelength used, the A. is frequently extended in a horizontal direction in order to increase its capacity and thereby its 'effective height.' The natural wavelength of an A. is that wavelength at which the A. is in resonance when connected to earth without any additional reactance. For a simple earthed vertical A. the natural wavelength is a little more than 4 times the length of the A. Some types of A. in use are in the form of closed loops, with one or more turns of wire, the inductance so formed being tuned by a variable condenser to resonance at the working wavelength. These frame As. are employed in portable receivers and direction-finders as well as in special types of transmitter. In Great Britain, a private receiving A. must not exceed 100 ft. in length.

**Aerial Navigation** is the science that deals with all points of practical flying, outside the actual working of the machine itself. It includes fixing one's geographical position, maintaining a course, and selecting an altitude favourable with regard to wind and weather.

The best way of fixing position, called the *dead reckoning*, is by recognising objects on the ground. This, however, is not always possible. In *dead reckoning* navigation allowance has to be made for wind. Aircraft cannot travel along a set 'track,' unless the 'track' runs fore and aft with the wind. Ordinarily the actual path of the machine is at an angle to its course, called the *drift angle*. For *dead reckoning* navigation it is necessary to know the true air speed and the wind velocity. The *air-speed* indicator gives the speed of the aircraft in relation to the air. It is an *air-pressure* gauge, and, since pressure decreases with altitude, true air speed is found by adding  $\frac{1}{4}$  per cent to the reading of the indicator for every 1000 ft. of altitude. There are also instruments—the *aero bearing plate* and the *wing gauge bearing plate*—which register the drift of the aircraft and the velocity of the wind.

The *Aero Compass* consists of a bowl of non-magnetic material filled with liquid and fixed to a mounting constructed to overcome vibration. The iron used in the construction of the aircraft causes a deviation of the compass needle, and this has to be corrected by compensating magnets.

The *Altimeter* is an aneroid barometer, which records the atmospheric pressure at any altitude. Pressure on the earth's surface decreases in proportion to the altitude. A fall of  $\frac{1}{4}$  in. corresponds to a rise of 90 ft. The altimeter, however, records changes in pressure due not only to altitude, but also to weather.

The *Gyro Turn Indicator* enables the pilot to keep his machine level when flying straight and to bank at the correct angle when turning. It consists of an air-driven gyroscope, which reacts only to motion about a vertical axis and is unaffected by rolling or pitching.

*A. N. at Night or in Bad Weather.*—The pilot equipped with radio can obtain 'fixes,' bearings, or meteorological information on request from major airports. Such airports have a control organisation for regulating traffic within a zone extending in some cases up to 35 m. The navigator is helped by the airport's runway, boundary, and taxi-track lights and by the aids to landing in poor visibility. These include radio and radar beacons, which indicate on the aircraft's instruments the approach path it must follow to arrive at the end of the runway. Another system allows the track of the incoming aircraft to be followed by radar and approach instructions to be given by radio to the pilot. The control also instructs pilots the heights and courses to follow within the control zone, and this is of the utmost importance, particularly in foggy weather.

*Aerial Laws.*—The first International Air Convention, 1919, laid the foundation of trustworthy communication by air between one country and another. At this time separate provisions were made for Germany under the treaty of Versailles, articles 313 to 320. When Germany became a member of the League of Nations, these were abrogated, and Germany abided by the international convention. The main clauses of the convention establish a nation's sovereignty over the national atmosphere, made a certificate of airworthiness obligatory for all machines, and forbade the carrying of such cargo as high explosives from one country to another. An international commission for A. N. was also set up to deal with all points of aerial law.

See C. M. Botley, *The Air and its Mysteries*, 1938; F. G. Brown, *Air Navigation*, 1941; M. J. Hearley, *Air Navigation: Some Problems and their Solution*, 1942; D. E. Webster, *Air Navigation for Cadets*, 1942.

*Aerial Perspective*, see PERSPECTIVE.

*Aerial Surveying*, see SURVEYING AND LEVELLING.

*Aerial Warfare. Experimental Period.*—Military aviation was in the experimental stage in 1912. The Central Flying School at Upavon was opened in that year and a beginning was made in the instruction of pupils in map-reading and signalling. In the same year military aeroplane trials were held on Salisbury Plain with a view to finding the most suitable type of fast good-climbing machine, able to take off and alight on

rough ground, and to pull up within a reasonably short distance after alighting. These trials did not evolve a suitable machine, but they gave a real stimulus to the aeroplane industry. Progress was rapid thereafter, and early in the First World War a good 2-seater machine could rise to a height of nearly 10,000 ft. in less than 10 min. In the army manoeuvres of 1912 the reconnaissance work of the aeroplanes was a complete vindication of the Royal Flying Corps, in spite of the fact that previously, in bad weather, their co-operation in cavalry divisional training had not been highly successful. Only biplanes were used, monoplane being forbidden owing to the record of fatal accidents. But the sole use in war for which the machines of the military wing of the Royal Flying Corps were designed and the men trained was reconnaissance. This was so up to the beginning of the war. It was in the stress of war that experiments in other directions, such as the regulation of artillery fire, were applied with practical effect on a large scale. The Brit. military wing was much smaller than the military air forces of either France or Germany, and was designed merely to operate with a C-Division Expeditionary Force as the 'eyes' of that force. Later, when the Gers. were forced back from the Marne (Sept. 1914), the function of co-operating with the artillery became one of the first importance. During the war, too, the aeroplanes usurped many of the duties hitherto believed possible only for the airship—namely, aerial photography, bombing, and the sending and reception of wireless messages. The performance of these duties was, however, postponed until such time as the Royal Flying Corps grew sufficiently in numbers to be able to do them without jeopardising the more essential work of reconnaissance.

The naval wing of the Royal Flying Corps developed on different lines from the military wing. Co-operation with the Navy required conformity to the doctrine that the best defence is attack. Though aircraft were capable of defending the Brit. coasts, they were not as yet (1912-13) in theory capable of carrying war whithersoever the fleet might go. In 1913 the Admiralty adopted the policy of evolving 3 new types of machine: an overseas fighting seaplane capable of operating from a battleship as base; a scout to work with the fleet at sea; and a home-service machine for driving back enemy aircraft from our coasts and for patrolling the coast. Progress was slower than with the military wing because the problems were more difficult. The detection of submarines from the air and the use of depth charges by surface craft acting in co-operation were a problem which called urgently for solution. Experiments gradually yielded results, and before the war was over the U-boats had learned to fear the seaplane as their most deadly foe. Aircraft also proved to be the U-boat's master in the Second World War.

For the rest, progress was made in the early years of the war in bomb attack by means of an efficient dropping gear; in the effective use of small-bore fire-arms against attack by Zeppelins, especially by the invention of the tracer bullet, and in the mounting of machine-guns on aeroplanes.

*Development in First World War.*—The Ger. Army at the outbreak of war possessed 12 rigid airships and were constructing others. Their airship engines were of 200 h.p. and more, and were capable of modification for use in aeroplanes. Probably Great Britain had the fastest machines in Europe, but preoccupation with reconnaissance handicapped the Brit. service in other directions, so that for a time both the Ger. and Fr. armies were more adequately equipped for aerial warfare than the small Brit. expeditionary force. Early in the war, however, the Brit. machines rendered most essential service. Numerous reconnaissances during the Great Retreat (Aug. 1914) gave Sir John French accurate information on the location of the enemy and of his batteries. The Great Retreat also saw the beginnings of fighting in the air as distinct from reconnaissance and artillery fire direction. About this time an important change in organisation was made by the decentralisation of the Royal Flying Corps, so that certain squadrons were attached to the corps commands. This experiment, which followed the Ger. organisation, saved time by enabling observers to report direct to the corps to which they were assigned instead of going back to their own centre. In the Ger. Army the pressure of duties on so extended a front made it impossible to do much more than reconnaissance work, although its flying force was very large. Its most active machines were the single-seater scouts and, later, the 'trench-strafting' machines. The precursors of these latter were the escort squadrons originally estab. for the protection of 'working machines.' The function of the escort was to ward off attack from the 'working machines' which were carrying out patrols or observations. The 'trench-strafting' machines flew by day over Fr. and Eng. trenches, dropping bombs, and then, at night, flew behind the lines to damage billets, stations, and other objectives. The prin. duty of the artillery observation machines in the 1917 operations consisted in relieving the pressure upon the infantry by subduing the allied artillery (Aisne-Champagne front). In every group certain machines were told off to undertake fire control for Ger. long-range guns. Bombing squadrons came under the direction of the army groups, and were used against depots, camps, and other traffic centres. Duels in the air became very common in the later years of the war. The term ace became the accepted title of a Fr. airman who had 'bagged' a certain number of enemy machines. In the last 2 years of the war all the duties enumerated in this article had come to be performed by all the flying forces on

either side and A. W. had reached, under the stress of war, a pitch of development which before the war had hardly been dreamt of.

*Modern A. W.*—Air raids and air attacks were extensively employed as an instrument of modern warfare in Abyssinia, China, and Spain; but in none of these instances was any effective resistance possible. In Abyssinia (*q.v.*) the abrupt termination of the war in the early months of 1936 was largely due to the terror inspired by air raids; in the Sp. Civil war, 1936-39, the bombing of Guernica, Barcelona, Madrid, and many other open towns, by Franco's machines was a decisive factor against the Republicans who had no great resources in either bombing machines or fighters; while the Jap. bombing of Hankow and Canton soon reduced those places to submission. The results of It. aerial action in Abyssinia, with practically unfettered scope, provided an excellent example of what modern aircraft can do in a colonial war, and it is from that point of view that the aerial aspect of the Italo-Abyssinian campaign is to be judged. The chief purposes for which aircraft were used in Abyssinia were: reconnaissance; bombing of places regarded as being of strategic importance; co-operation with ground troops in attack; inter-communication and pursuit; supply and transport; propaganda behind the Ethiopian lines; and map-making by photography. Before the outbreak of the Second World War many experts made ingenious and not entirely inaccurate predictions of the kind of thing that would happen in the air in a new major war. In particular, numerous books appeared giving alarming accounts of the effects of bombing on large cities, and there were not altogether unjustified pictures conjured up of tremendous air battles. In this respect Gen. Douhet's works had considerable influence among air staff officers all over the world. And in 1931, a year after his death, the It. conducted manoeuvres in the air which were designed in accord with his theories. Fortunately Britain had different ideas. Had the Brit. air staff followed Douhet, Britain would have had a much more powerful bomber force, but almost no interceptor fighter force at the outbreak of war in 1939. We might, in those circumstances, have so battered the Gers. that they would never have been able to launch their great raids on Great Britain, and in that event we should never have needed interceptor fighters. But the risk would have been appalling. For had the bombers failed to crush Germany's power to strike, Britain would have been without adequate interceptor protection, and the Luftwaffe would have bombed the Brit. S. ports, aerodromes, factories, and centres of pop. at their will. Had Douhet lived he would have had some difficulty in adjusting the facts of the battle of Britain to his theories, for he expatiated always on the offensive qualities of aircraft, having little belief in their defensive powers. Yet if he did not

foresee the power of the fighter he foresaw that of the bomber. He almost exactly described the kind of tactics which the day bomber forces of the United States Eighth Army Air Force employed in its raids on Germany in 1943-44—the close formations which were held at all costs and the great fire power. But again he underestimated the effectiveness of the fighter defences against these attacks in many instances. Douhet wanted the armies and navies to be concentrated on defending and holding, while every effort should be expended on constructing huge fleets of bombers which would assume the entire responsibility for offensive operations. It was an offshoot of this central idea that led him to exalt the mass of aircraft against the individual performer, and to decry the idea of the ace fighter pilot. Up to the end of 1943 the bombing of Berlin showed that the complete destruction of a great cap. city was not quite so easily accomplished as Douhet supposed; but though no attainable bomber force in the Second World War could do what Douhet suggested—completely destroy a target in a single attack—the cumulative effect of repeated attacks was almost as destructive; while the lesson of Hiroshima and Nagasaki in 1945 proved that one aircraft carrying an atomic bomb could achieve more than the largest bomber force not armed with atomic bombs. A. W. developed enormously in the Second World War and, indeed, it is not too much to say that the aeroplane became the master weapon, counteracting to a disturbing extent the received doctrines of sea-power and rendering gallantry in defence by large and well-equipped forces nugatory where these latter were inadequately supplied with aircraft, as e.g. in the Cretan campaign, the Gk. campaign, and in the Jap. invasion of the Malay Peninsula. Moreover, in the Second World War, bombing of open tns., as was expected, became a common feature, the Ger., It., and Jap. commands relying to a great extent on it as a means of destroying civilian morale. Used, however, by the Brit. Command against legitimate objectives aircraft were often a decisive factor, e.g. in the seaplane attack on the It. fleet at Taranto and in the constant bombing of the Ger. munitions centres in the Ruhr. The Jap. plane attack, without any previous declaration of war, on Pearl Harbour in 1941 was also decisive in immobilising Amer. naval power in the S. Pacific.

*Brit. Policy of Strategic Bombing in Second World War.*—Early in 1942 parl. critics cast doubt on the military effectiveness of strategic bombing and regarded the Gov.'s decision to open a 'second front' at some time as implying an acknowledgment of the failure of its bombing policy. The critics were over-impressed by the quality of the Ger. defences by fighters, searchlights, and anti-aircraft guns, forgetting that, in due time, Britain's development in all these respects might well become so much greater as to discourage hostile retaliation, while the Brit.

bombing offensive would become immeasurably heavier without, at the same time, involving the failure to provide the aircraft required to make land and sea operations successful. The escape of the Ger. ships *Scharnhorst* and *Gneisenau* from Brest, notwithstanding repeated bombings, lent plausibility to the arguments of the critics of long-distance bombing; but their arguments, if valid, would have discredited bombing as such, whether long-distance or otherwise. That the building of 4-engined bombers for long-distance strategic bombing did not affect the aircraft-building programme was estab. by the Gov.'s realised policy of building up the Fighter, Coastal, and Middle E. Commands as a first charge on the resources of the empire and only to use the residu of the capacity for Bomber Command. The fact that by 1943 the Bomber Command was able constantly to send great bombing fleets over Germany and Italy was but further proof of the great extent of the resources of the empire. Nor was there any justification for the fear that strategical bombing was carried out without regard to the requirements of the other arms; indeed the bombing of Brest and Lorient was motivated by the hope of helping the Navy and Mercantile Marine against the submarine menace. Moreover, at times the great raids on Germany ceased whenever other and more pressing tasks called for the diversion of aircraft; e.g. there was a lull after the 1000-bomber raids on Cologne and Essen (May-June 1942) owing to the urgent requirements of the Middle E. Command, where the situation had become very dangerous, and, in order to co-operate with Coastal Command and the R.N. in the battle of the Atlantic, at that time the most vital of all theatres of war. The role of the R.A.F., far from being an independent one, was to co-operate with the Army in the tactical field, and only after that task had been performed was it free to devote itself to other operations. This was shown by Air Vice-Marshal Tedder's brilliant operations in Libya in support of Gens. Alexander and Montgomery against Rommel in 1942 at El Alamein. Actually Bomber Command's strategical operations, though widely advertised, had not up to July 1941 done Germany's war potential any great damage and no doubt the pilots and air crews were deceived on some occasions by the ingenious devices which the Gers. adopted to mystify them, especially that of lighting large fires outside centres which were about to be bombed so as to induce the raiders to drop their bomb-loads there and not on the real target. Brit. bomb-loads in 1940-41 were puny judged by the standards of 1942 and later and were incapable of doing any serious amount of damage, e.g. 15 tons was regarded as a formidable weight, but 1500 tons or more were often dropped in 1943 in well under an hour's bombing; and also the number of incendiaries dropped was insignificant in comparison with those subsequently scattered. The

greatest load ever dropped on London or anywhere in Britain by Ger. bombers was 450 tons; yet that total was much in excess of that dropped on Germany in the later part of 1940. The tables were turned by the spring of 1942, e.g. Lübeck, on Mar. 28, 1942, received a load 50 per cent greater than Coventry had received on Nov. 14, 1940. Yet the Brit. air offensive of those earlier years was by no means futile, for it compelled the Gers. to create a second front in the air which extended right across the Reich and throughout the occupied countries of W. Europe and thereby to deplete their air forces elsewhere. The benefit which the Bomber and Fighter Commands' activities conferred on Britain's Russian allies in their gallant resistance was obvious from the transfer of fighter squadrons of the Luftwaffe from the E. to the W. front. Further, Bomber Command's activities in this earlier period kept the spirit of attack alive at a time when the Brit. Army could do but little and while the Navy's work was obscured in the mists of the Atlantic. The only arm which could hit the enemy was the Air Arm, and while the Coastal and Fighter Commands struck whenever opportunity offered, Bomber Command struck all the time. Even in 1940 Brit. bombing raids were widespread. In 3 nights in Sept. of that year they attacked objectives in over 40 cities. It was then the exception to concentrate attack on one or two centres at a time. Pinprick raiding was probably the right policy in 1940, for the Bomber Command had to make the most of restricted forces, and the price the Brit. people had to pay at home for their bombers' aggressiveness was endured with steadfastness and fortitude. But even as early as Dec. 1940 the weight of Brit. attacks began to be directed to special areas where industry and transport were concentrated—a change due to the simple cause that more crews and more aircraft were gradually coming into action. Long before 1943 Ger. raids over Britain had grown insignificant; those over Germany had become avalanches. The Gers. were early perturbed by the Brit. raids—even in the autumn of 1940. They even tried to persuade the Brit. people that night bombing was out of date and achieved nothing. But if bombers were to be used, no logical distinction could be drawn between night and day bombing.

*Limitations of International Law re-interpreted.*—Gradually Brit. bombing re-interpreted the limitations of international law concerning identifying targets and taking 'reasonable care not to bomb civilians' to the wider conception of bombing 'target areas.' Yet strictly area-bombing was legitimate, the question being, as e.g. in a naval bombardment, whether the incidental destruction of civilian life and property can be justified by the military advantage to the attacking belligerent of the effective destruction or reduction of the enemy's capacity to make war. If, because of intense anti-

aircraft fire or other reason, the only way to make sure of putting the objective out of action is to place a pattern of bombs over the area where it is known to be situated, it is not contrary to international law to bomb that area, whatever the consequences to civilian life. But in any case the Gers. could not logically question this or any similar practice. Not long after the change or development of Brit. bombing policy, bombs known as high-duty bombs were brought into use by the R.A.F. To the Gers. they were known as block bombs, because they could destroy whole blocks of buildings. They were first used against Emden (Mar. 31, 1941) and later with devastating effect on Cologne, Essen, Hamburg, Düsseldorf, and other towns with great industrial areas. Brit. bombing was still strategic, but inevitably it also had a psychological effect on Ger. civilian morale, the more so as the Ger. Gov. had early assured the people that no Brit. bomber would ever reach a Ger. city. Bomber Command's offensive was essentially a night offensive; but occasionally a daylight raid was made by heavy bombers, notably on Apr. 17, 1942, when a score of Lancasters bombed Augsburg; and again on Oct. 17, 1942, when 94 Lancasters made a low-level attack lasting 7 min. on the Schneider armament works at Le Creusot, for the loss of only 1 machine, and that by mischance, there being no opposition. But medium bombers and fighter-bombers were more often used for daylight sweeps into the Low Countries and France, Blenheims being the machines mostly used. Hurricane fighter-bomber machines were also employed in these sweeps. Stratosphere bombing by Flying Fortresses was also tried, Aug.-Sept. 1941, but results at that stage did not justify the loss of such highly trained crews. A still more spectacular daylight raid than those above mentioned was that made by Lancasters on Oct. 24, 1942, on Milan (1350 m.) with fighter escort over only the first part of the outward journey. About this time an important influence on the issue of air warfare was the appearance of the Ger. Focke-Wulf 190, a fighter with a very high rate of climb. When they appeared in 1942 over N. France and the Low Countries the Brit. fighter-pilots met with a much more difficult task than in 1941 against the Messerschmitt 109 E and 109 F. But on June 23, 1942, Brit. bombers wrecked the Focke-Wulf factory and assembly works at Bremen. In any case the Focke-Wulf 190, despite its top speed of 400 m.p.h. and armament of 4 cannons and 2 machine-guns, was in no way superior to the most developed Spitfires then being made. In the autumn of 1942 Bomber Command introduced the Mosquito bomber, a small twin-engined light bomber. Four of these raided Oslo, Sept. 25, 1942, in daylight, on the occasion of a Quisling meeting there.

*Technique of Concentrated Attacks.*—As implied above, Brit. bombing policy changed from night-long visitations to

much larger and extremely concentrated attacks. The new technique of sharp, short overwhelming assault was tried out by the R.A.F. on Kassel on Sept. 8, 1941, but the force employed was under 100 machines. The new and almost revolutionary development in the 1000-bomber raids on Cologne and Essen was their brevity in relation to their mass, the whole attack being over before the defences could adjust themselves to meet it. An equally strong attack on Bremen, July 2, 1942, was concentrated into half an hour. There were soon to be in that year and later, innumerable further illustrations of the damaging effectiveness of these highly concentrated massed raids—blanket attacks leaving nothing untouched within a wide perimeter and overwhelming (as at Dusseldorf, July 31, 1942, and Kiel, Oct. 13, 1942) both guns and searchlights. Losses of heavy bombers were, however, severe, and according to Lord Sholto Douglas, Air Chief Marshal, a casualty rate of 10 per cent would be a deterrent which no air force could endure. The Gers. broke off their night-bombing when their losses rose above that percentage; Brit. losses, even when, as e.g. against Berlin in 1943, they amounted to 58 machines, were not so much as 10 per cent of the number sent. In any case the Brit. losses were certain to increase with the strengthening of the Ger. defences, particularly by the multiplication of Ger. fighter squadrons. This consequence, however, achieved the Brit. strategical plan of assisting the Russian armies and air force by drawing away from the E. front large Ger. forces that would otherwise have assailed the Russians. Moreover, even if the Brit. losses had been more than they were, there was still the mounting mass of Amer. machines and air crews at hand to pursue the strategical bombing campaign. It was on Aug. 21, 1942, that the Amer. Flying Fortresses in a successful encounter in which 25 Focke-Wulf 190's attacked 11 Fortresses, and soon afterwards in raids on the Fr. and Dutch coasts and elsewhere, proved their deadly, if relative immunity. It is true they were escorted by Spitfires, but the Fortresses were generally able to shoot down the enemy fighters and their own losses were often phenomenally low, though it is to be borne in mind that their armament was much heavier than that of the Lancaster or Wellington or any Brit. 4-engined bomber, and consequently they carried a much smaller bomb-load. The Fortress carried, in fact, 13 machine-guns, mostly of large calibre, and their arcs of fire gave protection against attack from all quarters, while their ceiling was higher than that of the Brit. bombers and therefore they were less exposed to anti-aircraft fire. (See Spaight, *Volcano Island*, 1943.)

*Strategic Bombing Policy justified.*—R.A.F. raids on Ger. targets in the first months of the war were delayed by the influence on the Allied Command of Fr. fears of reprisals. But the Brit.

Command at length ignored this unworthy motive and Brit. bombs fell on the Ger. mainland before Ger. bombs fell on Britain (18 Whitley bombers attacked railway installations in W. Germany, May 11, 1940). This boldness in exploiting strategic bombing was justified, for the truth is that Hitler, in spite of the strength of the Luftwaffe, was afraid of the bomber being used as a strategic weapon—whence he masked his fear in a cloak of hypocritical rhetoric on sev. occasions both before and after the start of the war. Thus, in 1935–36 he tried to obtain international agreement on limiting bombing to attacks within the boundaries of battle zones. This, superficially, seemed to be inspired by humanitarian motives, but, had it been adopted, it would not have saved from bombing Warsaw, Rotterdam, or Belgrade, but it would have protected the Ruhr, the Rhineland, and other centres of Ger. industry. The Ger. Command planned a war of mass attack, a war which demanded an uninterrupted flow of material to the battle fronts; hence the Ger. fear of the long range bomber. Furthermore, the battle-fronts, according to the calculation of the Ger. general staff, were always to be outside the frontiers of the Reich. Seen against this background the 'humanitarian' plans of Hitler to outlaw strategic bombing assume their true and ugly shape. But they were the kind of astute propagandist plea which prevailed with those arm-chair critics who, even in Britain, protested against what they called the bombing of civilians, by which term they defined the strategic bombing offensive of the allied air forces. But, in fact, the bomber is a primary instrument for the repression of aggression and would seem to be the only weapon that can, in the long run, destroy war; for it can smother and stifle war at source, and this was the policy of the Allies in their great bombing raids of 1943–44.

It is a truism that the newer the weapon the more rapid is likely to be its development in the course of a great war in which the combatants possess the resources needed to expand it. Fortunately the Allies possessed the greater resources and they did not hesitate to develop independent or strategic bombing. By 1943–44 there was a great development in day bombing; this was carried out on different lines by the Brit. and Amers.—the Brit. by surprise raids with low-flying aircraft, the fast long-range Lancasters; the Amers. by means of 'precision' bombing from high altitudes by Flying Fortresses and Liberators. Each method had its advantages. The Brit. aircraft carried the heavier bomb-load and was on that account more economical. The Amer., armed with a dozen large-calibre machine-guns, with a range equal to the cannon of the Ger. fighters, had a much greater power of self-defence. The most serious handicap for the low-flying bomber was a first-class system of observation and intelligence, the factor which so greatly influenced the

battle of Britain. Hence the Gers. experimented in greater altitudes so as to avoid the fighter and they produced the Junkers 86P which was capable of reaching a height of over 40,000 ft. They also introduced the barbarous 'tip-and-run' raid directed against non-military targets, which required counter-measures quite different from those employed against any other form of attack. In night-bombing the chief development was in the size of the high explosive bomb and the more deadly effectiveness of incendiaries.

After much experience of night-bombing against Germany it was generally agreed among the Allies that the offensive was necessary, but that the results of bombing alone were indeterminate and incomplete. Strategic bombing, in fact, must be driven home by other action—a lesson soon learned by the Jap. in the Pacific. Moreover, it was also realised that a bombing offensive fails in moral effect as well as material, if it be at all relaxed. Hence the Allies increased the weight of their attacks in spite of the worst difficulties and, with their expanding resources, they were favourably situated for carrying out their settled air policy.

An obvious immediate justification for the policy of strategic bombing, intensified by the Allies in 1943-41, was the necessity for destroying enemy fighter plants. Fighters had destroyed many allied bombers and, with greater concentration in the Reich on the production of fighters as against bombers, it was imperative to hunt out and bomb the Ger. fighter plants. This was so effectively done that production fell and the strain on the fighters of the Luftwaffe from this cause and from the wide range of their commitments, soon became noticeable in 1944. The intensification of the allied bombing offensive in the last weeks of 1943 and through the early months of 1944 at length forced on the Luftwaffe the dilemma of either coming to grips with the bombers and suffering great losses—a dangerous risk in view of the then-impending invasion of W. Europe—or of declining combat and leaving Ger. industry virtually undefended.

*All-out Allied Air Offensive against Ger. Fighter Factories. Day and Night Attacks on Berlin. Air Force's Co-operation in the Invasion of Normandy. Super Flying Fortresses.*—The week of Feb. 20-26, 1944, which saw the beginning of the 'all-out' allied air offensive against Ger. fighter factories by heavy bombers from bases in both Britain and Italy, marked a decisive battle of hist., for it changed the course of the air war. From that time the Luftwaffe, converted to a defensive air force, was no longer effective in that capacity. Though still potent, it could no longer challenge the Anglo-Amer. aircraft anywhere and everywhere they flew over Ger.-held ter. From that week the Luftwaffe rose to battle only when it believed it had local superiority or when high-priority targets were under attack. But the great air offensive did not end there, and Berlin was the next

great target to come under night and day attack. Oil targets had high priority on the bombing lists of the 8th and 15th Air Forces and there were many other tasks that had to be carried out. Then came the climax—D Day for the invasion of Europe. As the time for the Normandy landings approached the allied air forces switched their main effort from Ger. oil plants and aircraft factories to railways and bridges. R.A.F. Coastal Command made new dispositions to meet the potential threat to the allied sea armada from Ger. U-boats and E-boats based on Fr. ports; defensive fighters took special precautions against reconnaissance aircraft; and 'intruder' planes destroyed as many as possible of the Ger. radio-location stations in N. France. On D Day the allied forces' 'sea-ground' services struck at the most vital target of all—the overland route to Berlin. Yet the Luftwaffe failed to appear. The R.A.F. and the Amer. air force had made it impossible. Just before allied troops stormed the beaches of Normandy, Amer. heavy bombers and large formations of R.A.F. heavy bombers joined with allied naval forces to smash at beach defences. A few small motor launches, equipped with lights and radio beacons to guide the airborne troops, took up their positions in the Channel. The airborne troops, operating behind enemy lines, disrupted communications, seized cross roads, and cut railway lines. The allied air forces bombed bridges over the Loire and the Seine to seal off the Normandy and Brittany battle areas from the rest of France. Largely because of this the enemy was unable to bring up reinforcements to the front. Gen. Patton's lightning drive through France in 1944 was made possible by the tactical support of the air forces, whose fighters and light bombers covered his otherwise unprotected right flank. Again, the incessant battering from the air of flying-bomb launching sites in N. France reduced the weight of the flying-bomb attacks on Britain to one-quarter of what they would have been. The operations of the 15th Air Force heavy bombers based in Italy were directed mainly against Germany's oil installations, but it was this force that was able to give most direct support to the Russians, who had no strategic air force of their own. The advent of the giant Super-Fortress opened up a new chapter in the hist. of air war. Many difficulties had to be overcome before these great machines could go into operation. But in Aug. 1944 they began the series of attacks that were destined to bring the war to the Jap. homeland. See further under PACIFIC CAMPAIGNS IN SECOND WORLD WAR.

*Air Operations in the Second Battle of the Ruhr.*—The great strength of the Brit.-Amer. air forces in 1945 was shown in the cumulative force of their attacks on the Ger. defence and concentration areas on the farther bank of the Rhine in Mar. 1945. Battles did not cease when the ground forces came to a halt or began to re-form before a fresh obstacle. They continued so long as the

air forces were able to maintain the pressure and develop a planned offensive. Air warfare played a prominent part in the isolation of the Ruhr and of N. Holland through its interdiction of road and rail communication. Immense new bombs, nearly 10 tons in weight, produced an effect which bore e.g. no relation to anything that had ever been experienced in Britain. Allied air sorties were now made, not with 100 or 200 aircraft, but with 4000 or 5000. The development of bombing sealed the fate of the Ruhr. Early in 1945, every one of the 6 main approaches to that valley was cut by air bombing and, by the same agency, the Dortmund-Ems canal was drained dry. With almost unlimited foreign labour the Gers. effected the speediest repairs, but all to no purpose against ever-mounting attacks. The 1941-42 attacks on the Ruhr were minor affairs judged by 1944-45 standards and the approach to the Ruhr presented peculiar difficulties in those earlier years: visibility was nearly always bad; anti-aircraft fire was excessively heavy; and very powerful searchlights were employed to dazzle the pilots. Probably very little of the serious destruction found in 1945 was wrought in that early period.

*Technique of the 'Pathfinder' and 'Master-bomber'.*—But in Sept. 1942 the 'pathfinder' technique was introduced. The basic principle of this was the employment of flares to light up the target. There were 3 successive phases of flare-dropping during a raid: first, a few aircraft flew ahead of the main body to drop flares to illuminate the general target area; a second wave of raiders dropped further flares over a more concentrated region; then the bombers dropped pink incendiaries over particular targets. That was the method of attack during the winter of 1942 and it represented a general improvement of 20 to 30 per cent in damage. It was then that the Gers. began to develop their counter-measures in the way of dummy fires in open country to distract the allied bombers. They also set a network of electric-light globes close to the ground, and by flicking these on suddenly, in combination with arc lamps, gave an effective impression of falling bombs. They also constructed dummy buildings filled with combustibles and set these on fire when the alarms announced the approach of allied aircraft. But these devices had only a short period of success, for the allied air command developed a new technique, that of the master-bomber. The master-bomber and deputy master-bomber, flying in Lancasters, would arrive over the target 15 min. ahead of the main body, and drop a 250-lb. or 500-lb. bomb, which, exploding 300 ft. above ground, would emit a series of flares well above the level that could be reached by the normal 'fake conflagrations.' If the ground was not visible the process known as sky-marking would be adopted, and flares dropped over the target above cloud

level. The main body would then bomb the area indicated by these flares. Further help was given by an invention known as 'magic eye,' which made visibility possible through heavy cloud. Again, different-coloured flares were dropped by the master-bomber to show where a particular target had been obliterated and to direct following bombers where to select a new target instead of wasting bombs on obliterated targets. In the raids of 4 successive nights Krupps' works at Essen were practically laid flat. Twice the Gers. rebuilt them; a third time the bombers came, and in Mar. 1945 they still remained a disused wreck. Shattered to their foundation, the 14 prin. tns. of the Ruhr and of the neighbouring valley of the Wupper were found in 1945 by the advancing allied armies to be mere ruins of rubble and ashes—ruins that spoke volumes for the devastating effect of area-bombing by 41,600 aircraft of Bomber Command. It is estimated that, altogether, Bomber Command by the end of Mar. 1945 had rained down 143,000 tons of bombs on these cities; while intervening and other targets in the area received 39,000 tons dropped by another 9,600 machines of the same command. This near obliteration of the Ruhr's war machinery, actual or potential, greatly influenced the later classical double envelopment by the land forces, for the trail of destruction stretching over silenced engineering works, shattered armament factories, twisted railway tracks, bomb-torn roads, corroding oil-pits, wrecked pit-head machinery, and bomb-pitted streets, left the impression that the battle for the industrial Ruhr was as good as won months before the end of the war in May 1945.

*See further under BRITAIN, BATTLE OF; BOMBER COMMAND, and NAVAL OPERATIONS IN SECOND WORLD WAR.*

*Aerodoloscope*, a species of semaphore form publicly signalling changes in barometric readings.

*Aerodrome*, alternatively airfield or, if supplied with customs and immigration facilities, airport, a place at which aircraft land and take off. Varies in type from flat grass-covered surface allowing take-off runs of 600 yds. to great open spaces crossed by concrete runways up to 3000 yds. in length and 100 yds. in width and surrounded by concrete tracks for taxi-ing. Most As. have hangars for housing aircraft. Bigger types have buildings to house control organization, administrative services, workshops and offices of operating companies. Chief A. in London area is at Heathrow, near Staines. When finished it will consist of 9 runways arranged in form of 3 interlocking triangles, 3 of runways being 3000 yds. long, and the others 2000 yds. These should allow 240 aircraft to be handled per hour in daylight. This airport is intended for inter-continental traffic. Second inter-continental airport in Britain is at Prestwick, near Ayr, Scotland. London has another airport at Northolt for European traffic.

There are some 130 As. in the United Kingdom; 52 of these are owned and operated by Ministry of Civil Aviation. Landing charges are made at every A. and are graduated according to loaded weight of aeroplane. Many of smaller As. have club-houses; bigger As. have public waiting-rooms and refreshment-rooms for passengers and also public enclosures for spectators. Control organization is responsible for regulating air traffic within airport control zone which extends from radius of 9 m. at smaller airports to radius of 35 m. at bigger. It is also responsible for providing runway, boundary and taxi-track lights, and for aids to landing in poor visibility. These include radio and radar beacons which indicate on instruments in the aircraft the approach path an aeroplane must follow to arrive at the end of the runway. Alternative system allows track of incoming aeroplane to be followed by radar and approach instructions to be given by radio to pilot. Control also instructs pilots what heights and courses to fly within control zone. Major As. provide pilots with bearings, 'fixes,' and special meteorological information on request. One civil and one R.A.F. A. in Britain have fog-dispersal apparatus installed on each side of 1 runway for use in emergency. Every A. in commercial use has a neon beacon which flashes the 2-letter call-sign of the A. at night. Most As. are some miles from the cities they serve and only 1 in the United Kingdom (Gatwick) has its own railway station. Communication is generally by road. The development of rail links has been considered desirable for main airports and these will probably be provided unless, in the meantime, helicopter services should make them unnecessary.

Aircraft carriers (*q.v.*) are floating As. for aeroplanes and are important units of all the chief navies of the world. They have a speed of over 30 knots and flying decks of nearly 1000 ft. in length. Machines are transferred very speedily to the deck from the hangars below by hydraulic lifts. In taking off, the machine rises well above the deck before reaching the forward end. Landing is not so easy an operation. It is done over the stern of the aircraft carrier and if the wind and aircraft-carrier speed are together about equal to the landing-speed of the aeroplane, the aircraft carrier, from the pilot's standpoint, is scarcely moving and there is little if any run after alighting.

Airships, too, have acted as aerial As., and the ill-fated Amer. dirigible *Akron* was large enough to house 5 aeroplanes in a special compartment. The aeroplanes, suspended from trapezes, were lowered, detached themselves and flew off and, at the end of their flight, could attach themselves to the trapeze and be hoisted aboard the airship again.

The name aerodrome was also given by Prof. Samuel Pierpont Langley (*q.v.*) to the steam-driven model of a double monoplane which he built in order to prove that the power required to lift a

machine into the air was much less than commonly supposed by scientists. His machine, which was most skilfully constructed, was launched in 1896 from a boat in the Potomac R. and flew for half a m. at 20 m.p.h., thus proving that 1 h.p. could maintain at least 20 lb. in the air.

**Aerodynamics.** The science of A. consists of the study of the forces which air can exert on a body, owing either to the motion of the body through the air or to the motion of the air past the body. It finds its most important application in the design and construction of aircraft, and the word A. is now generally used to refer to the mechanics of flight. In this sense the subject deals with: (a) the origin and nature of the air forces experienced by an aircraft, and (b) the effect of these forces on the behaviour of the aircraft. A knowledge of A. is therefore essential for the determination of such important items as the strength of the structure, the capability of the aircraft to carry its load, and the degree of stability and controllability.

In so far as A. deals with (a) above, it cannot be regarded as an exact science, for many of the air forces acting on an aircraft are not directly calculable from first principles, but have to be determined by experiment. Most of the experimental work is carried out on models, and in this work advantage is taken of the fact that the air forces are the same, whether the model is moving through still air or is stationary and the air is flowing past it, provided that the relative speed is the same in each case. The model is therefore kept at rest and mounted in a long box of circular or square cross section, called a wind channel or wind tunnel, and the air is driven through the channel by the action of a propeller or an airscrew driven by an electric motor. In this way the air forces can be simply and accurately measured.

The fundamental law of A. states that, for all geometrically similar bodies inclined at the same angle to the air stream, the air force experienced may be taken with good accuracy to be directly proportional to the density of the air, the square of some linear dimension, and the square of the speed; and it is by the use of this law that data obtained from model experiments can be applied to the full-scale aircraft. Suppose, for instance, the full-scale resistance at 100 m.p.h. is to be deduced from the measured resistance of a  $\frac{1}{4}$ -scale model at 50 m.p.h., the air density being the same in each case. Then, since every dimension of the full-scale aircraft is 10 times the corresponding dimension of the model, the measured resistance must be multiplied by  $10^3$  or 100 to allow for scale. Again, since the full-scale speed is double the model speed, the measured resistance must also be multiplied by  $2^2$  or 4. Thus the full-scale resistance at 100 m.p.h. is 400 times that of the model at 50 m.p.h.

Near the ground density variation is negligible, but the decrease of density at height is most important. For instance,

the density at 22,000 ft. is only one-half that at ground level, and so the resistance at this height is halved also. It might be thought from this that aeroplane performance is better at height than near the ground, whereas, in point of fact, exactly the reverse is the case, owing to the introduction of sev. other factors, the primary one of which is the loss of engine power due to the density reduction.

Although A. still depends to a great extent upon experiment, the mathematical theory of airflow has not been neglected, and modern research has thrown considerable light on the true working conditions of such important aircraft components as airscrews and aeroplane wings. Applied A. is now, in fact, a blend of theory and experiment, and it is possible to predict most air forces with considerable accuracy. Clearly, when all the air forces on an aircraft are known, aerodynamics fulfils its function with regard to (b) above by the application of the more exact principles of ordinary mechanics. (See also AEROPLANE.) See N. A. V. Piercy, *Aerodynamics*, 1944.

**Aero-Engines.** There are three main types: reciprocating (Otto or Diesel cycles, i.e. normal I.C. engine with electric ignition, or solid injection I.C. engine, q.v.); turbine; and rocket—the 2 latter appearing during the Second World War.

The essential requirement is high power for low weight. In the reciprocating internal combustion engine this is achieved by attention to detail design (every part being reduced to the least possible weight consistent with strength by the use of special materials and the careful machining of components) and by supercharging to obtain the highest possible power per cylinder vol. At the end of the First World War, dry weight was approximately 5 lb./h.p., now it is only about 1 lb./h.p. Carburetion is complicated by the small amount of oxygen in the rarified air at heights, which reduces the quantity of fuel that can be used and consequently the power of the engine. On small engines, i.e. up to 200 h.p., the effect on the fuel/air ratio is counteracted by an altitude control which reduces the fuel delivered at a given throttle setting; but this method only keeps the engine running, it does not maintain the power output at its sea-level figure. To maintain power superchargers (i.e. compressors designed to deliver air at more than atmospheric pressure to the cylinders, thereby increasing the effective capacity and power) are fitted. These are of 2 types; gear-driven and exhaust-driven, by passing the waste gases through a turbine. In both cases centrifugal fans are used (i.e. fans that revolve at high speed, 20,000 r.p.m., sucking in air near the shaft and throwing it out at increased pressure at the periphery), since they are the most compact form of compressor. Originally, fixed gear ratios were used, but with increased operating heights 2 and then 3 gears were employed. In Great Britain an automatic boost control is fitted to the

carburettor (q.v.) so that the engine is not damaged by opening the throttle too much, and obtaining too great a power at a given altitude. The automatic boost control is a device, operated initially by a variant of the ordinary barometer, which overrides the normal throttle in such a way that the maximum quantity of fuel admitted at any air pressure will not cause an explosion in the cylinders that will overload them. Freezing is another serious problem which has to be overcome by having alternative heated air-intakes, by using injection carburetors (U.S. method adopted in Great

3. Air heated by cooling engine expands further and is ejected through small outlet at high speed. Volume of air is controlled by varying size of outlet.

Britain about 1943), where the fuel is squirted into the induction manifold instead of being sucked off a jet in a venturi, or by direct injection through nozzles in each cylinder (Ger. system). Owing to high power (largest piston engine 3,500 h.p.) cooling is important. Air-cooled engines dissipate heat through fins on the cylinders and are assisted by ducted cowlings (Fig. 3) which pass air round the cylinders without increasing drag. Liquid-cooled engines use a glycol/water mixture with a high boiling point and the radiators are mounted in ducts (Fig. 3) where the air is passed through at low pressure and then ejected through a narrow outlet—giving thrust, not drag, at high speed.

Reciprocating A. E. (R.E.) can be classified as follows: *Otto cycle*: air-cooled radials, 3, 5, 7, 9, or combinations up to 4 rows of 7 cylinders: power 50–3,500 h.p. (Fig. 2); air-cooled in-line or vee, 4, 6, 12 cylinders: power 50–500 h.p.; air-cooled horizontally opposed 2, 4, 6 cylinders: power 50–200 h.p.; liquid-cooled vee,

The *gas turbine engine* (T.E.) has only been practicable since 1939, its use depending largely on the development of heat-resisting alloys for the turbine. The *gas turbine* differs from the steam turbine (*q.v.*) at present, since it consists of a single or at most 3 turbine wheels instead of the sequence of wheels (or drum) that are used in the steam design. This is because it is only necessary to extract sufficient energy from the combustion gases to drive the air compressor, in fact it is the residual energy left in the fast-flowing gases which provides the thrust, or power of the engine. There are 2 main principles: that of Sir Frank Whittle with a centrifugal compressor (Fig. 4), and the axial compressor type (Fig. 5). The basic principle of each is the same, viz. air taken in at the front is compressed, then

revolving parts, and the whole unit is very light for its power—this cannot be easily compared with R.E. since it is measured as lb. thrust, not as h.p. T.E. delivers its power by the jet of heated air expelled at the rear, the thrust being the reaction to the mass of air ejected. Efficiency depends on ratio of forward motion of engine to backward flow of jet, 100 per cent being when the speeds are equal. This engine is most effective at high speeds (500 m.p.h. plus), and at lower speeds it is more efficient to convert the s.h.p. of the turbine to thrust by gearing it to an airscrew. In this case the greater part of the energy in the gases is usually absorbed by the turbine. It can be converted into airscrew thrust by gearing direct from the compressor shaft, or, more efficiently, by taking the power from a

separate turbine stage (Fig. 6). Another arrangement is to combine a very simple 2-stroke engine for driving the compressor with the jet effect of heated and compressed air (Ricardo theory). T.E.s are notable for running at high speeds, 10,000-15,000 r.p.m. as against the 3000 r.p.m. of a R.E.; but since the rotating masses are light, stresses are lower than in R.E. and the resulting engine is very light. Simplest jet engines are impulse ducts (Ger. V-1), or athodyds (Fig. 7), consisting of a form of venturi in which fuel is burnt with the air taken in the front by forward speed, the gas is expanded by heating and is ejected with increased energy. This system requires the engine to be given initial forward speed to provide the initial air compression before the cycle comes into operation—at very high speeds it is efficient. Main disadvantage of all jet engines is high fuel consumption; due mainly to the high powers and to inefficient operation of the cycle at cruising and idling speeds. This difficulty is being overcome rapidly by refinements in design.

*Rocket engines* were developed by Germany in the Second World War, and are driven by liquid fuels. Liquid oxygen and liquid hydrogen are pumped into a combustion chamber where they form a very powerful propellant. Rockets give very high powers, but only for short periods, because the fuel consumption is large, since the engine provides its own oxygen instead of using that in the air—this latter fact makes them independent of the earth's atmosphere. See also *Jet Propulsion*. See A. W. Judge, *Aircraft Engines*, vol. i, 1945; vol. ii, 1947; R. T. Sawyer, *The Modern Gas Turbine*, 1946; R. A. Beaumont, *Aero-Engines for Students, including Gas Turbines*, 1947.

**Aerolite**, a mass of stony or metallic matter known to have fallen to the surface of the earth from beyond the region of the atmosphere. Sometimes a distinction is drawn between As. and meteorites, the latter being taken as the generic term and the former applied to those masses which are composed of stony matter only. Other meteorites contain a large proportion of metallic iron alloyed with nickel; these, however, are of comparatively rare occurrence.

At different periods during the year, particularly in the month of Nov., showers of 'shooting stars' or meteors are to be observed. They consist of planetary bodies which have come within the earth's gravitational influence, and are heated to incandescence by friction with the earth's atmosphere. They may be divided into two classes, shooting stars and fireballs. The former usually appear as bright streaks rapidly drawn across the sky, and gradually fading away; the latter are distinguished by a greater radiance and a slower motion. They are sometimes accompanied by loud detonations, and as stones have been sometimes seen to fall soon afterwards, it appears that fireballs are meteors that actually reach the earth, or at any rate arrive to within a short distance of it.

It is estimated that meteors enter the atmosphere with a velocity up to 50 m. per sec. In most cases the substance is dissipated before the body reaches the ground; if it survives to the lower and denser parts of the atmosphere, the velocity is considerably reduced, thus meteorites examined shortly after their fall are found to possess no very high temp. In appearance they are irregularly-shaped fragments covered with a crust or glaze, which is the result of their previous incandescence. They consist of substances which are to be found in the earth's crust, and at least two-thirds of the earth's elements are represented. No trace of organic matter has been discovered, so that they throw no light on the problem of the existence of life in the rest of the planetary system.

Meteors were naturally superstitiously regarded by the ancients, and the stones were venerated as visitants from heaven. The image of Diana of the Ephesians 'which fell down from Jupiter' (Acts xix. 35), was probably a conical A.

Masses of meteoric stone have been found weighing as much as 50 tons, but the largest actually seen to fall came down in Hungary in 1866 and weighed 547 lb. A collection of As. may be seen at the Natural Hist. Museum in S. Kensington.

**Aeronautics**. This science may be divided into 2 parts, acrostation, that is, flight by means of something lighter than the air; secondly, aviation, that is, artificial flight, either by means of machines, or else as birds by means of artificial wings. Historically, aviation is the older of the two, since, if we go back to mythology, we find the stories of Pegasus and later of Daedalus. Further, the monsters of Assyrian and Egyptian mythology give us examples of beasts that were supposed to be able to fly. During the Middle Ages and down until the beginning of the eighteenth century we get story after story of men fitted with artificial wings, either making or attempting to make flights. We have, for example, the story given us by William Dunbar, the poet, of how an It. magician gave an exhibition of flying for the edification of James IV. He purposed to fly from the walls of Stirling Castle, armed with wings which were composed chiefly of birds' feathers. Naturally he failed, being fortunate enough to escape with only a broken thigh, his explanation of his failure apparently being that his wings were not made of eagles' feathers, but of some of the lesser birds of the sky. We have further references to the art of flying in Leonardo da Vinci and in Francis Bacon, and later still we find an attempt to prove that flight by means of man's own strength was impossible, this being argued chiefly from a detailed examination of the muscular strength of birds. The first science, however, to be more or less successful was acrostation. In the classics we get one reference which gives us an idea that the later method of acrostation by means of hot air was known to the ancients, this reference being to the flying dove of Achytas, but for a

further development of this method we have to come down to medieval times. Roger Bacon (1214-94) speaks of attempting by means of a hollow globe and liquid fire to solve the problem, while in the following century he is followed by Albert of Saxony (fl. 1366-90), who also spoke of aerostation by means of fire in a light sphere. During the sixteenth and seventeenth centuries, however, we get a number of fantastic ideas put forward. Laurus, for example, spoke of swans' eggs filled with sulphur or mercury being drawn up to the sun, while in the *Histoire comique* of Cyrano de Bergerac vessels filled with morning dew are supposed to have carried a man into the middle of the atmosphere. But also in the seventeenth century we get the beginning of much better ideas. Francis Lana came forward in 1670 with an idea which, though practically unserviceable, was nevertheless a great advance on previous ideas. He proposed that 4 hollow balls should be taken, made of brass of the very slightest thickness, and that these should be exhausted of air. To them should be attached a small boat and sail, and in that way a balloon would be contrived which could carry a man. The idea was not feasible, since the globes, made of brass only 1-250th of an in. thick, would have collapsed by reason of their own weight. But although Lana saw this difficulty, he argued that their shape would prevent that. It is not until the next century that we get the real balloon invented.

The beginning of the development of the balloon was the work of 2 brothers, Joseph and Etienne Montgolfier, who were the sons of a paper manufacturer of Annonay. They seem to have been influenced by Cavendish's experiments relating to the weight of hydrogen, and by Priestley's paper on 'Different Kinds of Air.' From their own observation of the clouds they came to the conclusion that a paper bag filled with 'substance of a cloud-like nature' would float in the atmosphere. They experimented with paper bags over fires and found that they floated. This determined them to have a public exhibition at Annonay. On June 5, 1783, they inflated a bag, made probably of linen, though some authorities say that it was made of paper, over a fire of chopped straw. This balloon rose to the height of about 1½ m. before it cooled sufficiently to descend about 10 min. after its ascent. The Montgolfiers, however, came to the conclusion that the ascent was due to the smoke of the fire, and did not realise that it was really due to the lightness of the heated air. This experiment attracted much attention, and steps were taken for the sending up of a hydrogen balloon in Paris. The prime movers in this were M. Faujas de Saint-Fond, M. Charles, and 2 brothers named Robert. The balloon was filled with hydrogen made by the action of 500 lb. of sulphuric acid on half a ton of iron filings, and took 4 days to inflate. It was about 13 ft. in diameter, and weighed less than 20 lb.

When liberated it rose to the height of about 3000 ft. and remained in the air for about three-quarters of an hr., and then descended in a field at Gonesse. The 2 types of balloons have usually been differentiated as air balloons and fire balloons, or Robertières and Montgolfières. Following this experiment came another by Montgolfier, who sent up a balloon from Versailles carrying a sheep, a duck, and a cock. These animals descended safely about 8 min. after the ascent. The first man-carrying ascent took place in Oct. 1783, when Pilâtre de Rozier went up in a Montgolfier captive balloon, the inflation again taking place by means of fires of chopped straw which were carried in a brazier suspended under the balloon. In Nov. of the same year the first free ascent was made by Rozier and the Marquis d'Arlandes, who made an ascent in a fire balloon. They journeyed about 5 m. at a height of about 500 ft., descending safely in a field just outside Paris. In Nov. there seems to have been made at Philadelphia the first man-carrying ascent with a hydrogen balloon, 7 days after the ascent of Rozier and d'Arlandes at Paris. Longheed says that a carpenter named James Willcox allowed himself to be persuaded to make the ascent, which was under the auspices of the Philosophical Academy. In Dec. Charles and Robert made an ascent in a free hydrogen balloon of about 27 ft. diameter. They safely accomplished a journey of about 27 m. in just under 2 hrs., when, Robert having got out, Charles made a further journey of about 3 m., rising to the height of about 2 m., and enduring some discomfort from the rapid ascent and the height to which he was carried. To Charles is due the credit for the ideas of a valve and a car suspended from a hoop attached to the balloon by means of silk netting. The first woman to ascend was Madame Thible, who went up from Lyons in 1784.

The development of the hydrogen balloon, however, was due also to the experiments which had already been made by Cavendish, who showed the lightness of hydrogen as compared with the air, and the work of Dr. Black and Tiberius Cavallo. Dr. Black had attempted to cause a calf gut bladder to ascend when inflated with hydrogen, but had failed because of the heaviness of the calf gut; but Tiberius Cavallo had inflated soap bubbles with hydrogen and floated them in the year previous to the first ascents by Montgolfier (1782). The first ascent in Great Britain took place about 5 months after the first Montgolfier ascent in France; the balloon was made by a certain Count Zambecari, being about 10 ft. in diameter and weighing 11 lb. It went up from the artillery ground in Nov. 1783, and descended about 48 m. from London in Sussex, having been in the air about 2½ hrs. At the beginning of the next year (Feb. 1784) a balloon was liberated from Sandwich, and descended in Fr. Flanders; this was the first cross-Channel flight. The real introduction of aerostation

into England, however, was made by Lunardi. He was secretary to the Neapolitan ambas., and in his letters gives a detailed description of the circumstances attending his first flight. His balloon was 33 ft. in diameter, and was visited by about 20,000 people during the time that it was on view at the Lyceum in the Strand. On Sept. 15, 1784, he made an ascent from the artillery ground by himself. A huge concourse of spectators, amongst whom was the Prince of Wales, watched the ascent. Lunardi took with him a dog, a cat, and a pigeon, and his balloon was fitted with oars by which he intended to try to navigate the balloon. One of the oars, however, broke shortly after the beginning of the ascent. He landed first of all at a vill. in Hertfordshire after about 1½ hrs.' travelling, and again continued his journey to Standon near Ware, which he reached after about a further ¼ hr.'s flight. This was the first real ascent in Britain, and attracted an enormous amount of attention. Lunardi became the lion of the moment, he was presented at court, and was received everywhere with extravagant enthusiasm. He made further ascents in Scotland in the following year, during one of which he travelled about 110 m. The first man-carrying cross-Channel voyage was made by Blanchard and Jeffries in Jan. 1785. Blanchard had already in the previous year estab. a reputation as an aeronaut, and by this and succeeding voyages he became known as one of the most famous of aeronauts. The cross-Channel voyage was accompanied by some perils, but was safely negotiated, the descent being made in the forest of Guines. In the same year another attempt was made to perform this same feat by Rozier and Romain. The balloon used on this occasion was a combination of a Montgolfiere and a Robertière. The actual ascent was made in safety, but the balloon having risen burst into flames, and the aeronauts were both killed. During the century which followed balloons were greatly developed, and were used for scientific and military purposes. Long voyages were undertaken and immense balloons were constructed for the purpose of carrying out various projects—e.g. the great Nassau balloon journey in 1836 from London to Weilburg, a distance of nearly 500 m., in about 18 hrs. In 1863 Nadar constructed what was called *Le Grand*, a very ambitious vessel, which was constructed for the purpose of making long voyages. The car of this balloon was exhibited at the Crystal Palace during the years 1863-64.

During the nineteenth century a number of long voyages were either made or contemplated, the 2 longest made being voyages of over 1000 m. in 1859 in America, and in 1900 from Paris to Korostyshev, a distance of 1193 m. In 1897 an attempt was made to discover the N. Pole from Spitzbergen by balloon, but Andrée and his 2 companions perished, no traces of them being found until over 30 years later. (See ANDRÉE.)

The development of the balloon soon brought with it the possibility of scientific research, and various experiments were made during the early part of the nineteenth century. Most of the experiments were not at first carried out very carefully, and the results did not come up to expectations. Two ascents by the scientist Gay-Lussac, however, gave some useful information regarding the upper air and the effect, or rather lack of effect, of the upper air on magnetic force. After 1805 the experiments seem to have ceased until the middle of the century. Between 1850 and the end of the century a number of important ascents were made for scientific purposes; the most important of these were the ascents made by Glaisher between 1862 and 1866. Altogether 28 ascents were made, a number being made from Wolverhampton and from Woolwich. The chief problems that these ascents tried to solve were: the height, density, and thickness of clouds, the direction and the rate of the various air currents, the amount of electricity in the air, and the comparison of readings of an aneroid barometer with those of the mercury barometer. The results of the observations were pub. in the Brit. Association reports between 1862 and 1866. A number of extremely high ascents have been made, but these have always been attended with much danger. The highest was made in July 1901, when a height of some distance over 34,500 ft. was reached by 2 aeronauts from Berlin. To obviate the necessity of making these dangerous high ascents, unmanned balloons have been sent up with recording instruments attached that work automatically.

Although it is only from about 1885 that balloon corps were organised by the armies of the various great powers, previous to that time they played an important part in the various campaigns of Europe. From the beginning they had attracted the attention of the military authorities, and we hear of their being used during the wars which followed the Fr. Revolution. In June 1794 balloons were used for the purpose of reconnoitring by the Fr., who were fighting the Austrians, but the idea was not seriously developed, and in fact the ballooning corps of the Fr. were disbanded by Napoleon. But war balloons were used by the Fr. when fighting in Italy, but were at this period in charge of 2 civil aeronauts, there being no ballooning corps. In the Amer. civil war, at least during the beginning of that war, they proved themselves of very considerable value; in fact a small Federal balloon corps was formed during this period. During the siege of Paris they proved of great use in keeping up communications with the outside world, and 64 of them were dispatched between the beginning and end of the siege.

*Dirigible Balloons.*—From the time of the beginning of balloon flights it was recognised that the great problem before aeronauts was to be able to navigate the balloon safely through the air, and to

make it to a very great extent independent of the air currents. The first means of propulsion tried was oars, but although in a calm atmosphere some little success was gained with them, it was recognised that this means could never be really successful. Oars were experimented with at the end of the eighteenth century, but the first attempt to navigate the balloon by means of a small, light engine came over 50 years later, in 1852, the experiment being made by Henri Giffard. Between that time and the end of the century many experiments were made, some of which attained a transient success, and some met with almost instantaneous disaster. In 1897 an experiment by Dr. Wolfert with a small gasoline motor led to the explosion of the airship in mid air and to the death of the aeronauts. From the year 1897 the development of the airship was the special work of the Count Zeppelin. In 1900 he made his first flight with a dirigible balloon which carried 5 men. It was made of aluminium, supported by gas-bags and driven by 2 motors, each about 16 h.p. His first experiment met with some success, but the first Zeppelin airship was succeeded by another in 1905 with greater motor power; this was wrecked and was succeeded by a third which met with great success. This airship carried 11 passengers and attained a speed of about 30 m.p.h. The fourth Zeppelin airship succeeded in travelling about 250 m. in 11 hrs., but was wrecked by a storm in 1908, the wreckage catching fire and completely destroying the ship. In the meantime many other experiments had been carried out, notably by Santos Dumont, who circled the Eiffel Tower in the face of a fresh wind; while in England a number of experiments were carried out by the War Office with dirigible balloons. The most successful voyage was that of the *Nulli Secundus*, which, leaving Farnborough, sailed round St. Paul's to the Crystal Palace, carrying 2 passengers and attaining a speed of about 20 m.p.h. (See also AIRSHIPS; BALLOONS.)

The study of artificial flight can be traced back practically through legendary story to the beginnings of hist. As has already been pointed out, the hist. of aviation is older than that of acrobatic, and during the Middle Ages we get many attempts to produce a workable airship or to imitate the flight of birds by means of artificial wings. Leonardo da Vinci initiated theories concerning flight, and during the latter part of the seventeenth century and the beginning of the eighteenth many theories were advanced and much research made concerning the theory of flight. Much experiment was done with artificial wings and with aerial screws. Amongst the names which may be mentioned in this connection are those of Ronelli, Morey, Pettigrew, and Cayley. To Sir George Cayley is given the credit of being the inventor of the modern aeroplane. Prof. Berlet in his book *The Conquest of the Air* points out that every essential to

successful flight was given in the airship invented by Sir George Cayley. 'In fact everything was there in Sir George Cayley's idea—the wings forming an oblique sail, the empennage, the spindle forms to diminish resistance, the screw propeller, the explosion motor, the calculation of the centre of thrust, and the demonstration of the fact that displacement takes place towards the front. The author even describes a means of securing automatic stability.' This machine was described by Sir George Cayley in a paper contributed to *Nicholson's Journal* in 1809, and in the following year he produced the apparatus itself—at first without a motor, but later with a motor as well. The invention, however, was not successful, and during the trials the machine met with disaster. The next attempt at aviation that we hear of is in 1813, when Hensons, by a combination of aerial screws and supporting surface, tried to complete a successful machine. The attempt was not a success, although it was followed up in the succeeding years by many other attempts, especially by his partner, Stringfellow. During the years which followed many attempts to solve the problem of aerial flight were made, but none of them met with great success. The difficulties in the way were enormous; the science of aerodynamics had yet to be developed; flight in the air was flight through a substance the laws of which were only dimly beginning to be understood. The science of aerodynamics, which even now is only at its beginning, was developed during the latter part of the nineteenth century by Sir Hiram Maxim, and Prof. Langley, an Amer. physicist. By 1896 the experiments of Langley had been so far successful that he made an aeroplane which, although it did not by its own effort lift itself from the ground, flew for a distance of about half a m. along the Potomac R. Further experiments had in the meantime been carried out by Sir Hiram Maxim and N. C. Ader. The former to a very great extent helped to solve the problem of light motors by producing in 1894 an aeroplane with an engine which weighed not quite 2 lb. per 1 h.p. But in spite of this the aeroplane failed to fly. Ader seems to have been the first inventor to produce a machine which lifted itself from the earth by its own effort. Between 1896 and 1903 he produced 3 machines, none of which was very successful, but which embodied new ideas, and one of which flew for about 350 yds. The first aeroplane flight may be said to have taken place at Satory in 1896, when Ader's machine lifted itself by its own power and flew for the short distance already mentioned. In the meantime experiments were being made with soaring machines and gliders. The chief name to be mentioned in connection with this movement is that of the Berlin engineer, Otto Lillenthal, who, with an arrangement formed on the plan of birds' wings, attempted to imitate their 'soaring flight.' These wings were made of a light framework covered with a light

fabric with 2 rudders in the rear. In the centre of this framework Lilienthal was poised, and with an apparatus of this description he made over 2000 flights in safety. He met his doom while using a biplane glider, falling from a height of about 80 metres and breaking his neck. These experiments were further carried out by Chanute in New York; he introduced several new ideas. The experiments were also continued at the beginning of the present century by the brothers Wright. These 2 young Amers., Orville and Wilbur, were originally cycle makers of Dayton, Ohio. They followed up the ideas which had already been promulgated by Lilienthal and Chanute. The result of these experiments was that in 1903 the brothers Wright produced their first aeroplane. The first invention of the Wrights was simply an aeroplane that flew in a straight line, but this received many modifications, and in 1908 they came to France to carry on experiments there. So much mystery had surrounded them, and so many canards had been spread concerning them, that their successful flights came to the many as a great surprise. During the experiments Wilbur Wright created a record by remaining in the air for over an hr. while carrying a passenger. He also attained a speed of 60 kilometres an hr. During this period, however, great strides had been made by many other inventors. Farman had succeeded in producing a machine with which he remained in the air for nearly 45 min., and he was closely followed, and sometimes surpassed, by the Frenchman Léon Delagrangé. The best results, however, were undoubtedly attained by the brothers Wright, who succeeded in remaining in the air for nearly 2½ hrs. The year 1909 may be taken as the real era of the beginning of successful aviation. In that year records were made only to be broken, and the ultimate success of the monoplane and biplane was proved by many successful experiments. On July 25, 1909, Biériot flew the Channel in a monoplane, but in the same year Farman covered a distance of nearly 110 m. in 4 hrs. on a biplane. Between 1890 and 1903 the best distances flown were 164 ft. by Clément Ader in France in 1890, 852 ft. in 1903, 20½ m. in 1905, and 50 m. 1638 yds. in 1908, all by Orville Wright in the U.S.A.

Compared with the First World War period and after, progress was relatively slow in the 5 years preceding that war. Up to that time the chief international records were: *duration*, 24 hrs. 10 min. by Boehm (Ger.) in an Albatros biplane, 1914; *distance* (over circuit without alighting), 1200 m. by Landmann (Ger.) in an Albatros biplane, 1914; *distance* (in straight line without alighting), 486·87 m. by Deroye (It.) in a Biériot monoplane, 1913; *altitude*, 25,750 ft. by Oelrich (Ger.) in a D.F.W. biplane, 1914; *speed*, 126·59 m.p.h., by Prevost (Fr.) in a Deperdussin monoplane, 1913. Passenger-carrying records were: *duration*, 19 hrs. 47 mins., 9 passengers, pilot Noël (Fr.) in Graham-

White biplane, 1914; *distance*, 68·3 m., 6 passengers, pilot Garaix (Fr.) in Schmitt biplane, 1914; *altitude*, 980 ft., 15 passengers, pilot Sykorsky (Russian) in Sykorsky biplane, 1914; *speed*, 66·85 m.p.h., 6 passengers, pilot Garaix in Schmitt biplane, 1914; *flying over sea*, 320 m., Cruden Bay (Scotland) to Kleppø (Norway), pilot Gran (Norwegian) in Biériot monoplane, 1911. Garaix in Sept. 1913 flew 700 m. across the Mediterranean, but passed over Sardinia en route. Among the best Brit. flights of those years were 107 m. 1320 yds. in 3 hrs. 12 mins. 40 secs. by T. Sopwith and 185 m. 810 yds. in 4 hrs. 47 mins. by S. F. Cody, both in 1910. These pioneer records, if valuable, look unimpressive to-day. It was the First World War (see also AERIAL WARFARE) which gave so great an impetus to A. in all its branches, and if progress during that period was hastened by and directed along the lines of military necessity, it ensured to the ultimate benefit of aviation generally.

The transition of both heavier-than-air machines and dirigibles from the experimental stage to the practical, judged by the low percentage of accidents as compared with other modes of transport, by the immense distances flown without a stop, and by the regular use of air routes involving the carriage of more than 100,000 passengers (in Brit. aircraft) annually over a total distance of more than 1,000,000 m., was complete many years ago. A further indication of the progress made was afforded by the existence of national and international laws for the regulation of civil aviation, the creation of air ministries, and the establishment of aerodromes in all countries. The increasing reliability of heavier-than-air machines was shown by the long distance and spectacular flights of recent years. The most remarkable oceanic flight was the lone venture of Capt. Chas. D. Lindbergh, of U.S.A., in flying from New York to Paris in the *Spirit of St. Louis* (see ATLANTIC FLIGHTS). Subsequent to Lindbergh's flight (3000 m. in 33 hrs.) there were 12 flights across the Atlantic from W. to E., but there was no solo flight until that of the late Miss Amelia Earhart, who, in 1932, flew from Newfoundland to Ireland (2026½ m. in 13 hrs. 30 min.). In 1933 Wiley Post flew from New York to Berlin (4000 m. in 26 hrs.) and, concluding the journey to New York via Siberia, thus made the first solo flight round the world (16,500 m.). The first E. to W. transatlantic solo flight was made by J. A. Mollison in 1932 in a Puss Moth machine from near Dublin to New Brunswick (2400 m. in 30½ hrs.). Mollison and Amy Johnson flew the Atlantic together from Penderine in Wales to Bridgeport, U.S.A., via Canada, in the same year, this being the first flight from Britain to U.S.A.

The first flight to Australia was that made by Sir Alan Cobham, who flew there and back (28,000 m.) in 1926. Two years later Capt. Herbert Hinkler, of Australia, flew from Croydon to Port

Darwin (10,340 m.) in 15½ days at an average speed of 95 m.p.h., stopping at various large ins. at intervals between 400 and 900 m., but in 1930 Sir Charles (then W.C.) Kingsford Smith made the same journey in about 10 days. In 1930 Miss Amy Johnson, in a Gipsy Moth, set up a record for a solo flight from London to India and, continuing her journey, reached Port Darwin in 19 days, having covered in all 9960 m. Other notable Australian flights include those of C. W. A. Scott, London to Port Darwin in 9 days 3 hrs. 30 min. and back to London (1931); J. A. Mollison, Australia to England in 8 days 22 hrs. 25 min. (1931); A. C. Butler, England to Australia in 9 days 2 hrs. 20 min. (1931); C. W. A. Scott, London to Australia, 10,200 m., in 8 days 20 hrs. 44 min. (1932); in 1933 Kingsford-Smith and C. F. Ulm made 2 flights in stages in 7 days 4 hrs. 47 min. and 6 days 17 hrs. 56 min. respectively. In 1934 C. W. A. Scott, with T. Campbell Black, further reduced these times, by winning the 'Mac Robertson' international air race from England to Australia. This race started from Mildenhall (Suffolk) on Oct. 20, 1934, and the 2 men, flying a D. II. Comet, reached Melbourne on Oct. 23, their time being 70 hrs. 34 min. 18 secs., but the handicap prize was awarded to the winners of the second place, Parmenter and N. Moll, flying a K. I. M. luer with passengers and mail, whose time was 90 hrs. 13 min. 36 sec. The first woman to fly from England to Australia was Jean Batten, who, in 1935, flew the outward journey in 14 days 23½ hrs. and the homeward in 17 days 16 hrs.

A successful trans-Pacific journey was that of Kingsford-Smith, pilot, and C. T. Ulm, relief pilot, with H. W. Lyon, navigator, and I. Warner, radio-operator, both of U.S.A., in a triple-motor monoplane. They flew from California to Honolulu, Fiji, and on to Melbourne, 7800 m., in 3 days 16 hrs.; the features of the flight being accuracy of navigation and continuity of wireless communication.

The first Cape Town flight from England was that by Alan Cobham in 1925 (a distance of 17,000 m.). J. A. Mollison flew from England in 4 days 17 hrs. 19 min. in 1932, but this record was soon beaten by Amy Johnson, who flew from Lympne to the Cape in 4 days 6 hrs. 54 min. In the same year 2 Fr. airmen, Goulette and Salel, flew from Le Bourget to Cape Town in 91 hrs.

In Polar regions Capt. Hubert Wilkins, the explorer, flew from Alaska to Spitzbergen (20,000 m.) in a monoplane with a Wasp engine, to demonstrate the superiority of the plane over the dirigible for Arctic flights. In 1926 Rear-Adm. Byrd, U.S. Navy, accompanied by Pilot Floyd Bennett, flew from King's Bay, Amsterdam Is., direct to the N. Pole, and back to his starting point—a total distance of 1600 m. in under 16 hrs. The same aviator has also flown over the S. Pole.

In these days air records do not stand long unbeaten; but we may note the following aviation records and per-

formances: a non-stop flight in 1929 from England to India (4130 m.) by S./Ldr. A. G. Jones-Williams and F./Lt. N. H. Jenkins in an R.A.F. monoplane, taking 50 hrs. 38 min.; by Capt. C. D. Barnard and the Duchess of Bedford, from Lympne to Karachi and back to Croydon in 7½ days, in 1929; by R. F. Caspareuthus of S. Africa, from London to Cape Town in 8½ days, in 1930. The U.S. Army monoplane flight of 1929, lasting 150 hours, was remarkable for the feat of refuelling in the air. In 1933, S./Ldr. O. G. Gayford and F./Lt. G. E. Nicholetts made a non-stop flight from Cranwell to Walvis Bay, 5309 m. in 57 hrs. 25 min. in a Fairey (Napier) monoplane, while in the same year, P. Codos and M. Rossi flew from New York across the Atlantic to Syria, 5657 m. in 54 hrs. 44 min. Two lt. squadrons of flying-boats, consisting of 25 Savoia-Marchetti S.55 seaplanes, carried out a flight in formation to New York, via Holland, Iceland, Greenland, Labrador, and Montreal, covering in all 11,770 m. in 42 days, all but 2 machines returning. In 1931 Sir Charles Kingsford-Smith crossed the Pacific again, this time from Brisbane to California (7410 m.). C. J. Melrose, from Australia to Croydon, in 8 days 9 hrs. (1934); H. L. Brook, Port Darwin to Lympne, 7 days 19 hrs. 50 min. (1935); H. F. Broadbent, England to Port Darwin, in 6 days 11 hrs. 19 min. (1935); Jean Batten across the S. Atlantic from Dakar to Brazil in 13 hrs. 15 min. (1935); F./Lt. Rose, Lympne to Cape Town, in 3 days 17 hrs. 31 min., returning in 6 days 6 hrs. 57 min. (1936); Mrs. Mollison (Amy Johnson) (Gravesend to Cape Town, 6400 m. in 3 days 6 hrs. 25 min., returning to Croydon (7885 m.) in 4 days 16 hrs. 17 min. (1936); in 1936 Mrs. Markham made the first solo flight by a woman across the Atlantic from E. to W., flying from England to Cape Breton; double crossing of the Atlantic by Harry Richman and Richard Merrill (1936); Jean Batten, solo flight from New Zealand to Australia in 4 days 21 hrs. 3 min., afterwards completing the flight to Auckland, the whole journey occupying 11 days 56 min. (1936); J. A. Mollison, Newfoundland to Croydon in 13 hrs. 17 min. (1936); Inuvara and Tsukagoshi, from Tokyo to Croydon, 94 hrs. 18 min., a distance of 10,000 m. (1937); H. F. Broadbent, Port Darwin to Lympne, 9825 m., in 6 days 8 hrs. 25 min. (1937); H. L. Brook, Cape Town to Heston aerodrome, 6980 m. in 4 days 20 min. (1937); Merrill and Lambie (U.S.A.), Atlantic double crossing from Brooklyn to England (Sussex), 20 hrs. 31 min., and from Southport (Lancashire) to Quincy, Massachusetts, in 22 hrs. 27 min. (1937); Gremov, Yumashev, and Danilin (Soviet), from Moscow, over the N. Pole, to California (6700 m.), being the record non-stop flight up to that year, in 2 days 14 hrs. (1937); Jean Batten, from Port Darwin to Lympne, 9900 m. in 5 days 18 hrs. 15 min. (1937); F./O. Clouston, R.A.F., and Mrs. Kirby Green, from Croydon to Cape Town, 6370 m. in 1 day, 21 hrs.

6 min. and back to Croydon, 7135 m. in 2 days 9 hrs. 23 min. (1937); F/O. Clouston and V. Ricketts, England to New Zealand, in 4 days 7 hrs. 8 min., and back, the whole journey taking 10 days 21 hrs. (1938); H. P. Broadbent, Port Darwin to Lympne, in 5 days 5 hrs. 21 min. (1938); Ger. seaplane *Dornier 28*, flew from Devon to Rio de Janeiro, 5100 m. in 43 hrs. (1938); Mlle. Elizabeth Lion (France) flew from Istres to Basra, 7500 m., this being the longest flight by a woman (1938); Howard Hughes (U.S.A.) and 4 companions made a round journey from New York, via Paris, Siberia, Alaska, and Canada, back to New York in 3 days 19 hrs. 17 min. (1938); D. Corrigan (U.S.A.) New York to Eire in 28 hrs. (1938); Brit. seaplane *Mercury* accomplished shortest E. to W. Atlantic crossing, from Foynes (Eire) to New York, in 13 hrs. 29 min. (1938); in the same year, the *Mercury*, under Capt. D. C. Bennett, with First Officer Harvey, launched pick-a-back, flew 6045 m. in 42 hrs. 6 min. from Dundee (Scotland) to the mouth of the Orange R., while attempting a non-stop flight to Cape Town.

The long-distance record until 1939 was held by the R.A.F. with the flight of 3 Vickers-Wellesley bombers from Ismailia for Australia (Nov. 1938). L.2638 and L.2680 reached Darwin in about 48 hrs. and L.2639, which had refuelled at Koepang, followed some 3½ hrs. later; the non-stop distances flown being 7162 and 6600 m., and the average speed was 149 m.p.h. Other flights in recent years: S. African Lockheed machine, Pretoria to Nairobi, 2000 m. in 10½ hrs. (Oct. 1940); Pat Paves beat the Sept. 1937 record from Newfoundland to Eire (1941); Caleb Haynes, Curtis, Lemay, and Cochran, 4 engineering U.S. bomber officers, Takoradi (Gold Coast) to Belem (Brazil), 3400 m. 13½ hrs., longest flight to be completed in daylight (Oct. 3, 1941); Capt. O. P. Jones, in Amer. Liberator, flew from U.S.A. to England (Atlantic Ferry), 8 hrs. 23 min., beating the previous fastest time by 22 min. Capt. Cramer, in a Liberator, flew the journey on Dec. 5, 1943, in 8 hrs. 29 min. In May 1943 Capt. W. S. May, also in a Liberator, flew from Newfoundland to Great Britain in 6 hrs. 20 min. In the same month Capt. S. T. B. Cripps (B.O.A.C.) flew from Montreal to Britain in 12 hrs. 51 min. Soon afterwards Capt. C. W. A. Scott did the journey in 12 hrs. 21 min. On Nov. 29, 1943, Capt. Richard Allen, in a Liberator of the R.A.F. Transport Command, did the journey in 11 hrs. 35 min. On Nov. 6, 1943, Capt. G. B. Lothian in a Lancaster flew from Montreal to Britain in 10 hrs. 13 min. On Mar. 23, 1943, Capt. J. H. Hart and crew in a Boeing flying boat flew from Natal (Brazil) to W. Africa and back in 23 hrs. 59 min. A Liberator of the R.A.F. Transport Command flew from England to Bathurst (Gambia), a distance of 3150 m., in 15 hrs. 58 min., this being the first direct passenger-carrying flight from England to W. Africa. In May 1944 a Mosquito (no

pilot named) is said to have completed the Atlantic crossing in 6 hrs. 46 min. In Nov. 1944 F/Lt. J. Linton in a Mosquito of Transport Command flew from Britain to Karachi in 16 hrs. 46 min. overall time or 14 hrs. 37 min. flying time. On Feb. 9, 1945, a Liberator (B.O.A.C.) crossed from Newfoundland to England in 7 hrs. 18 min. But the record up to 1946 was held by a reconnaissance Mosquito of Coastal Command flown by W./C. J. R. H. Merrifield, which crossed in 5 hrs. 10 min. A transcontinental W. Airways aircraft on Nov. 26, 1945, flew from Gander, Newfoundland, to Rineanna, Eire, in 6 hrs. 55 min., at an average speed of 297 m.p.h. The Pan-Amcr. Airways *Constellation* set up a new record for the Atlantic crossing on Feb. 4, 1946; carrying 29 passengers and a ton of freight it flew from New York to Shannon airport, Eire, in 11 hrs. 9 min. It did the 1020 m. from New York to Gander in 4 hrs. 33 min., and the rest of the journey, 1775 m. in 6 hrs. 36 min. In 1946 R.A.F. Lancaster *Aries* achieved the following flights: Britain-Cape Town, 32 hrs. 21 min. (Jan. 16); Blackburn, Surrey-New Plymouth, New Zealand, 59 hrs. 50 min., via Karachi (19 hrs. 14 min.) and Darwin (45 hrs. 35 min.), Aug. 22-24. A Pan-Amcr. Clipper crossed from Newfoundland to Shannon, Eire, in 5 hrs. 23 min. on Apr. 27, 1947. On May 29, 1947, a B.S.S.A. Lancaster flew to Bermuda in 20 hrs., refuelling in mid-air. The first transatlantic automatic flight was made (Sept. 21-22, 1947) by a pilotless U.S. Army Skymaster from Newfoundland to Britain.

**Speed Records:** The Schneider trophy (v.v.) contest has produced high speed records: 318.62 m.p.h. at Venice, on Mar. 30, 1923, by Maj. Mario de Bernardi; 328.63 m.p.h., over the Solent on Sept. 7, 1929, by F/O. Waghorn (R.A.F.). 284 m.p.h. being on that occasion the speed of the runner-up, Dal Molin of Italy, and 282.11 m.p.h., that of F/Lt. D'Arcy Greig (R.A.F.), who, at Calshot, 1929, reached 319.57 m.p.h. On a supermarine Rolt-Rove S. 6 S./Ldr. A. H. Orlebar set up, also in 1929 at Calshot, a world's record for 3 kilometres, averaging 355.8 m.p.h. This, however, was exceeded in 1931 by F/Lt. G. H. Stainforth, who averaged 389.67 m.p.h. at Lee-on-Solent, his fastest circuit being 408.288 m.p.h. The Schneider trophy contest has since been discontinued, the cost and risk alike being considered to be excessive. Until 1946 the air speed records were: W/O. Agelle over Lake Garda, Italy, 423.76 m.p.h. (682.483 km.) in 1937. Dr. Wurstner, Germany, 379 m.p.h. (610 km.) over land, in 1938. S./Ldr. J. W. Gillan, 327 m. in 48 min. (408.7 m.p.h.), at night over land. At Augsburg in Apr. 1939, a Messerschmitt 109 set up a record of 469.2 m.p.h. This last record was unbeaten for 6 years, when, on Nov. 7, 1945, 2 Meteor jet-propelled aircraft both averaged over 600 m.p.h. G/C. W. J. Wilson averaged 606 m.p.h. and Mr. Eric Greenwood 603 m.p.h.; Cmdr. Turner Caldwell, U.S.

Navy, achieved an average speed of 640.7 m.p.h. over a 1.86-m. course in California, the highest speed reached being 653.4 m.p.h., on Aug. 21, 1947. Mr. John Derry attained a speed of 605.23 m.p.h. over a 100-km. closed circuit course in Hertfordshire, England, on Apr. 12, 1948.

*Altitude Records:* F. Lt. M. J. Adam, 53,937 ft., in 1938; Lt.-Col. Mario Pezzi (It.), 56,017 ft., in 1938; Mr. John Cunningham, 59,492 ft., in 1948.

*Airship Flights, etc.*—The *Graf Zeppelin* left Friedrichshafen on Oct. 11, 1928, and reached Lakehurst, New Jersey, in 11½ hrs. (return journey took 71 hrs.), covering 6300 m., and going via France, Gibraltar, Funchal, the Azores, and Virginia. The commander was Dr. Hugo Eckener, the designer, and with him was a crew of 40. The flight was successful despite storms, wind, and fog, and from the time taken indicates a considerable advance since 1919, when the Brit. dirigible *R34* flew from E. Fortune, Scotland, to Mincola, New York, or 3130 m. in 108 hrs. The only other crossings were in 1924 by the *Los Angeles* from Lake Constance, in somewhat better time and by the Brit. airship *R100*, which flew from England to Montreal in Aug. 1920, taking about 5 days. The *Graf Zeppelin* was flown round the world in 1929, taking 21 days and reaching Lakehurst Aug. 29, and also in 1930. The loss of the Brit. airship *R101* in 1930 and of the Amer. airship *Akron* in 1933 has reinforced the agreements against the continued construction of airships (q.v.).

A remarkable experiment, but only partly successful, was that of Juan de la Cierva, who in 1928 crossed the Channel in an autogyro at a speed of 90 m.p.h. and toured England for 3000 m. This machine was wrecked a few days later, owing, it seems, to a broken landing cable rather than to any structural defect (see under *AUTOGYRO*).

In commercial development it is probable that the U.S.A. are ahead of Great Britain, in that the aeronautical industry has so far secured the co-operation of the banking and financial interests as to have emerged from the subsidised or dependent state to that of an industry supported by the public as a whole. In this connection, the trustees of the Daniel Guggenheim Fund, created to assist commercial aviation and to stimulate public interest in its development, are now able to concentrate on aerodynamics and cognate problems. (For designs of and developments in aeroplanes see *AERO-ENGINES*; *AEROPLANE*; for progress in theories of viscosity and allied topics see under *AERODYNAMICS*.)

See J. E. Hodgson, *The History of Aeronautics in Great Britain, 1921*; S. A. Vento, *Air Liners and Airways of To-day, 1947*.

**Aerophor**, a musical appliance for enabling a wind-instrument player to sustain his notes *ad infinitum*, invented by Bernard Samuels, flautist in the Duke of Mecklenburg-Schwerin's orchestra. It consists of a small bellows worked by the

foot, with rubber tubing attached, ending in a metal reed fixed near the mouth-piece of the instrument played. The air from the player's lungs is prevented from passing into the bellows by a stop-cock in the tubing. First used in Richard Strauss's *Festliches Präludium*, written for the opening of the Concert House, Vienna, 1913.

**Aeroplane**, a power-driven heavier-than-air flying machine, that obtains its lift from fixed wing surfaces.

*History.*—The first flight of 12 sec. by such a machine was made by Orville Wright at Kitty Hawk, N. Carolina, on Dec. 17, 1903. The first crude *As.* consisted of flimsy single-surface wings of fabric stretched over wooden frames, engine and pilot carried in the open framework of an uncovered fuselage, and the tail surfaces. After the initial flight, progress was slow until the years just prior to the First World War, when the development of more powerful and lighter engines gave the *A.* designer a better chance to make practical types. In those early years a surprising number of successful far-sighted experiments were made: the Bréguet all-metal biplane with tricycle undercarriage; the Antoinette streamlined monoplane with surface radiators; the Dunne inherently stable tailless machines; the close-cowled streamlined engine installation; the Nieuport cantilever monoplane; the amphibian flying boat Sopwith Bat Boat, to name a few. Despite these outstanding examples the usual *A.* was a simple tractor biplane like the Avro 504 (Fig. 1a) or a pusher biplane with the tail carried on booms behind the nacelle as on the Vickers 'Gun Bus' (Fig. 1b), which was one of the earliest gun-carrying *As.*

During the First World War engine power increased rapidly, while aerodynamic design did not make great progress beyond the general adoption of the tractor arrangement because of its simpler form. The biplane was the most general because it was easier to brace than either the monoplane or the triplane. Generally, thin wing sections were used for speed because of their lower drag, although one designer, Anton Fokker, had realised the possibilities of thick sections which could be used for internally braced cantilever wings. One of the 1918 Fokker designs is shown in Fig. 2.

Immediately after the war a boom in air transport led to the conversion of many of the larger military types, and to the building of some specialised air liners; but, to all intents and purposes the *As.* of the first decade after the war showed little advance on those of 1918— aerodynamically, structurally, or in performance. In 1929 the Brit. Air Ministry radically revised its ideas on military *As.*, and the Hawker Hart light bomber and Fury single-seater fighter (Fig. 3) set a new standard in performance, the former being capable of nearly 200 m.p.h. and the latter of over 200 m.p.h. About this time the monoplane began to come into favour on the Continent and in the U.S.A., first for air liners, and later

for military use. With the advent of the monoplane there was also a gradual change over to wood—and then metal-covered structures. During the period 1919 to 1931 the Schneider trophy contest gave a fillip to the development of high-speed *As.*, and the Supermarine S-6 and Rolls-Royce R engine of 1929 and 1931 (Fig. 4) were the direct ancestors of the Spitfire and Merlin.

other countries produced aeroplanes as fast as those designed for the R.A.F.

The period 1939-45 saw a somewhat similar development to that in the previous war; *i.e.* extra speed was gained mainly by adding more and more engine power, culminating in the advent of the jet engine. Outstanding among the aeroplanes of this period were the Spitfire (Fig. 6B), whose speed was raised by more

FIG. 7A. SUPER-FORTRESS FOUR-ENGINED HEAVY BOMBER MONOPLANE, 1943

FIG. 7B. FOUR-ENGINED MONOPLANE AIR LINER, 1945  
Lockheed Constellation (Wright Cyclone 2500-h.p. engines) used for transatlantic flying; it has a pressure cabin to increase passenger comfort above 20,000 ft.

In the early nineteen-thirties the *Americans* started to use 200-m.p.h. air liners, the Boeing 247, Lockheed Orion, and Douglas DC-2 being among the first. Gradually other countries followed their lead, although Great Britain, in particular, retained strut-braced, fabric-covered biplanes until shortly before the Second World War for many civil and military purposes. In 1935 a number of outstanding prototypes appeared in Great Britain: the Short Empire flying boat, the first really modern 200-m.p.h. large flying boat; the first single-seater fighters to exceed 300 m.p.h., the Hurricane and Spitfire; and the first light bomber to approach 300 m.p.h., the Bristol Blenheim. Up till this time Brit. *As.* had been renowned for their quality and dependability rather than for their performance, but for the next 10 years few

than 100 m.p.h. between 1939 and 1945; the Brit. heavily armed, large-load-carrying, 4-engine bombers, the Avro Lancaster, Handley Page Halifax, and Short Stirling; the fast wooden light bomber-fighter-reconnaissance de Havilland Mosquito (Fig. 6A); the high-altitude long-range Boeing Super-Fortress heavy bomber (Fig. 7A); and the Messerschmitt Me 163 (Fig. 8) and 262, the first jet-propelled, 500 m.p.h. fighters.

By the end of the war speeds of 600 m.p.h. (Gloster Meteor, Fig. 9); bomb loads of 10 tons (Lancaster); ranges of 5000 m. (Super-Fortress); passenger loads of over 100 (*i.e.* Boeing C-97); and ceilings of 45,000 ft. (Spitfire XIV) were practical propositions, and not mere record performances.

*Theory of Flight.*—Briefly the lift of a wing is obtained from the suction above

FIG. 10. DEVELOPMENT OF THE AEROFOIL SECTION AND THE EFFECT OF ANGLE OF INCIDENCE UPON LIFT

- A. Flat plate—lift and drag, act at C.P., centre of pressure
- B. Cylinder—drag only
- C. Streamline—low drag
- D. Aerofoil section—combination of (a) and (c) giving lift and low drag
- E. Early thin, highly curved section

- F. Thick, high-lift section as used on gliders
- G. Modern general purpose bi-convex section
- H. High-speed thin symmetrical section
- I. Small incidence ( $\alpha$ ): moderate lift, low drag
- J. Large incidence high lift, increased drag
- K. Stall, breakdown of air flow, no lift, large drag

and pressure beneath a plate when it is passed through the air at speed (Fig 10). Since a thin plate is not very efficient and is difficult to construct, it is combined with a streamline to form an aerofoil section. There are hundreds of such

FIG 11A THE PRINCIPAL FORCES ON AN AIRPLANE IN STATIC EQUILIBRIUM

FIG 11B THE ACTION OF THE THREE CONTROL SURFACES

sections the earliest being thin and highly curved (Fig 10E), then they began to become thicker (and easier to make structurally) until with the advent of very high speeds after 1940 they were made thinner again (Fig 10H).

The lift of the wing increases with the angle to the air flow ( $\alpha$ ), as does the drag,

or resistance until at a point called the stall the air ceases to flow smoothly over the wing and all lift is lost. This state of affairs also exists when the speed of the wing through the air is insufficient to cause enough suction to give lift.

When a wing moves through the air at high speed the boundary layer (or envelope) of air close to its surface moves at a lower speed than the rest, owing to its clinging to the surface of the aerofoil. If this boundary layer is flowing smoothly (laminar flow) there is little resistance, but if it is turbulent there is a great deal of drag. At the present time much energy is being expended in trying to induce this laminar flow for, as the speed of sound is approached the turbulent area creeps forward until it breaks away in a shock wave. This shock wave is a sudden

FIG 12 EQUILIBRIUM AND CONTROLS OF A TYPICAL TAILLESS AIRPLANE

in case in pressure where the local velocity of the air exceeds the speed of sound. When this occurs there is a very sudden rise in the drag of the wing while just before its onset there are several disturbing phenomena that upset the stability of the A.

A wing on its own would be of little use and at the rear of the fuselage a fixed horizontal tail plane and a fixed vertical fin provide stability (Fig 11A). Control is obtained by adding hinged flaps to wing, fin and tail plane. A tail on the end of the fuselage is not essential to stability, although it is the simplest way of obtaining it. Many tailless As have been built and flown successfully. One of the commonest forms is shown in Fig 12, the rudders are at the wing tip while the ailerons and elevators are placed along the trailing edge of the swept back wing—balance being obtained by this sweepback. Obviously, where there is no tail weight and drag are saved, while recent aerodynamic research has shown that sweepback has a good effect on air flow at high speeds, so that such As are becoming more common.

Since the air resistance of the wing is the greatest part of the resistance of the whole A it has to be kept as small as possible. A small wing provides less lift, so a compromise is made by fitting slots to the leading edge and/or flaps to the trailing edge. The action of these

devices is shown in Fig. 13. All modern As. have flaps of some type and many have slots.

**Structural Developments.**—The essential need for an A. structure has always been lightness. Originally achieved by using frameworks of wood braced by wires and covered with fabric for both wings and fuselage; gradually there was a change to fabric-covered tubular metal structures (some still wire-braced, others welded) or to all-wood designs where the

structure (geodetic) covered with fabric was employed.

The alighting gear (undercarriage) of As. has always presented the designer with problems: it must be light yet capable of supporting sev. times the weight of the whole A. when it is brought violently to the ground: it has to be resilient to absorb such shocks and at the same time it must not be too springy or the A. will bounce badly when taxiing. Early undercarriages consisted of

FIG. 13. HIGH-LIFT DEVICES

- A. Stalled wing
- B. Addition of slot to (A) smooths air flow and prevents stall, at same time giving high lift
- C. Addition of flap to (B) increases both lift and drag
- D. Plain flap
- E. Split flap
- F. Slotted flap
- G. Extension flap, increases area as well as camber

plywood skin of fuselage and wing (Fig. 14B) carries part of the structural loads. Since 1930 the tendency has been to make all classes of A. of the all-metal stressed-skin type (Fig. 14A). In this case the whole A. is usually made of an aluminium alloy, the fuselage having light longitudinal members (stringers), light transverse frames, and a sheet-metal covering; the whole being joined by riveting and forming, in effect, a light metal tube. The wing is of similar construction, but the main loads are taken by one or more transverse spars. Notable modern exceptions to the all-metal rule are the de Havilland Mosquito, made largely from balsa wood and spruce, and the Vickers Armstrong Wellington where a type of lattice

of light wire-spoke wheels carried on an axle tied to the apices of 2 wood or tubular vees by rubber cord, which served as the sole shock absorber. Later coiled springs, rubber blocks, and oil and air pistons were incorporated to form shock absorbers with better qualities. Recently, for very large As., the compressibility of fluids at very high pressures has been utilised to provide a compact and light springing medium. The development of wheels and tyres have resulted in magnesium-alloy cast wheels with large-contact medium-pressure balloon tyres for most types of aircraft. With the increase of performance the drag of an undercarriage became substantial and the majority of modern As. capable of speeds over 150 m.p.h. are fitted with

A Spitfire stressed skin metal fuselage with light alloy stiffening members and duralumin skin.

B An Oxford wooden main plane with spruce and plywood spars and light lattice ribs, the whole covered by plywood

FIG 14 A & B. WOOD AND METAL AEROPLANE STRUCTURES

retractable undercarriages. The retraction is most commonly done by hydraulically operated jacks, although pneumatic power is also used and some systems have been designed using electric motors and screw jacks.

Originally, piston engines (see *AFRO-ENGINES*) were used to drive the airscrew, but now the jet engine is replacing it for high-speed As. Where only moderate speeds are required the jet engine is inefficient and the jet/airscrew engine

is used. With this engine more thrust can be obtained at take-off and the cruising power is more economically converted into thrust. The airscrew has been developed from a wooden 2- or 4-bladed type, first to a duralumin or steel one and then (in 1927) the variable-pitch mechanism was added. The object of this is to change the angle of the blades to suit the speed of the A., so that the engine can be run at its best r.p.m. whatever the speed of the A.

Another advantage is that the blades can be feathered to present low drag if an engine stops in flight. The latest development is a reversible-pitch airscrew in which the blades are turned right round to give a negative thrust and so slow the A. on landing. The reversible pitch can also be used for manoeuvring a multi-engine A. on the ground, or on the water, rather than as an oarsman backs water.

Seaplanes are of 2 general types; land As. mounted on floats or flying boats, where the fuselage is turned into a hull, and is provided with a stepped planing bottom (see Fig. 5) to enable it to lift out of the water. The flying boat is generally used for the larger sizes, while the float plane is used for smaller and faster types. For a long time (from 1925 to 1929 approximately) the world's speed record was held by seaplanes because they were easier to land and take off at high stalling speeds. Generally, though, seaplanes have a lower performance than landplanes; the large flying boat at present has an average maximum speed of 250 m.p.h. compared with 300 to 350 m.p.h. for similar large landplanes. Failing the invention of a satisfactory retractable float system, the float seaplane is always much inferior to the landplane in speed, and also in load capacity and climb because of the weight of the floats and their extra drag. Flying boats carry large loads, though rather slowly.

See A. S. Niles and J. S. Newell, *Airplane Structures*, 1938; C. H. Latimer-Needham, *Aircraft Design: Aerostructures*, 1939; R. Abbott, *Fundamentals of Flight*, 1942; M. Langley, *Metal Aircraft Construction*, 1942; W. Lockwood Marsh, *The ABC of Flying*, 1945; L. Bridgman, *Jane's All the World's Aircraft* (annual).

**Aeroscope**, an instrument for measuring the purity of the air. Air is drawn by an aspirator across a film of glycerine for a given time. The particles adhering to the film and examined for quantity and an estimation of the amount of dust in the air is arrived at.

**Aerotherapeutics**, a mode of treating disease by compressing or otherwise modifying the atmosphere. Many diseases, particularly those affecting the lungs, respond to changes in the pressure, temp., or composition of the air breathed. When a diver emerges suddenly from work at a great pressure, symptoms somewhat resembling those of apoplexy sometimes present themselves. This disease, which is known as caisson disease, or diver's paralysis, may at once be checked if the patient is subjected in an air-lock to a pressure greater than that of the atmosphere. The pressure is then gradually reduced as the body accommodates itself. Pneumatic cabinets, air-tight iron cells into which air can be pumped, if systematically used in asthma, are of benefit, and cases of emphysema have responded favourably to a treatment which comprises the inhalation of compressed air and the breathing into rarefied air.

The 'iron lung' is an apparatus for

carrying out artificial respiration over long periods, for instance when the respiratory muscles have been inactivated by infantile paralysis. It consists of a large metal chamber, containing the patient's body but not his head, in which the air pressure can be alternately increased and decreased, affecting respiration and inspiration respectively.

The diminution of air-pressure is the effective principle of Junod's boot. A case of stiff leather is made to enclose the leg, so that when the air is exhausted, blood rushes to the enclosed part, thus relieving congestion and inflammation of the internal organs. The rarefied air of mts. has a beneficial effect on chronic phthisis, but the changes induced in the lungs make it advisable for the patient to spend the rest of his life in such an atmosphere.

Hot-air treatment is often successful in certain skin diseases, such as lupus, causing necrosis of the diseased tissue. Cold air is valuable in promoting general vigour, so that consumptive patients are often benefited by a climate where the average temp. is lower than that to which they have been accustomed.

The air is varied in composition for the purpose of producing anaesthesia, as in the use of chloroform, ether, and nitrous oxide. The inhalation of oxygen is often beneficial in cases of asthma, and also relieves the difficulty of breathing in pneumonia and heart-failure. Antiseptic substances may be inhaled by using a respirator containing a sponge moistened with the liquid; the constant wearing of such a contrivance tends to arrest the progress of pulmonary tuberculosis.

Allied to the use of artificially modified atmospheres is the climatic treatment for bronchial and lung affections. The individual has to be studied in considering the choice of a climate, but phthisical patients are usually benefited by residence on the high tableland of S. Africa or the high and cold slopes of the Alps. The open-air treatment as carried on in one's own domestic surroundings is also of great value, and many devices for enabling patients to sleep with comfort in the open air are in common use. Finally mention may be made of 'artificial pneumo-thorax', a method of collapsing and testing a tuberculous lung by introducing air into the surrounding pleural cavity.

**Aerschot**, see AARSCHOT.

**Aertzen or Aartsen, Pieter** (1507-73), called Peter the Long because of his height, a Dutch painter, was b. and d. at Amsterdam. Besides his historical and religious works, he painted interiors and homely scenes.

**Æschines**, an orator of Athens, b. about 389 B.C. For the eloquence of his oratory he has been placed next to Demosthenes. In the attitude maintained by Athens towards Philip of Macedon, Demosthenes advocated the wiser policy of opposition. Æ. placed himself at the front of the party supporting the adoption of peace measures. The success of Demosthenes' advice earned public recognition, and

Ctesiphon suggested that a golden crown be awarded as a mark of gratitude. Upon this proposal Æ. vented all the forces of his extraordinary eloquence, and his speech attacking the idea and its mover is placed foremost among his utterances. The greatness of his oratory could only be rivalled by one man, Demosthenes, whose reply, defending Ctesiphon, is placed in the front rank of the world's orations. In addition to the eclipse of Æ.'s eloquence, an accusation was levelled against him by Demosthenes of receiving bribes, but it failed through want of evidence. Æ. was now forced to retire, and shortly afterwards he estab. a school of oratory in Rhodes, which became famed through the empire. He d. in 314 B.C. His oration against Ctesiphon, with 2 others, are, unfortunately, the only works ascribed to Æ. that have come down to us. They are pub. in Jebb's *Attic Orators*, 1876-80.

Æschines Socraticus, the 'Philosopher,' was one of the scholars of Socrates, and according to tradition he was the son of a sausage-maker. Three dialogues, still extant, are supposed to have been written by him.

Æschinite, see THYATIRA.

Æschylus (c. 525-456 B.C.), one of the masters of Attic tragedy in the form posterity knows it. He was b. at Eleusis in Attica, and was the son of Euphorion, a man of good family. He fought at the battle of Marathon, 490 B.C., at Salamis, 480 B.C., and at Plataea, 479 B.C. It was at the beginning of the fifth century that he entered the lists of dramatic competition against Pratinas and Choerilus, and his first victory is believed to have been in 485 or 481 B.C. In 472 B.C. he gained the prize with the trilogy of which his *Persæ* was one piece. In 468 he went to the court of Hiero, king of Syracuse; but returned to Athens on the death of that monarch. He was again in Sicily in 456-55 and d. at Gela, leaving 2 sons, Euphorion and Bion, and a nephew, Philocles, to carry on the literary tradition. The great work of Æ. was to remodel the old drama of the satyr-play (*satyricon*) into tragedy, and it is in Æ. that the distinction, both in name and in character, becomes complete in the Dionysiac cycles. Of the 70 tragedies that he is believed to have written only 7 are extant—the *Suppliants* (dealing with the legend of Danaus); the *Persians* (on the defeat at Salamis); the *Seven against Thebes* (on the beleaguering of Thebes in support of the claim of Polyneices to the kingdom of Oedipus); the *Prometheus Bound* (on the punishment of Prometheus by Zeus for giving fire to the race of men); and the *Orestes*, consisting of the *Agamemnon* (on the tragedy of Agamemnon and Clytemnestra following the fall of Troy); the *Choephori* (on the avenging of his father's death by Orestes); and the *Eumenides* (on the purification of Orestes). Æ. was considered by the Athenians as the father of tragedy because he altered the drama by introducing a second—some say also a third—

actor, made the actor sing as well as the chorus, giving him monodies and also a part in the musical dialogue, and made great improvements in the staging. Æ. is the foremost of the Gk. prophets and, with Pindar, the last. He was a moral and religious teacher as well as an artist, although the literary and dramatic technique of his art has always seemed to overshadow all other considerations.

Æsculic Acid, see ESCULIC.

Æsernia, see ISERNIA.

Æsculapius (called Asclepius by the Gks.) was the god of the medical art. According to Homer he was the 'blameless physician' whose sons were physicians in the Gk. army. The common story is that he was a son of Apollo, and was instructed by Chiron in the art of healing and in hunting. He healed the sick, and restored the dead to life, and was therefore killed by Zeus; but was afterwards placed among the stars. The chief seat of the worship of Æ. was Epidauros, whence it extended to Rome, 293 B.C. The Asclepiads (supposed descendants of Æ.) were an order of priests claiming a knowledge of medicine. Their prin. seats were Cos and Cnidus.

Æsir, see ASÆS.

Æsopus (Æsop), the celebrated author of the immortal fables inseparably connected with his name, lived during the latter half of the sixth century B.C. Traditionally a native of Phrygia, he is believed to have been a slave, being later set free. He visited Croesus and gained such favour that he was sent upon sev. important missions. Upon one of these errands he roused the priests at Delphi to such fury by his clever but blasphemous witticisms, that they flung him over a precipice. We gather from Aristophanes that the fables were popular in his time. While Socrates was in prison he rewrote those of the fables familiar to him, in verse. The fables themselves are believed to have been derived from very early sources, and they gain considerable value from a theory that some of them can be traced so far back as Buddha, in a collection of his birth-stories. The only Gk. version is that of Babrius.

Æstheticism. This word, which in its original and general sense implied an attachment to æsthetic principles, came to be applied particularly to a movement in art which in the seventies and eighties of last century was characterised by many

whimsicalities and absurdities. Arising from a natural and healthy reaction against the ugliness and philistinism of the mid-Victorian period, under Oscar Wilde and others it developed tendencies which justly made it the butt of much ridicule, drawing down on it the shafts of satire of Du Maurier in *Punch*; and W. S. Gilbert in his operetta *Patience*, 1881, ridicules one Bunthorne, who walked down Piccadilly, with a poppy or a lily in his medieval hand. But the saner adherents of the movement, such as Ruskin, Morris, Leighton, and the Pre-Raphaelite school of painters, did much to spread the appreciation of the artistic among their countrymen.

**Æsthetics** is the name given to that science or philosophy which treats of the beautiful and attempts to establish the principles and theories upon which works of art are based. The word is derived from the Gk. *αισθητικος* (that which concerns feeling or perception), and it was in Greece that the theories of *Æ.* were first propounded. As instancing the importance attached to this subject by the philosophers of classical antiquity, one recalls the amount of attention devoted to it by those twin giants of intellect, Plato and Aristotle. The name of Plato will always be remembered in all discussions on the nature of the beautiful, whilst Aristotle in his discourse on the theory of art in poetry, contained in his *Poetics*, contributed to æsthetic literature the most important work among the ancients. In it he treats of tragedy, a form of dramatic art carried to great heights by the dramatists of his time. His canons of criticism, many of which are still valid, include the assertion that beauty was the mean between 2 extremes, neither too large nor too small. Plato's teaching on the subject is in keeping with his general position, i.e. of an absolute and perfect ideal behind all appearance. From this it follows that beauty in finite things arises from their correspondence to their ideal archetype. This doctrine of Plato is expressed by the poet Keats in his *Ode on a Grecian Urn*, in which he expresses the opinion in the oft-quoted lines, 'Beauty is truth, truth beauty—that is all Ye know on earth, and all ye need to know.' The science of *Æ.* has been divided into subjective and objective. The objective side deals, *inter alia*, with the relationship of art to nature, the classification of the sev. arts, and the definition of their functions and limitations. Subjectively the question is one largely of psychology and an attempt to determine the nature and origin of æsthetic judgment or taste, and this dept. of the science is further subdivided into consideration of the conditions of artistic production and of artistic appreciation or perception. The latter aspect of the theory is put succinctly in the phrase that 'Beauty resides in the eye of the beholder.' The modern science of *Æ.* may be said to have been inaugurated by the publication in Frankfort at about the middle of the eighteenth century of *Æsthetica*, a book by Baumgarten, a

disciple of the Ger. philosopher Christian Wolff. In this work, which earned him the title of the father of modern *Æ.*, he differentiates between truth, which is apprehended by reason, and the beautiful, which is perceived by sense, which, he maintains, is on a lower plane of intellect. Following Baumgarten came a whole host of Ger. philosophic writers, who can only be briefly enumerated here. First comes Winckelmann, who developed Baumgarten's theories. Lessing in his *Laocöon* defined the spheres of poetry, painting, and sculpture. Schiller, the poet, who by influencing Goethe influenced the current of European thought, defined the secret of art as the super-session of the matter by the form. Kant denied the possibility of a strict science of beauty, as he regarded it as subjective. Fichte and Schelling, Herbart and Schopenhauer are the names of other Ger. æsthetic writers, the place of art being exalted in the latter's philosophy; but the colossal figure of Hegel dominates all, his *Lectures on Æsthetics* being the chief work on the subject. Eng. writers include Hume, Burke, Alison, and Ruskin, and the Fr., Diderot and Buffler; but, as will be seen by the space devoted to their writers, in the matter of *Æ.* the Ger. hegemony is practically unchallenged.

**Æstivation** (Lat. *æstivus*, belonging to summer), or **Prefloration**, in botany, is a term to describe the way in which the floral organs are arranged in the flower-bud, as veneration or prefloitation describes the arrangement of leaves in a leaf-bud. If the parts do not touch, the *Æ.* is *open*, if they touch but do not overlap it is *valvate*, if they overlap it is *imbricate*. When the *Æ.* is such that 2 parts overlap completely, 2 parts are completely overlapped, and 1 part overlaps at 1 edge and is overlapped at the other, it is called *quincuncial*; *convolute* or *contorted* when each part overlaps another and is itself overlapped at one edge.

**Æstivation** (Lat. *æstivare*, to pass the summer), or **Estivation**, in zoology, a state of dormant vitality in summer of some animals, such as land snails, in warm climates which prevents them from suffering from heat or drought. It is opposed to hibernation, which is a state of dormant vitality in winter.

**Astas**, the name by which the Negritos of the Philippine Is. are known among themselves. They are dwarfish in stature, with round heads, bulging foreheads, large eyes, and woolly hair, and are almost wholly uncivilised.

**Æther**, or **Ether**, a medium conceived as permeating all matter and space, the movements of which constitute the waves which give rise to the sensations of heat and light. The idea of an exceedingly tenuous medium pervading the whole universe has suggested itself to philosophers of all ages. In the Hindu mythology it is given as one of the 5 elements: earth, water, fire, air, and ether. Descartes elaborated a vortex theory of matter, in which he conceived all space to be filled with one substance

whirling round in great vortices. It was thus he explained the formation of the solar system, particles flying off from the centre to the circumference constituting the light radiated from the sun. Leibnitz in 1671 declared his belief in an  $\mathcal{A}$ ., a fine substance permeating all bodies in the direction of the earth's axis and producing the phenomena of gravity, elasticity, etc. Kant pub. in 1755 a thesis which postulated an  $\mathcal{A}$ . connecting all matter. It seemed necessary to him, in order to explain action at a distance, that bodies should operate upon each other by means of an elastic and subtle medium, uniformly diffused through the universe. This medium, he was convinced, was the underlying substance of heat and light.

The later development of the conception of an  $\mathcal{A}$ . occurred mainly in connection with the mathematical treatment of physical phenomena, particularly with regard to the propagation of light. Newton conceived light to be occasioned by particles moving with great velocity in straight lines from the source. He explained refraction by assuming periodic changes in the velocity of the light corpuscles; they have, he said, alternate fits of easy reflection and easy refraction, and it depends on which of these a particle is in when it reaches the surface whether it will be reflected or refracted. A ray of white light, he maintained, consists of many particles with differing periods of refrangibility and reflectibility, the most refrangible causing the sensation red, and the least refrangible producing violet. Newton objected to the wave theory held by Huygens and his supporters in that it did not explain the rectilinear propagation of light, or the phenomenon of double refraction. It was inconceivable, he also said, that a medium should be so transparent that light could reach us from stars known to be enormous distances away. Nevertheless the wave theory was to triumph; investigation of the phenomena of interference and polarisation (*q.v.*) led to them being explained by undulatory motion, so that the corpuscular theory hardly survived the eighteenth century.

In 1801 Thomas Young once more put forward the hypothesis that luminiferous  $\mathcal{A}$ . pervades the universe, that it is rare and subtle in a high degree, and that it is by vibration in this medium that light is propagated. The  $\mathcal{A}$ . was conceived of as offering no opposition to the passage of material substances; 'it passes through them,' he said, 'like the wind through a grove of trees.'

The existence of  $\mathcal{A}$ . had been assumed to explain light waves, it was therefore necessary, in order to avoid postulating different kinds of media, to discover some connection between light propagation and other physical processes acting through space. Faraday showed that iron filings spread on a card held over a magnet arranged themselves in a series of curved lines between the poles. These were called lines of force and indicate some disturbance or stress in the medium

connecting the poles of the magnet. He also showed that an electric current was induced in a continuous conductor cutting the lines of force. For years he attempted to discover whether magnetism had any effect on polarised light, until in 1845 he succeeded in producing the rotation of the plane of polarised light by transparent dielectrics in a magnetic field. Thus magnetic force and light were shown to have a relation to each other, and the  $\mathcal{A}$ . was now looked upon not only as the light medium, but as the medium of electric disturbances as well. Faraday's work was carried further by Clerk-Maxwell and Lord Kelvin. The latter connected magnetic force with a rotatory movement of the  $\mathcal{A}$ ., the energy of irregular translation constituting heat, the theory of the transformation of energy being thus considerably advanced. By calculating from the energy of solar radiation near the sun's surface, Kelvin obtained a value exceeding  $10^{18}$  for the density of  $\mathcal{A}$ ., that is to say, 1,000,000,000 cub. m. of  $\mathcal{A}$ . would have a mass of over 1 lb. The further investigation of mathematical values in connection with light-waves led Sir Joseph Larmor to the conception that  $\mathcal{A}$ . corresponds to a solid with a density considerably greater than any known substance and quite incompressible. To sum up: The  $\mathcal{A}$ . has long been regarded as the vehicle of light. During the nineteenth century it was regarded as the medium, filling all space, through which light, gravitational forces, and electro-magnetic waves were propagated; it was widely believed that the  $\mathcal{A}$ . was material, having the properties of matter, such as mass, rigidity, and motion. Matter itself was regarded as vortices in the  $\mathcal{A}$ ., but this view was abandoned as being illogical, since the  $\mathcal{A}$ . could not consist of vortices in the  $\mathcal{A}$ . Michelson and Morley in 1881 and 1887 attempted to discover the existence of an  $\mathcal{A}$ -drift at the earth's surface, and their experiments, which gave negative results, led to the principle of relativity. Sommerfeld says that 'nowadays we like to avoid speaking of the  $\mathcal{A}$ ., since the theory of Relativity has deprived it of its material existence in the older sense,' but, as Eddington points out, 'this does not mean that the  $\mathcal{A}$ . is abolished. It is agreed that the  $\mathcal{A}$ . is not a kind of matter, and, being non-material, its properties are *sui generis*—it has definite characters of its own.' Sir Oliver Lodge indicates some of its properties: it fills all space in the most thorough manner, it is absolutely cold, it is absolutely transparent and undispersive, it is devoid of viscosity, it is the sole vehicle of radiation, i.e. of light, X-rays, wireless waves; electric and magnetic fields are forms of energy existing in the  $\mathcal{A}$ ., and since all varieties of matter are ultimately electrical in origin, being composed of protons and electrons, Lodge asserts that 'the  $\mathcal{A}$ . is indirectly responsible for all physical and chemical activity. What other functions this universal medium may be found to possess, and whether life and mind can be in any way associated

with those functions, it must be left to posterity to find out.

**Æthicus**, see **ETHIUS**.

**Æthiopia**, see **ETHIOPIA**.

**Æthophyllum** (Gk. αἶθος, flame, φῦλλον, leaf), a name given by Brongniart to a fossil genus of palms.

**Æthusa**, the anct. name of Favignana, the largest of the Ægadian Is., in the Mediterranean. It is 6 m. long, and has a pop. of 7000.

**Ætiology**, see **ETIOLOGY**.

**Aetion**, or **Eetion**, a Grecian painter b., according to Pliny, 350 B.C. References are made to him by Cicero, Pliny, and Lucian. He was contemporary with Alexander and Apelles. His chief work represented the marriage between Alexander and Roxana. At an exhibition in the Olympic games he won the admiration of the president, who was sufficiently struck by his work to give him his daughter in marriage.

**Aetius**, 'the Atheist,' a native of Coele-Syria, flourished in the fourth century A.D. After following various trades he became a doctor. He gained distinction particularly in medical controversy. Leontius of Antioch installed him deacon, but his heterodox views caused his banishment from the tn. In 358 A.D. he went with Eunomius to Alexandria, only to be sent into exile by Constantius. He was recalled by Julian, and elevated to the rank of bishop. Here he used his influence on behalf of Arianism. He retired upon the succession of Valens, and d. in 367. A work of his that survives, called *De Fide*, attacks the doctrine that the Son is God, on the ground that the fact of being begotten destroys the nature of a god.

**Aetius** (c. 390-434 A.D.), a Rom. general who lived during the latter period of the W. Empire, b. in Moesia. He passed his early life as a hostage among the Goths and Huns, using afterwards his intimate knowledge of them to their ultimate defeat. In 424 he invaded Italy at the head of over 50,000 Huns to support Joannes, the proclaimed emperor. His intrigues directed against Count Boniface, his rival, caused that dignitary to revolt. The battle that followed saw the count's death and the triumph of A., who now rose to be the most conspicuous figure of the W. Empire. Most of his military glory had been won in Gaul. His greatest victory was at Châlons-sur-Marne, 451, when he led the Gauls against the Huns. He was killed by the emperor Valentinian, who suspected him of complicity in an attempt to overthrow him.

**Ætna**, see **ETNA**.

**Ætolia**, a prov. of N. Greece. It is divided into 2 natural divs. by the basins of the Lower Archelous and the Evenus. Among the mts., many of which rise above 7000 ft. above sea level, is Kiona. The soil is agriculturally rich; currants, vines, maize, and tobacco being cultivated with ease in the S.W. plain. The chief tns. are Missolonghi and Lepanto. In the early hist. of Greece, the *Ætolians* played a prominent part. The

country was created primarily to safeguard an attack from the Macedonians, and rapidly rose to a high position controlling almost the whole of Greece. The Macedonians, however, gradually weakened their forces, till, after the disastrous conflict with the Romans, their power had almost been sapped away. In the fifteenth century Æ. was brought under Turkish control. To-day with Acarnania it forms part of the kingdom of Greece. The N. region is wild and barren, the only inhabitants being Vlach shepherds. Area 3020 sq. m. Modern prov. is Acarnania and Æ.; pop. of prov. 220,000.

**Ætolikon**, see **ANATOLIKO**.

**Afer**, **Domitius** (16 B.C.-A.D. 59), Rom. orator, was b. at Nemausus (Nîmes), and became the preceptor of Quintilian. Under Tiberius he betrayed to death Claudia Pulchra and Q. Varus, and in Caligula's reign he was made consul. He d. of over-indulgence. See Tacitus, *Annales*, iv. 52; xiv. 19; Quintilian, v. 7.

**Affettuoso**, an It. musical term, indicating that a passage should be played with feeling, in a movement between *adagio* and *andante*. *Con affetto* is used alternatively with this term.

**Affidavit**, a statement of facts in writing made upon oath, or by a solemn affirmation, before a magistrate or commissioner for oaths. The word is derived from the old Lat. form of a declaration on oath, which commenced thus, 'Affidavit M. N.' i.e. 'M. N. has sworn.' The employment of A. is generally confined to litigation, but sometimes the A. is employed to lend force to a public statement, for the person who knowingly and advisedly falsely swears to an A. is liable to punishment for perjury. In judicial proceedings the A. is used in lieu of oral evidence, and particularly is this the case in interlocutory applications. Sometimes the whole of evidence may be taken by A., and this was especially the case in the old Chancery courts, but as a rule this practice is discouraged.

**Affiliation**. An A. order is an order made by an Eng. court of summary jurisdiction at the instance of the mother of an illegitimate child, or by the public assistance authority where the child becomes chargeable to the parish, ordering the father to pay a sum not exceeding 20s. a week for the maintenance and education of the child until the age of 16. The process is governed by the Bastardy Acts, 1845, 1873, and 1923, and the Affiliation Orders Act, 1914. The uncorroborated testimony of the mother is not sufficient proof of paternity, and an appeal to the quarter sessions may be made. Failure to comply with an order is punishable by imprisonment.

**Affinity**, in law, relationship through the fact of marriage. On the principle that man and wife are one flesh, one party to a marriage bears to the relatives of the other party a relationship by A. which is determined by the latter's blood-relationship, or *consanguinity* (q.v.). A. is only important in connection with the marriage law, which in England and

Scotland is based in this respect on the Mosaic law as set forth in Lev. xviii. An important exception to the general rule that marriages are prohibited within the same degrees of A. as of consanguinity is provided by the Deceased Wife's Sister Act of 1907, which allows marriage between a man and a woman standing in that relationship. The objections to marriage within certain degrees of A. as distinct from consanguinity rest mainly on religious grounds; scientific observation having disclosed no reason for supposing that such marriages would result in degeneration.

**Chemical A.**—The property in virtue of which atoms or groups of atoms tend to enter into chemical combination with other atoms or groups. See CHEMISTRY, ELECTROLYSIS, VALENCY.

**Affirmation**, a solemn declaration prescribed by the Oaths Act of 1888 as a substitute for an oath in all cases where for conscientious reasons a person objects to being sworn. An A. in court is subject to the same liabilities for perjury as an oath. The privilege of affirming was first granted to the Quakers in William III.'s reign, and gradually extended to other categories of people. See OATH.

**Afforestation** (*from* Lat. *ad*, to, and *Low Lat. forestis*, unenclosed). The planting of trees in sparsely wooded districts for the purpose of converting them into woods and forests. The science dates from the eighteenth century, when the depletion of forest lands resulted in a serious shortage of timber. During recent years the system has received much impetus from a more intelligent recognition of its significance, and Sir Henry Rider Haggard was responsible for much of the progress it has made as a science. He was appointed a member of the Royal Commission on Coast Erosion and A. in 1906, a body which has considerably furthered the interest now shown in A. The steady migration of the rural pop. to the large industrial centres, the damage caused by deer and hares, the clearances which take place to render accessible for gaming purposes our forests, emphasise the urgency and value of A. as an economic factor. The science was most thoroughly carried out by Germany and Switzerland, but the replanting of forest lands on a large scale is a development of the twentieth century. The chief cause of failure and difficulty of operation has often been the lack of co-operation between theorising experts and practical forest men. From such co-operation it is now recognised that a foreseen shortage in the output of coniferous timber is only to be counteracted by the application of such a scheme. To indicate clearly just what considerable benefits would accrue from A., it has been shown on trustworthy evidence that our own shortage of supply and inferiority of quality could be so improved that where we import at the present time between £45,813,197 (in 1945) and £52,381,816 (in 1946) annually of timber, that tremendous quantity could for the most part be cultivated within England itself.

Reliance, however, is placed chiefly on Canada, Sweden, Finland, and U.S.A. (in that order).

In 1909 provision was made in the Budget of that year for the establishment of a body of commissioners 'to develop some of the neglected resources of the country,' £200,000 being ear-marked for this purpose. The development commission made tentative beginnings by the purchase of land in Scotland and Ireland. Subsequently, owing to the lack of skilled labour, the commissioners concentrated on founding centres for instruction in forestry. The lack, in the United Kingdom, of the State co-operation which in Germany and the U.S.A. have for long been given to forestry, is shown by the fact that only about 4 per cent of the country is under timber, and supply necessarily depends on the activities of private landowners. The scarcity of home-grown timber was acutely felt in the First World War, and high prices had perforce to be paid for imported timber. But even before the war a tentative beginning was made in 1913 by the establishment of forestry branches by the Board (now Ministry) of Agriculture and the (former) Office of Woods, whose expenses were defrayed from the fund created by the Development and Road Improvement Funds Act, 1909. But it required nothing less than the extraordinary demands on home-grown timber during the war to awaken the legislature to the urgency of the problem. The reconstruction committee, through a forestry sub-committee, recommended a national policy of A., and in 1918, pending legislation, an interim forest authority was appointed as the preliminary to a permanent authority. In 1919 the Forestry Act was passed to provide for the acquisition and A. of land in the United Kingdom so as to be independent of foreign supplies in an emergency up to a period of 3 years. Later a forestry commission was set up and given wide powers for promoting A. in the United Kingdom. The commissioners are empowered to buy or lease land, advance loans, or make grants to encourage A., whether by local authorities or private owners. Expenses are met from a forestry fund, provision for which was made by payments up to £3,500,000 during 10 years from Apr. 1919. The Forestry Act 1927 authorised an increase of the number of forestry commissioners and empowered them to make by-laws with respect to land vested in them or under their management or control. By the combined operation of the Forestry Acts 1914-27 the commissioners are charged with the general duty of developing A., and promoting the production of timber in Great Britain. Together with the former Crown woods, transferred to the Commission in 1921, the forestry commission have acquired 1,415,000 ac. of land—80 per cent being plantable and over 479,000 ac. have now been planted, including land in the Esk and Uddon valleys. A. plans in the Lake district,

however, have given rise to much controversy and opposition. Some 6000 ac. have been planted in the special areas of Durham, Tyneside, W. Cumberland, Halthwistle, and S. Wales. In 1939 receipts from all sources, including forest produce, rents, mines, and minerals, amounted to £225,000 a year. Of the land in the United Kingdom suitable for A., about 50 per cent is in Scotland, where the commissioners hold 354,000 ac. of plantable land. The commission have (1945) proposed that the United Kingdom should have 5,000,000 ac. of forests in 50 years, and planned to plant 1,100,000 ac. in the first 10 years.

**Affre, Denis Auguste** (1793-1848), archbishop of Paris, b. at St. Rome-de-Tarn. Educated at St. Sulpice, he became in 1818 prof. of dogmatic theology. As archbishop he endeavoured to establish peace between the soldiers and insurgents during the rebellion of 1848. Wearing a green branch to denote his peaceful intentions, he mounted a barricade. He was killed by a stray bullet. Among his works are many valuable treatises and an *Essai sur les hiéroglyphes égyptiens* (1834), where he showed Champollion's system of translation to be faulty.

**Affreightment**, see BILL OF LADING; CHARTER-PARTY.

**Afghan Hound**, a native of Afghanistan, where it has been used for centuries as a hunting dog and guard. Rock carvings of 2200 B.C. show the dog in the same form as it is now known. It was introduced to England and shown for the first time in 1907. In build it resembles a greyhound, but appears shorter and heavier on account of the long shaggy coat which covers flanks, shoulders, hindquarters, and legs. The smooth muzzle of the long narrow head is in strong contrast with the silky top-knot surmounting the skull. The ears are heavily feathered and carried close to the head. Legs are straight and well-boned; the sprightly ringed tail has a curl at the end. The A. H. is intelligent, but shy with strangers. It is hardy, and is essentially an outdoor dog; it should not be kept in towns or in small houses. According to official standards the height at the shoulder for dogs is 27-28 in., and for bitches 24-26 in. A number of colours are found, but cream, fawn, golden, or red are preferred; the nose is black in all but light-coloured dogs, which may have a brown nose.

**Afghanistan** is a country situated at the N.W. of India. Placed between Asiatic Russia and India, it owes its importance politically to its position as a 'buffer' state between the 2 regions. It is bounded on the W. by Iran (Persia), on the S. by Baluchistan, on the N. by Asiatic Russia, and on the E. by the N.W. Frontier Prov. The N. boundary runs from Zulfikar on the Iranian frontier to Kushk, the Russian railway terminus on the branch line from Merv, and thence to the Oxus. The Indo-Afghan frontier was settled by the Durand agreement of 1893. It extends 400 m. from N. to S. and 600 m. from E. to W. The 5 major provs. of A. are Kabul, Mazar, Kandahar,

Herat, and Qataghan-Badakshan. Its area is approximately 245,000 sq. m., being twice the size of Great Britain and Ireland. Pop. (estimated) 11,000,000.

The mt. system of A. contains the Hindu Kush range, with its continuation the Koh-i-Baba and the Firozkoh plateau. Of the Koh-i-Baba peaks, Shah Fuladi (16,870 ft.) is the highest. Next in importance to the Hindu Kush and Turkestan mts. are the Safed Koh, whose highest peak is Sikaram, which is 15,600 ft. above sea level. The rivs. may be divided into the 3 prin. basins of the Oxus, Indus, and Helmand. In the Oxus basin the Murghab and the Hari-Rud owe considerable value to their geographical position, as well as to the richness of their valleys. Before, however, these rivs. reach the Oxus, they disappear. Indeed, of the many streams that flow from the N. slopes of the Hindu Kush, only 2 reach the Oxus, these being the Kokcha and the Kunduz. In the basin of the Indus are the Kabul and its tribs., which flow from the S. slopes of the Hindu Kush and the valleys of the Safed-Koh; the Kuram, and those streams flowing from the Waziri Hills and the Sulaimans. The Helmand, fed by the Argandab, the Tarvak, and the Afghastan, waters the whole of S.E. A.

The climate, owing to the different altitudes, is very varied, and suffers sudden and severe extremes. The temp. for the greater part of the year changes through the extraordinary range of 30° in a day. In the N. the winter is marked by a lasting and rigorous severity; while in the Oxus country the heat of summer reaches 120° F. To the severities of the intense heat are to be added the frequent dust storms and fiery winds; while the night-time is rendered almost intolerable by the radiating heat absorbed during the day by the vast masses of rock. The most temperate region is at Herat. Generally the climate of A. may be said to be dry, whatever rain it receives being derived from the S.W. monsoon. From the athletic and handsome appearance of the pop. it would be expected that healthy conditions prevailed. But the existence of frequent and intermittent fevers, and the almost universal suffering from bowel complaints, rendered easy by the too heavy abuse of a rude diet, prove very costly to life.

The Afghan peoples are made up of very diverse elements—Pathans or Afghans proper ('the children of Israel') in the E. and S. provs., Tatar Hazaras in the centre; a few Persians in the W., and Tajiks, Uzbeks, and other Turki tribes in the N. up to and well within the Russian boundary. The religion throughout the whole of the country is Mohammedan. Although Pushtu is the prevalent language, that of the court and Afghan literature is Persian. The literature of the country is significant enough to be given the name, most of it being poetry, especially of the ballad kind. The best-known poets are Abd-ur-Rahman (seventeenth century) and Khushal Khan, of the time of Aurungzebe. The laws of A.

are founded on the 'Sharlat' or Islamic law, and on tribal custom. Education, once so primitive, is being developed, there being some 3 colleges in Kabul, which use Eng., Fr., and Ger. media of instruction respectively, and a large number of middle and primary schools in the provs.

A. is ruled by an absolute monarch, the king (once amir), whose successors claim accession by right of heredity. Under the constitution of 1931, there is a Senate of 43 nominated members and a National Assembly of 110 elected members, with a Grand Assembly (*Loe Jirgeh*) which is summoned on important occasions. The administration is vested in a Council of ministers. The Afghans claim descent from King Saul, calling themselves 'Beni-Israel' (children of Israel). As a people, the Afghans are of dignified and noble bearing. Their predominant character is keen and acutely developed treachery and cunning. Travellers are regarded with suspicion, the imposition of taxes and the punishment of crime as tyranny. Their chief occupation is agriculture.

The land, if well cultivated, would be rich in yield. The natural productions of A. include castor oil and tobacco from Kandahar, wheat, barley, cotton, grapes, melons, and the mulberry from Herat. The ash and elm are grown, and the apricot, apple, plum, quince, peach, and pomegranate the prin. fruits, a branch of cultivation which absorbs considerable attention. In some parts the pistachio, valuable for its dyeing qualities, is cultivated. Over 100,000 ac. are under irrigation from canals and *karez* or underground channels fed from springs. The farmer still, for the most part, ploughs with a trivet of sticks and reaps with a 15-in. sickle. The prin. revenue is from the land—the State's age-old share of the crop throughout all Asia; in A. it is from one-tenth to one-third of the gross produce, though un-irrigated land is scarcely taxed at all. Salt, copper, silver, lead, coal, iron, lapis lazuli, and rubies are found. Industrially, the chief articles manufactured are carpets, *poshtins*, i.e. clothing made from sheepskin, and cloth materials from the many varieties of goat-hair. Silks are manufactured at Herat and Kandahar, which tuss. owe their importance to this industry. Exported to India by the Kandahar route are mainly timber, fruits, carpets, raw wool, skins, and ghee, *asafoetida*, and tobacco. Imports include cotton goods, sugar, and tea. All the carrying was, until fairly recent years, done on the backs of camels and ponies, and even that crude system of transport suffered from misgovernment and constant warfare; but to-day a number of the roads are fit for motor traffic except after heavy rain and snow, and though goods are still conveyed by pack animals, motor transport is rapidly supplanting pack transport as the chief means of conveyance. The prin. trade routes from A. to India are those connecting the Oxus regions with Kabul, and

those which lead from Kabul, Ghazni, and Kandahar to the Indian plains.

The early hist. of A. is so involved in obscurity, and records of its development contain so many conflicting attempts to fix its authenticity, that, until the middle of the eighteenth century, little matter definitely concerning its past exists. As has been stated before, the Afghans claim descent from Saul, though their heredity is traced more directly from Kais, a wise man who led a band of men, representing the Afghans, to seek Mohammed in quest of information concerning his message. The observations of many officers who have spent a considerable number of years among the Afghans, besides the indication in their physiognomy of Heb. descent, tend to confirm the theory of the descent from Saul.

A. began its existence as an independent country with the reign of Ahmad Shah, who was chosen leader by the Afghans, then serving under Nadir Shah, on his assassination. He called himself king of the Duranis, a clan which is uppermost in A. to-day. He extended his dominions very considerably, and at the battle of Panipat (1761) he defeated the supposed invincible Mahrattas with crushing effect. In 1773 he d., leaving his kingdom to his son Timur. During his reign extreme conditions of utter lawlessness demanded his incessant exertions. He d., leaving 23 sons, the fifth of whom, Zaman Mirza, captured the royal position. As was to be expected, strife between the numerous aspirants to the throne waged with barbarous ferocity. Out of the turbulence Kamran gained the coveted position. In 1831 the Persians besieged Herat, and the Russian attitude rousing anxiety, Sir Alex. Burnes was sent to be a resident in the amir's court. The Afghans, however, made terms impossible of acceptance, and, as a result, the first Afghan war was commenced in 1838. Shah Shuja, who had taken refuge, on his fall from power, in Brit. ter., was reinstalled at Kabul. Violent eruptions of insurrection, however, broke out, and found a vent in the massacre of the Brit. officers at Kabul in 1841. A series of calamities followed, resulting upon the many disadvantages which the Brit. experienced. In order fitly to punish these offenders, speedy preparations were made, and Shah Shuja was once more placed on the throne. The position, however, was fraught with many dangerous possibilities. It was natural that the Afghans should resent the action of the Brit. in placing above them a ruler whom they detested, and the native temperament, quick as it is to revolt against the slightest element of compulsion, only served to augment the bitterness of their hostility. For a time a policy of non-interference was maintained. The disaffection, seething in the Afghans, led to the ready alliance of their forces with those of the Sikhs against the Brit. In 1849, the combined forces were totally defeated by Lord Gough at the battle of Guzerat. A treaty was

concluded in 1855, followed by the death of Shah Shuja 8 years later. Of his many sons Shere Ali Khan was willingly recognised as ruler for a time. Disagreement speedily arose, and a state of anarchy followed. During the strife the amir suffered the loss of his favourite son. This bereavement affected him so severely that all active interest in this condition of uncertain and troublous warfare was destroyed. It was not until Kabul was captured, and his dominance in other parts almost entirely alienated, that the Amir Shere Ali began definite operations. For some time, in spite of extraordinary determination and perseverance, he suffered continual defeat. Finally, however, in 1868 he was once more in possession of Kabul. In this ultimate success he was aided by the viceroy of India, Sir John Lawrence. In 1869, he was informed that the Brit. Gov. intended no further interference with A. affairs, save in the event of a civil war. It was made clear that Brit. influence was intended for the securing of the peace and well-being of the country.

In 1870 Ali's eldest son, Yakub Khan, rebelled against his father. He had distinguished himself by talent and ability to an exceptional degree. In spite of his efforts he was imprisoned 4 years later. Abdulla Jan was proclaimed heir apparent. Following this period a coldness had grown between Shere Ali and the Brit. Gov. Russia began overtures, and in view of the seriousness of possible developments a Brit. mission was suggested, to make a pacific visit. The amir's refusal to receive the deputation led to the outbreak of the second Afghan war. A greater degree of success attended Brit. efforts, and by the end of 1878 the amir had fled the country, after the capture of Kandahar and Jalalabad by the Brit. forces. He d. in the following year at Maga-i-Sharif. His son Yakub Khan succeeded him, and signed a treaty with the Brit. at Gandamak. This agreement contained the following conditions: 1. A Brit. representative to take up residence at Kabul. 2. The guarantee of Brit. assistance in the event of collision with foreign powers. 3. A subsidy to be granted to the amir. 4. Kuram, Pishin, and the Sibi valleys to remain under Brit. control, for the purposes of developing a frontier defence for India. A settlement followed, though of short duration, for, 6 months later, the amir's troops, in a state of revolt, surrounded the Brit. residence. A bloody massacre was perpetrated in spite of a determined resistance. Punishment followed in the defeat of the Afghans in Sir F. (later Lord) Roberts at Charasia, and possession was taken of that city. Yakub Khan abdicated, placing himself under Brit. protection. Speedily fresh troubles arose in the rebellion of the tribes. The Brit. were held up at Sherpur until Gen. Gough relieved them. In 1880 the ex-amir's brother Ayub, filled with a spirit of righteous fanaticism, proclaimed a holy war (*ghaza*) upon

the Brit. At Malwand he completely defeated Gen. Burrows. A further loss followed when Brooke was forced to retreat before the religious frenzy of Ayub, suffering heavy losses. Kandahar was now besieged. Sir F. Roberts, however, severely repulsed Ayub Khan and once again estab. Brit. rule in S. A. It was resolved now to evacuate Kandahar, whereupon Sirdar Shere Ali, perceiving his helplessness, withdrew to India. Meanwhile, learning of the Brit. evacuation of Kandahar, Ayub once again advanced upon the city. It was not long in falling into his possession. The Amir Abd-ur-Rahman, however, prompted by the loss, summoned sufficient determination to succeed in recapturing the town, in destroying the army of Ayub Khan, and in fixing once more his position as amir. In 1884 the demarcation of the N. Afghan boundary continued under Brit. and Russian co-operation, in an atmosphere of contention and constant disagreement. By 1891 Abd-ur-Rahman had strengthened his position to a degree more considerable than the preceding years had known. A period of rigorous administration saw the imposition of increased taxes, the organisation of a standing army, and the destruction of the power enjoyed so long by the many neighbouring tribes. His death in 1901 brought to an end a reign wherein complete reform had taken place, though at the cost of cruel and harsh measures. Habibullah succeeded him.

He began his career with universal acclamation, and ensured that popular reception by his relations with outstanding tribes and the organisation of his army. He arranged for representation of each tribe in a tribal council for the settlement of inter-tribe disputes. In his foreign policy he followed the example his father had set. In return for Brit. assistance in the event of foreign aggression, he promised to abide by Brit. advice referring to questions of external affairs. This agreement he faithfully observed, and those questions which arose from Russia's relations with bordering provinces he referred to India. Overtures made by the Indian Gov. were received with coldness, and all attempts to alter the terms of the agreement met with little encouragement. True to the traditions of his race, all ventures that tended to increase the cordiality of his relations with India failed to arouse any response. It became necessary that he should have access to the highest Indian experts and authorities, and to that end a meeting was proposed between a Brit. mission and the amir. A series of dilatory and hesitating replies indicated his attitude towards the movement. However, in a few months he finally gave his consent. No actual change occurred from the meeting, the only benefit that resulted being the more strongly binding nature of the previous arrangement of 1880. Later, however, a meeting was successfully convened between the viceroy and the amir, to the satisfaction of both sides. But throughout all his dealings of

a diplomatic nature the amir evinced a tendency to independence and a wish for practical isolation.

The Amir Habibullah Khan was assassinated in 1919. Thereupon his brother Nasrullah seized the reins of power, but was deposed by Amanullah, the third son of Habibullah. Amanullah's troops crossed the frontier of India in May 1919, but were speedily repelled by the Brit. troops, who advanced to Dakka, thereby compelling the amir to conclude peace (Aug.), but with a recognition of Afghan independence. In 1921, a treaty was signed at Kabul by which Great Britain recognised the internal and external independence of A., and A. accepted the then-existing frontier between India and A. subject to a slight adjustment near the Khyber. It was also mutually agreed to interchange diplomatic representatives, including consular officers at Delhi, Calcutta, Bombay, and other tns. By the same treaty A. was permitted to import free of duty such war material as might be necessary to her defence. In 1923, a trade convention was concluded, and though there is no exact information of trade statistics, it is estimated that the exports and imports between India and A. are of the average annual value of £1,000,000, exports from India being chiefly cotton goods and sugar, the imports being timber, grain (especially pulse), drugs, and cattle. In 1928 King Amanullah and his queen paid a state visit to Europe, visiting Italy, France, and Great Britain. Everywhere they were cordially received, and presents showered upon them, mainly with the object of securing concessions in A. and of furthering divers political interests. Amanullah manifested considerable diplomacy in promising much and doing little, his dominant idea being to westernise his kingdom and to give most, no doubt, to the country which should render him the greatest benefit in this direction. He also concluded treaties of goodwill with Turkey and Persia, by which the different signatories agreed to adopt a conciliatory attitude towards each other in the event of disputes. On reaching his own country again, many reforms were put in train. Afghan students were sent to Europe to study modern methods of army administration and military training, political science and engineering, and a comprehensive programme of public works embracing railways and telegraphs and an aeroplane service was planned at enormous expense for so poor a state. But perhaps the most striking reform initiated was the emancipation of women through the zeal of Queen Souriyah, who, being a woman of Damascus, was not slow to appreciate the backward state of the women of her royal consort's country. European dress was also adopted by the king's council, even to the familiar European bowler hat. Still more ambitious reforms were the decrees of the king for the abolition of titles of nobility and the curtailment of the powers of the religious leaders, together with a bold

attempt to introduce Cabinet gov. It is not easy to say which of these drastic reforms caused the most unrest among the tribesmen, but the removal of the veil in public and the education of girls soon inflamed public opinion to danger point. The direct cause of the revolt which followed this westernising zeal, however, was the royal order to all tribesmen to become naturalised citizens of A., and under the lead of the Shinwari tribe, supported by the incensed Moslem priesthood, armed rebels were soon mustering for a general attack. The situation in Kabul became so critical, in spite of the initial defeat of the rebels by the king himself, that all European residents were evacuated by aeroplanes sent out from Brit. India. Amanullah's position grew steadily worse during the autumn of 1928. His capital was isolated and severe damage done to numerous buildings. He removed his court to Kandahar and, in a despairing effort to save his crown, deemed it advisable to recant his European doctrines by recalling the Afghan students and giving orders to foreign legations to leave the country. But it was too late, and in 1929 he abdicated in favour of his elder brother Inayatullah. But when the new king abdicated in his turn, Amanullah rescinded his abdication. Meanwhile the rebel leader Bacha-i-Saqao, under the name of Habibullah Khan, had usurped control at Kabul. Amanullah met with no better fortune, and in May fled with his wife and brother to Bombay, whence they journeyed to Europe. In Oct. Habibullah, defeated in his turn, fled from Kabul, which fell to Nadir Khan, former war minister under Amanullah, who later was elected king. This monarch was recognised by the Brit. Gov. and his position seemed to be comparatively secure, but he was murdered in 1933 and the new king, his son, Zahir Shad (b. 1914) was proclaimed king in his stead. The new fundamental law, made in Nadir Khan's reign, declared A. to be completely independent and, under the same law, slavery and forced labour were abolished and education made compulsory. A. was admitted to membership of the League of Nations in 1934, mainly at the instance of Russia and Turkey. In July 1937 A. signed, with Iran, Iraq, and Turkey, a pact of mutual non-aggression (treaty of Saadabad). In 1938 the Afghan air force was considerably expanded and work began on the building of military aerodromes at Herat, Kandahar, Muzar-i-Sharif, and Jalalabad. Plans for the industrialisation of the country were developed in 1939 and already cotton and other textile factories have been opened; while efforts are being made to exploit the almost untapped mineral resources of the N. part of the country. In 1946 A. applied for admission to the United Nations Organisation and was admitted.

Afium Kara Hisar, or Afiorin Kara Hisar (Opium Black Castle), a tn. in Anatolia, Asia Minor, on the route between Smyrna and Armenia and Persia. It contains beautiful churches and mosques.

Its chief trade is in opium, but it manufs. firearms, woollen and cotton goods, felts, and tapestry. Pop. 20,000. In the Greco-Turkish War, 1921-22, the Gks., heavily defeated in Sept. 1921, retired on Eskischir and repulsed Turkish attacks at A. K. H. in Oct.

**Afragola**, a tn. near Naples, Italy, noted for its wine and its straw goods. Pop. 24,000.

**Africanus**, Lucius (fl. c. 100 B.C.), a Rom. comic poet, playwright, and orator, who was the first to give up imitation of the Gks. in depicting Rom. life. His extant works are only fragmentary, and have been collected by Otto Ribbeck in *Comitorum Romanorum Fragmenta*, 1898.

**Afreer** or **Afrir**, see **IFRIR**.

**Africa** is one of the 5 continents, and belongs to the 'Old World,' being connected with Asia by the isthmus of Suez, and separated from Europe by the Mediterranean Sea. The name Africa was first given by the Romans to their African provs. with the city of Carthage, and it has since been extended to the whole continent. Both Gk. and Rom. writers called this continent Libya, and Herodotus (b. 484 B.C.) and Ptolemy (fl. A.D. 139) in their works give us information about this land. In the seventh century the Arabs were acquainted with the country S. of the Great Desert, and the Arab geographers, the chief of whom are Edrisi, Ibn Batuta, and John Leo (Leo Africanus), have left records which, though often vague and unsatisfactory, show a more extensive knowledge of A. than that possessed by the Gks. and Romans. In the fifteenth century the Portuguese made discoveries along the N.W. coast, reaching between 1467 and 1494 as far S. as Sierra Leone, Fernando Po, Cape St. Catherine, and the Congo. In 1487 Bartholomeu Diaz discovered the Cape of Good Hope, or, as he called it, the Cape of Storms; and in 1497 Vasco da Gama discovered the Cape route to India. The Portuguese soon made journeys into the interior, and during the sixteenth and seventeenth centuries settled along the E. coast. During the sixteenth century the Fr. sent ships to the R. Gambia, and during the end of the seventeenth and the beginning of the eighteenth century they opened up the country of the Senegal, estab. commercial factories, discovered Bambuk to be rich in gold, and obtained new information about the Niger and Timbuktu. The Dutch, the Danes, and the Eng. then commenced to explore. Mungo Park made journeys in 1795, 1796, and 1805, discovering new land around Timbuktu, and sailing down the Niger. At the beginning of the nineteenth century various discoveries were made by Tuckey, Peddie, Campbell, Bowdich, Mollen, Ritchie, Lyon, and Laing. In 1822 Denham and Clapperton set out from Tripoli and reached Lake Chad; Laing and Callie reached Timbuktu; and Richard Lander reached the mouth of the Niger in Nov. 1830. About the middle of the nineteenth century expeditions were made to Abyssinia,

the Upper Nile valley, and N. A., and about the same time attention was turned to S. A. David Livingstone reached Lake Ngami, 1849, went northwards up the Zambesi, and explored the regions round Lakes Nyasa and Tanganyika from 1859 to 1873. Burton and Speke discovered Lake Tanganyika, 1857, and Speke discovered the S. part of Victoria Nyanza. In 1860 Speke and Grant went up the White Nile and reached Gondokoro, and Baker discovered Albert Nyanza. Barth, Gustav Nachtigal, and Schweinfurth explored E. Sudan from 1850 to 1870. Cameron made discoveries in the Congo basin, and Stanley, after exploring the regions around Lake Tanganyika, arrived at the mouth of the Congo in 1877. Serpa Pinto, Thomson, Johnston, Grenfell, Pogge, Wolf, and Wissmann made many discoveries during the latter part of the nineteenth century in the basins of the Nile and Congo. N. A., especially the dist. between Morocco and Timbuktu, has been explored by Oscar Lenz. Crogan and Sharp traversed A. from the Cape to Cairo in 1901.

**Boundaries, Size, and Coast-line.**—A. is bounded on the N. by the Mediterranean Sea, on the W. by the Atlantic Ocean, on the S. by the Indian Ocean, and on the E. by the Indian Ocean and the Red Sea. Its greatest length from N. to S. is 5000 m., and its breadth from Cape Verde to Ras Hafun is 4650 m. Its area, including Madagascar and the other adjacent is., is nearly 11,500,000 sq. m., or 3 times that of Europe. The coast-line is regular, with no deep seas, bays, or riv. estuaries of any size to afford climatic or commercial advantages; so that in proportion to its size A. has less coast-line than any other continent, its total length being about 16,000 m.

**Islands.**—A. has very few is., and they are all small with the exception of Madagascar (228,000 sq. m.) which is one of the largest in the world. In the N. Atlantic are the Madeira Is. (Portuguese), the Canary Is. (Sp.), and Cape Verde Is. (Portuguese). Fernando Po (Sp.), Prince's Is. (Portuguese), St. Thomas (Portuguese), and Annobon (Sp.) are 4 volcanic is. in the gulf of Guinea. St. Helena and Ascension (Brit.) are solitary rocks in the Atlantic. On the E. in the Indian Ocean are Madagascar (Fr.), Mauritius (Brit.), Bourbon or Réunion (Fr.), the Seychelles, Amirante, and Aldabra (Brit.), Comoro (Fr.), and Zanzibar (Brit. protectorate); and further N. is Socotra (Brit.), and in the Red Sea are Perim and Dahlak.

**Surface.**—The continent is an enormous plateau with terraced tablelands rising one above the other, terminating in the rugged mts. of the M., where the Nile and the Congo take their rise. The interior plateau is bordered by mt. ranges which run parallel with the coast and descend in terraces to it. The Great Desert or Sahara is shut in between the Atlas Mts. on the N. and the S. Plateau, and the Congo basin occupies the W. part of the peninsula. The S. Plateau is much

higher than the N., having an average elevation of nearly 4000 ft.

**Mountains.**—The mts. of A. may be divided into 3 distinct systems: 1, the Atlas; 2, the W. Coast, and 3, the E. Coast.—1. The Atlas Mts. occupy the N. portion between the sea and the Sahara, from Wadi Daa to Cape Bon. The E. portion, from 6000 to 8000 ft. high, consists of 2 parallel ranges enclosing a plateau where salt lakes called shotts are found. The W. portion, known as the Great Atlas of Morocco,

and the Great Lakes. Killimanjaro, 19,500 ft., and Mt. Kenya, 18,000 ft., are extinct volcanic peaks. The Livingstone Range, near Lake Nyasa, is 11,000 ft. high; the Ruwenzori Range ('Mountains of the Moon'), between Lake Albert and Lake Edward, is from 16,000 to 20,000 ft. high; and Mt. Mfumbiro, between Lake Albert and Lake Victoria, is 11,000 ft. high. (c) The Abyssinian System rises abruptly from the coast and gradually descends, and contains Ras Dashan, 15,000 ft., and Abba Yared, 15,000 ft.

E.N.A.

#### THE ZAMBESI GORGE, RHODESIA

The railway bridge, whose central span is 500 ft. long, is the highest bridge in the world

has an average elevation of 10,000 ft., and the highest peaks are over 14,000 ft. high. 2. The W. Coast System consists of the Cameroon Mts., between 13,000 and 11,000 ft. high, and the highlands of Lower Guinea, known as the Kong Mts. 3. The E. Coast System, which is the most important, consists of: (a) The S. section containing the Drakensberg with Mont-aux-Sources, 11,200 ft.; the Randberg with Stritzkop, 7500 ft.; and the Nieuwveld, with Compassberg, 8000 ft. In Cape Prov. is the enormous plateau called the Great Karroo, great plains the total area of which is probably 100,000 sq. m., with a climate as dry and healthy as any in the world. (b) The section between the Zambesi and Abyssinia, containing the highest peaks in A.

**Plains and Deserts.**—There are 2 great deserts, the Sahara, the largest desert in the world, in the N., and the Kalahari, a sandy rainless region in the S. The Libyan and Nubian deserts are really a continuation of the Sahara.

**Rivers and Lakes.**—Considering its size and compared with other continents A. has but few rivs., and her commercial prosperity has been greatly retarded by the want of navigable rivs. with good harbours. Most rivs. are impeded by cataracts. The most important are the Nile, Congo, Zambesi, and Niger. The Nile is of political, historical, and commercial importance, and its overflow is of vital importance to Egypt. The great lakes connected with the Nile are Victoria, Albert, and Edward. The Congo,

which drains an equatorial rainy dist., has a constant water supply, and between Stanley Falls and Stanley Pool the riv. is navigable for 1000 m. Lake Tanganyika supplies the Congo with a considerable amount of water. The Zambesi is the chief riv. in the E., and though navigable in some parts, its course is impeded by cataracts and rapids. The Zambesi or Victoria Falls, the largest in the world, are situated on this riv. The Zambesi is connected with Lake Nyasa by the Shire. The Niger is of great commercial importance, being navigable almost entirely from its source to its mouth in the gulf of Guinea. The Orange R. is neither useful for navigation nor irrigation, but the Limpopo, with its mouth just N. of Delagoa Bay, is navigable for about 60 m. The Senegal, Gambia, and Ogoway flow into the Atlantic on the W., and provide navigable waterways for some distance from their mouths.

*Climate.*—Nearly three-fourths of the total area lies within the tropics, under the vertical rays of the sun, so that there is almost perpetual summer with definite seasons of rain and drought. The variations in the climate are caused by the prevailing winds and height. Ruwenzori and Kenya, almost on the Equator, are covered with perpetual snow for 2000 or 3000 ft. downwards from their summits, and there is also perpetual snow on many peaks in Abyssinia. The sides of the mts. are in many cases very fertile, yielding different vegetation according to the height. The prevailing winds are from the N.E. and the S.E. The N.E. winds, having come across Asia, bring no rain to N. A. The S.E. winds bring moisture to the coast dists., but owing to the mts. it does not reach the interior, hence the Kalahari desert. The region of the tropical rains extends from 18° N. lat. to 20° S. lat., where the vegetation is luxuriant and the soil productive except in the swamps near the coast.

*Productions.*—The vegetation varies in different parts according to the climate and soil. In the regions bordering on the Mediterranean the olive, fig, orange, and vine are found. In the Sahara the date palm grows in the oases; but the vegetation of this dist. is very scanty. In the Lower Nile valley—the fertility of the soil of which depends on the overflow of the Nile—cotton, wheat, flax, rice, and maize are produced. The Sudan is a pastoral and agric. region. Cattle are reared, and durra and maize are cultivated. In the W. dists. bordering on the coasts, and especially in Senegal and Gambia, the palm is found and palm oil is the chief article of export. The W. equatorial regions consist of dense forest with thick undergrowth, and here the chief productions are palm oil, ebony, ivory, rubber, and bananas. The chief product of Abyssinia is coffee. The E. plateau produces millet, and the savannahs provide good pasture land. In the S. sheep, goats, and the ostrich are reared, wool, skins, and feathers being exported; and the vine, maize, sugar, and tobacco are cultivated. The fauna

of A. is remarkable. The Hon. hippopotamus, elephant, rhinoceros, panther, leopard, hyena, buffalo, and giraffe frequent the forests. The crocodile is found in large rivs., and the monkey is found all over the continent. The zebra and antelope are also common, the camel frequents the N. deserts, and the ostrich the S. deserts. Birds, reptiles, and insects abound in great varieties. Of the mineral products the most important are gold, diamonds, copper, coal, and iron. Gold is found in S. Rhodesia, the Transvaal, the Orange Free State, and the Gold Coast; diamonds at Kimberley; copper at Ookiep in Cape Colony; coal in Natal and Cape Prov.; and iron in Algiers.

*Races and Population.*—The pop. is estimated at 150,000,000. Some dists., such as the deserts and swamps, are almost entirely uninhabited. The most thickly populated regions are the Nile delta, the Lower Nile valley, and the basins of the Congo and Niger. The S. and extreme N. are not so thickly populated as these dists. In this continent are found many branches of the human race. 1. European settlers include Dutch, Portuguese, Eng., Fr., Sp., Its., Gers., and Turks, who occupy the extreme N. and the S. 2. Asiatic settlers include Hamites, Semites, and Hindus. The Hamites, from Arabia, early settled in Egypt, Nubia, and Libya, and they have wandered over the Sahara. The Semites also, from S.W. Asia, followed the Hamites and settled in the Mediterranean coast dists., the W. Sahara, and the Sudan. Their descendants are known as Berbers. Hindus are found chiefly in the Transvaal. Tuaregs, a mixture of Berbers and Negroes, dwell in the Asben Mts. in the Sahara, and the Tibbus in the E. of the Sahara. 3. The original natives consist of Negroes, Hottentots, Bantus, Bushmen, and several dwarf tribes. The Negroes dwell mostly in the Senegal and Gambia dists., the Guinea coast, and the Sudan. The Bantus—the most important types of which are the Zulus and Kaffirs—occupy the S. or peninsular part of the continent. The Hottentots dwell in the S.W. coast dists.; the Bushmen in the W. of Cape Prov. and in the Kalahari desert. The inhab. of Madagascar, the Malagasy, are not an African stock, but a branch of the Malay family.

*Religion.*—Mohammedanism is the religion of the Hamites and Semites. Christianity prevails in Upper Egypt and Abyssinia, and has been introduced in many parts by European missionaries. Many of the natives of the S., however, are still nature-worshippers, and believe in evil spirits and fetishism.

*Social Conditions.*—The occupations of the natives are hunting, cattle-rearing, and agriculture. In the N. the Hamites and Semites rear cattle, and the people of the Sudan, the Nile valley, and Abyssinia are mostly agriculturists. In the Sahara and E. Sudan are the Nomads. In the European settlements agriculture, sheep and ostrich farming,

gold, copper, and diamond mining, are the chief occupations. Many people are also engaged on the plantations. Slavery, although being gradually discontinued under European influence, is still prevalent amongst the Arabs of the interior; and cannibalism is still common among some of the native tribes.

**Political Divisions.**—European nations who have settled in A. have gradually extended their dominions, until almost the whole continent has come under the influence of European states. The only states that are independent are Morocco, Abyssinia, and Liberia, but the first-named is a protectorate partly Fr. and partly Sp.; while the last owes its independence to the intervention of the U.S.A. The different divs. and the European states to whom they belong are:

**French.**—Algeria, a large part of the Sahara and the Sudan, Tunis, Fr. Guinea, Senegal, the Ivory Coast, Dahomey, Wadal, Fr. Congo, the Fr. Somaliland Protectorate, Madagascar, with the Comoro Is., and Bourbon or Réunion Is. Area, 3,619,641 sq. m. Pop. 4,000,000.

**British.**—The Union of S. A. (consisting of the provs of Natal, Cape of Good Hope, Orange Free State, and the Transvaal), Swaziland, Basutoland, Bechuanaland Protectorate, N. and S. Rhodesia, Nyasaland Protectorate, Uganda Protectorate, Kenya Colony and Protectorate, Somaliland, the Colony and Protectorate of Nigeria, Gold Coast, Sierra Leone, Gambia, and the Is. of Ascension, St. Helena, Mauritius, Seychelles, Socotra, and a few other small is. and dists. Area, 1,652,000 sq. m. Pop. estimated at about 50 millions.

**Egypt** (area, 383,000 sq. m. Pop. 14,186,756) and the **Egyptian Sudan** (area, 1,008,100 sq. m. Pop. 5,500,000) were, prior to 1922, under Brit. and Egyptian administration. By the Anglo-Egyptian treaty of 1936 Egypt became a Sovereign State, and the military occupation by Brit. forces was terminated. Provision was made in the treaty for a reconsideration of its terms in 1956. Negotiations for revision were begun in 1946. The status of the Sudan as a condominium was reaffirmed in the treaty of 1936. (See further under EGYPT.)

**Portuguese.**—Madeira Is., Cape Verde Is., St. Thomas Is., Prince's Is., Portuguese Guinea, Portuguese W. A., and Portuguese E. A. Area, 791,294 sq. m. Pop. 8,399,101.

**Spanish.**—The Canary Is., the portion of the N.W. coast between Cape Blanco and Morocco, Ceuta, and a few other ports on the N. coast, and Fernando Pó and Annobón in the gulf of Guinea. Area, 83,400 sq. m. Pop. 722,167.

**German** (before the First World War).—Togoland, the Cameroons, Ger. S.W. A. between Portuguese W. A. and the Orange R., and Ger. E. A. Area, 931,659 sq. m. After the war Togoland and the Cameroons were mandated partly to Great Britain and partly to France, while Ger. S.W. A. was mandated to the Union of S. A. From that time Ger-

many's colonial empire in A. ceased to exist. Pop. 12,320,000.

**Italian.**—Tripoli, or Libya. Area, 399,000 sq. m. Pop. 1,000,000. It. Somaliland, 220,000 sq. m. Pop. 1,000,000. Eritrea on the Red Sea Coast. Area, 64,000 sq. m. Pop. 510,000. Abyssinia 350,000 sq. m. Pop. 7,000,000. By the end of 1941, with the surrender of Gondar, Italy had lost her entire E. African Empire to the Brit. forces. Its disposal, apart from Abyssinia, which has regained its independence, remains to be decided by the United Nations Organisation.

**Belgian.**—The Congo is Belgium's only colony. Area, 902,665 sq. m. (including Ruanda-Urundi), 923,590 sq. m. Pop. 15,000,000.

**Changes in Boundaries after the First World War.**—The chief results of the First World War on the map of A. were the complete erasure of Germany from A., and the complete cancellation of all Turkish claims and interests in the continent. This followed from Germany's renunciation, under the treaty of Versailles, of all her rights and titles over her overseas possessions. Under the mandatory system created by the covenant of the League of Nations Ger. S.W. A. is now administered by the Union of S. A. as a fifth prov. of the Union; Ger. E. A. was transferred to Great Britain with the exception of the sultanates of Ruanda and Urundi, which were mandated to Belgium; the Cameroons (*q.v.*) (or Kamerun) and Togoland were divided between Great Britain and France, the greater part of Togoland, with the cap. Lomé, and the railways, and practically the whole of the Cameroons as it stood before 1914 going to France. The Brit. mandated sphere of about 13,000 sq. m. in Togoland is administered by the Gold Coast Gov. The Brit. sphere in the Cameroons is a strip of 33,700 sq. m., which is administered by the Nigerian Gov. When the First World War broke out, Turkey had already lost all her African possessions, apart from retaining a few vested interests in Egypt and Libya. But under the treaty of Sèvres she gave up all rights in or over Egypt, including her claim to tribute, and all rights in Libya; and she also recognised the Fr. protectorate in Morocco and Tunis to the fullest extent. Since this treaty arrangement Egypt has become an independent Sovereign State, the Brit. protectorate having terminated in 1922. (See above.) Thus France and Great Britain dominate the field in A.—though after the It. conquest of Abyssinia, Italy's share had for a few years considerably increased—and the elimination of Germany removed the power which pre-eminently influenced the scramble for A. which before the First World War twice at least gave rise to serious international incidents.

**Recent Exploration.**—By the first decade of the twentieth century practically the whole surface of the continent had been explored except in the sandiest parts of the Sahara and Libyan deserts, the mountainous regions of Tibet, and

the S. of Gallaland. Probably there remain no new or startling fauna, certainly no new tribes to add to the sum total of known African wonders. This, however, as researches in N. Rhodesia and Tunis show, does not preclude the discovery by archaeologists of remains which may enrich the study of anthropology and geology. Indeed, so high an authority as the late Sir Harry Johnston avers that the scientific study of A. past and present is only just commencing.

In the field of pure anthropology the most significant event of the last few years was the finding in 1925 in Taungs, Bechuanaland, of a human skull (*Australopithecus*) with affinities both to that of an ape and of the Neanderthal man. This followed the finding in 1913 of a human skeleton at Oldoway in N. Tanganyika, which resembled that of a Negro-Hamitic skeleton unearthed at Lake Elmenteita in Kenya by L. S. B. Leakey. Much valuable ethnological information, too, has been gathered concerning the numerous and little-known tribes in different parts of the Sahara, e.g. the Bushongo. From their language, weapons, etc., it seems that they are a kindred people with other tribes of the Ubangi-Chad region such as the Azande (E. Torday, *On the Trail of the Bushongo*, 1925). (See ANTHROPOLOGY.)

*Social Anthropology.*—Researches in African social organisation have been steadily pursued in recent years, and the work of social anthropologists has added greatly to our information. Much has been learned of the moral code of the Ngoni of Nyasaland; of the law and authority among Nigerian tribes, of whom our knowledge is still scanty; of problems of culture-contact among numerous Bantu tribes, notably through the researches of B. Malinowski; of the tribal culture of the Lango (see J. H. Driberg, *The Lango: a Nilotic Tribe of Uganda*, 1923); of the customs of the Bemba and Lambas of N. Rhodesia, particularly through the work of C. Doke and Edwin Smith; of the marriage customs of the Sotho group of the Bantu-speaking tribes of S. A.; of the religions of Nigeria, on which C. K. Meek's researches are especially valuable; of the social structure of the Ibo of S. Nigeria and of the Bushmen of the Kalahari; of the strange culture of the Lovedu society (see E. J. Krige and J. D. Krige, *The Realm of a Rain Queen*, 1943); of the socio-religious activities of little-known tribes of the Tumba region of the Middle Congo; of the social custom of polygamy in the Mende country of W. A.; of ancestor worship and the sacrificial practices of the Kikuyu tribes of E. A.; of witchcraft and anti-witchcraft in Nupe-land in Central Nigeria, on which the researches of S. F. Nadel are noteworthy. Belief in witchcraft is still general (*ju-ju* in W. A.—see JU-JU) and sorcerers are credited with being able to change themselves into animals; and though there are special laws and punishments for sorcery, witchcraft is recognised as being too deep-rooted in the African social organisation to justify a policy

aimed at extirpation regardless of the consequences to that organisation (see F. H. Melland, *In Witchbound Africa*, 1923). Again, the horrors of human sacrifice, ritual murder, and live burials were prevalent until very recent times, and may still prevail here and there where the white man has not trod; and lying, stealing, gluttony, and licentious debauchery were at their worst within comparatively recent years; but much has been achieved through the efforts of the missions and the gradual advance of the social services through the aid of the white man's gov. Above all, there has developed in the sphere of social anthropology a general recognition that policies which do not take into account the nature of the native societies to which they are applied are apt to provoke unforeseen and unwelcome reactions. Modern anthropological work or that branch of anthropology which is variously described as social, practical, and functional, in A. attempts to record the behaviour of the African in his reaction to indigenous and imported influences, and it is progressively devoting greater attention to the latter. At its best it indicates how a desirable reform may be brought about in such a way as to harmonise with the custom of the people whom it affects (see Hailey, *An African Survey*, 1938).

*Communications.*—The inland communications were very defective before the First World War. Except in the S. and in Egypt there were but few railways; and according to its size A. has but a small amount of navigable waterway. Inland communication is, therefore, carried on to a great extent by means of caravans. Camels are used in the N. and oxen in the S. as beasts of burden. Caravan routes cross the Sahara, the 2 chief being the E. caravan route from Tripoli to Lake Chad, and the W. caravan route from Taflet in Morocco to Timbuktu. Thus there is regular communication between the ports of the Niger and Lake Chad and the ports on the Mediterranean. With the help of a few railways and roads, there is natural water communication by riv. and by lake from the mouth of the Nile to the mouth of the Zambesi. The R. Niger and its trib., the Benue, are important means of communication between the Sudan, Nigeria, and the gulf of Guinea, being navigable for large riv. steamers. The Congo brings the produce of the Belgians Congo to the Atlantic coast; and the Zambesi is navigable for a considerable part of its course, except where rapids and cataracts occur.

*Railways.*—There has long been a project for a railway from the Cape to Cairo, which is to run as far as possible through Brit. ter. From the N. it has been constructed from Cairo along the Nile valley through Aswan, Dender, Korosko, Wady Halfa, Abu Hamed, Berber, Shendi, to some distance beyond Khartoum. From the S. it has been constructed from Cape Town through Worcester, Beaufort W., Hope Town.

Kimberley, Vryburg, Mafeking, Palapye, Bulawayo, to beyond the Zambesi. Cape Town and Port Elizabeth are connected by rail, and from Port Elizabeth a line runs through Colesberg, Bloemfontein, Kroonstad, Johannesburg, and Pretoria to Pietersburg. Other lines run from E. London to Aliwal N. and Springfontein; from Durban through Pietermaritzburg to Johannesburg; from Lourenço Marques to Pretoria; and from Mombasa to Port Florence on Lake Victoria. Another extension of 1000 m. connects Dukama with Port Franqui on the R. Kasal, trib. of the Lower Congo. Many other railways have been constructed in Brit., Fr., Belgian, and the former German territories.

Railroad construction has proceeded rapidly since the pioneer work of Cecil Rhodes. Of other than Brit. railways the most important completed work prior to the First World War was the German trunk line from Dar-es-Salaam to Lake Tanganyika (800 m.), opened in 1914. Fr. railroads were not increased to any great extent, but in 1915 a line was completed from the Red Sea coast to the heart of Abyssinia. At Lobito Bay in Portuguese W. A. the Benguela railway has its terminus, a useful line giving the Katanga dist. of the Belgian Congo an outlet to the W. The Cape-to-Cairo all-rail route remains incomplete, but the commercial mind has begun to appreciate that the more practical route is across the continent from E. to W. With the completion of the railway from the Upper Congo at Kabalo, to Albertville, on Lake Tanganyika, the first transcontinental combined rail and boat route was an accomplished fact. There is also E. and W. rail communication, though less direct, between Walvis and Delagoa bays, a 20-m. connection linking up the S. African Union and the S.W. African railway systems. In S. A. in 1918 the line from Cape Town via Bulawayo and the Victoria Falls was extended to Bukama on the Lualaba R. (Belgian Congo). In the colonies new Brit. railways are opening up and connecting the interior with the coast, though not for any great distance; there are now lines feeding the coal- and tin-mining dists. of Nigeria, a local line from Tabora, on Lake Tanganyika, which is projected to a terminus on Lake Victoria, and an extension of the Uganda railway has been in process of construction since 1921. Communications in Brit. E. A. are in course of development, the Brit. Gov. having approved in 1925 the proposal to raise loans up to £10,000,000 for the work. The main railway is the Gov.-owned line from Mombasa through Nairobi to Lake Victoria and on to Uganda (841 m.). There are 600 m. of branch lines.

Road construction proceeds apace, especially in the Brit. W. African colonies, Uganda, and the Belgian Congo. Telegraphic communication in the course of the last few decades has been considerably extended, and the impulse given to wireless telegraphy by the First World War naturally had its effect in A., where modern high-power wireless stations were

installed in E. A., S.W. A., W. A., Algiers, etc., before the Second World War.

**Commerce.**—The Portuguese were the first to trade with A., and they had commercial relations with Upper and Lower Guinea; but the Dutch were the first to settle in the S. Here Huguonots came in the seventeenth century, but it was not until the end of the nineteenth century that trading relations began to exist between Europe and the interior, when Brit., Gers., Fr., Sp., and Its. began to settle in A. There is a local traffic between France and Algiers, but otherwise most of the ocean maritime trade of A. is in the hands of the Brit.

Africa, German East, First World War, Campaign in. The conquest by the allied forces of this Ger. colony was virtually completed on Nov. 27th, 1917, when the Mahenge Force under Col. Tafel, comprising 3500 officers and other ranks, surrendered to Gen. Van Deventer. The residue of the Ger. forces then took refuge in the adjoining Portuguese ter., but were gradually rounded up in the course of the next few months. In point of area Ger. E. A. is twice the size of Germany, and its conquest by the E. African Field Force under Gen. Smuts and Gen. Van Deventer after a campaign of some 20 months was a triumph of determination and resourcefulness over conditions which offered hardships. The country is one of almost impenetrable bush lands and desert, abounding in pestilential swamps, and crossed by mt. ranges. Never before in the hist. of warfare had operations on a large scale with modern artillery and weapons been conducted within a few degrees of the Equator, and seldom indeed has one consecutive series of operations taken place over so vast an area. From the nature of the terrain the difficulties in maintaining supplies were serious, the absence of roads and water in the greater part of the country making the support and transport of large armies, marching ever further from their bases, an extremely harassing undertaking. In a measure these difficulties were common to both antagonists; but the Ger. forces were not only more familiar with the country and consequently in a position to baffle pursuit for a considerable time, but in their retreat over a distance of not less than 1000 m. were approaching ever nearer to their supply bases and food depots. Finally, the bulk of the Ger. forces were negroes, hardened against diseases incidental to the climate and country, while the Allies, who were for ever groping blindly in the bushland after an indigenous and elusive foe, specially trained to the peculiar conditions of African bush warfare, comprised men from the temperate regions of S. Africa, Indian troops from the hills, and troops from the United Kingdom.

The first stage of the campaign, from Aug. 1914 to Mar. 1916, when Gen. Smuts arrived, was the longest and most arduous of all, for if the privations were not perhaps so severe as in the later stages, yet the allied troops, being very few in numbers, were always in peril. Not only were they set the task of defending a frontier line of some 600 m., but the military situation was one of ever-increasing anxiety, as on every sector the Ger. forces were in occupation of Brit. ter., the opening attack on the enemy from the sea at Tanga having proved a more or less complete failure. The Ger. forces had between them and

Mombasa no force other than a few Arabs under their picturesque chief Wavel (q.v.), while their outpost at Taveta was a direct menace to the Uganda railway, and their garrison at Longido threatened Nairobi, the cap. of Brit. E. A. Had the Gers. shown the same capacity for aggressive action as for defensive the campaign might well have taken an entirely different turn. This stage was characterised throughout by sporadic fighting, chiefly in the Tsayo region and in the neighbourhood of the Longido line and Ngururhan. At the close of these operations Gen. Sir Michael Tighe, who had taken over the supreme command, made preparations for a general offensive, constructing a new railroad from Voi so as to link up Mombasa with the Ger. N. frontier. At the same time he ran a pipe-line from the well-watered hilly districts of Bura to the desert around Maktan. The first battle was fought at Salaita Hill, where the Ger. forces were strongly posted, but the issue was indecisive. In the early part of 1916, when the enemy's forces numbered about 2700 Europeans and 12,000 natives, Gen. Smuts opened the second stage of the campaign with a brilliant attack near Taveta on the one vulnerable point in the enemy's mt. line. This action marked the turn of the tide, for Gen. Van Deventer, the rains having set in, sent patrols as far into the enemy's country as Kondo Irangi. So far, however, the E. ter. had not been touched, and it was necessary to drive Kraut's army from the Pangani valley, so as to advance on the Central railway. This, after many forced marches, was accomplished, but Kraut's force escaped, and it was only after the lapse of 2 months that Deventer was in a position, having reorganised his riv. transport, to advance on the railway. Gen. Smuts meanwhile forcing the passage of the Wami and isolating the chief town of the colony, Dar-es-Salaam. Following on this success, Gen. Smuts overwhelmed the defensive system of the Uluguru Hills, driving the enemy as far S. as the Rufigi R., in the neighbourhood of which they took refuge during the rainy season. The third stage opened with the problem of dislodging the enemy from the valley of the Rufigi, a task which was accomplished by the S. African Infantry, while at the same time troops landed at Kilwa and elsewhere to drive the enemy from the coastal regions. Then followed a long and very disheartening period of campaigning through dearth of food, almost insurmountable transport difficulties, and the ravages of malaria. About this time Lt.-Gen. Sir J. L. Van Deventer became Commander-in-Chief in E. A., and thereafter conducted the campaign to its conclusion. By the end of Aug. 1918 the enemy had been repulsed with considerable loss at Lioma and barely escaped from converging attacks E. of that tn. The Ger. commander, Lettow Vorbeck, after the most stubborn fighting in the whole campaign—in the Lindi and Kilwa dists.

in the latter part of 1917—had retired across the Rovuma into Portuguese E. A. with some few hundred white troops and about 2500 black troops. The Ger. force having made for the Songea area, Gen. Hawthorn was detailed to get troops there ahead of the enemy. The Ger. commander, who was now at New Utengulu, seemed compelled to go towards either Itunda in the N. or Bismarckburg in the W. Contrary to expectation, he changed his plans, despite the vast and impassable swamps of Lake Rukwa, and marched further S., apparently with the object of attacking N.K. Rhodesia, in the hope of obtaining food and supplies. Early in Nov. the enemy attacked Fife (which stands midway, near the frontier, between Lakes Tanganyika and Nyasa) in force, but was beaten off with loss by the N. Rhodesian Police. Hotly pursued from the N. by the 1st/4th King's African Rifles, he retreated towards Kayambi Mission, reaching Kasama on Nov. 8, Ger. E. A. being thus once more clear of the enemy. The next engagement of the campaign was fought near Kavembe, the 1st/4th King's African Rifles having caught up with half the enemy force at that place. After a stiff engagement the enemy was driven from his position, but all further operations stopped shortly afterwards owing to the news of the signing of the armistice. The last engagement was actually fought on Nov. 12 N. of Kasama, the interruption of the telegraph communications preventing Gen. Van Deventer from getting info touch with the Ger. commander before that date. On the morning of Nov. 14 the Brit. terms, based on Clause 17 of the Armistice, were handed to Gen. von Lettow Vorbeck, in accordance with which the latter formally surrendered at Abercorn on Nov. 25. 'In view of the gallant and prolonged resistance,' says Gen. Van Deventer, 'maintained by the Ger. Force in E. A., I allowed Gen. von Lettow Vorbeck and his officers to retain their swords, while the European rank and file were permitted to carry their arms as far as Dar-es-Salaam.' Under Article 119 of the Peace Treaty Germany, having renounced her overseas possessions, lost Ger. E. A., which was thereafter administered by Britain as mandatory. See Francis Brett Young, *Marching on Tanga*, 1918. See TANGANYIKA TERRITORY.

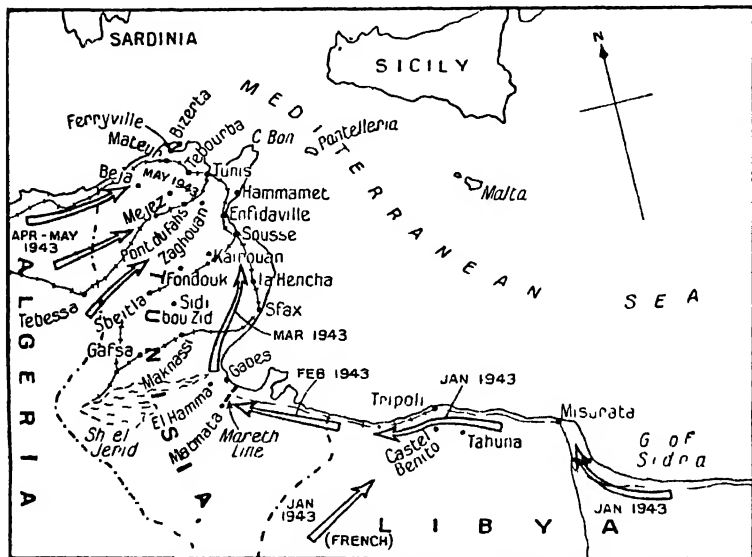

**Africa, North, Second World War, Campaigns in.**

*Battle of the Western Desert* (Dec. 1940–Feb. 1941).—This battle, resulting in the conquest of Cyrenaica by the Brit. Army of the Nile, began on Dec. 9, 1940, and reached the end of its first stage the following Feb. It was one of the most spectacular achievements of all time in the annals of desert warfare, alike in the scientific organisation of the supply services, in its brilliant strategic conception, in the speed and skill of the tactical manoeuvring, and in the remarkable disparity of the casualties sustained by the opposed forces. Five months

previously, when, with France prostrate and her great Syrian army immobilised, Italy had declared war on Britain and her allies, the threat to Egypt from Italy's army of 250,000 men seemed ominous indeed. The dramatic suddenness of Gen. Sir Archibald Wavell's successful onslaught on Sidi Barrani, which opened the Brit. offensive, and the rapidity with which the Brit. Army of the Nile captured one stronghold after another until the whole prov., twice the size of Italy, had fallen into their hands, went far to restore Brit. prestige, besides spelling the doom of Italy in the whole war. Prior to the attack of Dec. 9, the Brit. forces, in spite of their grave difficulties, had not been idle. As early as July, after Marshal Graziani (q.v.), conqueror of Omdurman in the Italo-Abyssinian war, had taken over the Libyan command from the murdered Marshal Balbo (q.v.), there had been patrol encounters at Fort Capuzzo, and air raids on the aerodromes of El Adem and El Gubbi, on shipping in the It. naval base of Tobruk, and on troop concentrations on the Libyan-Egyptian frontier. Graziani crossed the frontier at Sollum, drove back the Brit. forces at Buq Buq, and entered Sidi Barrani on Sept. 21 in pursuance of the plan to strike in the Near E. at the same time that the Gers. struck in the W. In the course of this advance monuments extolling Fascist prowess marked the route into Egypt. Meanwhile Brit. planes had attacked Bomba, El Tmimi, and other aerodromes in E. Libya, while submarines were preventing supplies from reaching the It. forces. The Its. were, however, confident on account of the great strength of their fortified positions in Bardia and Tobruk, having spent 4 years in their preparation; but, as time would show, their offensive was too cautious and unimaginative, assuming almost the character of a defensive operation, while the Brit. defensive always had the latent element of attack which characterises successful guerrilla warfare. At this time Graziani had command of the coastal road for his advance, though it offered one flank to interruption from the sea, and he was separated from the Brit. railhead at Mersa Matruh by only 75 m. But, instead of boldly taking the plunge and advancing, he had halted and wasted time on the preparation of a series of powerful perimeter camps. No doubt, in accordance with the Ger. strategy, the It. main fleet, precluded from engaging in any major action, could not cover Graziani's left flank; but it is to be observed that the dramatic Brit. coup at Taranto (see under NAVAL OPERATIONS IN SECOND WORLD WAR) and the attack W. of Sardinia (*ibid.*) were subsequent to Graziani's stand at Sidi Barrani. In Nov. the R.A.F. had done considerable damage to It. aerodromes at Berka, Benina, Tobruk, and Barca—an essential preliminary to the advance which had been intended by Gen. Sir Archibald Wavell, Commander-in-Chief of the Brit. forces in Egypt. But at this moment Italy suddenly invaded Greece

in the hope of upsetting Britain's sea power in the Mediterranean, and it was incumbent on the Brit. Gov. to send a considerable part of the R.A.F. from Egypt to aid the Gk. army in its heroic resistance. But meantime further reinforcements of Australian and other troops and material had reached Cairo to augment the Army of the Nile, which was under the command of Gen. Sir Maitland Wilson, and indeed, the obvious difficulty of defending Egypt at all after

Maktila garrisoned by the 1st Libyan Div. The assault on Sidi Barrani was unique in its success. Almost at a single leap, across 75 m. of desert from Mersa Matruh, a strong detachment of Brit. and Australian troops advanced on positions which the Its. had fortified 3 months earlier, and entered Sidi Barrani from the quarter least expected by the garrison. At the cost of only 400 casualties the position fell to Gen. Wilson, together with 38,114 prisoners

THE NORTH AFRICAN CAMPAIGN: ALGERIA, TUNISIA, AND LIBYA

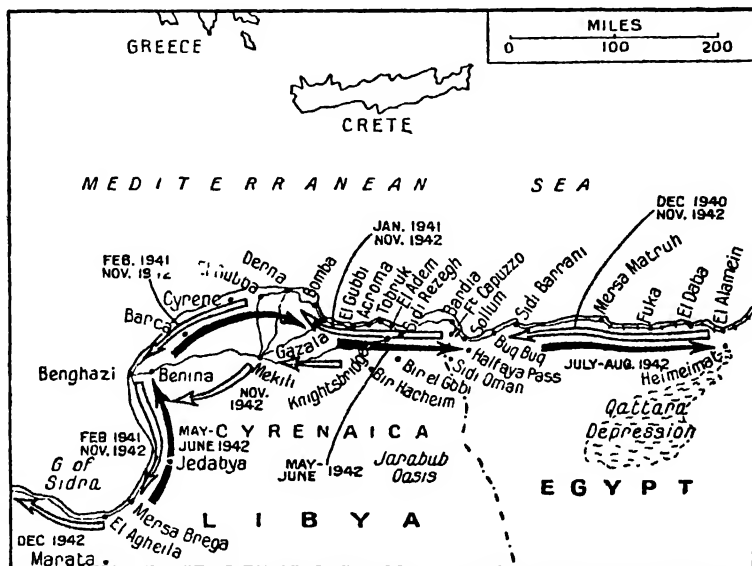

the elimination of France had imposed on the Brit. Gov. the hazardous risk of sending forces—air force personnel, infantry, and guns—to Egypt, which were equally urgently needed in Britain to repel a probable Ger. invasion. The risk, however, was boldly taken and considerable reinforcements in men and munitions were expeditiously and secretly sent out on the long ocean journey.

The now historic Brit. offensive began with an air attack on the It. camp at Nibeiwa—held by an It. mechanised column—15 m. S. of Sidi Barrani, all the It. aerodromes from Derna to Sidi Barrani having been previously so heavily bombed that Italy's total air strength in N. A. was already seriously crippled—Castel Benito, the most powerful It. air depot in Libya, being left a blazing wreck. Simultaneously with the attack on Nibeiwa, the R.N. bombarded the It. positions at Sidi Barrani and

(including 24,841 Its.) and a great many guns, tanks, and stores of all kinds, including choice foods and wines in abundance. A few days later Sollum, Fort Capuzzo, and Sidi Omani were captured and the threat to Egypt had gone. Bardia, Tobruk, Derna, Cyrene, and Benghazi all fell in rapid succession, the Its. never having recovered from the initial shock, and by late Feb. Cyrenaica had been entirely conquered and placed under Gen. Wilson as military governor. Some two-thirds of Graziani's army had been captured or destroyed, and the remainder hurled into headlong flight to Tripoli. Bardia, which fell on Jan. 5, was thought by Graziani to be impregnable, and he had given assurance to that effect to Mussolini. Fortifications on which the Its. had worked for 4 years were as sand castles against the brilliant strategy of Gen. Wavell and the irresistible *élan* of the Brit. mechanised

forces. The position was taken in 4 days, a contributory cause being the overwhelming aerial and naval bombardment which the garrison had to undergo before and during the assault by the Brit. armoured div. The total Brit. casualties in the capture of Bardia were less than 800; the It. casualties were 2041 officers and 42,827 other ranks killed and captured, and, in addition, 368 medium and field guns, 26 heavy anti-aircraft guns, 68 light guns, 13 medium and 117 light

of mechanical transport and the entire absence of water over a vast ter., and, as soon as the fighting troops went forward, advance repair depots had to be estab. in their tracks and pipe lines laid behind, so that a chain of depots, large and small, stretched back behind the firing line, stage after stage, for hundreds of m. Meanwhile, even during the operations at Bardia, the guns of Wilson's Army of the Nile, reinforced by fresh battalions, were shelling Tobruk. Flying columns of

LIBYA AND EGYPT. ALLIED MOVEMENTS, WHITE ARROWS; AXIS, BLACK

tanks, and over 700 transport vehicles were destroyed or captured. Gen. Berganzola, the It. commander at Bardia, escaped only to be taken later S. of Benghazi. The operations at Sidi Barrani and Bardia had reduced Graziani's army by one-third of its effectives, while the capture of Bardia now made it possible to bring up supplies to the Brit. troops by sea, besides considerably extending Gen. Wavell's liberty of action. As a fact, when Gen. Wavell launched his attack of Dec. 9 his striking force was given only 5 days in which to win a decisive success. That was the limit fixed by its supplies of water and fuel and transport. Either it must take Sidi Barrani by Dec. 14 or return to its starting point at Mersa Matruh, having done no more than test the It. defences in a large-scale raid. The need for haste came from the wear and tear imposed by desert conditions on all forms

armoured and mechanical units had cut the coast road to Derna and Benghazi, and were operating still further westwards. The assault on Tobruk, following many days of air bombing, was delivered at dawn on Jan. 21, strongly supported by the Navy, and very soon Australian troops had penetrated outer and inner defences to a depth of 5 m. An It. cruiser, *San Giorgio* (9000 tons) was destroyed in the harbour. The capture was completed by nightfall of Jan. 22 after rapid and brilliantly executed action, similar to that at Bardia, the attack being launched simultaneously at a number of points and assisted materially by the naval and air arms. On the same day Brit. advanced forces had already reached the coast near Derna, 110 m. W. of Tobruk, and Mekhili, an important road junction 50 m. inland; while, as a result of the capture of Tobruk, the It. had to abandon nearly all their chief air bases

in Cyrenaica, besides losing the best natural harbour on that part of the African coast. Derna fell on Jan. 30, after a series of minor actions and affairs of outposts, the fall of the town involving the expulsion of a garrison of 10,000 men. Simultaneously Brit. night bombers made a heavy raid on the docks at Tripoli, tons of explosives being dropped on shipping, seaplanes, mole, and railways. On Feb. 3 Brit. troops occupied Cyrene (W. of Derna), a tn. dating from Rom. times, and previously used by Graziani as his headquarters; Graziani's remaining forces, leaving hundreds of stragglers in Brit. hands, were now pressing in all haste to Benghazi. But 5 days later this tn. also fell, through a skilful manoeuvre involving a twofold assault by Australian troops attacking westwards along the coast and by Brit. armoured units cutting communications from the S. The capture of Benghazi—a tn. of 60,000 inhab., who welcomed the victors with unaffected enthusiasm—and of its excellent harbour was the culmination of one of the most skilfully planned campaigns in military hist. Within 2 months the Army of the Nile had thrown back the Its. from firmly entrenched positions 130 m. inside Egyptian ter. and advanced over 500 m. in country practically devoid of good roads, water, and food, and subject to blinding sandstorms and with steadily lengthening lines of communications. Altogether over 120,000 prisoners were taken, including 19 generals and an admiral and a vast amount of booty—much of which was used in arming the Abyssinians in their revolt against their It. masters. Brit. casualties were less than 2000 in the whole of the operations. It has been generally recognized that the assault on Sidi Barrani was the crucial action of the campaign. The 4 great It. forts or perimeter camps there each measured about 2 m. in circumference, and they were defended by a ditch, a wall, barbed wire, anti-tank guns, and machine guns. The Brit. heavy tanks moved forward under a barrage and passed right round to the rear of the forts. The It. fire was terrific, such as no infantry could have penetrated, but the heavy tanks were not stopped even by hits from shells, while the machine gun bullets were no more to them than rain. Broadly, the heavy tanks were used for assault all through the campaign, the light tanks to carry out reconnaissance and to isolate each successive It. stronghold and, when the bigger tanks and the infantry saw success assured, the light tanks pushed on to the next objective. Following the fall of Derna the light tanks accomplished a remarkable journey of 150 m. in 30 hrs. from Mekili over boulder-strewn country. The column reached its destination, the tarmac road, in the very nick of time to head off the retreating It. Army from Benghazi. The Its. were taken completely by surprise. They had taken no precautions against interception by tanks, simply because they had not believed the journey to be possible. From the direction of

Tripoli the normal motor-coaches were running with civilian passengers. At dawn of the next day the main body of the It. Army appeared, with a strong force of artillery and no fewer than 70 medium tanks. The Brit. cruiser tanks at once attacked. The day saw the hardest fighting of the campaign. All save 8 of the It. tanks were knocked out and, after Brit. infantry had come up in lorries, the whole It. Army surrendered.

*The Struggle for Libya: Defence of Tobruk. Loss of Gunboat 'Ladybird'.*—After the conquest of Cyrenaica by Gen. Wavell the centre of military gravity shifted to the Balkans and (as shown above) Wavell's Army of the Nile was called upon to supply an expeditionary force for Greece. It was assumed that the only Axis threat to Egypt was through the Balkans and Syria, and this assumption derived support from both the premature and abortive revolt in Iraq and the complete annihilation of the greater part of Graziani's legions. But while Tripoli remained in the hands of the Its. the road to Benghazi lay open to Ger. forces, provided these could be landed unobtrusively farther W. and assembled for a determined surprise assault on Benghazi. Ger. armoured formations of first-rate quality were, in fact, landed in N. A. and formed the spearhead of an intended attack on Egypt from the W., to be co-ordinated with indirect attack from the E. through revolt in Iraq. Rashid Ali's *coup d'état* and the Ger. plan to seize Syria utterly failed through the prompt action of the Brit. military commanders, and this in spite of the Ger. success in Greece and Crete. (See IRAQ; SYRIA.) The new direct threat to Egypt from Libya was checked by Wavell's strategy in occupying Tobruk on the communications of the Axis forces and by the resistance offered to the Ger. spearhead round Sollum. The Gers. under Gen. Rommel first made their appearance up the E. coast of the gulf of Sidra late in Mar., and the real strength of their force was cleverly concealed from the Brit. garrison in Cyrenaica until the road to Benghazi had been overrun. The Brit. garrison (much depleted to supply the force for Greece) withdrew and in a few days the Ger. mechanised troops had captured Cyrene, Benghazi, Derna, and Bomba, and were now advancing speedily on Sollum. By the end of Apr. the enemy was standing about 5 m. across the Egyptian frontier, harassed by light forces of the Brit. armoured units. Dust storms and supply problems, however, also played their part in holding up the advance of the enemy, who was still mainly dependent on Tripoli for supplies. Heavy fighting took place at Fort Capuzzo and Halfaya Pass, which latter position was retaken by the Brit. in May, only to fall again to the Gers. a week later. In all, 4 Ger. mechanised columns were engaged, and in spite of the great length and the exposed nature of his lines of communication, the enemy succeeded in bringing up tanks and heavy

motor vehicles. Meanwhile, the Brit. defences of Tobruk had been much strengthened, and the Gers. found the cross fire from the Brit. guns there as heavy a barrage as they had ever experienced.

In operations off the Libyan coast the It.N. lost the monitor *Terror* and the gunboat *Ladybird*, both sank after they had in the previous days inflicted heavy punishment on the enemy. Both vessels were old naval units, the *Terror* having been built in 1916, and the *Ladybird* in 1915. The *Terror* was one of the most curiously camouflaged ships in the R.N., and was often dubbed the Fleet's 'Little Warspite' on account of its heavy armour. Slow-moving and flat-bottomed, she moved (during the battle of the W. Desert) to within sight of the It. shore batteries and then flung hundreds of tons of high explosives into the enemy's positions at Sidi Barrani, Sollum, Tobruk, and Bardia, and was generally credited with paving the way for Wavell's advance in Libya (see *Battle of the Western Desert*). The *Ladybird*, which had made hist. in Panay, China, and later in Libya, went down in a glorious fight to a finish against diving Stukas until the last of her guns slipped beneath the water of Tobruk harbour. Six of nearly 50 Nazi bombers attacking Tobruk shipping and shore defences on May 21 hurled bombs on the boat, but every gun aboard the little 25-ton gunboat met the diving planes with a hail of metal. Bombs burst in her boiler room, exploded heavily aft, and shook her almost out of the water, but the gunners kept to their guns until the order 'Abandon ship.'

In the month May 15-June 15 Brit. attacks on the enemy by air and by ground forces resulted in the destruction of at least 24 Ger. tanks, 140 armoured cars and transport lorries. But the enemy remained in possession of Sollum and Halfaya Pass—the Brit. objectives in an attack delivered by Brit. armoured forces in the second week of June. The retention of Tobruk as an outpost for the protection of Egypt made it possible to hold a line closer to the frontier than was the case when Mersa Matruh was the Brit. base, and when the It. army of invasion occupied Sidi Barrani and its attendant forts. The defence of Tobruk was a veritable epic in Brit. military annals. The siege was, in fact, a deliberate piece of Brit. strategy designed or, at least, invited by Wavell to halt the Ger. movement on Egypt. It changed the face of the campaign by becoming a nodal point of defence obstructing the enemy's lines of communication, and compelling him to maintain a large investing force at Tobruk which could not operate on Egypt. For months the small Eng. and Australian garrison, numbered in hundreds only, defied the armoured power and constant bombing of Rommel's troops. Meanwhile the R.A.F. returned bomb for bomb, and in 2 months (May-June) Benghazi alone was raided over 50 times by Wellington and Blenheim bombers.

Frequent bold sorties by Brit. patrols were the feature of the next few months. Armoured forces, supported by mobile artillery, inflicted casualties on the enemy almost daily. The growing strength of the Army of the Nile rendered these tactics increasingly effective. By early Sept. the Imperial land and air forces standing between the Axis Army and the Suez Canal were far more powerful than they had ever been since the war began. These forces included Brit., Indian, S. African, Australian, and New Zealand troops, many of whom had already been toughened in hard campaigns. With Axis forces blocked on a line stretching roughly due S. from Sollum the desert was now held by an army and an air force greatly outnumbering those which forced their way to Benghazi in the original Libyan campaign of the autumn of 1940.

Throughout this period Brit. submarines, destroyers, and bombers wrought havoc among Axis supply ships and on buildings, wharves, and moles at Tripoli, Benghazi, and other tns. on the N. African coast. It was always evident that each side was now manoeuvring for an attack as soon as climatic conditions permitted. When at length the Brit. did launch their offensive, it was motivated partly by the policy of diverting pressure from the Russian armies defending the Caucasus. And when the offensive was begun Rommel was making his final preparations to reduce the indomitable Tobruk garrison, which had been a thorn in his side for more than 7 months. Rommel's forces, continually reinforced from Italy and Greece, now consisted of 3 armoured divs., the 15th and 21st Panzer and the 132nd Ariete (It.) Divs. and, in addition, a Ger. infantry div. (motorised) and 4 other motorised It. divs. The main Ger. armoured force was S.E. of Tobruk with another panzer div. on the coast, some way to the E. of the tn. The It. Ariete Div. was in reserve at Bir el Gobi, some 80 m. S.E. of Tobruk. The enemy's main infantry force was strung round the Tobruk garrison.

**Second Brit. Offensive (Nov. 1941); Battle of Sidi Rezegh.**—The second Brit. Libyan offensive began on Nov. 17, 1941, when Gen. Auchinleck opened the attack by the newly constituted Eighth Army under Gen. Cunningham, the conqueror of It. E. A. The Brit. plan was to strike right across the desert with their armoured forces by cutting in between the Ger. tanks around Tobruk and the It. tanks at Bir el Gobi and leaving the strong frontier garrisons behind to be attended to first by mobile infantry and then, later, when the main objective should have been attained, to be reduced at will. These frontier positions were exceedingly strong; they had as garrison a whole It. div. plus sev. Ger. battalions—at least 12,000 men in all, with powerful supporting weapons. After 5 months of waiting and preparation Brit. troops for the first time met the Gers. on an equal footing as far as equipment and arms were concerned. The offensive had

been long and elaborately prepared in view of the peculiar conditions prevailing in the W. Desert, in which swift and far-reaching manoeuvres were only feasible through the extraordinary use of armour, air power, and mechanisation—conditions, in some respects, analogous to those of sea warfare. The tanks on the move in the desert, with their high turrets dipping and rising as they cruised on the uneven desert surface with their signal pennons waving in the breeze, looked very like a great fleet of destroyers. The Eighth Army (or Army of the W. Desert) took up its preliminary stations on a broad front from the Jarabub oasis. The attack was launched at nightfall on Nov. 17, and at dawn on the next day the general advance began. Very heavy and exceptional rains hampered the movements of the attacking forces, which had great distances to cover; but these rains, being still heavier in the coastal regions, also hampered the enemy. As was to be expected, there could be no strategic surprise as in Wavell's victory, for each army fully expected an attack by the other at any time. Moreover enemy aeroplanes were active and the movement of troops in the desert even in ordinary times was difficult to hide. Auchinleck struck at the flank—bearing in mind that the coastal sector had been elaborately fortified by the Gers. and its—but far to the S. of the point where Wavell's blow had fallen. In 36 hours Gen. Cunningham's army had advanced 75 m., and very soon its foremost elements had captured the important stronghold of Sidi Rezegh, on the escarpment 10 m. S.E. of the perimeter defences of Tobruk. During the afternoon of Nov. 21 the Ger. panzer forces, hemmed in W. of Fort Capuzzo, made sev. attempts to break out of the Brit. ring, but each time were beaten back with heavy losses on both sides. In 2 major engagements between the armoured forces, the Gers. lost 130 tanks, some threefold the Brit. losses. Brit. armoured columns were now striking at the enemy's communications in many directions over a large area, S. African and other dominion forces pushing northwards behind the Ger. fortified position along the Egyptian frontier. Within the first 5 days New Zealand troops had taken Bardia and Fort Capuzzo, while Indian troops seized Sidi Omar Nuovo. But the hub of operations was the encounter between Brit. and Ger. armoured forces about Sidi Rezegh, S.E. of Tobruk, an area of about 40 sq. m. A rough outline of the battle as a whole as it had shaped between Nov. 18 and Nov. 23 shows that when the order to advance was given, Indian formations, which were stationed at the coastal end of the line, crossed the frontier and got behind the enemy forts there. New Zealanders, a little farther down the line, performed a similar operation, and went round Fort Capuzzo. Armoured divs., which were farther to the S., went straight ahead and then wheeled towards the coast, holding the Ger. armoured divs., which at the time were

operating between Sollum and Tobruk. The tanks met the enemy on the coastal plain round about Sidi Rezegh. The enemy was completely surprised and, from that moment, strenuous efforts were made to prevent him from recovering from this initial blow. The great tank battle of Nov. 21–22 was bloody, but inconclusive. When it was over, however, the enemy withdrew to the N.W., and did not reform until the morning of the 23rd. Brit. anti-tank guns and 25-pounders did heavy execution. The Gers. used thermite shells, which on some occasions succeeded in setting Brit. tanks alight. Throughout Nov. 22–23 action was concentrated round Sidi Rezegh, where the fighting grew hourly more intense and more furious. The Ger. panzer divs. hit back with wild desperation as the Brit. forces drew in upon them, and soon supporting infantry were engaged on both sides. By now there were no definite lines, but merely masses of death-dealing tank+ manoeuvring, attacking, and counter-attacking.

These tank battles were an affair of sudden onslaughts in unexpected places. Sometimes small groups only were involved, and at others whole divs. or brigades were flung into each other's tanks from as close a range as they could manage. For sheer heroism there can have been little in this or any war to surpass that of those Brit. tank crews who, with lighter guns and thinner armour, stood up to and fought off time and again the massive Ger. medium tanks, armed with a gun twice the size of theirs. The attempt to contain the Ger. tanks within the area Sollum–Sidi Omar–Tobruk meant dividing up the Brit. armoured forces, whereas the Gers. could concentrate theirs upon 1 brigade at a time. Rommel's 2 armoured divs. were S.E. of Tobruk and S.W. of Bardia. Seeing the dispositions of the Brit. forces he moved the larger part of the div. near Tobruk to join that near Bardia, and from the morning of the third day of the offensive this formidable combined div. of light and heavy cruiser tanks was attacking and trying to knock out the Brit. tank brigades 1 at a time. The Brit. were not dismayed at the weight of metal against them. Generally, the Brit. tanks could more than hold their own with Ger. tanks of comparable size and gun-power, and fortunately the Ger. tank divs. did not wholly consist of vehicles so formidable as their Mark IV. tank. Heavy bombing attacks on enemy tanks and armoured vehicles in the desert were constantly delivered by the R.A.F., and in the first 6 days of the offensive the R.A.F. destroyed 120 Axis aircraft. A bold diversionary raid made by a Ger. tank column towards the Egyptian frontier through one of the gaps inevitable in the long Brit. 'line' penetrated eastwards, crossed the frontier, and reached a point half-way between Sidi Omar and Halfaya. Then they were met by Brit. aircraft and later by ground forces, which destroyed a third of the enemy tanks. On the following days elements of the

main Brit. forces joined detachments advancing from long-belleguered Tobruk. All through there was the most bitter fighting for Sidi Rezegh, the focal point of the tank battles. The Gers. retook this position, but were thrust out again by New Zealand troops supported by tanks. The Ger. column which had essayed a diversion over the Egyptian frontier was now broken up into smaller groups, which were then hunted down as they fled westward, the diversion having failed to deceive Gen. Cunningham into sending back armoured divs. to deal with it.

**Rommel's Ger. Afrika Korps.**—By the end of Nov. the battle had resolved itself into 3 main areas, but, as at the beginning, the main and by far the most important front was the tank-strewn area round Sidi Rezegh. Ger. armoured forces and motorised infantry penetrated the Brit. positions on Dec. 1, only to be thrown out again after extremely bitter fighting. The It. Ariete Div., after losing half its remaining tanks in a violent action E. of Sidi Rezegh, fled northwards with Brit. forces in hot pursuit. Brit. bomber and fighter aircraft always retained mastery of the air. Up to Dec. 1 they accounted for 176 enemy aircraft, their own losses being less than a third of these. It was found, however, that in the 1600 sq. m. of desert over which fighting raged, the air arm was robbed of a great part of the importance it had attained in a land of roads, railways, and large towns; for tanks in the open proved that they could not then be dominated by the air arm. Only armoured aircraft carrying quick-firing cannon were likely to reassert the authority of air fleets over land fleets. It may here be pointed out that the Gers. had been specially trained as colonial troops. In Mar. (1941) the Ger. counter-offensive in Cyrenaica had been undertaken mainly by the specially trained Ger. Afrika Korps, not an improvised organisation, but the product of large-scale work by certain depts. of the Ger. general staff incorporated in the Nazi party Colonial Office. Two centres were formed in Bavaria and Schleswig-Holstein, in which selected officers and men had to undergo the most extraordinary but, at the same time, most rigid training a soldier has ever received in Germany. Specially constructed hot-houses with tropical temp. were the permanent living quarters of these troops. Exercises for advance and defence were held in large halls, also under tropical temp., and Gen. Rommel, an officer of the inner circle of Hitler's staff, was in charge of this training. The medical staff of the Hamburg Tropical Diseases Institute formed the nucleus of the medical personnel attached to these units. It was troops of these units that had made their dramatic appearance at El Agheila on the Gulf of Sirte in Libya late in Mar. 1941.

**Siege of Tobruk lifted.**—During the intense tank battle at the end of Nov. in the area about Sidi Rezegh and Bir el Hamed, where the Gers. made

a desperate effort to break westwards through the Brit. and New Zealand troops, Gen. von Ravenstein, commanding the 21st Armoured Div., together with 610 other Ger. officers and men, were captured. Meanwhile Brit. mechanised patrols had reached the coast S. of Benghazi; while in the S., at Jalo, another force was preparing to strike N.-westward to the coast. Gen. Rommel now threw all his remaining armoured forces into the fighting round Sidi Rezegh, and succeeded in breaking through the Brit. corridor, and again cutting off Tobruk. At this juncture both sides paused to refuel and reorganise for the next phase of the battle, the Brit. concentrating their main strength on an offensive line from El Gobi, 25 m. S. of Tobruk, towards Sidi Rezegh, 11 m. S.E. of that fortress. Up to this time some 8000 Ger. and It. prisoners had been taken. The battle was soon joined again, and Gen. Rommel was again defeated near El Gobi and the Tobruk supply line was restored. The loss of this area was a blow to Rommel, whose tanks were now being driven W. To the E. of the chief battlefield the greater part of the country between the Tobruk-Bardia road and the El Gobi-Sidi Omar road was now cleared of the enemy, though Bardia itself still remained in Ger. and It. hands. In the central Mediterranean many blows were struck at the enemy's sea-borne supplies, loaded supply ships and tankers carrying petrol and ammunition being frequently torpedoed, bombed, and sunk. The siege of Tobruk was lifted by Dec. 10 and the enemy's westward withdrawal accelerated.

The battle against Rommel's forces had now been in progress for over 3 weeks, but the quick decision hoped for by Gen. Auchinleck had not been obtained. Brit. tank losses had been severe, and the battle had not progressed according to plan, the armoured battle being inconclusive; and, but for strong pressure at Tobruk, the full force of the Ger. motorised infantry would have moved on Bardia to relieve the encircled garrison and thus have jeopardised the whole Brit. offensive.

**Rommel's Forces in Retreat to Sedabya and El Agheila.** Brit. close in on Halfaya.

—The beginning of the third phase came with the storming of El Adem, on the escarpment due S. of Tobruk and 20 m. W. of Sidi Rezegh. Striking along the coast the New Zealanders from Tobruk soon reached Gazala, while other Indian and Brit. troops pushed up from the S.E.; while on the S. flank Brit. columns continued a slow but steady advance, mopping up enemy positions in their progress. Thus both a N. and a S. prong were closing in on Rommel's westward-moving forces, which, however, fought back strongly to avoid encirclement. After 5 days of intense fighting, in which all his remaining forces were flung into the battle, Rommel's front in Libya was broken, and his forces were in retreat.

But though the enemy had been driven out of the positions which barred the Brit. advance westward—with the exception of Bardia, Sollum, and Halfaya

—his forces were as yet far from destruction. In his flight westward Rommel, who had begun the campaign with more divs. than his antagonists, was reinforced with supplies from the sea and air, and was always prepared to take up fresh positions, and stand at bay for a time. The Brit. offensive was handicapped by the growing problem of transport over great distances of desert terrain. The retreating enemy forces were now being pursued towards Mekili and Derna, and the aerodrome at the latter place fell to the Brit. forces on Dec. 18. Both places fell the following day without opposition and, as the enemy retreated W. of Mekili, the R.A.F. delivered heavy attacks on Benghazi, Henina, and the Barce-Derna road and at Jedabya. Cyrene and Apollonia were taken on Dec. 21, and the Brit. forces were now pursuing enemy columns along the road to Jedabya, S. of Benghazi. By the 22nd the Eighth Army, now reinforced, were heavily pressing It. forces covering Benghazi, while Brit. mobile columns reached the coastal plain on the gulf of Sirte, S. of the cap. Along this plain Rommel's Afrika Korps were retreating in some disorder, abandoning large quantities of war material. Benghazi was entered on Christmas Eve by the Royal Dragoons after it had been evacuated by the enemy. The tn. was found to be devastated. The whole harbour front had been battered to crumbling ruins through the incessant R.A.F. attacks on the port. The Hotel Bernice, former base control post of the Luftwaffe, was completely gutted, while 15 hulks of sunken Axis ships were discernible in the harbour. The nearby aerodrome of Barce was captured by the Central India Horse and the Henina aerodrome by a Brit. mobile column comprising units of the Rifle Brigade and the Royal Horse Artillery.

The enemy's main forces under Rommel were now in the Jedabya zone, where they were striving to repulse Brit. columns advancing from the S. On Dec. 29 S. of Jedabya the bulk of Rommel's armoured units counter-attacked, but lost 22 tanks while 20 others were badly damaged, the Brit. losing 14; but a mechanised Hussar regiment captured 5 lorry loads of Ger. infantry.

Bardia was recaptured on Jan. 2 by S. African troops, supported by Brit. tanks, and over 1000 Brit. prisoners of war were thereby released. Before the attack the tn. was subjected to the heaviest barrage of the Libyan campaign, which included a naval bombardment and intense bombing from the air. Nearly 8000 Axis prisoners, including 1000 Gers., were captured, among them being Maj.-Gen. Schmidt, chief administrative staff officer of the Ger. panzer force.

The Brit. forces (under the command of Gen. Ritchie, who had succeeded Sir Alan Cunningham in Dec.) had covered over 400 m. in their advance across the country, which had thus occupied 6 weeks. The heaviest toll had been taken of the enemy, and the war booty captured was enormous. On

Jan. 6 It. infantry of the Trento div. and the remnants of the Ger. Afrika Korps rallied on a line running S. from Jedabya, hotly engaged with Brit. troops of the Brigade of Guards. While Rommel was being barred here, and in his subsequent retreat on El Agholla, Brit. forces had taken Sollum and were closing in on Halfaya. The positions at Halfaya were exceptionally strong. One of them was centred in a deep winding gully which split the face of the escarpment from top to bottom. Both the gully's head, where it came out on top of the escarpment, and the foot, where it debouched seawards, were covered by an elaborate system of strong points and minefields, the average depth being 500 ft., while the precipitous sides were honeycombed in caves and dug-outs capable of hiding thousands of men. The importance of the Halfaya positions to the enemy, and also to the Brit., was that they commanded 2 of the shortest roads from the coastal belt at Sidi Barrani and Sollum on to the escarpment.

Rommel having been pushed out of Jedabya, now made a stand between Aghella and Marada where a series of broad wadis provided a natural obstacle and from that time (mid Jan.) he proceeded to consolidate his positions while awaiting reinforcements.

*Four Months' Lull. Rommel's Counter-attack.*—There now followed a period of some 4 months of uneasy quiescence, during which there were intermittent patrol activities and air raids. But behind these minor exchanges strenuous efforts were being made on both sides to reinforce and re-equip the opposed armies. Rommel's task in this respect being much the easier in view of the far greater distance over which Brit. reinforcements and equipment had to be transported. On Mar. 20-21 Brit. tanks daringly raided the Martuba and Tmimi aerodromes nearly 40 m. beyond the enemy's main position, and returned with 200 prisoners. Thus challenged, Rommel moved up from the Tmimi-Mekili 'line' to a position much closer to the Brit. front. This enabled him to establish defence in depth and to seize every dominating crest and ridge in front of the Brit. positions, thus limiting the area within which the Brit. patrols could operate. The Brit. Command had, meanwhile, lost no time in fortifying their own positions. On May 26 the storm broke. Gen. Rommel launched the Afrika Korps to the attack, his object being to defeat the Brit. armoured forces and to retake Tobruk. Probably the remoter objective was an advance on Suez concurrently with a break-through by the Ger. armies to the Caucasus. The Brit. Command, through air reconnaissance, had foreseen the attack, and the Eighth Army under Gen. Ritchie was fully prepared to meet it. The Brit. air forces opened a counter-offensive on the 21st Ger. Armoured Div. with heavy attacks against enemy forward aerodromes. On the night of May 26-27 the Afrika Korps passed to the S. of Bir Hachem, moving

N. with great rapidity towards Acroma, and also towards the old battlefields of El Duda and Sidi Rezegh, which were actually reached by some of its most forward troops. These were soon driven off by Brit. armoured forces. On the same night the enemy attempted a landing from the sea near Acroma, but was driven off by Brit. naval forces. Long before they approached El Adem, which is near Tobruk, or Acroma, the Axis armoured and motorised troops were brought to action by the 1st and 7th Brit. Armoured Divs., together with Brit. heavy tank brigades.

*The 'Battle of the Cauldron'—Fr. Defence at Bir Hacheim.*—The full brunt of the enemy initial advance to the E. of Bir Hacheim was taken by the 3rd Indian Motor Brigade Group, which was overborne by sheer weight of metal, but not until after it had inflicted heavy losses on the enemy. Meanwhile an attack on Bir Hacheim had been beaten off by the Free Fr. forces, with heavy loss. Rommel's attacks on the N. front of the Brit. main positions S. of Gazala, launched on the 27th, achieved little. Throughout May 28, 29, and 30 there was very heavy and continuous fighting between the Brit. armoured divs. and brigades and the Ger. Afrika Korps backed up by the It. Mobile Corps. The battle swayed backwards and forwards over a wide area, from Acroma, in the N., to Bir Hacheim, 40 m. to the S., and from El Adem to the Brit. minefields, 30 m. to the westward. Finding himself running short of supplies and water Rommel made gaps in the Brit. minefields, one along the general line of the Capuzzo road, and another 10 m. to the S. These 2 gaps lay on either side of the defended area held by a brigade of Brit. infantry, which strenuously resisted the enemy's attempts to pass his transport through their ranks, and on the 28th A.V.M. Cunningham directed his whole air force on to low attack against the enemy armour and motor transport in this region, and a great number of vehicles and tanks were knocked out or disabled. But by night-fall on May 31 Rommel had succeeded in withdrawing many of his tanks and much transport into one or other of the gaps, which he then proceeded to protect from attack from the E. by bringing many of his numerous anti-tank guns into action. The fighting from the start developed into the biggest battle that the W. Desert had theretofore known. On June 6 an enemy column 18 m. long, headed by 60 tanks and containing 2000 motor transport vehicles and lorried infantry and strongly supported by artillery, swept round Bir Hacheim in a S.W. direction, and headed for the Brit. positions in the 'Cauldron,' an area lying between the gaps in the minefields. A series of exceptionally fierce engagements took place. An attack launched by Rommel's main armoured forces against the Brit. positions known as 'Knightsbridge' was stopped by Brit. and Indian infantry and artillery, and the enemy was

driven back westwards. After nearly 2 days of furious fighting the first phase of the 'battle of the Cauldron' ended in a definite Ger. repulse; while in the S. the Fr., now surrounded at Bir Hacheim, held fast against almost continual attacks. This third Libyan campaign was waged by the Brit. Command on different lines from the previous encounters. This time Gen. Auchinleck was content to let his adversary take the offensive in the hope that he might whittle away his armoured strength by a succession of attacks on rock-like defences, and in mighty but fruitless battles with the greatly strengthened Brit. armoured units. In the midst of the utter desolation that is Libya the physical endurance of the tank crews on both sides in the heat and dust of the desert was evidence of the mutual realisation of the seriousness of failure. Even when a heavy thunderstorm blotted out everything for a brief period, the parched and dusty desert was almost dry again within an hour, and the sun, breaking through, revealed the Brit. armoured brigades charging across the Trigh-Capuzzo Ridge. The Gers., following their usual tactics in meeting such counter-attacks, gathered their armour together in one solid phalanx and the thunder of guns and the staccato bark of Brens and rifles rolled over the Libyan plains until darkness fell. The defence of Bir Hacheim was, however, becoming ever more difficult, Rommel increasing his tank forces there and sending reinforcements to help the Its.

*Rommel captures Tobruk.*—From now the course of the battle swung sharply against Gen. Ritchie's army. The crucial moment for the Brit. was when the enemy, having forced a gap in their minefields, was having difficulties with supplies owing to the intense air attack. For at this juncture the enemy was exhausted; but unfortunately the Brit. army, being equally exhausted, was unable to exploit its adversary's condition. Gen. Ritchie's counter-attack on June 4 on Rommel's forward base in the Brit. minefield area was premature, and the Brit. forces were compelled to fall back before a fierce counterstroke and suffered considerable losses. Rommel was therefore able to concentrate his attention on Bir Hacheim. Gen. Ritchie tried to lift the pressure on this position by using mobile troops and intense air support, but on June 10 he decided that the risk of maintaining this isolated garrison was too great, and it was withdrawn. With the fall of Bir Hacheim the investing enemy forces were released for co-operation with the forces preparing to attack in the Knightsbridge-El Adem area and 3 days later the Brit. had to abandon some positions there, which opened the way for Rommel to break through to the coast and try to cut off the 1st S. African and 50th divs. in their position S. of Gazala. Gen. Ritchie, however, was very largely successful in withdrawing these divs., which joined the Eighth Army to the E. of Tobruk. But Rommel continued

to press his attack in the El Adem area and estab. himself E. of the El Adem defended local area at Sidi Rezegh. After 4 days of the fiercest fighting Ritchie on June 17 withdrew his army to the El Adem-El Duda-Sidi Rezegh area, and concentrated his main forces towards the frontier, leaving what he erroneously considered to be an adequate garrison in Tobruk. Rommel, having advanced rapidly eastward merely to ascertain the Brit. strength between the Egyptian frontier and Tobruk, now wheeled sharply round westward and on June 20 attacked Tobruk from the S.E., and quickly penetrated the perimeter and positions E. of the Tobruk-El Adem road. The attack on the Brit. garrison at Tobruk then began in earnest with panzer thrusts of considerable ferocity and dive-bombing Stukas following a particularly heavy artillery barrage. Soon the Gers. were shelling the harbour. Scratch units formed of engineers, men of the Ordnance Corps and Army Service Corps, together with S. Africans, fought with desperate bravery against the most hopeless odds both in men and material. Heavy and medium tanks, guns, and the large number of 88-mm. anti-tank guns, which the enemy rushed up into the gaps made in the perimeter defences, put down a terrific barrage, and hurled the defenders back. The small Brit. tanks inside Tobruk now came out to join battle, being outnumbered in a furious bloody struggle, and, though many Ger. tanks were knocked out, the enemy's numbers and fire-power inevitably won the day. Two enemy columns flooded in through the gaps, and moved at reckless speed towards Tobruk tn. The Brit. and S. African forces retired inside the tn. and put up a gallant fight, meeting enemy attacks with artillery, machine-gun, and small-arms fire all day, hurling back attempt after attempt of the Gers. and its. to enter the tn. Then dusk fell. The defenders spread a tornado of fire all round the approaches to the tn., but under cover of darkness the enemy crept up, entered the streets, and began to force the defenders out of the houses with grenades, Tommy-guns, and machine guns. House-to-house fighting ensued, and there were savage encounters in the streets. The end was now not long in coming, and soon afterwards the garrison surrendered, 28,000 prisoners being taken by the enemy, together with much material.

*Explanation of the Brit. Defeat. Superiority of the Ger. Tanks and Anti-tank Guns.*

—Thus for the third time in 2 years a Brit. force suffered a reverse in Libya, and each time the reverse followed what had appeared to be substantial victory, the enemy in the first 2 battles being driven back to the borders of Tripolitania. In all the battles the fighting took place at great distances from bases, and not only was the vast battlefield barren, waterless, and uninhabited, but it contained only 3 natural defensive positions, and these were coastal tns.; any other position had to be constructed and fortified with materials brought from

a base. The only way to win a desert success on such a terrain was to assemble a force strong enough to defeat the enemy's armour so thoroughly that there was none left to get away. But in this, as in the 2 previous battles, the Brit. armoured force was inadequate for this task. The Brit. initial success was partly due to their unremitting air attacks on Rommel's motor transport. With the armoured forces nearly equal in mere numbers as was the case in this third battle, the decisive factor was hitting power. Apart from a blunder in tactics, the main reason for the Brit. reverse was the fact that they were outgunned. The new General Grant (Amer.) tanks carried excellent 75 mm. guns, but the bulk of the Brit. force consisted of tanks armed with a 2-pounder gun, which was useless against Ger. tanks equipped with at least a 47-mm. gun. The Ger. Mark IV. used either 75-mm. guns or converted 88-mm. anti-aircraft guns in vehicles with specially hardened armour; the Mark III. had 75-mm. or 50-mm. guns, and even the It. tanks with 50-mm. and 47-mm. guns outmanoeuvred and outgunned everything on the Brit. side except the Amer. General Grants. It was due to his contempt for the Brit. tanks that Rommel made his confident sweep northwards in the opening days of the battle and, though the Grants were a surprise, they were not in sufficient numbers to prove decisive. The fact that victory so long seemed within the Brit. grasp was due to an improved recovery of damaged tanks, and to the commanders' skill and courage in individual encounters. Again, Rommel had the advantage in anti-tank guns, and showed much cleverness in their use; while the bulk of the Brit. anti-tank guns were only 2-pounders, the new and excellent 6-pounders being very few in number.

But the Brit. reverse was not to be assigned even primarily to the undoubted if temporary inferiority of their mechanised arms: for Gen. Ritchie still held Rommel's forces, and could still hope to win, until July 13, on which disastrous day the main Brit. armoured force ran into an ambush, and of the 300 tanks with which the Brit. commander started the day only 70 (excluding light tanks) remained by nightfall. In those few hours the battle was lost, and lost on the spot, thus illustrating the truth that, in these mechanised desert battles, one false move or one brilliant tactical stroke might turn the course of a campaign.

*Rommel's Advance on the Nile checked.*

—The fall of the fortresses compelled Gen. Auchinleck to fall back before a victorious and better-armed foe to Mersa Matruh. Flushed with success Rommel now gathered his forces for an advance on the Nile delta (July 3), but his advance now received a very definite check at El Alamein. Gen. Auchinleck's Eighth Army, having repelled Rommel's new general attack, delivered a counter-attack with tanks and motorised infantry and forced the enemy to withdraw westward. Having regrouped and replenished his

tanks Rommel returned to renew the assault, but in a different direction, this time swinging his armoured forces N.E., while his coastal columns attacked from the W. in the expectation of smashing the Brit. infantry in the Alamein 'box.' But the Brit. commander immediately turned his forces N. and went in against Rommel's flank and rear. The fighting that ensued was fierce but short-lived and, before dusk, the Axis forces withdrew from the ridge to the S. of the Brit. positions, whence they had hoped to out-flank the defence. Time was, however, essential to Gen. Auchinleck, for it was becoming a battle of attrition, and the issue might well lie with the side to which reinforcements came quickly. Every day of successful resistance and counter-attack served to reduce the peril to Egypt. Moreover, the allied air forces, whose co-operation with the land and naval forces was growing daily closer, were now increasing their attacks to a scale unprecedented in the Middle E. A vital change had already come over the desert battle. The Axis momentum had spent itself. Hitherto Rommel's tired men, with the lure of Cairo and Alexandria, had forgotten their fatigue, the scantiness of their rations, and their long bout of costly fighting. This glorious prospect gradually faded as their terrific effort brought them no nearer their goal (Aug. 20).

*Mr. Churchill visits Egypt. Appointment of Gen. Alexander and Montgomery.*—Before the fall of Tobruk most of the 6-pounder guns which were to be used in the coming battle had been dispatched, together with the more heavily armed and more heavily gunned Brit. tanks; while, in addition, President Roosevelt sent over a number of Sherman tanks and a large number of self-propelled 105-mm. guns for contending with the Ger. 88-mm. high-velocity guns, all of which were destined to play a recognisable part in the forthcoming battle of Egypt. Unfortunately the Brit. set-back of the summer had delayed the advance on the road to Tripoli, a move which had been prepared in conjunction with the projected Anglo-Amer. landings in Morocco and Algeria. It was now essential therefore to bring the Brit. Eighth Army into a condition to regain the initiative and to resume the offensive, this being an integral part of the Allies' whole N. African strategy. Meanwhile the Brit. units in Egypt needed intensive training in the use of the new weapons when they reached that country. By rearming the men on a gigantic scale, the disasters of the summer were eventually repaired and the defence of Egypt converted into a successful attack. It was of good augury that Gen. Auchinleck had succeeded in stemming the Axis advance, but Mr. Churchill, having visited Egypt, decided to make changes in the higher command, and Gen. Alexander, the defender of Burma, replaced Gen. Auchinleck, who was later transferred to India, while Lt.-Gen. Montgomery was appointed to command the Eighth Army. On Aug.

10 Mr. Churchill gave Gen. Alexander the instruction to take or destroy at the earliest opportunity the Ger.-It. army commanded by F. M. Rommel, together with its supplies and establishments. Intensive preparations were made behind the Brit. lines in face of an imminent attack by the Axis army, whose leader felt confident in his ability to take Cairo in his next leap, and so drive the Brit. E. of Suez. Rommel delivered his attack on the Eighth Army, which was now reinforced by the 44th Div., on the night of Aug. 30-31. Pivoting on the Ita. in the coastal area he came round the Brit. open S. flank, which had been left free of the Qattara Depression in order to allow liberty of movement in the event of a turning operation, with the whole Ger. Afrika Korps, including the 90th Light Div., 2 Panzer divs., and a large part of the 20th It. Motorised Corps. It was assumed that the Ger. commander would not venture to by-pass the Brit. Eighth Army and push on to Cairo, and in this surmise Gen. Alexander was right; but, in order that the Eighth Army should have the fullest freedom of movement, a new army was brought into being along the line of the Nile and Delta for the protection of Cairo.

*Renewal of the Struggle at El Alamein. Rommel driven back.*—Rommel now found himself confronted with stiffer resistance and with artillery used on the largest scale and abundantly supplied with ammunition. After 3 days he withdrew with heavy losses, the Brit. casualties being 2000, the Axis losing a disproportionate number of tanks. Rommel could ill afford losses, for he had been much hampered by the sinking of his supply ships by Brit. submarines and by Brit. and Amer. air attacks from Malta and Egypt. The heaviest fighting took place between Heimeimat, near the Qattara Depression, and the Ruweisat Ridge in the left centre of the Brit. line. Rommel hoped that the Brit. commander would send his armoured forces out against him, but the Brit. commander was not tempted into ambushes, and the Axis tanks then pushed up cautiously towards the N., where they were met at 1100-yds. range with a tremendous gun-fire and sheered off. The Gers. lost more than 40 tanks on Sept. 3, and their armoured divs., under ceaseless pressure from 25-pounders, 6-pounders, and heavier guns, which had been swiftly moved up to new positions, and from innumerable sorties by the Brit. and Amer. air forces, compelled Rommel to fall back slightly—an event of good augury for the Brit. commander in view of the weight of the attack. The Brit. commander of the Eighth Army wrested the initiative from Rommel by this date (Sept. 2), and 4 days later Rommel had been driven back to his starting point. Wherever he had probed the Brit. lines for a weak spot he was hurled back with losses. During the whole attack, especially on Sept. 2-3, the Axis made air attacks on the biggest scale, sev. raids being carried out by as many as 100 aircraft, but each time they met with severe reverses.

*The Brit. Victory of El Alamein (Oct. 23-Nov. 7, 1942).*—By late Oct. Gen. Alexander was ready to pass to the offensive. There followed one of the most glorious victories of Brit. arms. It was realised by the Brit. Command that the enemy was converting the position in front of the Brit. line into a fortress, blasting gun-pits and trenches in the solid rock, laying enormous and elaborate minefields. An attack round Rommel's S. flank would have led into difficult terrain, and was therefore impracticable. Yet, on the other hand, a frontal attack was a most formidable operation. It was, however, decided to attack frontally by putting up a terrific artillery and air barrage under cover of which the infantry would advance and clear the minefields to the subsequent advance of the armoured units, and these tactics were completely successful. On a 6-m. front of attack the Brit. had a 25-pounder gun or heavy weapon every 23 yds.; it was necessary to effect penetration of about 6000 yds. at the first stroke in order to get through the minefields, trenches, and batteries of the enemy, and this was successfully achieved, the Brit.- and Amer.-manned air squadrons contributing signally to the successful operation. This aerial ascendancy was used with the most devastating effectiveness: threatening counter-attacks were broken up before they could develop; far in his rear the enemy's supplies were ceaselessly bombed; his mechanised transport was blasted and his roads of retreat jammed with smashed vehicles. Heavy blows, too, were constantly struck at Rommel's supplies by the Navy. The Brit. naval and air forces sank 50,000 tons of Axis shipping over these few days, an operation which was assisted by the great defence put up by the R.A.F. and anti-aircraft guns against the Ger. air attacks on Malta in Sept.-Oct., during which period hundreds of Axis planes were shot down. On Oct. 29 there was a big-scale encounter between opposing tanks, the Axis forces being driven off with considerable losses, Brit. gains being held while their tank losses were slight. From the moment that the seaward flank of the enemy was broken and the great mass of the Brit. armour had flowed forward and successfully engaged the panzer divs., the fate of the Axis troops to the southward, amounting to 6 It. divs., largely motorised, was sealed. As the Brit. advance reached El Daba, and later, Fuka, the enemy's lines of supply and retreat were equally severed. They were left in a waterless desert to perish or surrender. At Fuka a grim action was fought on a smaller scale, but with equal spirit on both sides, between the Brit. armour and the remnants of the Ger. panzer army, the Gers. being almost entirely destroyed, only a few elements escaping to Mersa Matruh, where again no halting-place was found. Tactically the position had grown serious for Rommel on Nov. 1, when a corridor W. of Tel-el-Eisa was enlarged, and a lane cleared for armoured formations which were at last able to advance on to open

ground. Thereupon United Kingdom and Indian troops advanced rapidly and soon widened the already formidable gap in Rommel's lines. A few Axis tanks succeeded in crawling into a pocket at a position called Thompson's Point (Oct. 31); but they never got out again. On the night of Nov. 3 Rommel's army, depleted and battered, but still formidable, stood firm on strong positions from Sidi Abd-el-Rahman right to the Qattara Depression; but by the night of Nov. 7 that proud army had become a scattered rabble, fleeing blindly towards the illusion of safety which its former bases in the W. held out. All over the sandy and desolate region men were moving westwards, some in cars and lorries, others on foot, seeking hopelessly to escape remorseless fate in the shape of Gen. Montgomery's triumphant Eighth Army and the R.A.F., which was pursuing them and hunting them down. The Axis retreat, which had begun methodically on Nov. 3, first N. of the Qattara Depression, had by Nov. 7 become a rout, in which the Gers. abandoned their It. allies in the desert after depriving them of their transport in the hope of making good their own escape to Benghazi or elsewhere. By this date over 40,000 Axis prisoners had been taken. The Axis casualties steadily mounted, for the fleeing enemy, crowding the narrow coast road, presented amazing targets for the R.A.F.

*Halfaya Pass and Tobruk recaptured. Cyrenaica overrun.*—When this remarkable battle opened the Afrika Korps front line army was composed of some 100,000 mixed Gers. and Itas., with nearly 700 tanks, of which possibly two-thirds were It., and a very strong army of artillery and anti-tank guns. Well over half these tanks were totally destroyed or knocked out or captured, and the remainder were picked up in deserted workshops in the rear areas—16 being found at Daba. The majority of the guns (over 1000) were either destroyed or captured. The amount of booty in Brit. hands was reminiscent of the first Libyan campaign, when the W. Desert was strewn with Graziani's materials of war. Gen. von Stumme, who had commanded the Axis forces during Rommel's brief absence in Berlin, was killed. Gen. Ritter von Thoma, commander of the Afrika Korps, and numerous other senior Ger. and It. officers, were taken prisoner. By mid Nov. the number of Axis losses in men was more than 70,000. The Brit. casualties were 13,600. The race for the Libyan ports had now begun. Halfaya Pass fell a few days later, and Tobruk was once again in Brit. hands by Nov. 13.

Within a few days Sollum and Bardia were again in Brit. hands and, within 4 weeks from that time, the Eighth Army had overrun the whole of Cyrenaica. While Brit. engineers were effecting repairs to the Benghazi (g.e.) docks to render the port practicable as a supply base, Gen. Montgomery's forces pressed hard on the heels of the Ger. Afrika Korps. In the last week of Nov. Rommel reached the powerful natural position of El

Aghella, where, having received reinforcements, he hoped to concentrate his reorganised forces for resistance. But on Nov. 13 the Brit. Eighth Army completely outmanoeuvred him and turned his forces out of their strong positions at Mersa Brega just E. of El Aghella, at little cost to themselves. Rommel's forces then renewed their retreat westwards, relentlessly pursued by the Brit. forces. Allied

peditions, and suffered no losses, except for 2 small ships in Oran harbour. The landing forces, which were under the command of Lt.-Gen. Dwight Eisenhower, commander of all Amer. troops in the European theatre of operations, was led by U.S. Rangers in separate parties at strategic points, followed by armoured infantry and small numbers of marines and bluejackets. Parachute

EL ALAMEIN TO EL AGHEILA : 750 MILES IN THREE WEEKS  
Crusader and Sherman tanks pass through Mersa Matruh.

fighter-bombers, operating on an unprecedented scale, were employed to harass the enemy in his retreat, Axis air activity being entirely ineffective in preventing these operations.

*Anglo-Amer. Landing in Fr. N. A.*—U.S.A. and Brit. forces landed in Fr. N. A. early on the morning of Nov. 8, 1942. The city of Algiers at once surrendered, and thus paved the way for the occupation of the surrounding area. There were landings at sev. points, and a number of important air-fields were seized by the allied air forces. The only serious resistance was from navy and coast defence artillery, the mass of the Fr. armed forces having no wish to oppose the entry of Amer. troops. Brit. naval forces of great strength covered the ex-

troops seized vital airports and communications. Aircraft from carriers and heavy units of the Amer. and Brit. navies covered the landings. The landing parties swept inshore off the beaches near Algiers and Oran, capturing 3 air-fields. Resistance from coastal batteries was dealt with by allied naval forces under the supreme command of Adm. Sir Andrew Cunningham (q.v.). The capture of the naval base of Oran virtually ended all Fr. resistance in the Mediterranean. Amer. bombers and heavy warships bombarded the harbour of Casablanca, where the 35,000-ton battleship *Jean Bart* was left ablaze. The immediate objective of the allied forces was Tunis and President Roosevelt now requested the bey of Tunis to allow Amer. forces to

through Tunisia. Gen. Giraud, who had escaped from a Ger. prisoner-of-war camp and, later, from Vichy France, arrived in Algeria to assume the leadership of the Fr. movement and to organise the Fr. N. African army to fight beside the forces of the Allies. In a broadcast to the commanders of the Fr. fleet at Toulon Adm. Darlan (q.v.) asked them to bring the fleet over to N. A. It is difficult to say what would have been Darlan's course of action inasmuch as he still purported to act only in the name of Pétain; but his assassination soon afterwards left Giraud as the sole leader. This great N. African enterprise was planned in Apr. and July 1942, when Gen. Marshall, head of the Amer. Army and Air Force, visited London, with Adm. King, Commander-in-Chief of the U.S. Navy. It was decided to hold the Gers. on the Fr. shore and to strike at their S. flank in the Mediterranean through N. A. As a very important part of this N. African operation, it was necessary to bring the Brit. Eighth Army into a condition to resume the offensive in Egypt. How that task was achieved is shown above in the account of the battle of Egypt. Detailed negotiations with anti-Axis elements in N. A. were conducted by Gen. Clark, deputy-commander to Gen. Eisenhower, together with 3 Brit. and some Amer. officers, who all met in a lonely house on the coast. The expedition, and indeed all the participants in this preliminary conference, narrowly escaped capture by the Vichy police.

*The Tunisian Campaign Opens. Eighth Army's Pursuit of Marshal Rommel. Fall of Tripoli.*—In the early days of the Tunisian campaign Brit. infantry and artillery, on Nov. 17, reached the important pass at Djebel Abid in the N., and, in their first rush after landing at Algiers, it seemed as if the Allies might capture Tunis without difficulty. Parachutists seized the aerodromes of Souk-el-Arba and Tebessa, and, with Fr. co-operation, Gona was occupied. Then Mejez el Bab was taken and, on Nov. 26, the Brit. entered Tebourba. But thereafter the Gers., having landed heavy reinforcements and supplies from Sicily, stiffened their resistance and it soon became evident that the struggle for Tunisia would be arduous. Moreover, the Axis possessed most of the practicable air-fields, while the terrain offered great obstacles to the allied advance—obstacles which were aggravated by roads and tracks deep in mud under a continuing and protracted rainfall. A general advance of all the allied forces in Tunis in co-operation with the famous Eighth Army under Gen. Montgomery, now depended on the speed with which that army could advance into Tunisia. Advanced elements of the army cut Rommel's retreating columns in two at Wadi Matratin (50 m. W. of El Aghella) on Dec. 17, but the Gers. succeeded in breaking out of the flanking trap after losing 700 prisoners. None knew yet where Rommel's army would end its long retreat, and make a stand, but the general

belief at this time was that it might be at Misurata (110 m. E. of Tripoli). The vanguard of the Eighth Army, aided by the astonishing speed with which the R.A.F. had moved up, reached Taurga (120 m. E. of Tripoli) on Jan. 18, and the position of Misurata was obviously useless to Rommel. With the possession of advanced air-fields in Tripolitania the siege of Malta was virtually ended, and towards the close of Jan. the island's aircraft were co-operating in the Brit. offensive in Tripolitania. On the road to Tripoli the Ger. rearguards fought stiff delaying actions, notably near Tarhuna and Castel Benito, at which latter place was a large air-field. The capture of Tarhuna meant that the Eighth Army had reached the end of the desert and was assured of its water supplies. The Brit. flag was hoisted in Tripoli on Jan. 23, 1943—a symbolic act which in effect marked the end of Mussolini's colonial empire—but the Eighth Army passed rapidly on, Montgomery's aim being to come to grips with Rommel's army. Rommel left all along the road of his retreat—the longest known in military hist.—strong rearguards and minefields to hold up the Brit. advance. There was now no doubt that his real destination and place of battle was to be the Mareth line, 200 m. W. of Tripoli. This line was a strong series of connected defences, on the pattern of the Maginot line, which some years previously had been constructed by Fr. engineers, no doubt with the intention of holding Tunisia against any possible attack by the Its. It started on the coast in the gulf of Gabes, and extended through Mareth to Matmata (a length of 20 m.). On the W. end are deep wadis, and a chaos of hills offering strong vantage points for defence.

*Rommel attacks at Sejenane and joins Forces with von Arnim. Rommel takes the Kasserine Pass. Allies regain the Initiative.*—The purpose of the Allies was to end Ger. occupation of N. A. as speedily as possible, particularly as the Gers. were still able to land reinforcements and guns and tanks at Bizerta. To accomplish this purpose the Brit. First Army under Gen. Anderson must advance in the N. of Tunisia through Mateur to Tunis, and attack the forces of Gen. von Arnim. Further S. the Amers. had Gafsa and Maknassi as their immediate objectives. Fr. forces were to co-operate, and the whole conception of the allied thrusts was to deprive the Axis forces of their control of the 'corridor' extending between the sea and mts. from Gabes to Tunis, and to drive them into the sea. With Montgomery's arrival on the S. border of Tunisia in mid Feb. the other allied armies now had some opportunity of driving against the flanks of the road up which Rommel's Afrika Korps must, if engaged and defeated at the Mareth line, withdraw. But the Axis forces took the initiative, on Feb. 14, when they began a twofold thrust towards the W. and N.W.—through the Fald Pass against Sidi Bou Zid, 70 m. W. of Stax, and in the direction of Sbetta, 60 m. W.

of Sidi Bou Zid. The first of these thrusts was strengthened by part of the forces of Rommel, whose position in the narrowing country between the allied line from Sejenane in the N. to the Shott Jerid in the S. and the sea was one which called for desperate manoeuvres, if only to delay the ultimate allied victory while the Nazi Gov. strengthened the fortifications of the It. and Fr. Mediterranean coasts. Early in Mar. the Axis forces made repeated attacks in the Sejenane area and gained ground though at heavy cost. All attacks in other areas had been successfully repulsed. But it was now clear that Rommel's long retreat had been skilfully executed, though hurried by the whole way by the Eighth Army and the R.A.F. In Tunisia he succeeded in joining hands with von Arnim and completing the occupation of a broad belt of ter. stretching from Tunis to the S. frontier, and he was now trying to seize the initiative by striking at first one foe and then another, while his adversaries, who, apart from the Eighth Army, had but small forces, had to withdraw into the mountains to regroup, having failed to pin Rommel against the coast. Following up his success Rommel captured the Kasserine Pass, 20 m. W. of Sbeitla, and then attacked at the Pass of Sliba, which was held by Brit. units of the Brigade of Guards. But as the campaign developed it became evident that these were temporary and comparatively slight reverses, representing, as it were, the rushes of a bull maddened by attackers in a restricted arena and seeking in all directions for some way of breaking through. The idea of Mar. were ill-omened for the Ger. command. Rommel's detached forces N. of the Mareth line were hurled back through the Kasserine Pass and retreated on Gafsa. The plan to cut through Gen. Anderson's lines in N. Tunisia, and turn his positions from the sea to Jebel Mansour, was foiled with heavy losses, but the Gers. persisted in their attacks. On Mar. 6 Rommel's infantry and tanks delivered 2 heavy attacks against the Eighth Army in the Mareth area, but the Gers. suffered severe casualties, those of the Eighth Army being negligible. In other parts of Tunisia Axis offensive efforts were now being relaxed, and the Allies had, after a long set-back, at last regained the initiative.

**Battle of the Mareth Line.**—On Mar. 20 Gen. Montgomery, having completed his preparations, attacked the Mareth line by a frontal and 2 flank attacks. The frontal attack began with hundreds of guns pouring tons of explosives on a sector less than a m. wide. Simultaneously with this, the main attack on the centre of the Mareth line, Brit. forces pierced the Axis coastal flank, and carried out another diversionary flank movement on El Hamma, 20 m. behind the Mareth line. There was desperate fighting for the Ger. stronghold by the Wadi Zigzaou. Crossing the Ger. minefields under intense fire Brit. troops spread into the wadi, crossed the ravine under cross fire, and clambered

up the bank of the wadi with scaling ladders. But, although they established a bridgehead for a time in the Mareth line and took 3000 prisoners, they soon afterwards lost the bridgehead to a strong counter-attack by the pick of Rommel's troops. It was clear that the effort to maintain a bridgehead through the narrow, viscid wadi bottom must involve heavy losses, especially to Brit. sappers whose arduous struggle to make a causeway of brushwood in the mud to carry tanks was thwarted by searching enemy fire even at night. When on Mar. 23 Gen. Montgomery saw that a continuance of the frontal assault was likely to prove too costly, he transferred the main weight of his attack round the Matmata Hills, throwing in infantry and tank forces to support the outflanking units which had already been engaging the enemy behind the Mareth line S.E. of El Hamma. The New Zealand Div. under Gen. Freyberg (q.v.) and the 51st (Highland) Div. played a great part in this outflanking movement from the W. which hurled the enemy into precipitate retreat. While this change of plan was being carried out, the Mareth forces continued to fight a holding battle, creating as best they could the illusion that the battle for the bridgehead would be renewed. The capture of a dominant hill (known as Hill 184), which denied to the enemy any distant view of the broad amphitheatre between the Jebel Melab, 15-20 m. S. of El Hamma, and the Jebel Tebaga running to the N.E. in which it was intended to draw up the Brit. forces, was effected after the decision to switch the main attack from the centre, and was a vital part of the plan. A hot, choking *khamisin* wind enveloped in their own dust the Brit. line of vehicles which had been coming up with the reinforcements from Medenine to Fom Tatahouine in a continuous line 30 m. long. The plan was to surprise the enemy by violation of the usual rule of attack by night and give him no time to make fresh dispositions. Thus the *khamisin* now proved useful, for it blew dust into the enemy's face, and provided a low screen over the Brit. troops hidden in the folds and in deep wadis lying in the gap near the ancient 2-ft.-high Rom. wall constructed 1700 years previously against hostile attack from the S. and W. The R.A.F. started the attack on El Hamma at 2 p.m. on Mar. 26, and 2 hrs. later the barrage of medium guns, howitzers, and 25-pounders opened. The guns were concealed behind every convenient natural feature in the vast amphitheatre over which the whole force would advance and were so trapped on the enemy that every 30 yds. of his line had the entire fire of 1 gun. At the same time the expansion of the knolled plain became alive with the erstwhile hidden tanks and infantry, and soon the whole mechanised mass was roaring and lurching over the bumpy ground in 6 columns towards the Rom. wall. The Gers. and its watching from the other side gazed with horror, as shells fell thick round them and bombs

crashed in destruction behind, while the wind blinded with its acrid dust the mighty array of allied power rolling inexorably against them. Down among the advancing columns they could see the Brit. infantry jolting through the track previously opened in the minefield. By next day the Gers. were caught between the hills to the E. and the allied forces, with no escape except towards the Mareth line, which by now was crumbling, or northward through Gabes. By the 28th the Eighth Army was in possession of the whole of the strongly organised defences of the Mareth line, the Axis forces withdrawing at great cost of tanks, guns, motor transport, and men (8000 prisoners), and was retreating through Gabes, which was then being bombarded by Brit. warships.

*Brit. Victory of Akarit. Eighth Army contacts Amer. Forces from Gafsa. Sfax, Kairouan, and Sousse taken. Rommel's Forces escape northward. The Allied Attack on Tunis and Bizerta.*—The Axis defeat at El Mareth was soon followed by another defeat at the hands of the victorious Eighth Army, at Akarit, a very strong position N. of Gabes. In pitch darkness on the morning of Apr. 6 some 500 Brit. guns opened up on the position. Under cover of the barrage Brit. and Indian infantry, including men of the Northumbrian Div., which had fought with the utmost gallantry in the frontal assault on the Mareth line, overwhelmed the surprised Axis forces, seized all key points, and estab. a bridgehead. A hole having thus been blasted in the centre of Rommel's defences, the Brit. tanks streamed through, chasing the retreating foe towards the N., and, by nightfall of the same day, the open country had been reached, and over 6000 prisoners taken. At the same time the Eighth Army made contact with the 2nd U.S. Corps from Gafsa. Four days later Montgomery's forces seized Sfax (90 m. N. of Mareth) and continuing a relentless pursuit were soon beyond La Hencha on the way to the port of Sousse. In the central sector allied forces from the W. were converging on the holy city of Kairouan, which lies some 30 m. S.W. of Sousse. The air offensive was playing an even greater part in the operations than ever before. Cagliari had been heavily bombed some time previously, a 10,000-ton cruiser, *Trieste*, was sunk in La Maddalena, Sardinia, numerous cargo boats were sunk in their attempts to bring oil and other supplies to the Axis forces in Tunis, and scores of large Savoya and Junkers transport planes were shot down or destroyed on their air-fields in Pantellaria or in Sicily. Kairouan and Sousse were taken by Apr. 12, and the Eighth Army continued its advance through more difficult country in the face of demolition and mines. The first junction between Anderson's First Army and the Eighth Army occurred on Apr. 11 some 20 m. from Fondouk, S. of Kairouan, so that the Axis had now lost the greater part of Tunis, and were being hemmed in within the N.E. corner between Enfidaville and Pont du Fahs southward and Bizerta in the N. Some 20,000 Axis prisoners had been taken by the Eighth Army since Mar. 20. Most of these were It., Rommel taking all available transport for Ger. troops for their retreat northward. Though the Ger. armour suffered severely in an engagement between Kairouan and Fondouk on Apr. 10 the bulk of Rommel's troops escaped northward to join von Arnim. On Apr. 14 the Eighth Army's advance guard reached Ger. prepared positions on the ridge between Enfidaville (on the coast) and the Jebel Bou Hajar, a ridge running across the coast plain from the main mountain spine. Meanwhile Fr. forces had taken part of Jebel Mansour, a position dominating the valley of the Oued el Keb and the Pont du Fahs region, the last-named place being on the railway to Tunis; while the Brit. troops of the First Army in the N. were driving von Arnim's forces back along the Beja-Mateur road, so that the Allies had regained by now most of the positions they had previously occupied in the first rush through Tunis only to lose them to von Arnim in Feb. By Apr. 15 the total number of prisoners had risen to 30,000.

*Axis Forces driven into the Perimeter of Tunis and Bizerta.*—From the Nov. day when the Allies landed in Algeria and the First Army (which was then no more than a div. strong) began its advance into Tunisia, it was manifest that the keypoint where the fate of N. A. would be decided was the old Arab port of Bizerta, steadily converted into a first-class naval base since Franco imposed her protectorate on the bey of Tunis under the treaty of Bardo. To the de Gaulist Frenchmen it was a matter of the bitterest irony that their country's efficiency in the past should be a boon to the enemy in 1943. Most important of all to the Axis forces were the arsenal near Ferryville, S. of Bizerta, in which all kinds of munitions were stored in miles of underground galleries, and the military oil-port where sov. large tankers could berth together, and which was connected by pipe-line with storage tanks holding 200,000 tons of fuel under 60 ft. of rock. But as against this it was true that Adm. Darlan (g.r.) had called a halt to the development of Bizerta because he thought that It. aircraft based on Pantellaria could easily put it out of action. But in spite of Bizerta's strength as a naval base the allied armies were gradually winning the means to sap its strength, having taken the air-fields from which to prepare devastating air assaults; while their air forces were able to attack the lines which linked Bizerta with the continent of Europe. Bizerta, for all its underground arsenal and reservoirs, depended for replenishment on the It. merchant navy, and the continual pounding of the Axis supply service had already taken a tremendous toll. Since sho had entered the war Italy had up to this time lost in merchant shipping sunk or captured well over 4,000,000 tons. On Apr. 19, in one of the biggest aerial engagements

fought in the African campaigns, an Axis air convoy was almost entirely destroyed by Amer. Warhawks and Brit. Spitfires. No fewer than 74 Ger. aircraft, including 58 huge Ju-52 transports out of 100 or more, were hurled to destruction on the beaches or in the sea, together with many of their escort machines. By the closing days of Apr. the Amer., Fr., and Brit. forces were in contact with each other in an arc from the N. coast, through Mejez el Bab and Goubellat, to Enfidaville, and were fiercely attacking the enemy strongholds. The Axis forces were now penned up into almost the immediate perimeter of Tunis and Bizerta, from which they could not escape by land, whilst evacuation by sea or air was hazardous in the extreme. There now ensued a period of the most bitter and bloody fighting, often hand to hand with knives and bayonet, for every yard of the narrowing ground, every dominating ridge or hill in a terrain rugged with complex positions of great natural strength.

*Gen. Anderson's Resistance in Tunis. Strategy of the Final Plan of Attack.*—The whole Tunisian campaign was now, however, to undergo a rapid and most dramatic change; for before the end of the first fortnight of May the whole Axis army had been destroyed, and the First and Eighth Armies, assisted by the 2nd Corps and Fr. colonial troops, had won one of the greatest victories in the hist. of the Brit. Army. This swift transformation was the more remarkable in view of the situation only 6 months earlier. The Allies had invaded Tunisia the previous Nov. with only the weakest forces, the Brit. First 'Army' numbering barely one div. The actual forces which then invaded Tunisia were 2 infantry brigades of the 78th Div., 2 commandos, 2 battalions of parachute troops, and a composite force consisting of 1 regiment of Brit. tanks, 1 battalion of Amer. tanks, 1 motorised company of the Rifle Brigade, a battery of the Royal Horse Artillery, and some armoured cars of the Derbyshire Yeomanry, together with some divisional artillery and ancillary services. These troops succeeded in rushing forward to the occupation of the important pass of Jebel Abiod and, had the Fr. resident-general in Tunis stood firm against the Ger. demands, the Allies would have been in Tunis by Christmas (1942). But he gave the Gers. facilities for bringing in men and supplies, and very soon large Axis reinforcements were pouring into Tunisia. For a short time the Brit. forces, notably the W. Kents and Lancashire Fusiliers, clung to Mejez, drove the enemy back along the Mateur road, held Tebourba, and even attacked Jedida. This last-named attack was a most heroic battle in which the Hampshires greatly distinguished themselves (Nov. 29). Eventually the Brit. forces were obliged to reorganise their line with Beja as the base and Mejez as a salient. But they succeeded in holding the enemy until they were gradually reinforced by

Amer. and Fr. troops, and by the 46th (Infantry) Div. and the 6th (Armoured) Div. At one time, however, the Gers. might even then have driven the still scanty Brit. and Amer. forces back almost to the gates of Algiers. The credit for preventing this and for holding the lines on the edge of Tunisia from which the Ger. attack started, belonged to the Fr. forces, which contained the enemy until the allied armies were in sufficient strength. The Eighth Army's advance from Tripoli at first increased the First Army's burdens, for Gen. Anderson found himself confronted by formidable enemy forces which hoped to defeat him before Gen. Montgomery could arrive. Hence the Axis during Mar. (1943) launched a series of attacks on the First Army which at times Gen. Anderson had great difficulty in resisting, the enemy advancing, as we have seen, almost to Jebel Abiod and Beja, while Mejez was left at the apex of a very dangerous salient. The first task was to oust the enemy from these positions before delivering an attack, and on Mar. 28 the First Army, strengthened by 2 more infantry divs., set to work. The Beja-Mateur road was cleared by the 4th Div. almost to Sidi Nsir, while the 78th Div. attacked the Oued Zarga Hills on Apr. 7 and, by a series of brilliant operations, cleared them almost to Mejez. Meanwhile, the 6th Armoured Div. and infantry of the 46th Div. broke through at Pichon and Fondouk, joined hands with the Eighth Army, and pursued the enemy northwards to the Enfidaville line. Thus was the stage set for the general assault which began on Apr. 22 with an attack by armour in the Bon Arada sector, and, on the next day, the attack became general—the Eighth Army attacking along the Enfidaville line, the First on the Mejez sectors, and the 2nd U.S. Corps and some Fr. units in the hills on the First Army's left flank.

*Gen. Alexander opens the Final Offensive at Mejez and Enfidaville.*—In planning his culminating attack Gen. Alexander, commanding the whole 18th Army Group, realised that the enemy had grouped all his 3 armoured divs. astride the Mejez-Tunis road to meet the Brit. blow, and the one element of surprise he could hope to invoke lay in an unexpected concentration of force at the point of impact. Surmising that von Arnim, the Axis commander, would assume that the Eighth Army would be used to strike the final blow, Gen. Alexander opened the offensive with a feint attack on the Enfidaville line, discreetly withdrawing in the meantime 3 divs.—the 7th Armoured, which had fought all the way from El Alamein, the 1st Armoured, and the famous 4th Indian Div.—which were now transferred to the centre of the First Army front at Mejez. It was thus left to the rest of the Eighth Army to carry on the task of containing the 1st Panzer Army in the Zaghouan massif behind Enfidaville. Though von Arnim had strengthened his front before Mejez, his main dispositions were made to meet

the thrust from Montgomery in the S., and when the blow came from the W. he was unprepared and utterly overwhelmed. In a manner of speaking, the whole battle may be said to have been won before victory was visible; for the Axis steel ring from Bizerta to Enfidaville had been worn dangerously thin by the methodical progress of the infantrymen and gunners of the Brit. First Army through the difficult and tenaciously held mts. and ridges commanding the Mejez-Tunis road. The armoured stroke which was delivered on May 6, and split the Fifth Ger. Panzer Army in two, was essentially an exploitation of mastery already achieved.

*Fall of Bizerta and Tunis.* A breach was opened by the Brit. First Army's infantry in a night attack, and the armoured spearhead, its path blasted in advance by brilliantly organised air co-operation under A.M. Tedder, moved forward so rapidly that von Arnim's plan of defence—to hold Bizerta as an isolated enclave, and to wheel most of his Fifth and First Armies back, pivoting on Zaghuan, to the Cape Bon Peninsula for a final stand—was completely shattered. Half the Ger. Fifth Army was pushed N.-westwards from Tunis into a pocket the W. side of which was closed by the vigorous advance of the 2nd U.S. Corps—which had some time previously been transferred from Gafsa to the N. to co-operate with a Fr. force—from Mateur, which important rail junction was seized by the Amer. corps on May 3 together with hundreds of Ger. prisoners, to Bizerta and the mouth of the Medjerda R. In this pocket nearly 50,000 Ger. troops and 6 generals, including the general commanding the Fifth Army, capitulated *en masse*. Both Bizerta and Tunis fell later in the day of May 7, the Amers. entering Bizerta and the Brit. Tunis. The Amers. reached Ferryville on the S. shore of Lake Bizerta at midday and, swinging eastwards, entered the outskirts of Bizerta soon afterwards. The Brit. First Army smashed Axis resistance E. of Le Bardo, a suburb 3 m. from Tunis, in a street battle, after having advanced rapidly along the main Mejez el Bab-Tunis road during the night. By 8.30 a.m. they were only 8 m. from Tunis, by noon were at the race track 4 m. from the centre of the city, and by 4.20 they were in complete occupation.

*Von Arnim's Withdrawal to Cape Bon Peninsula foiled.* Von Arnim captured, together with a Quarter of a Million Prisoners. —It was the next stage, however, which justified still more strikingly the tactics of Gen. Alexander in transferring part of the Eighth Army to increase the weight and impetus of the First Army's breakthrough. If von Arnim's planned withdrawal to Cape Bon was to be frustrated and his forces, instead of effectuating a 'Dunkirk evacuation,' were to be decisively disintegrated, it was essential, on reaching Tunis, to have sufficient strength to fan out in 2 directions—one part of the spearhead to complete the encirclement of the enemy at the Medjerda R.,

the other to pursue the Fifth Army retreating eastwards from the cap. and, by forcing a way down the Hammam Lif-Hammamet valley, to cut off from Cape Bon the strong Ger. First Army which was held between Zaghuan and Enfidaville by the remainder of the Brit. Eighth Army and by the Fr., who were now in possession of Pont du Fuis. This object was achieved. The Brit. armoured forces reached Hammamet and thereby disorganised all Axis resistance on their way. Cape Bon, with a large additional haul of prisoners, was quickly seized. The Ger. First Army was surrounded and on May 12 the last resistance collapsed. Von Arnim and his staff were taken prisoner, but Rommel had long escaped to Germany. The R.A.F. and Navy prevented any Ger. repetition of the miracle of Dunkirk. In all over 50,000 of the enemy were killed and nearly a quarter of a million prisoners (more than half being Gers.) were taken. Only 638 escaped—mainly by air. The Brit. losses (killed, missing, and wounded) since the general offensive began were 35,000 in all (Eighth Army, 11,500; First Army, 23,500). Thus was won a mainly Brit. victory which afforded a truly classic example of military art, crowning the double campaign which had been begun 6 months previously by forces nearly 3000 m. apart. The Ger. defeat was not inglorious. With the greatest skill the Gers., defeated at Alamain, and threatened in rear, gathered their forces to hold a bridgehead, while Rommel undertook a retreat which was masterly in its timing of moves, economy of forces, and organisation of transport. But the allied plans were too well laid for the Axis commanders, and the heavy reinforcements they had sent across the Sicilian Narrows were but doomed to be mostly captured or destroyed. For only in the turn of the tide the Luftwaffe had been chased from the skies, and the R.A.F., together with Adm. Cunningham's ships, dominated the seas. Closely on the heels of this great victory the allied air forces bombarded the It. fortress of Pantellaria, Cagliari, Naples, and all the Axis bases in Sardinia and Sicily, maintaining their offensive day after day without intermission.

Guedalla, *Middle East*, 1910-42, 1941; H.M. Stationery Office, *The Eighth Army*, 1944; Viscount Montgomery, *El Alamain to the River Sangro*, 1948.

*Africa, South-west.* Bounded on N. by Portuguese W. A., W. by Atlantic Ocean, S. and E. by the Union of S. A. and Bechuanaland Protectorate. It lies between S. lat. 17° 25' and the Orange R., with a narrow strip between 17° 30' and 18° 20' S. lat. extending from 21° to 25° E. long., known as the Caprivi Zipfel, and giving access to the Zambezi. The boundaries are the Okavango and Kunene Rts., in the N., and the Orange R., in the S. The total area is about

317,700 sq. m. (excluding Caprivi Zipfel, which is under the Bechuanaland Protectorate), and Walvis Bay (375 sq. m.). Pop. according to the 1936 census is 359,500, of whom 31,000 are Europeans (in 1938 there were 9000 Ger.-speaking Europeans). The native pop. in the ter. proper is 110,100 and that beyond the police zone is estimated to be 216,500, of whom over 165,000 are estimated to be in Ovamboland. The prin. native race is the Ovambo (a Bantu race), and others are the Hereros and Hottentots. The Hereros are a pastoral race, but their tribal organisation was ruthlessly shattered by the Gers. in the Herero war. Under the S. African mandatory rule reserves have been assigned for their occupation.

*Physical features.*—The coastal areas of the W. are barren, especially between the Orange and Ugab rvs. and towards the E. boundary, where a part of the Great Kalahari Desert is included in S.W. A. There are good grazing dists. in the E. but the country, as a whole, is poorly watered, only the Orange and Kunene rvs. having a perennial flow. For the rest the country depends on wells and the subterranean streams of the 'karst' region.

*Administration.*—The administration is exercised by the governor-general, who has, however, delegated most of his powers to an administrator appointed by the Union Gov. The ter. is divided into some 18 dists., each under a magistrate. The ter. of Walvis Bay, which is an integral part of the Cape Prov. of the Union, is administered as a portion of S.W. A. The constitution granted under the Union Act of 1925 provides for a Legislative Assembly of 12 elected members and 6 nominated members, an Executive Council of 4 members elected by the assembly under the administrator as chairman.

*Commerce, Communications, etc.*—Stock-raising is the chief industry, but there is some agric. activity in the less barren regions of the N. Diamonds form the staple product, and the stones, if small, are of good quality. Copper, tin, and marble are also worked. The ann. value of the exports (chiefly diamonds and copper) between 1936 and 1941 ranged from £3,000,000 to £5,000,000. The total length of the railway from the Cape, within S.W. A., is about 1300 m., much of the extension having been carried out during the campaign of 1915. There is also a line of 100 m. linking up the diamond fields near Luderitz. The cap. of S.W. A. is Windhoek. Other tns. are Koetmanshoop, Aroub, Bethame, Grootfontein, and Swakopmund.

*First World War Campaign.*—In the beginning of the First World War campaign the Gers. seized Walvis Bay. Their forces, late in the campaign, were estimated at 5000 regulars and reservists, a high proportion of the white pop. of 13,000 being composed of well-trained reservists. Their total force was not large enough for operations in a colony of 320,000 sq. m. with a native pop. of

90,000, many of whom were still smarting under the memory of the Herero war. Large stores of guns, aeroplanes, and other military equipment had been accumulated in the hope of fitting out an accession of rebels from the S. African Union. The Union forces under Botha and Smuts numbered at least 50,000, equally divided into Brit. and Dutch, the mounted soldiers being chiefly Dutch. The hot desert waste which extends far inland opposes difficulties to an invading force, but the Union leaders were not only skilled in the type of warfare required, but boldly undertook long surprise desert marches and wide enveloping movements, while the Gers. kept to their railways. The first objective was the wireless stations. In Sept. 1914 a Cape Town force seized Luderitz Bay, and soon afterwards another force also landed in the bay, but was held up in case it should be required to deal with De Wet's rebellion elsewhere. A third force landed at Port Nolloth and crossed the Orange R. into the S. extremity of the Ger. protectorate, but owing to the betrayal of Maritz, who soon afterwards joined the rebels, was severely defeated. When the rebellion assumed serious proportions, Gen. Botha took the field in person and in 4 months had suppressed the rebels, whose last stand was made on the Ger. border (Feb. 1915). Meanwhile a new invading force had reoccupied Walvis Bay and taken the port of Swakopmund (Jan.), which Botha thereafter used as his base, while Smuts led the forces operating to the S., which was soon swept clear of the enemy by detachments moving inland from Luderitz Bay. By Apr., after a stiff fight at Gibeon, the enemy had been driven entirely out of the S. part and Gen. Botha issued a proclamation formally taking possession of it. It now remained to take Windhoek, the cap., where the Gers. had a powerful wireless station. But for those operations Gen. Botha wanted increased rail communication from the Union. By June 1915 the railway had been extended nearly 200 m. beyond its previous limit, Prieska, and within a fortnight of its completion the campaign was over, Botha, moving inland from Swakopmund, seizing Windhoek in May. The enemy retreated along their own line to the N.E., hotly pursued by the mounted troops, who accomplished a wonderful desert journey, outflanked them, and forced them to surrender (July). The campaign was a vindication of high military skill applied to special local conditions and a triumph of endurance by the troops. Under the treaty of Versailles the colony was ceded by Germany—who had annexed the country in 1881—to the Union of S. A., which administers the ter. under mandate as an integral part of the Union of S. A.

In the course of the Nazi regime in Germany efforts were soon made to induce the Ger. settlers in S.W. A. to agitate for the retrocession of the country to Germany. In Oct. 1933 Gen.

Smuts and 2 representatives of the Ger. Gov. (de Haas and Ruppel) reached an agreement in London under which the Ger. Gov. stated that it would not use its influence over the Ger. nationals to become Union nationals and, later, by a general agreed Act of the Union Parliament, all except about 200 became Union nationals and Brit. subjects. These moves were calculated to render nugatory the efforts of the Deutsche Bund, representing the naturalised Gers. In S.W. A., to manufacture grievances—such as that the educational system was biased against the Gers. and that Ger. ought to be an additional official language to Eng. and Afrikaans. But agitation by no means died down, and in July 1934 the police took action and raided Nazi headquarters, seizing a very large amount of compromising correspondence. The Nazi leaders were expelled and their party proscribed, but the position remained but little changed. By 1938-39 the whole atmosphere of the country was clouded with political anxiety owing to the obvious efforts of the Nazi Gov. to make the most of every Ger. community in every part of the world as a cell or nucleus for promoting Ger. influence. In S.W. A. there were in 1938-39 approximately 20,000 Union nationals as against 10,000 Ger., but they were not politically organised. Hence, to counteract the pressure exerted by the Nazis on the loyalist elements, they formed the S.W. African League, the objects of which were to knit the Union elements more strongly together and generally to strengthen resistance to Nazi influences by enlightening them on Union and Imperial policy. The retention of S.W. A. must remain a cardinal feature in the Union's external policy; for the Union can never permit the intrusion of a powerful and aggressive neighbour, nor do they desire the forces of anti-Semitism in the Union to be strengthened; and, moreover, they always look forward to a day in the near future when the Union shall be the paramount power in Africa S. of the equator.

**Africander**, or **Afrikaner**, a person living in S. Africa descended from European parents settled there. The A.-Bond, or the Bond party, was founded (1879) in Cape Colony by Hofmeyr, Du Toit, and others, and had as its object the furtherance of A. or Dutch influence in S. Africa. From its object and personnel it followed naturally that it warmly sympathised with the Boer republics in their war with England (1899-1902). After that war it changed its name to the S. African Party. In the first parliament of the S. African Union this party, under the name of Het Volk (The People), secured a majority, and its leader, Gen. Botha, became Prime Minister, and the chief A. leader against Gens. Botha and Smuts was Hertzog, whose attitude in the First World War was equivocal. The suppression of the rebellion which took place during the First World War destroyed Afrikanerism as a force designed to secure an independent S. Africa.

**Afridis**, a numerous tribe belonging to the Pathan or Pukhtun div. of clans and occupying the mountainous region of Afghanistan on the N.W. frontier of India. They are not Afghans, but are the next dominant race to the Afghans proper, and were among the tribes over whom the Afghan Gov. for long exercised no control. Occupying the hilly fastnesses on the Indian-Brit. frontier, or, more particularly, the difficult country S. of the Khyber Pass and W. of Peshawar, and being warlike and fanatic, their hostility to extension of the Brit. *raj* or influence was for years a constant menace to the Brit. authorities. They are estimated to number some 250,000, and, in the past 50 years, were able to muster a war strength of about 25,000. The most serious revolt against Brit. authority in the past half-century was in 1897-98, following the general tribal insurrection in the Swat valley; and the troublesome Tirah campaign was fought before the A. were overcome. The N.W. Frontier irregular troops have often been recruited from the A., Mohmands, and other frontier tribes, but such recruits, being of a treacherous character, are an uncertain factor.

**After-birth**, see PLACENTA.

**Afterglow**, the phenomenon of a broad arch of light, either whitish or rosy, which sometimes appears above the highest clouds after sunset, and is due to fine particles of dust which affect the white light. This phenomenon was widely observed in the red sunsets occasioned by the eruption in Krakatoa in 1883.

**After-image**, in psychology, the persistence of a sensation after the stimulus has been withdrawn. It may be positive, when the sensation continues throughout of the same quality though not of the same intensity; or negative, when a complementary quality presents itself upon the withdrawal of the stimulus. The latter type is chiefly associated with the sense of sight; after looking at a patch of colour and shutting the eyes or fixing them elsewhere, a patch of the same apparent size and form, but of complementary colour, appears. Thus red gives a green A., yellow a blue one, and vice versa. It is suggested that the second image is due to the exhaustion of the sensory powers connected with the first colour and a kind of sympathetic excitation of the elements concerned with the second colour during the process of repair.

**Aftermath** is the grass which grows after the hay has been made. It is sometimes called latter-math, rowen, or rowett; and when left long on the ground it is known in some parts as fog. It provides food for cows and sheep, but is bad for horses. The word is now used metaphorically for any sequence or consequent event.

**Afzelius**, **Adam** (1750-1837), a Swedish botanist, became demonstrator in botany at Upsala 1785, and prof. of medicine 1812. He explored Guinea 1792, was secretary of the Swedish legation in London 1794, and wrote sev. works on natural hist.

**Afzelius, Arvid August** (1785-1871), a Swedish writer and historian. He was the author of *Den Sista Falkengen*, a drama, and a hist. of Sweden up to the death of Charles XII.; ed. popular Swedish songs; and trans. into modern Swedish the Elder Edda and the *Herwara Saga*.

**Aga**, a word signifying lord, said to be of Tartar origin. The Turks use it for chiefs of the janissaries, and commanders of artillery, cavalry, and infantry. It is also used as a title of distinction.

**Agades**, a tn. in the Niger Colony, Fr. W. Africa, and centre of nearly all the most important caravan routes. It is the cap. of Asben, S. of the Sabara, and is situated on the edge of a plateau.

**Agadir**, a Moroccan tn. It was once an important seaport owing to its situation at the mouth of the Sus, being the most southerly maritime tn. in Morocco. The revolution of 1773, and the subsequent rise of Mogador, lessened its importance. In Aug. 1911 the A. incident, as it was known, nearly precipitated a European war on a large scale. The incident arose as follows: The treaty of Algeciras (q.v.), concluded in 1906, to which all the great powers, including Germany, were signatories, and in which France and Spain were entrusted with the task of preserving order in disturbed Morocco, was supposed to have settled the Moroccan question, but the sudden appearance off A. of the Ger. gunboat, the *Panther* (replaced later by cruiser *Berlin*), and the demand of the Ger. Kaiser for 'a place in the sun,' precipitated a feeling of exasperation in France, which, had it eventuated in war, would have inevitably embroiled England. The prolonged negotiations or 'conversations' between the 2 countries resulted in Germany agreeing to forgo her claims in respect of Morocco, in exchange for which certain portions of Fr. Congo were ceded to her. Pop. 2500.

**Aga Khan, Aga Sultan, Sir Mahomed Shah** (b. 1877). Head of Ismaili Mohammedans. Rendered loyal service to Great Britain during the First World War, and was granted the rank and status of first-class chief. Has numerous religious followers in E. Africa as well as in India and Central Asia. Well known for his horse-racing activities. Pub. *India in Transition*, 1918.

**Agallochum**, see ALOES WOOD.

**Agalmatolite** (Gk. ἀγάλμα, image, λίθος, stone), or **Pagodite**, a hydrous silicate of aluminium, grey to pale green and red, which is used in China in the sculpture of small statues and other objects.

**Agama**, a genus of lizards of the family Agamidae (q.v.), native to Africa and India. It is of sombre colour, has a triangular head, conical tail covered with scales, is capable of inflating the skin, and inhabits ruins and rocky places.

**Agamedes**, the legendary son of Erginus, king of Orchomenus. He and his brother Trophonius were regarded as supernaturally gifted architects. They built a treasure house for the king of Myria and systematically robbed it by means of a loosened brick. On discovery

of A., his brother cut off his head and fled, to be swallowed up by an earthquake. According to a tradition mentioned by Cicero, the two brothers, having built a temple to Apollo at Delphi, prayed the god to grant them whatever reward was best for man. This was promised them on a certain day, and on that day they died.

**Agamemnon** was the son of Pelistes and Acropo or Eriphyle, and grandson of Atreus, king of Mycenæ. According to Homer he was a son of Atreus and grandson of Pelops. After the murder of Atreus, A. and his brother Menelaus went to Sparta, where A. married Clytemnestra, sister of Helen. He became king of Mycenæ, and commander-in-chief of the Gks. in the siege of Troy. At Aulis, where the army and fleet assembled, A. killed the favourite stag of Artemis (Diana), for which deed a pestilence and calm were produced, causing a delay in the start. To avert the anger of the gods, A. consented to sacrifice his daughter Iphigenia, but she was carried off by Artemis, and another victim was selected. The army then sailed to Troy, and the quarrel between A. and Achilles is one of the most memorable events of the siege of Troy. When Troy was taken A. received Cassandra, the daughter of Priam, as his prize; and on his return home he was murdered by Ægisthus and Clytemnestra, his wife. His murder was avenged by his son Orestes, who killed Ægisthus and Clytemnestra. The Gk. tragedians Æschylus, Sophocles, and Euripides make these legends the subject of several of their plays.

**Agami**, the native name for the trumpeter of tropical S. America, to which Latham has given the name of *Psophia crepitans*. It belongs to the Gruiformes, and is closely allied to the cranes. It is a beautiful, many-coloured bird, gregarious, easily tamed; it chooses mts. and upland forests for its home, and feeds on insects and fruit. The eggs, 10 to 16, are laid in a scratched-out hole, the young are covered with down, and the mature bird is about the size of a pheasant. Its name is obtained from its trumpet-like cry.

**Agamidæ** (Gk. ἀγάμ, without, γάμος, marriage, ἄδος, form), a family of saurian reptiles, or lizards, which has the agama for its type. It includes the *Chlamydosaurus* of Australia, which runs on its hind legs and has a curious frill on each side of its neck; the *Draco*, or flying dragon, common to Java; the *Moloch*, an Australian lizard, whose body is covered with large spikes; the *Calotes* of India, which changes its colour.

**Agana**, or **San Ignacio de Agana**, fortified cap. of Guam, Ladrões Is. Its port is San Luis de Apra. Pop. 9000.

**Aganippe** is a celebrated fountain in Boeotia. It is situated at the foot of Mt. Helicon. The Permessus receives it. The fountain was held to be sacred to the muses, who were named Aganippides from their association with it.

**Agapæ**, from the Gk. word ἀγάπη, meaning love, signifies love-feasts. They

were founded in connection with the Lord's Supper. The spirit of charity which is responsible for the name of the function pervaded the banquet, the rich supplying food to which the poor were invited. For a time the A. and the Lord's Supper were celebrated together during the evening, but the persecution of the Christians compelled them surreptitiously to observe them at separate times, often before dawn. Subsequently a formal separation was made. From the third century the banquets deteriorated in character, and the clergy were ultimately forbidden to take part in them. Owing to the extreme freedom from moral restraint which marked the proceedings, the whole ceremony was banned by the Church.

**Agapanthus** (Gk. *αγαντη*, love, *ἄθος*, flower), a genus of African plants belonging to the Liliaceæ. *A. umbellatus* is a common garden flower.

**Agapemonites**, the name given to persons who were members of a community which was founded by H. J. Prince, a former clergyman of the Church of England, and his rector, Starkey, at Charlynch near Bridgewater (Somerset) in 1859. The community lived in a single building, sharing their possessions under the leadership of Prince, whom they termed 'the Lord.' Agapemone, the name of the community, means 'the abode of love.' There were similar societies in England before this one, e.g. the Family of Love, in the sixteenth century, and also a later one about 1896 known as 'The Children of the Resurrection,' who built a place at Clapton, which they called the Ark of the Covenant. It is not fully established whether Prince really permitted or proclaimed free love at the Agapemone, but that there were serious breaches of decorum and manners there is evidenced by the proceedings taken in the Chancery Court in 1860.

**Agapetæ** (from Gk. *αγαπητός*, beloved), virgins of the early Church who were associated with bishops, priests, and deacons, being bound to these celibates by spiritual love and attending to their material needs. Originally a beautiful institution, it was later abused, and consequently was suppressed by the Lateran Council of 1139. It was denounced by several councils of the fourth century, by St. Jerome, St. Chrysostom, and the Emperor Honorius.

**Agapetus I.**, pope of Rome from 535 to 536, assisted in the establishment of a library of eccles. books at Rome and deposed Anthimus, the patriarch of Constantinople. He d. at Constantinople, where he had been sent by Theodahad, king of the Goths. The Rom. Catholic Church celebrates his festival on Sept. 20, the Gks. on Apr. 22.

**Agapetus II.**, a Rom. by birth, pope from 946 to 955, appealed to Otto the Great of Germany against Berenger II., king of Italy, and attempted to free Rome and the papacy from degradation.

**Agar-agar**, otherwise known as Bengal or Japan isinglass. It consists of slices of

the dried stem of seaweed. It is similar to gelatine, though it requires more heat to liquefy it after it has once assumed jelly form. Its prin. use is as an artificial culture-medium for bacteria.

**Agardh, Karl Adolf**, a Swedish botanist, b. in 1785 at Lund. He became prof. of botany there in 1812. Later he entered the Church, becoming bishop in 1859. He wrote voluminously upon the algae, and on these great works our present knowledge of that botanical division is based. His son, Jacob Georg, succeeded him in the professorial chair (1854-79), contributing further revelations concerning the algae.

**Agarius** is a genus of fungi, of the subclass Basidiomycetes, which comprises the mushrooms. It contains numerous species, some edible and some poisonous; among the former are *A. campestris*, the common mushroom; *A. pratensis*, the fairy ring mushroom; and *A. Georgei*, a large mushroom, while the latter includes *A. muscarius*, fly agaric, and *A. arvensis*, horse mushroom. Plants of this genus grow on rocks, heaths, meadows, and decaying vegetable matter over the whole of Europe; *A. melles* is most destructive to timber.

**Agasias**, a Gk. sculptor of Ephesus of the first century B.C. The statue called 'The Borghese Gladiator,' now in the Louvre, was his work.

**Agassiz, Jean Louis Rodolphe** (1807-1873), celebrated naturalist, b. at Motier in Switzerland. He was educated first at home, and afterwards at the academy of Lausanne. He adopted medicine as a profession, studying at Zurich, Heidelberg, and Munich. In 1829 he took the degree of doctor of philosophy, and in the following year that of doctor of medicine. From that time he gave his energies to the study of ichthyology, and became the most eminent authority on the subject. He was asked, previous to graduating, to complete a hist. of the freshwater fish of Brazil, which had been commenced by Spix, who d. while on the work. His brilliant success earned recognition from Cuvier who became his friend. In 1831 he accepted a professorship at Neuchâtel. He gained the London Geological Society's Wollaston prize by the publication of his *Researches on the Fossil Fishes* (5 vols. of this work appeared between 1833 and 1844). In 1840 he began a study of the glaciers of the Alps, expressing his views in the *Études sur les glaciers* and his *Système glaciaire*. Previously (1839) he had written a *History of the Freshwater Fishes of Central Europe*. In 1846 he went to America and delivered a course of lectures on zoology at the Lowell Institute, expounding his theories on the 'Plan of the Creation.' These lectures were most successful, and in 1848 he was appointed to the chair of zoology and geology at Harvard, and made expeditions of a scientific nature to Lake Superior. Distinction after distinction followed, and he had to decline invitations from Paris and Zürich to accept professorships. Incessant work had meanwhile undermined his health, and a

holiday, afterwards an organised scientific expedition to Brazil, was arranged. He d. at Cambridge, Massachusetts, while engaged on the compilation of *Contributions to the Natural History of the United States*.

His son Alexander (1835-1910) was b. at Neuchâtel, and graduated at Harvard in 1855, studying chem. and engineering. In 1859 he became an assistant in the U.S. Coast Survey, taking a great interest in mining. Incidentally he amassed a fortune from some copper shares which he held. He made a collection of Peruvian antiquities for the Harvard museum, and became its curator. Among his other interests riv. dredging occupied a large place. His works include a *Review of the Echini* (1872-74), *Seaside Studies in Natural History* (1865), and *Marine Animals of Massachusetts Bay* (1871).

**Agastya**, a Brahman saint, who is supposed to have been the founder of Tamil literature, and who is said yet to dwell as a *yogi* on the peak of Agastya-malai, a hill in Travancore. The construction of the pond called Vishnu Pushkarni Tirth in Bombay is accredited to him.

**Agate**, a mineral comprising all the many forms of silica, chiefly chalcedony. Most As. exist in rounded nodules or in veins in trap rocks. Among the numerous kinds of As. are the cornelian, amethyst, quartz, jasper, opal, and flint. The stones are easy to polish and are much used for ornamentation. They are probably formed by deposits of water containing silica in lava when viscous. The slow movement of the lava explains the drawn-out elongated shape of A., and on account of this almond shape, the name amygdalæ has been applied to them. When depositions have not occurred sufficiently to fill the hollow in the lava, the A. is hollow. A considerable industry in A.-working has been carried on in Germany around Oberstein. The dist. is rich in amygdaloid rocks of andesitic types. At the present day, however, the As. themselves are imported from Brazil. Naturally unattractive, As. are artificially stained, an art which is of anct. origin. The colorations are many, the chief being dark brown, red, blue, green, and yellow, while the appearance of others gives rise to the names star As., moss As., and clouded As. Many are found in Scotland under the name of 'Scotch pebbles.' Besides ornamentation, As. are used in the making of knife-edge fulcrums for delicate balances, and for the manuf. of small pestles and mortars. Some of the finest As. come from Ontario, a dist. on the edge of Lake Ontario being called A. Bay. Another variety is that manufactured from wood obtained from the silicified forests of Arizona. India, New S. Wales, Queensland, and Africa also produce As.

**Agatha, St.**, the patron saint of Catania, Sicily. According to a legend she was a Sicilian noblewoman of great beauty, who refused the love of the Rom. prefect. She was sentenced to be burnt

alive, but at the application of fire to the stake an earthquake occurred. She d. in prison and was numbered among the Rom. Catholic saints. Her festival day is Feb. 5.

**Agatharchides**, or **Agatharchus**, was a native of Cnidus, and a contemporary of Ptolemy Philometor (187-146 B.C.). He is celebrated as a Gk. historian and geographer. His works include a treatise on Asia, Europe, and the Red Sea. Preserved by Photius are interesting and valuable extracts from this last work. Photius commends the style of his writings, which was modelled on that of Thucydides.

**Agatharchus**, an Athenian painter of the fifth century B.C. Vitruvius says he was the first painter to execute scene-painting, but his only work in this direction was the front of a stage building which could be used, and was, on all occasions. He was seized by Alcibiades and compelled to paint the interior of his house, an event which proves the popularity of the decorative painting of rooms.

**Agathias** (A.D. 536-82), a Gk. poet and historian of Æolis. He studied law, and practised in the courts of Constantinople. Literature, however, became his favourite pursuit. He wrote sev. short love-poems called *Daphniacæ*, and compiled an *Anthology of Epigrams*. He wrote a hist. of his own times in 5 vols., which is the chief authority on the period 552-58.

**Agathis**, a genus of Conifere with broad, lance-shaped, leathery leaves, native of the E. Indies and Australia; the resin makes varnish. *A. Dammara* is the dammar pine, *A. Australis* the kauri or cowrie pine.

**Agathocles** (361-289 B.C.), tyrant of Syracuse, was b. at Therma Himeræ in Sicily. His father was a potter, and A. was put to the same trade. After learning the business he joined the army. In 333 he married the widow of his patron, Damas, a distinguished and wealthy citizen. He was banished from Syracuse for endeavouring to overthrow the oligarchy. In 317 he returned at the head of an army of mercenaries, and after his triumph he made a solemn oath to fulfil the ideals of the democratic institution now raised by him. A wholesale massacre was perpetrated of over 1000 citizens who resisted his authority. He made himself master, however, and, with the aid of a strong army and a powerful fleet, succeeded in conquering nearly the whole of Sicily. He now engaged in a war with the Carthaginians, and was repulsed by them, till in 310 he was besieged in Syracuse. With an intrepidity characteristic of his methods, he courageously broke through their lines and attacked them in their own country. After a series of victories he was defeated, and abandoning his army to the mercies of the Carthaginians, fled secretly to Sicily. Peace with Carthage followed, and A. had himself proclaimed king of Sicily, and ruled with a firmness that earned him his name of tyrant. Until his death he displayed consistently extraordinary energy in

whatever he strove to acquire, and was, in fact, meditating a fresh attack on Carthage when his death occurred. Ill health and the turbulence occasioned by the revolt of his grandson harassed his last days. Some authorities aver that he d. poisoned by his grandson Archagathus, while others state that he met his death naturally.

**Agathodæmon**, a map designer of Alexandria who lived probably about the second century A.D. Ptolemy's *Geography* contains in the MS. 27 maps said to have been executed by A.

**Agathodæmon**, in Gk. mythology, a spirit of good fortune attendant particularly upon cornfields and vineyards. Wine was drunk in his honour after every meal.

**Agathon** (c. 447-100 B.C.), a poet of Athens famous for his tragedies. In modern times he is best known by his appearance in the *Symposium* of Plato, which immortalises the banquet he gave to celebrate his first tragic victory in B.C. 417. Aristotle remarks upon the originality of his plots, the custom being, at the time, to borrow them from mythology.

**Agave**, a genus of plants belonging to the order Amaryllidaceæ, found mostly in Mexico. It somewhat resembles the aloe, and on that account is often confused with it. Its beauty is remarkable. The best known species is the *A. Americana*. The plant grows to a height of 24-36 ft. Its roots possess detergent qualities, and are therefore used in large quantities for washing purposes.

**Agbatana**, see ECBATANA.

**Agde**, a tn. on the Mediterranean coast in the dept. of Hérault, France. It is near the mouth of the R. Hérault, and has a considerable trade in wines. Pop. 9000.

**Agdistis**, see CYBELE.

**Age**, in common law, at which a marriage is valid is 12 for a girl and 14 for a boy. In 1929 an Act was passed raising this A. to 16 years. The A. which gives the privileges of an adult, and at which a person ceases to be an 'infant' in the eyes of the law, is 21; the computation of these years is curious, for the day of birth is included and fractions of a day are unconsidered, so that a person may attain his majority nearly 2 days before his twenty-first birthday. The canonical A. in the Rom. Catholic Church is 21 for a sub-deacon, 22 for a deacon, 24 for a priest, 30 for a bishop. In the Anglican Church a man may become a deacon at 23, and a priest at 24.

**Age of Animals** is difficult of determination, as it can be studied only in creatures in captivity, the unnatural conditions tending to shorten life considerably. Among the low forms of life a sea anemone (*Actinia mesembryanthemum*) lived in captivity from 1828 to 1887 in the botanical gardens of Edinburgh, while a gastropod, *Tridacna gigas*, lived for a century; oysters and edible snails exist for about 4 years, while crabs can attain 50 years. Insects frequently die after a few hrs. or months, though the larva may have endured for sev. years. Lord Averbury kept an ant

once for 15 years; among bees the workers die soon, while the queen may reign for 5 seasons. Fish are usually devoured by larger species, but the more ferocious sometimes survive for an enormous period, a pike having been known to live for 267 and a carp for 200 years. Tortoises are said to exist for 2 centuries, while crocodiles exist for 1; frogs die sooner than toads, which may live for 36 years.

Fish and reptiles are longer lived than birds and mammals. Small birds, such as canaries, average about 15 years in captivity, though parrots and swans may live for 80, eagles and falcons for 100 years. Prolific animals are usually short-lived, swine seldom passing 20 years; large rodents, such as hares and rabbits, 10 years; small rodents, such as rats and mice, 5 years. Among domestic animals, cats may live 12 to 25, dogs 16 to 18, horses and asses 15 to 30, cattle 25 to 30, sheep and goats 12 to 14, deer 10 to 15 years. Wild animals, such as the elephant and the hippopotamus, cannot be fairly judged in captivity, but under such a condition they have attained 35 years. Monkeys soon die when in this cold climate, and lions do not here reach their estimated 30 years.

The determination of the A. of domestic animals is usually accomplished by noting their dentition. In sheep and goats the incisors appear during the first month, the first permanent molars by the sixth month, the milk-teeth fall at the age of 2 years, the true molars are complete in the fifth year. The milk-teeth of a dog come out between the third and fourth month, and the animal ceases to be a puppy at the ninth month. In horses the front incisors appear at the end of 8 days, the middle at the end of 5 weeks, the back between the sixth and eighth month. They show signs of wear in order of appearance; at 2 to 2½ the front teeth fall and are replaced; at 3½ to 4 the middle teeth, and at 4½ to 5 the back incisors. At 6, 7, and 8 respectively, the front, middle, and back teeth decay. In cattle both dentition and the rings on the horns indicate A., the first ring appearing at the A. of 3. The A. of a stag can be ascertained approximately by the branches of the antlers up to the seventh year, but the oldest stag never has more than 10 or 12 branches. See G. L. L. Buffon's *Histoire naturelle*, 1749; Sir E. Ray Lankester's *Comparative Longevity in Man and the Lower Animals*, 1870.

**Age of Discretion in Law** is the time at which an infant is supposed to have attained sufficient understanding to judge of the morality of his actions. In criminal law an infant under 7 is not held guilty of felony, a boy under 14 cannot be guilty of carnal knowledge of a girl under 13 years—though he may be convicted of assault—and it is a misdemeanour for one over 16 years of age to ill-treat a child under 16 who is in his charge.

**Age in Physiology** is divided into 5 periods of development and decay in human-kind—infancy, which extends to the end of the seventh year, childhood

to the fourteenth, adolescence in males and females varies, but averages to about the twenty-first year, adult life to about 50 years, and after that period comes old A. The limits of human existence are unknown, but Thomas Parr ('Old Parr'), the oldest known Englishman, whose dates are not properly authenticated, is said to have *d.* at the A. of 153. Cases of persons attaining a century of existence are of common occurrence.

**Age of Trees** may be computed by cutting a section of the stem and counting the number of concentric ann. rings. These rings are formed by the difference in constitution of the wood in autumn and spring, the latest-formed xylem bundles in a year being much smaller than those of the spring. The oak, elm, and ash show this difference, but it is not so clear in such trees as the beech and lime. Many trees attain to a great A., e.g. the oak, which reaches maturity between 120 and 200 years, and of which sev. examples are known to be 1000 years of A. Many yews are quite 3 centuries old, while the Scots pine (*Pinus sylvestris*) has frequently weathered 400 years.

**Agen**, a city in S.W. France, and cap. of Lot-et-Garonne. The tn. is old and presents a depressing appearance. It carries on a trade in woollen and linen goods, and is an important railway centre. Jamain, the poet (q.v.), was b. there. Pop. 24,900.

**Agent**. An A. is one who is authorised by another to do acts for him and in his name, the person who authorises him being called the principal or constituent. There are many kinds of As., public and private, and they are known by many names, such as broker, bailiff, factor, ambas., consul, etc., and the title of A.-general is borne by many Brit. colonial officials who represent the self-governing colonies in the home country. For transactions other than those of minor importance it is usual for an A. to receive his appointment in writing, and an A. by deed cannot bind his principal otherwise than by deed. The granting of such instructions is called the granting of 'power of attorney.' An A. acting under a commission *del credere*, i.e. undertaking to be surety to his principal for the solvency of his principal's customers, is, in these customers' default, held accountable for debt, but in all other cases he is not liable. As a general rule the act of an A. is considered as an act of the principal, and the principal is in general liable for damage occasioned to third persons by the negligence or unskillfulness of his A.

**Agent Provocateur**, one employed, during political or social conflicts, in the guise of an adherent, to stir up compromising action. The method was much in vogue in Tsarist Russia when the Gov. used As. Ps. to foment risings for the express purpose of having an excuse for suppressing revolutionary movements. They have also been used in other countries in the struggle between govs. and revolutionary movements. Also, in labour disputes, their purpose is

to try and induce strikers to commit unlawful acts to provoke armed clashes. In international politics As. Ps. have been used to provide pretexts for interventions in wars by promoting disorder or bringing about 'incidents.'

**Ages of the World**, periods into which the hist. of the world is divided, each period being marked by some special feature. The idea originated among the Gks., and in the works of Hesiod 5 periods are mentioned: 1. The Golden A., when Saturn reigned, was a time of perfect innocence and happiness, without work. 2. The Silver A., when Jupiter reigned, was a time of godlessness, when troubles and labour commenced. 3. The Brazen A., when Neptune reigned, in which war, violence, and lawlessness prevailed. 4. The Heroic A., which was an improvement on the Silver and Brazen As. 5. The Iron A., when Pluto reigned and Hesiod himself lived, was the most miserable and wicked of all, for virtue had gone out of the world. Ovid, in his *Metamorphoses*, mentions the Golden, Silver, Brazen, and Iron As. European hist. has also been divided into periods, as: The Middle As. (q.v.), or the period after the fall of Rome until the fifteenth and sixteenth centuries, which were marked by the Reformation and the discovery of America. The Dark As. (q.v.), a period marked by the decline of classical learning and civilisation, extended from the inroads of the barbarians into Europe until the time of the Renaissance. It is also common to speak of such periods as the Homeric A., the Augustan A., and the Elizabethan A.; and also the Stone A. and the Bronze A.

**Aggershuus or Christiania**, a div. of Norway. Area, 2063 sq. m. Pop. 237,000.

**Agglomerate** consists of a large mass of blocks or bombs of all sizes and shapes. It is of volcanic origin, and is frequently found in the necks of the craters of ant. volcanoes. These blocks sometimes consist of igneous rocks, sometimes of sedimentary rocks, and sometimes of both.

**Agglutinative Languages** are those languages which have long compound words, consisting of the prin. word and the qualifying words, and are distinct from the inflectional languages. The prin. A. L. are the Mongolian, Turkish, Finnish, Hungarian, N. Amer., and the Dravidian (Tamil and Telugu, etc.) in S. India.

**Aggression**, a term first used officially in the treaty of Versailles, 1919, which speaks of 'the aggression of Germany.' It is incorporated in the 'Covenant of the new defunct League of Nations, member States undertaking 'to respect and preserve against external aggression the territorial integrity and existing political independence of all members' (see COVENANT OF THE LEAGUE OF NATIONS). The Mutual Assistance Pact, 1923, and the Geneva Protocol, 1924 (q.v.), were vain attempts to found the definition of an 'aggressor nation' on rejection of arbitration. In 1944 the Dumbarton Oaks Conference produced a plan that, unlike the

'call to repentance' of the Covenant, invoked no principles, but contained practical arrangements for restraining an aggressor. The conference looked to a 'Security Council' to decide whether the conduct of a nation amounted to A. and, in fact, alone to shoulder the burden of keeping the peace. These proposals were incorporated in the following year in the Charter of the United Nations. See SAN FRANCISCO CONFERENCE; UNITED NATIONS CHARTER.

**Aggtelek**, see AGTELEK.

**Aghrim**, or **Aughrim**, a vil. in the co. of Galway, Ireland. It is famous historically on account of the victory of the forces of William III. over Ginkel over the Irish and Fr. forces of James II. under St. Ruth. St. Ruth was killed. Pop. 200.

**Aghuat**, El, see LAGHOUAT.

**Agila-wood**, see ALOES WOOD.

**Agilochum**, see ALOES WOOD.

**Agincourt**, a vil. of N. France, situated in the department of Pas-de-Calais. It owes its notoriety to the famous battle fought there between Henry V. of England and the Fr. The Fr. possessed overwhelming numbers, but the cumbersome armour with which they were covered and the muddy nature of the intervening ground, due to heavy rains, nullified their practical superiority. On Oct. 25, 1415, the armies faced each other. A pause followed, during which each expected the other's attack. At length Henry's archers opened the assault with dense flights of arrows. The Fr. replied with a charge. Fortunately for the Eng., the condition of the ground caused considerable confusion among the cavalry, who now found the greatest difficulty in extricating themselves from the clinging mud. They provided an admirable target for the Eng. archers, who proved themselves worthy of the reliance placed upon them. A *mêlée* followed, during which the Fr. suffered appalling loss of life, eventually yielding over 1000 prisoners of war, among whom was the Duke of Orleans (in literature Charles d'Orléans). The slain, lying in places 3 and 4 deep, included the Constable, 3 dukes, 5 counts, and over 90 barons. While the Eng. losses are estimated at a few hundreds, the wholesale slaughter of the Fr. resulted in no fewer than 10,000 dead.

**Agio** (It.), a term denoting difference between (i.) actual and face value of money; (ii.) the metallic moneys of different countries; also appreciation or depreciation from fixed rates of exchange.

**Agira**, tn. of Catania, Sicily, 9 m. S.E. of Nicosia. It is the ant. *Agryrium* and was till recently known as San Filippo d'Argiro. Contains a ruined Norman castle, and has sulphur mines and marble quarries. The bp. of Diodorus. Pop. 15,700.

**Agis**, the name of 4 Spartan kings, of whom the first is legendary, being supposed to have reigned in the eleventh century B.C. The historical A. I. (or II.), who reigned 427-399 B.C., was a

distinguished general, and led the Spartan army at the battle of Mantinea. A. II. (or III.) (388-331 B.C.) was a prominent member of the league of the (Grecian) states against Alexander the Great, and defeated the Macedonians under Corraus. He was killed in battle at Megalopolis. A. III. (or IV.), the most noted, who reigned 214-241 B.C., endeavoured to remedy the poverty of the Spartans by a system of land redistribution, but his schemes were suspected of being dangerous to the welfare of the state, and he was put to death.

**Agistment** (law), an agreement entered into with an owner of land, whereby the latter, known for the purposes of such agreement as the agistor, allows cattle to pasture and lie on his land; also, the profit accruing to a landowner from such transaction. In this latter sense the word applied formerly more especially to pasturage in the royal forests.

**Agnadello**, tn. of Cremona, Italy, 10 m. E. of Lodi. The site of 2 famous battles: on May 14, 1509, when the Fr., under Louis XII., defeated the Venetians; and on Aug. 16, 1705, when the Duke of Vendôme defeated Prince Eugene. Pop. 1500.

**Agnano, Lake**, situated in the crater of an extinct volcano near Naples, was drained in 1870 on account of its malarial properties. The waters are now used for remedial baths. On its shore is the famous Grotta del Cane.

**Agnate** (law). *Agnati* signified in Rom. law persons related through males only, *cognati* (cognates) being those in whose relationship one or other female link intervened. The distinction between *agnati* and *cognati* was founded on the peculiar institution of *patria potestas*. See FAMILY, THE; TWELVE TABLES.

**Agnes, Saint**, a beautiful Christian virgin in the reign of Diocletian, was, according to legend, in her thirteenth year publicly humiliated and executed in Rome for refusing the praetor's heathen son. Her festival is held on Jan. 21.

**Agnesi, Maria Gaetana** (1718-99), scientist and scholar, b. at Milan. In 1750 she succeeded her father in the chair of mathematics and natural philosophy at Bologna. Her prin. work was the mathematical treatise, *Istituzioni analitiche*, 1748.

**Agnew, David Hayes** (1815-92), an Amer. surgeon, b. in Pennsylvania; d. at Philadelphia. Served as surgeon in the Civil war. Pub. *Principles and Practice of Surgery* (1883).

**Agni**, in the Hindu religion god of the fire of sun and lightning.

**Agnolo, Baccio d'** (1460-1513), b. at Florence, where he acquired considerable reputation as a wood-engraver. He went to Rome to study architecture, and afterwards settled at Florence. His most important works are the villa Borghesini, near Florence, the campanile, or bell-tower, of the church of Santo Spirito (a production of Brunelleschi's) in Florence, the Bartolini and Orsini palaces, the choir stalls and organ-case of Santa Maria Novella. He was

in charge of the works of the cathedral of Florence.

**Agnone**, a tn. of Campobasso, Italy, on W. slope of the Apennines, 22 m. N.W. of Campobasso. Celebrated for copper mines and sulphur and other mineral springs. Pop. 3166.

**Agnosticism**, the name invented by T. H. Huxley in 1869 for the doctrine (in itself old) that man does not and cannot in the nature of things *know* anything about a spiritual existence either of God or man or of any after-death state. The term would appear to have been suggested to Huxley by the Gk. words *ἄγνοστος θεός* (To the Unknown God), which we learn from Acts xvii. 23, was the inscription which St. Paul found upon an altar in Athens. Certain it is that the teaching of agnostics is fundamentally contrary to that of the Gnostics (*q.v.*). The latter was an intensely mystical doctrine of the early Christian Church that claimed special revelation of the nature of the divine, while, on the other hand, the agnostic asserts that man's only cognition can be of the phenomenal world. This is not to say that there *may* not be a noumenal entity or soul behind the phenomenal—a First Cause—the 'thing in itself' of Kant, in fact, the agnostic would repudiate as dogmatic materialism or Atheism (*q.v.*) the denial of this possibility. Its one answer to all such questions is that we do not know and there is so far no reasonable grounds for believing that we shall ever know. In other words, man, being finite, can never comprehend the Infinite. In this country A. had many able exponents in the seventies and eighties of last century, chief among them being Huxley, Prof. Tyndall, and Herbert Spencer. The 'Belfast Lectures' of Tyndall and Spencer's *First Principles* did much to popularise A., but most of the conclusions of modern A. may be found in the works of Kant, the great Ger. philosopher. Two books for and against the theory are *An Agnostic's Apology*, by Leslie Stephen, 1893, and Dr. James Ward's Gifford Lectures, 1899, entitled *Naturalism and Agnosticism*.

See also R. Flint, *Agnosticism*, 1903; F. von Hügel, *The Reality of God and Religion and Agnosticism*, 1931.

**Agnus Dei** (Lamb of God), a title of Jesus; generally used to denote the symbol of Christ, a lamb supporting a banner, and more particularly the waxen or dough tablets bearing such image, distributed by the pope at Easter, and worn as amulets. The prayer in the Mass beginning *Agnus Dei, qui tollis peccata mundi* (O Lamb of God, that takest away the sins of the world) is also known by this name.

**Agonio Lines** (Gk. ἄγωνα, *agona*, angle), irregular imaginary lines on the earth's surface, passing through the magnetic poles on which the magnetic needle shows no deviation or declination, i.e. points true N. and S.

**Agora**, the public market and meeting-place of the anc. Gks., corresponding to the Rom. forum. Among the better-known *agoræ* are those of Athens,

Corinth, Messina, and Megalopolis. The name was also given to the people's assemblies of the Grecian states. See Gardner's *Ancient Athens* (1902) and the works of Pausanias.

**Agoraphobia** (Gk. ἀγορά, public place, φόβος, fear), a nervous disease, characterised by the sudden onset of symptoms of terror when the patient is in any busy open space, and by inability to cross it. The treatment is that for general neurasthenia.

**Agoué**, seaport in Dahomey, Guinea Coast, between Great and Little Popo, near the border of Togoland. Pop. 5500.

**Agouti**, Marie Catherine Sophie de Flavigny, Comtesse d' (1805-76), Fr. writer, b. at Frankfort and educated in a Paris convent. She left her husband, Comte d'A., to live with Franz Liszt, by whom she had 3 children, of whom Cosima married, as her second husband, Richard Wagner. Under the pseudonym 'Daniel Stern' she pub. *Néida* (1846), *Lettres républicaines* (1848), *Histoire de la révolution de 1818, et Esquisses morales* (1850-53). *Mes souvenirs* (1806-33) was pub. in 1877 and *Mémoires* (1833-54) in 1927.

**Agouti**, a S. Amer. rodent of the genus *Dasyprocta*, belonging to the same family as the guinea-pig. It does considerable damage among sugar plantations.

**Agra**, the headquarters of a dist. of 1856 sq. m., pop. 921,155, and of a div. of 8545 sq. m., pop. 4,182,825, in the United Provs., India. A. city, on the Jumna R., 840 m. N.W. of Calcutta, was for 150 years the cap. of the Mogul rulers, but was superseded in 1658 by Delhi as the seat of their gov. It was captured from the Mahrattas by Lord Lake in 1803, and was unsuccessfully besieged for some months during the Mutiny. Its most famous feature is the wonderful Taj Mahal, the marble tomb built for his favourite wife by Shah Jehan, who was also responsible for the other outstanding architectural features of the city, the Moti Masjid, or Pearl Mosque, and the Jama Masjid, or Great Mosque. In the suburb of Sikandra is the mausoleum of the city's founder, the emperor Akbar. The old city of A. covered 11 sq. m., half of which is still inhabited; the fort has a circuit of over a m., with walls 70 ft. high. The city is a busy railway and commercial centre, with cotton mills, flour mills, and carpet industry; the local manufs. are gold and silver embroidery, carving in soapstone, inlay work on white marble, carpets, and boots. Pop. of city 230,000.

**Agra and Oudh, United Provinces of**, see UNITED PROVINCES.

**Agrarian Laws**, see LAND LAWS.

**Agreement**, see CONTRACT.

**Agricola**, Gaius (1490-1555), Ger. metallurgist, his Ger. name being Georg Bauer, was b. Mar. 24, 1494 (some biographers give the year 1490, but the best authorities accept 1494) at Glauchau, Saxony, and educated at Leipzig Univ.

Studied philosophy, medicine, and natural science in Italy. Became tin-physician in Bohemia in the midst of a mining dist., where he studied the mines and metallurgy. In 1530 there was pub., by Froben at Basel, his dialogue *Bermannus*, a catechism of mining. In 1533—about which time he became city physician of Chemnitz—he issued *De Mensuris et Ponderibus*; and then he began writing his chief work, *De Re Metallica*, which, however, did not appear till after his death. *De Ortu et Causis Subterraneorum*, in 5 books, was pub. 1546. He was a member of the Diet of Freiburg, went afterwards on political missions to sev. foreign princes, and attended Diets at Leipzig, Torgau, and Dresden. An Eng. translation of *De Re Metallica*, by Herbert Clark Hoover (later president of the U.S.A.) and Lou Henry Hoover, was pub. with the original illustrations, in a thick folio vol., in 1912.

**Agricola, Gnaeus Julius** (A.D. 37–93), Rom. soldier and statesman, was distinguished by ability and the integrity of his character. He was elected consul in A.D. 77, after a brilliant career in Britain and other outposts of the empire. From A.D. 78 to 87 he was governor of Britain, where he estab. the Rom. dominion considerably N. of the Forth, defeating the Caledonians under Galgacus in the battle of the Grampians. His fleet sailed round Britain and discovered it to be an is. for the first time. His success aroused the jealousy of the emperor Domitian, who recalled him to Rome, where he spent the rest of his life in retirement. The story of his life by his son-in-law Tacitus (trans. Church and Brodribb, 1877) is one of the finest biographies in any language.

**Agricola, Johann** (1491–1566), a pioneer of Protestantism, also known as *Magister Eisleben*, from his bp. Eisleben, was educated at Wittenberg and Leipzig. After being sent by Luther to Frankfurt in 1525, to establish there the reformed religion, he preached for some time in Eisleben. In 1536 he was appointed to a chair at Wittenberg, but was compelled to resign in 1540 owing to his Antinomian controversy with Luther and Melancthon. He left for Berlin, where he was appointed court preacher to the Elector Joachim II. of Brandenburg. He wrote many theological books, but his best-known work is his famous collection of Ger. proverbs, 1528. See Kawerau, *Johann Agricola*, 1881, and Latendorf, *Agricolae Sprichwörter, ihr hochdeutsche Ursprung*, 1862.

**Agricola, Rodolphus** (1443–85), b. near Groningen, Friesland, and d. at Heidelberg. He was educated at Louvain, then went to Paris and Ferrara, where he attended the prelections of Theodoro Gaza on the Gk. language, and also gave lectures on the language and literature of Rome. He visited Rome, returned to Holland, and then went to Heidelberg in 1482. He was a great scholar (his most important work being *De Inventione Dialectica*), a musician, and a painter.

**Agricultural Adjustment Act**, an Act

passed by the U.S. Congress in 1933 in order to assist Amer. farmers. It provided for the setting up of an A. A. Administration to regulate prices of agric. products, partly by subsidising farmers in consideration of restricting cultivated acreage in accordance with a policy of soil conservation, and partly by purchasing and storing surpluses. For these purposes the A. A. Administration spent some 500,000,000 dols. annually. It was originally intended to secure reimbursement of the subsidy by taxes on industries engaged in processing agric. products, but the Supreme Court in 1936 declared these taxes void and funds had to be appropriated from other budgetary sources.

**Agricultural Bureau, Imperial**, an inter-imperial organisation, composed of nominees of the United Kingdom, the dominions and India, and of the Colonial Office, set up in 1929 to administer a number of bureaux so organised as to act as clearing houses of information on research in various specialised fields of agric. science, and financed from a common fund provided by the Govs. of the empire; these Govs. instructed it in 1933 to supervise the administration and finances of the Imperial Institute of Entomology and the Imperial Mycological Institute and in 1937 to organise bureaux for forestry and dairy science. The executive council of the bureaux submits ann. reports to each of the Govs. concerned. The bureaux are attached to appropriate research institutions, but are distinct from them.

**Agricultural Credit** is defined as 'a means of facilitating the flow of capital into agriculture wherever it can profitably be used for these purposes.' It embodies the problem of finding 'an adequate agricultural substitute for the industrial joint-stock method of obtaining working as well as initial capital.' These 2 capital needs of agriculture are met by the short-term, the intermediate, and the long-term credit.

**Short-term credit** is necessary to the farmer to finance marketing operations. Without this credit he may be forced to put his produce prematurely upon an unwilling market in order to meet his immediate liabilities. In the U.S.A. and Australia co-operative marketing associations receive the produce from the growers and make them an advance upon it. In Great Britain the best source of short-term credit is from the joint-stock banks. The security is that afforded by title-deeds, etc., or the loan may take the form of an overdraft. Agric. wealth—stocks and crops—is not a recognised security with a bank, except by a bill of sale, and the publicity attaching to this form of advance prejudices it in the eyes of the farmer.

**Co-operative credit** in Great Britain had some provision made for it under the Agricultural Credits Act, 1923. It was not successful, owing to the reluctance of the individual farmers to use the provisions, and the State has since withdrawn its financial support. On the continent the co-operative system on the

Raiffeisen model, originated in Germany, has been a conspicuous success, depending as it does on the deposits of a large number of peasant proprietors rather than on the resources of the State, as in Great Britain.

*Long-term credit* is not the business of the joint-stock bank. In Great Britain there had been no machinery enabling the farmer to obtain long-term or intermediate credit, necessary for farm purchase or permanent improvement. Provision is made under the Agricultural Credits Act, 1928, for long-term loans to be made to farmers by an agric. mortgage loan company, assisted financially by the Treasury. Under this Act the farmer's short-term requirements are also met by a floating charge on his stock and crops.

A proposal to inaugurate a Central Land Bank was put forward in the *Report on Agricultural Credit* (Economic Series No. 8), pub. by the Ministry of Agriculture in 1926. The sequel was the creation of the Agric. Mortgage Corporation—the first agric. mortgage bank to be estab. in Great Britain. The corporation is owned by banking and financial institutions and the dividend is limited to 5 per cent.

**Agricultural Holdings.** A Consolidating Act was passed in 1923 repealing and re-enacting, with changes, the Agricultural Holdings Acts 1908 and 1913, and the Agricultural Act, 1920. Under this Act a tenant has a right to compensation for improvements whether the improvement was or was not one which he was required to make by the terms of his tenancy. A schedule to the Act enumerates the improvements to which the landlord's consent is required. They include the erection or alteration of buildings; laying down permanent pasture; planting osier beds; irrigation works; gardens; making roads or bridges, water-courses, ponds, wells, permanent fences; reclaiming waste land; planting of orchards or hops; sluices against floods; and, in the case of arable land, the removal of bracken, boulders, etc. The tenant also has a right to compensation for damage by game, where the right to kill and take the game belongs to someone else. Compensation for disturbance of his tenancy is payable for some other reason than failure to cultivate the holding properly or to pay the rent due, or bankruptcy, or breach of some term or condition of his tenancy. By the Agricultural Land (Mobilisation) Act of 1931 the Ministry of Agriculture is empowered to provide small holdings, with financial assistance, for unemployed persons, or for agric. workers or suitably trained ex-service men. But the Ministry must be satisfied that the person is not of sufficient means to enable him to obtain a small holding from the co. council.

**Agricultural Machinery and Implements** have undergone in the twentieth century a rapid development, chiefly in the direction of adapting mechanical power (steam, petrol, or electricity) to their use. For motive power 3 classes of engines are

used: the portable, tractor, and stationary. The portable engine, mounted on road wheels, when not needed for threshing can be bolted up to any of the machines used on a large estate for such operations as sheep-shearing, wood-sawing, etc. The tractor is used for ploughing and harrowing, and can haul mowers, binders, etc. Steam ploughing has been largely superseded by motor-tractor ploughing. For a type of tractor the high-speed engine on a light frame certain has advantages, but the heavy tractor, if the soil can carry it, saves expense in repairs. The stationary engine can be installed in the barn or shed to drive fodder and dairy machines. The usual type is a vertical engine with multi-tubular boiler. Electric motors are sometimes used.

The various agric. implements may be classified under the following heads:

**Tillage Implements.**—Ploughing breaks up the soil into furrows, exposing it to the action of the atmosphere. Steam ploughing is not so successful as horse or tractor ploughing, but both plough and tractor must be adapted to the particular soil. Two distinct types of plough are the mouldboard plough and the disk plough, the former being more widely used. The function of grubbers, or cultivators, is to rend the soil with their curved teeth. The newest form of cultivator has a steel frame with sickle lines, able to penetrate the hardest ground. The spike-tooth or drag harrow is used to prepare the seed-bed after ploughing. The disk harrow is suitable for a stubble surface, and the spring-tooth harrow for hard or stony ground. Rollers are used to break up the clods and to smooth the surface after sowing. The most common type is the ring-roller. Various kinds of horse-hoes are used to stir the soil while the crops are still growing, at the same time destroying weeds.

**Seeding Machines.**—Seed-sowing machines scatter the seed either broadcast or in furrows, according to the class of seed sown and the crop required. The seed drill deposits the seed in the soil at equal depths, and there is a device for covering the seed with fine soil after it has been deposited. The potato drill is a machine having cups on an endless chain, which lift the tubers from the hopper and plant them at regular intervals.

**Harvesting Machinery.**—The self-binder cuts the standing corn and passes the cut corn on to a sheafing deck, where it is bound and knotted and finally ejected on to the ground. For hay harvesting the reaper works in connection with the swath-turner and collector. There are also machines for loading, stacking, and pressing the hay. For potato-raising the machine is fitted with forks, which throw out the potatoes without bruising or scattering them; a new type of potato harvester, whose manufacture commenced in 1948, lifts 60 tons in 8 hrs. The sorter is a machine which grades 5 tons of potatoes per hr. in 3 sizes.

**Threshing Machinery.**—The thresher

separates and cleans the grain weighs it, and delivers it into sacks at the same time delivering the cut straw tied into bundles. The whole process takes about 30 secs.

**Harvester thresher and Combine Baler** — The spread of mechanised farming has led to the introduction of a variety of labour saving machines notably those which combine the operations of 2 or more existing ones. Amongst these is the harvester thresher which combines the 2 operations of cutting and threshing grain. Essentially it consists of the appropriate parts of a binder and a threshing

progress in agriculture must be based. It is allied with experimental work which aims at directly improving farm methods. A.R. began with the experiments carried out in 1834 by Joseph Boussingault (qv) on his farm in Alsace. Since then institutes for research in agriculture have sprung up all over the world and it is now the recognised duty of a state to develop its agr. resources. As regards Great Britain a development fund was started in 1901 with a capital of £2,000,000 and State grants have been made increasingly to all research stations. A.R. is organised throughout the Brit.

John Lartien

#### THE COMBINE HARVESTER

The man seen standing is tying off filled bags of threshed grain

machine mounted on a common chassis. Another machine of this type is the combine baler, which picks up hay from wind rows in the field and packs it into bales.

**Manure Distributors** of various types admit of either broadcasting or drilling, and are able to deal with all kinds of fertilisers. The dung spreader is simply attached to the end of a wagon, and distributes the manure fan wise over a large stretch of ground.

**Food preparing Machines** save labour in preparing food for the various animals. Such are gist mills, chaff cutters, root pulpers, machines for slicing and shodding roots, breaking oilcake, etc.

See also under **DAIRYING** and **CHEESE**. See also H. J. Hine *Tractors on the Farm*, 1942, National Federation of Gas & Coke Associations, *Combine Harvesting and Grain Drying*, 1914 (Culpin Farm Machinery), 1946.

Agricultural Research establishes the fundamental natural principles on which

Empire and in 1927 an Imperial Research Conference was called with the object of providing a stimulus for the development and co-ordination of A.R. overseas in the interest of Empire trade and production. In Finland, Wales and Scotland the research institutes are controlled by independent bodies usually attached to univs., but dependent on the State for funds. In N. Ireland the work is entirely administered by the Ministry of Agriculture for N. Ireland. The A.R. Council, created in 1931 as part of the organisation for the scientific supervision of gov. aided research in all spheres, advises the development commissioners and the agric. depts. upon the application of moneys voted by Parliament for the furtherance of A.R., besides itself promoting research with the aid of funds from Parliament or from any other source.

The problem of agric. science may be classified under the following heads

**Soil.**—The Rothamsted Experimental Station, founded by Sir T. B. Lawes (*q.v.*), is famous for its research into the chem. of the soil.

**Plant-breeding.**—The Cambridge Plant-breeding Institute has produced 2 new forms of wheat—'Yeoman II,' superior for milling and baking, and 'Cambridge Broomick,' a stiff-strawed wheat for intensive cultivation. (Grass-land farming is studied at the Welsh Station, Aberystwyth, and the Scottish Station, Corstorphine. The fundamental principles of plant-breeding are investigated at the John Innes Horticultural Institute, Merton, Surrey.)

**Plant Physiology,** referring to the inner processes of growth, is studied at the Research Institute in Plant Physiology, London. Field experiments, allied to this work, with hay, barley, and wheat, are conducted at Rothamsted, with oats at Linscliden, Dumfries, and with clover hay at Harper Adams College, Newport, Salop.

**Fruit Research** is centred at Long Ashton, Somerset, at E. Malling, Kent—famous for research in layered root stocks—and at Cambridge, in connection with the fruit-growing area there.

**Plant Diseases** have been combated by practical research throughout the United Kingdom. Pests which affect glasshouse crops are investigated at Cheshunt Research Station.

**Stock-feeding** is, in England, the concern of the Animal Nutrition Institute at Cambridge Univ., and, in Scotland, of the Rowett Institute at Aberdeen Univ. As part of a pig-research scheme, feeding trials are conducted at Harper Adams College.

**Animal-breeding** is the subject of extensive research at the Physiological Institute, Cambridge, while the work on sheep-breeding at the Research Station, Edinburgh, is noteworthy.

**Dairying.**—Clean milk is an outcome of the activities of the National Institute for Research in Dairying, estab. at Reading in 1912. In 1920 a farm of 340 ac. and a dairy herd were acquired. The Dairy School at Kilmarnock exists primarily for education, but the use of bacterial cultures as a starter in cheese-making was first examined there.

**Animal Diseases.**—The Institute of Animal Pathology is at Cambridge, and the scope of research at the Royal Veterinary College, London, has been enlarged. The London School of Hygiene and Tropical Medicine, which studies animal and plant parasites, is equipped with field laboratories at St. Albans. In Scotland the Animal Diseases Research Association, transferred to Moredun, near Edinburgh, now works in conjunction with Edinburgh Univ. In N. Ireland provision for the study of animal diseases is made at the State laboratories at Stormont, Belfast. In Mar. 1924 a committee of pathologists was appointed to investigate foot-and-mouth disease. Research was conducted at the Gov. laboratories, New Haw, Weybridge, and at the Foot-and-Mouth Disease Experimental Station at

Pirbright. See V. E. Wilkins, *Research and the Land*, 1926; also *The Report of the Imperial Agricultural Research Conference*, 1927.

See also AGRICULTURAL BUREAU, IMPERIAL.

**Agriculture** (Lat. *ager*, field, *colere*, to cultivate) in the strict sense is the art concerned with tillage of the ground and the raising of crops, but is now generally understood to include every branch of farm practice, upon which all the natural sciences have more or less bearing, as epigrammatically summed up in the motto of the Royal Agricultural Society, 'Science with Practice.' He who would pursue A., or the allied industries of horticulture and forestry, with the maximum of success should not only realise the possibilities presented by advances in science and be conversant with every practical detail, but must also know how best to adapt his methods of procedure to local conditions.

**History.**—In W. Europe, as elsewhere, a great stride was made in civilisation when prehistoric man, during the polished stone or Neolithic age, ceased to be a mere wandering hunter and adopted a more settled life, resulting from his discovery of the possibilities of tillage of the ground and domestication of animals. The Neolithic farmer lived in vil. communities, his habitations being sometimes in the form of lake dwellings; his domesticated animals included the dog, horse, ox, sheep, goat, and pig; his crops included wheat, barley, and millet; and he practised the arts of spinning, weaving, and pottery-making. Such primitive prehistoric beginnings, improved by numerous successive stages, ultimately led to the evolution of the vil. system prevalent in England during Saxon times and for long afterwards. The houses of the villagers clustered together in the centre of an area partly consisting of pasture, but to a larger extent of arable land, divided into 3 fields, one under grain, a second under peas, beans, or grain, and the third fallow, i.e. without a crop, and in a state of preparation for receiving one in its turn. The introduction of potatoes, red clover, and turnips in the seventeenth century marked a considerable advance, and the next century was epoch-making in sev. ways. During its latter part the most important name is that of Jethro Tull, who demonstrated the advantage of *thorough cultivation of the soil*, and initiated the practice of *drilling* as against broadcasting seed, thus causing the crop-plants to grow in rows, the intervals between which can be stirred and cleaned by horse-hoeing. This led to the abolition—in most cases—of bare fallow, largely a device for thorough cleaning of land, and found a place for turnips and other root-crops. Hence the replacement of the 'three-field' system of the vil. community by the *Norfolk or four-course rotation*, initiated by Charles, second Viscount Townshend ('Turnip Townshend'). The cultivation of turnips and other root-crops on a large scale rendered possible the

winter feeding of cattle, and thus did away with the extensive use of salted meat during that season, a practice very detrimental to the health of the community. The eighteenth century witnessed great improvements in farm animals, due to the pioneer work of Robert Bakewell, who effected great advances in the quality of horned stock and sheep, largely by means of in-breeding. Among other benefits derived therefrom was great reduction in the age at which bullocks and wethers were ready for the butcher. In the earlier half of the nineteenth century we find *improved methods of draining land*, largely due to Elkington and Smith. Associated with these advances came marked improvements in tillage implements, and much enclosure of land as a result of the 'new husbandry' rendered possible by Tull's work. During the nineteenth century many advances took place in continuation of those just mentioned, and sev. new lines of progress were initiated, but the years 1815-40 were marked by disastrous agric. depression. The following dates are significant as marking the beginnings of various forms of agric. activity which have had far-reaching results; Bath and W. of England Agric. Society, 1777; Highland and Agric. Society of Scotland, 1784; Chair of A. and Rural Economy in Edinburgh Univ., 1790; Board of A., 1793; Smithfield Club, 1798; Royal Agric. Society of England, 1838; Rothamsted Experimental Station, 1843; Royal Agric. College, Cirencester, 1845. The nineteenth century witnessed the improvement of crops by means of *artificial manures*, dung and various forms of rubbish being the only kinds of fertiliser previously employed. Bones came first, though Sir Humphry Davy (lecturing 1802-12) also mentions phosphate of lime, sulphate of potash, and salts of magnesia. Nitrate of soda and guano were first imported 1830; superphosphate resulted from the researches of Lawes and Liebig, and began to be used on a large scale in the early forties; potash manures, prepared from the Stassfurt deposits, came later, and were followed by the discovery of basic slag. The *improvement of wheat by crossing* was commenced by Knight towards the end of the eighteenth century, and taken up by Maund much later; while Shirreff began to improve cereals by *selection* in 1819, a variation of his method being subsequently practised by Hallett (1857). Practically all kinds of crop-plants were improved on similar lines. During the nineteenth century also the necessity of using *clean seed*—first realised in Denmark—was increasingly recognised. The implements of tillage were still further improved, *reaping machines* and other contrivances for harvesting and after-treatment of crops were evolved in profusion, and different forms of *power* employed for working many of them. During the century great advances were also made in the knowledge and treatment of *plant diseases*, especially those due to the attacks of parasitic organisms. The

rapid improvement in biological appliances (especially microscopes) and technique not only placed the study of *injurious fungi* on a scientific footing, but also enabled the science of *bacteriology* to be created, largely as a result of the pioneer work of Pasteur. Bacteria were found not only to be agents of infectious disease, but also to play an important part in the chemical changes which go on in the soil, in dairy processes, and so forth. Equally valuable progress was also made in respect of *live-stock*. Many breeds were improved or estab. on Bakewell's lines, and the formation of numerous breed-societies in the latter part of the century secured the maintenance of high standards. The biological advances above mentioned enabled great improvement in the treatment of *animal diseases*, while at the same time the importance of *farm hygiene* came to be realised. *Artificial foods*, of which linseed cake was the first (1795), gradually came to play an important part in winter feeding and the promotion of early maturity. Gilbert in England and von Wolff in Germany, with many others, placed the feeding of stock on a scientific foundation. (*See CATTLE.*—*Scientific Methods of finding Feeding Standards.*) The invention of the *cream separator* proved of great importance in the improvement of dairy work. A. has continued to make considerable advances during the present century on all the lines indicated. The application of *Mendelian principles* to the breeding of plants and animals, especially the former, is leading to considerable results, as in the production of *rust-resisting wheats* by Biffen, improved cereals, etc., at Svulof, and so forth. Further progress in research, horse-breeding, and education are assured by the establishment of a *Development Fund*.

*The Soil.*—Crops derive most of their food from the soil, in the form of a very dilute solution of mineral substances, though the air provides them with carbonic acid gas and they breathe in its oxygen, while the nitrogen of the atmosphere is fixed for their use by certain soil bacteria and—in the case of leguminous plants—by other forms of the kind living in swellings or nodules on the roots. As, too, animals depend directly or indirectly on plants as their source of food, it is obvious that a thorough knowledge of the soil is essential to the intelligent practice of A. By whatever agencies different soils may have been formed, a certain amount of organic substance, *humus*, due to the decay of organisms, must be present in addition to the mineral particles formed by disintegration in order to secure fertility. (*Green manuring*, i.e. the ploughing in of a rapidly growing green crop, is one way of supplying such material. The *physical properties of soils* largely determine the rate and amount of growth of crops, and therefore require notice. A particular soil consists of particles of varying size, with narrow interstices between them, collectively forming the *pore space*. Each particle is

closely surrounded by a film of water, and it is these films which are utilised as *plant food*. The free water in the interstices is more or less removed by drainage, and if this goes on too slowly a free circulation of air must be promoted by artificial means, especially when a large proportion of clay is present. As the water in the soil is used up, fresh supplies rise from below by capillary action, which also replaces the loss by surface evaporation. While drainage gets rid of superfluous moisture, it is often necessary in a hot climate or season, more particularly in the case of sandy soils, to *conserve the moisture* present. This is effected by constant stirring of the surface, by hoeing and otherwise, evaporation being thus checked. In some cases *mulches* of decaying vegetation, or other substances more or less impervious to moisture, answer the same purpose. Such conservation is practised to a very large degree in 'dry' farming, a comparatively new practice in arid regions, such as parts of the U.S.A. The *temperature* of the soil, partly determined by colour and aspect, is also of importance, more especially because seeds require a certain amount of heat in order to germinate, so that whether a given crop is early or late very largely depends upon this factor. The *classification of soils* is based on their *chemical composition*, and depends upon the proportions they contain of sand (mainly silica), clay (impure silicate of alumina), carbonate of lime, and humus. Sand is warm, and easy to drain and till, but apt to become too dry, and but little retentive of plant food. Clay is cold, retentive of moisture and plant food, hard to drain, and difficult to work. A proportion of *carbonate of lime* is important, because it furnishes one kind of plant food, helps to break down organic matter, and improves the texture of clay. Humus supplies nitrogenous matter, and its presence is associated with important bacteria, some of which effect *nitrification* of organic substances—with production of *nitrates* valuable as plant food—while others are *denitrifying* agents and lead to loss of nitrogen. Most soils are of *mixed* character, *loams* being primarily a mixture of sand and clay, while *marls* are made of clay and calcareous matter. Medium loams, with a certain admixture of calcareous material and humus, are the best soils for general purposes.

*Improvement of soils* is effected in a great variety of ways, the aim being to impart such desirable physical and chemical characteristics as are naturally lacking or deficient. *Artificial drainage* of heavy soils, for example, removes superfluous water and promotes the circulation of air, and in such case *winter ploughing* exposes the clods to the disintegrating action of frost. The lighter soils, on the other hand, require *consolidation*, as by the treading of sheep folded upon them, while hoeing and similar acts of tillage help to conserve the moisture which drains away too readily. It may also be said in general that *tillage*, by means of ploughs, cultivators, harrows,

and so forth, artificially imitates disintegration by natural agents, and produces a seed-bed of fine texture (tilth) made up of innumerable particles to which cling the films of moisture that serve as plant food. The application of suitable *manures*, though in some cases of physical importance, is mainly directed to supplying forms of plant food present in insufficient amount, such as—more particularly—lime, nitrogen, phosphorus, and potash. A distinction may here be drawn between natural and artificial manures. Among the former may be mentioned quicklime and ground limestone, of obvious importance in the case of soils deficient in calcareous matter, and also of great value in improving the texture of clays, and mellowing sour soils too rich in humus by disintegrating the organic matter and neutralising the acids. To the same category belongs *furnyard manure*, or *dung*, which not only improves the texture of soil, but is also a *complete* fertiliser, since it returns to the soil all the essential constituents of plant-food. The excreta of grazing stock have a similar chemical effect. *Artificial manures* may contain one or more than one kind of plant food. Among the latter sort may be particularly mentioned *Peruvian guano*, derived from the excrement of sea birds, and containing compounds of nitrogen and phosphorus. *Phosphatic manures* include various *bone* preparations, and *superphosphates* prepared by treatment with dilute sulphuric acid of finely ground bones or mineral phosphates. The most important deposits of the latter are in Florida and N. Africa. Accumulations of guano from which the nitrogen has been practically washed out ('crust' guanos) are also very valuable as a source of phosphorus. *Basic slag*, or *Thomas phosphate*, produced as a by-product in iron-smelting, is another important phosphatic manure, giving particularly good results when reduced to a very fine state of division. The chief *nitrogenous manures* are *nitrate of soda*, of which large deposits exist in Peru and Chile, *sulphate of ammonia*, a waste product from gas-works, and various *refuse substances* such as soot, shoddy, dried blood, horns and hoofs, damaged feeding-cakes, and so forth. It has also been found possible, by electrical means, to cause the free nitrogen of the air to enter into combination, with production of *calcium nitride* and *calcium cyanamide*. The leading *potash manures* are *chloride of potash*, *sulphate of potash*, and *kainit*, which consists of potassium sulphate and chloride together with compounds of sodium and magnesium. The *manurial treatment of crops* varies with their food requirements, which are by no means uniform in different plants; but in any case the aim is to add what is deficient in the soil as cheaply as possible. The method at time of application are naturally of importance. The *value of manures* is best determined on the *unit system*, and the *units* of nitrogen, phosphate of lime, and potash are taken at 1 per cent of a ton.

*Crops* in the widest sense are divisible into what is broadly termed 'grass,' and plants which are grown upon arable land. *Temporary grassland* bears grass, with clover and some other plants, and after a time is reconverted into arable. *Permanent grassland* includes *pastures*, which are grazed but not mown, and *meadows*, which are mown for hay either every year or at less frequent intervals. The botanical composition varies with the kind of grass-land, and it is obvious that the manurial treatment must also vary, especially when it is remembered that grazing stock effect a certain amount of natural manuring; while meadows do not benefit in this way to the same extent, and the hay crop is a continuous drain upon the resources of the soil without any manurial return. The *seed mixtures* employed when land is laid down to grass are different according as temporary or permanent grassland is the object in view, as also in relation to the kind of soil. In the case of *temporary grass*, rapid growth is of most importance, and perennial species need only be added should it be intended to maintain the area under grass for some years. A 1-year lea may even consist of broad red clover only, a plant which botanically is not a grass at all. The seed-mixtures employed for the production of *permanent grass* chiefly consist of grasses and various leguminous plants, to which are sometimes added composites (yarrow), rosaceous species (burnet), and umbellifers (sheep's parsley). Land, before being laid down to grass, should be very thoroughly cleaned, autumn ploughing being followed in spring by harrowing and rolling, by which means a finely divided seed bed is obtained. It is a common practice to 'nurse' the young grass by sowing it with a corn crop, and sowing is followed by light harrowing and rolling. By mowing the first year, and giving either a complete dressing of dung or a suitable mixture of artificials, the incipient permanent grass will be given a fair start. In subsequent treatment chain-harrowing is of importance for pulling out moss and some injurious grasses, while the manuring varies according to the local character of the soil. Grazed land, except perhaps for dairy purposes, gives the best result when horses, cattle, and sheep are maintained in suitable proportions, and turned out at suitable times. The processes involved in *haymaking* have as their object the conversion of grasses and associated plants into dry food. Although, unfortunately, largely dependent on weather conditions, there is here much room for judgment, and the time element has been under much better control since the introduction of various machines. Cutting should take place when the grasses are in flower, and before the formation of seeds has effected too great a drain on the nutrient substances contained in the stems and leaves. *Ensilage* is a method of converting herbage into succulent fodder, and, as the necessity for drying is avoided, can go on independent of weather. The crop is collected and

consolidated either in a simple heap or *silo stack*, or in a *silo*, which may be simply a hole in the ground, or a specially constructed receptacle. Fermentation takes place by bacterial action, and the resulting *silage* is sour (containing a large proportion of organic acids) when the temp. remains below 120° F., and sweet (with an aromatic odour) at higher temps.

It is generally recognised that the best results are obtained with crops on arable land when the same kind of plant is not grown continuously in any particular field, but a regular change or *rotation of crops* is practised. The advantages consist in the production of healthier plants, less liable to the attacks of pests, a saving in manure (since different crops vary in their requirements), provision for the needs of stock, and economy in labour. In this way, too, the plant food contained at different depths in the soil is drawn upon, for the roots of some culture plants feed in the surface layers, while others penetrate more deeply. The most typical arrangement is the *four-course* or *Norfolk rotation*—an autumn-sown cereal, roots, a spring-sown cereal, a leguminous crop. The autumn-sown cereal is commonly *wheat*, though *oats* may take its place, and its needs as regards nitrogen have been catered for by the preceding nitrogenous crop. The *straw* produced is valuable for fodder, litter, and thatching, and also provides work for the horses. The following *root crop*, replacing the old bare fallow, may consist of turnips, swedes, mangolds, carrots, or parsnips, where the nutritious part is really the root, and other plants which serve the same purpose, e.g. potatoes, of which the tubers are really thickened underground branches. The root crop is important because it gives an opportunity of thoroughly cleaning the land, and provides a large amount of fodder for stock, the constituents of which, essential for plant food, are largely returned in the form of dung. The *spring-sown cereal crop* consists either of barley or oats, the one chosen depending upon local conditions. The fourth, or *leguminous crop*, is of a restorative nature, especially as regards nitrogen. It is commonly spoken of as 'seeds,' because it may consist of a mixture including grasses, and is sown at about the same time as the preceding crop, so that it may have a chance of establishing itself. Clovers are an important element, but may be replaced by peas or beans. Deviations from the 4-course rotation are well known. They are arranged on the same principles, and may be regarded as adaptations to local conditions.

*Cereals*.—*Wheat* is best suited to soils with a considerable proportion of clay, and does best in a warm dry climate. As in cereals generally, the production of *straw* as well as *grain* must be borne in mind when selecting a variety for any particular locality. The choice of a suitable kind of wheat (and the same thing is true for any other cultivated plant) may to some extent be guided by

*variety tests*, where different sorts are grown side by side under similar conditions. The artificial manure giving best results for wheat (and other cereals) is nitrate of soda, to which basic slag or superphosphate may be added. Wheat should be harvested before it is quite ripe, and the average yield is about 30 bushels per ac., with 30-35 cwt. of straw. *Oats* may be grown on a great variety of soils, and do best in a cool damp climate. They must be harvested before becoming ripe, as the mature grains easily fall out. The average yield is 40-60 bushels per ac., with 30 cwt. or more of straw. *Barley*, most important for malting, is most successfully cultivated in the lighter calcareous soils, and in areas where the climate is dry. Owing to the necessity for uniform quality in the grain, the cultural operations have to be unusually thorough and careful. Average yield, 32-10 bushels per ac., with about 20 cwt. of straw. *Rye* is very little grown as a grain crop in Britain, but yields 21-32 bushels per ac., with 30-40 cwt. of straw. It is more often employed as a forage crop, which should be fed off early. It is harder than the other cereals, and thrives in soils and at low climatic conditions where these do badly. *Pulse crops*.—*Beans* do best on heavy soils, especially when these are of calcareous nature. Potash and phosphoric manures are of most importance, for, like all leguminous plants, beans enrich the soil in nitrogen. The yield is 30-40 bushels, with 25-30 cwt. of haulm. *Peas* differ from beans in being better suited for the lighter soils. The average yield is about the same. *Root crops*.—*Manure* is adopted to stiff soils and a dry climate. Very thorough preparation of the soil and after-cultivation are necessary. The average yield is 15-25 tons per ac. *Sugar beet* is closely allied to manure, and needs the same kind of treatment, but more labour is required, for the cultural operations have to be carried out with great attention to details. Attempts have now been made, with aid of a Gov. subsidy, for some years past to promote the growing of sugar beet on a large scale in Britain, and there appears to be no difficulty in raising the crop. *Swedes* are a valuable variety of the turnip, and belong to a different natural order (Cruciferae) from that (Chenopodiaceae) including mangel, so that it is not surprising to find their requirements somewhat different. They thrive best in the lighter soils and in a cold climate, provided plenty of moisture is available. The crop is shallow-rooted, and phosphatic manure is the one most necessary. Yield, 12-20 tons per ac. *Turnips* proper are comparable to swedes in most respects, but give on the average a larger yield, though not so valuable for feeding purposes. *Carrots*, a valuable crop for feeding horses and dairy stock, are only suited to light soils free from weeds, and require a fine seed bed. The cost of production is considerable. Average yield, 10-20 tons per ac. *Parsnips* are a similar crop, but, being tolerant of frost, can be left in the ground until wanted.

Average yield, 8-14 tons per ac. *Potatoes* are best suited to deep loose soils with a moderate amount of humus, but they can be successfully grown on almost any soil—except those of the heaviest kind—by adapting the treatment. They vary from early to late according to the time of maturity, and the production of the first kind is a very paying industry. The crop is usually propagated by 'sets,' which are either the entire tubers (thickened underground branches), or portions of the same including at least one 'eye' (bud). After a time a variety so cultivated begins to deteriorate, and fresh kinds are constantly being raised from seeds produced by crossing, though only a small proportion of these are of economic value. Manure treatment may be by dung alone, by a complete mixture of artificials, or— and best—by a mixture of the two. Potash is particularly essential. Average yield 6-10 tons per ac., or less in the case of early potatoes. *Kohl rabi*, *thousand-headed kale*, and *cabbages* are cruciferous forms which, though they do not produce thickened underground parts, may broadly be classified with the root crops, and receive much the same treatment. They are very healthy, resist frost and drought, are extremely nutritious, and are improved by transplanting, thus increasing the time for cleaning the land. Average yield per ac.: kohl rabi, 20-25 tons; thousand-headed kale and cabbage, 30-40 tons. *Cruciferous forage crops*.—Strictly speaking, a forage or fodder crop is one grown for the feeding value of its stems and leaves. The last 3 crops named are therefore sometimes included here. *Rape* is cultivated in much the same way as turnips, and *white mustard* is often grown as a summer catch crop, i.e. a crop which is not part of a regular rotation, but grown in an interval. It is obvious that rapidly growing plants are best suited for this purpose. The average yield per ac. of the two preceding crops is 10-15 tons. *Leguminous forage crops*.—*Lathes* or *fures* are grown to provide spring or summer fodder, and are a common catch crop. Potash manure is most essential, and some form of phosphate is usually added. When grown for seed the average yield is 25-30 bushels per ac., with about 25 cwt. of haulm. *Lucerne* and *sainfoin* are perennial deep-rooted species suited to loams of calcareous nature. They may either be used for forage or converted into hay. *Scotch* or *Italian clover*, commonly known as *trifolium*, is a catch crop sown for the production of forage in the spring and early summer. *Clivers* and '*seeds*,' i.e. various clovers plus grasses, constitute an important course in rotation, sown with a cereal, or somewhat later, and coming into use a year afterwards. *Weeds* are plants belonging to various natural orders which are harmful in the main, using up nutrient matters to the detriment of crops, and helping fungoid and insect pests to tide over unfavourable seasons. It has been shown experimentally that they may reduce the yield by as much as

one-half. They are best kept down by using clean seed and keeping land in a high state of cultivation, to which a locally suitable rotation conduces in no small degree. The use of the hoo on arable land, constant cutting of thistles on grassland, and spraying charlock with a per cent solution of copper sulphate, may be mentioned as typical examples of remedial measures.

**Farm Stock.**—These chiefly consist of horses, cattle, sheep, goats, and swine. Horses are divided into *light breeds*, including thoroughbreds, hunters, hackneys, ponies, Cleverlands, and coaching horses; and *heavy breeds*, to which belong shires, Clydesdales, and Suffolks. The heavy breeds are of agric. value, because they do so much work on the land, and the question of farm profit or loss largely hinges upon the intelligent use of horse labour. Shires, Clydesdales, and Suffolks are capable of performing the work required of them, the last-named breed being the most local.

**Cattle.**—Nearly a score of breeds are officially recognised in Britain, some of which are valued as beef-producers, others for milk, and still others for both purposes. Among the first kind may be mentioned Aberdeen—Angus (black), Galloway (black), Hereford (red), Highland (black), N. Devon (red), and Sussex (red). *Dairy breeds* are Ayrshire (various), Jersey (fawn), Guernsey (yellowish), and Longhorn (various). *Dual-purpose cattle* are Dexter (black), Kerry (black), Red Poll (red), Shorthorn (and Lincoln Red) (various), S. Devon (yellowish), and Welsh (black). (The predominant colours are given in parentheses.) The *polled* or hornless breeds are Aberdeen-Angus, Galloway, and Red Poll. *Longhorns* are particularly interesting because they were greatly improved by the pioneer breeding work of Bakewell, but their horns were against them, and they were superseded by the Shorthorns. The latter, now more widely favoured than any other breed, first rose into prominence in the latter part of the eighteenth century, owing to the production of a famous Durham strain by the brothers Colling. Other notable strains were subsequently established in Yorkshire by Booth and Bates, and in Aberdeenshire by the brothers Cruickshank. See CATTLE. The feeding and management of cattle are difficult arts, affording opportunity for the display of much skill and intelligence. The modern farmer is aware that the requirements of farm hygiene cannot be safely neglected, and the choice of artificial feeding-stuffs is now so large that the difficult question of *mixed rations* is receiving increasing attention. *Dairying* has reached a high pitch of perfection, especially in Denmark and other foreign countries—Canada, New Zealand, and Australia—the branch least successful financially—in Britain—being butter production. Sev. important factors have conduced to the modern development of the industry, and these include improvement of stock, rational feeding and management, and the keeping of milk

records, so that the worth of individual cows may be accurately known. The cream separator and other machines, and the introduction of power in large dairies, have reduced the labour bill and enabled some of the work to be effected in an improved manner. Even more important results have followed from the discovery that dairy processes are largely dependent upon the action of *bacteria*, some of which are beneficial and others harmful. Strict *cleanliness* in all stages is the best method of combating the latter. By the employment of *artificial cultures* of cream-ripening (lactic acid) bacteria it is possible to ensure butter of uniform quality, and this point has told strongly in favour of the Dan. and Ger. products, which have competed so successfully against us in our home markets. The standard of stock, for both milk and beef, is being improved by artificial insemination by pedigree bulls: this service is under the control of the Milk Marketing Board. See DAIRY; DAIRY FARMING.

Sheep are conveniently grouped into: 1. *Longwool breeds*—Cotswold, Devon Longwool, Kentish or Romney Marsh, Leicester and Border Leicester, Lincoln, Roscommon, S. Devon, and Wensleydale. 2. *Shortwool breeds*—Clun Forest, Dorset Horn, Hampshire Down, Oxford Down, Ryeland, Southdown, Shropshire, and Suffolk. 3. *Mountain breeds*—Black-face Mountain, Cheviot, Exmoor, Herdwick, Limestone, and Lonk. Among these the last group and the Dorsets are horned, and the remainder polled. The *Leicester* is the oldest breed of pure kind, which was greatly improved by Bakewell, and has since been used very largely for enhancing the value of many other types. Border Leicesters are a branch of the same breed. *Lincolns* are pre-eminent for production of wool, *Suffolks* and *Southdowns* are notable for their mutton—though the flavour of that from mt. breeds is greatly esteemed—while *Leicesters*, *Shropshires*, and *Oxford Downs* are among the leading dual-purpose breeds. Sheep are not only of direct value as producers of mutton and wool, but also as improvers of the land. When fed on light arable they greatly assist in consolidation, to say nothing of the manurial improvement effected, while they graze so closely that they can find abundant food on pastures which have already supported other classes of stock. The *mountain breeds* are of particular importance in utilising mountain tracts otherwise useless for agric. purposes.

**Pigs** are divided into Whites, Blacks, Berkshire (black with white points), Tamworth (golden-red), and Lincoln Curly-coated. As users of waste they play an important part in A., and are invaluable to the cottager and the small holder. Owing to their comparatively small stomachs, they require concentrated food, given at frequent intervals. Some of the best results are obtained from cross-bred animals.

**Fungoid Pests and Bacteria.**—The lower forms of plant life known as *fungi*,

and the still simpler microscopic *bacteria*, are unable to subsist on the simple compounds sufficing for ordinary green plants, the living substance of which, aided by the characteristic green pigment *chlorophyll*, can utilise the energy of sunlight for building up complex substances from water, carbonic acid gas, and certain mineral matters. Fungi and bacteria, in fact, somewhat resemble animals in their way of feeding, and are either *saprophytes* (e.g. mushrooms), depending on dead organisms or the products of their decay, or else *parasites*, which prey upon living ones. Many of the latter attack cultivated plants and domesticated animals, and are therefore very detrimental to A. They propagate by means of dust-like *spores*, which are readily disseminated by the wind. *rusts* are able to inflict losses of the most serious kind upon cereals and grasses, and the establishment of resistant varieties appears to be the most promising method of combating them. *Smuts* are fungi which prevent the formation of grains, these being replaced by powdery black spores. *Oat smut* (*Ustilago avena*) may be checked by 'pickling' the seed corn in dilute solutions of copper sulphate or formalin. *Hunt* (*Tilletia caries*) is nearly related to the preceding, but is distinguished by its greasy nature and unpleasant fishy smell. *Ergot* (*Claviceps purpurea*) attacks rye and meadow grasses, causing the grains to be replaced by hard spur-like bodies. These are particularly objectionable because they cause abortion in cows and ewes. *Potato disease* (*Phytophthora infestans*) attacks all parts of the potato plant, and is a pest of the most serious kind. Spraying with Bordeaux mixture (dilute solution of copper sulphate and quicklime) is the best method of treatment, especially as a preventive measure, for it stimulates healthy and vigorous growth. *Black scab or wart disease* (*Chrysophyctis endobiotica*) is due to a fungus of doubtful affinities, and is so serious as to be notifiable. Destruction of infected tubers and thorough disinfection of the soil are necessary, and the planting of a different crop for a time is highly advisable.

Speaking generally, fungoid pests of plants are best combated by high farming and rational rotations, by which vigorous and healthy plants are produced, able to resist the attacks of parasitic fungi, especially in the critical early stages of growth. A knowledge of the life histories of injurious forms often indicates the methods which can most advantageously be employed in dealing with them.

**Animal Pests.**—Among *mammals* the most pernicious forms are probably rats, mice, and voles, which all belong to the order *Rodentia* (gnawers). Rats and house mice are omnivorous, while field mice, harvest mice, and voles are vegetarian. All are exceedingly prolific, and when favoured by local circumstances, some of them—especially *field voles* (*Microtus agrestis*)—may make their appearance in vast numbers and become veritable plagues. *Rats* are objectionable

in another way, for they help to disseminate the disease known as *trichinosis*, due to minute thread-worms, while some of the fleas which infest them are known to spread the germs causing *oriental plague*. In coping with injurious rodents their natural enemies—such as owls and weasels—should not be ruthlessly hunted down as 'vermin.' Ferrets, traps, poisons, and forms of 'virus' (bacterial cultures) are all employed, with varying success. Only a systematic campaign, supported by legislation, is likely to achieve anything like full success. *Hares* and *rabbits*, which are also rodents, may do much damage to crops, and the ravages of the latter in Australia are matters of common knowledge. One large landowner in that continent expends £1000 per annum on rabbit-catching.

*Wild birds* have a varied relation to A. Some are wholly or mainly beneficial, others are undoubtedly harmful in the main. Nor must it be forgotten that species are liable to change their habits. *Starlings*, for example, at one time predominatingly beneficial, have begun to attack fruit in some districts. It may be remarked in passing that the interests of the farmer and fruit-grower are not identical in this direction, for birds which may be useful to the former are pests to the latter. Among birds entirely or mainly *beneficial* are game birds, birds of prey (except the sparrow-hawk), owls, swallows, martins, swifts, and cuckoos. More or less *harmful* are the sparrow-hawk, pigeons and doves, hooded crow, bullfinch, greenfinch, hawfinch, house sparrow, blackcap, and other warblers. *Molluscs*, especially field slugs, are able to do considerable damage. Repeated applications of quicklime are here to be recommended. *Insects*, owing to their extraordinary variety, great powers of rapid propagation, and powers of flight, are among the most serious foes with which the farmer has to contend. Many of them have a complicated life history, hatching out as a voracious *larva* (e.g. caterpillars of butterflies and moths), which passes into a *pupa* or resting stage, capable of remaining dormant through the unfavourable season of the year, and giving rise in spring to the adult or *imago*. *Beetles* constitute an exceptionally large order, including many pests. The *cockchafer*, for example, lives below the surface as a larva (grub), feeding upon roots and underground stems. When adult it devours foliage. *Wireworms*, the subterranean larvae of *click-beetles*, are especially notorious, and are best dealt with by thorough cultivation and the use of gas-lime. *Turnip 'fly'* is in reality a small beetle, and various long-snouted *weevils* attack the roots, flowers, or seeds of sev. crops. The *Colorado beetle*, whose grubs and adults both eat potato leaves, is a dangerous visitor from abroad. By the exercise of drastic measures this pest has so far been prevented from establishing itself. Some beetles, however, are useful, such as the little *ladybirds*, the larvae of which devour large numbers of

plant lice (aphides). The order (Hymenoptera) including bees and wasps embraces the harmful *sawflies*, which in the larval stage infest turnips and various fruits. But we must not forget the benefits conferred by *bees*, important fertilising agents, while the hive-bee yields honey and wax. The *ichneumon flies* also do much service by laying their eggs in the eggs or larvæ of many injurious forms, thus bringing about their destruction. *Butterflies* and *moths* (Lepidoptera) are almost always injurious, for their larvæ (caterpillars) are among the most serious enemies of crops. The extensive order of *bugs* (Homiptera) includes many injurious forms, of which those variously termed *green fly*, *plant lice*, or *aphides* are perhaps the most notorious. They attack cabbages, turnips, beans, potatoes, hops, cereals, and other crops, and are probably the most prolific insects. The *two-winged flies* (Diptera) are in many cases injurious to both crops and stock. Of those injurious to crops, the *crane-flies* or *daddy-longlegs*, with their underground larvæ, are most universally known, while the *Hessian fly*, *corn-midge*, and *fruit-fly* attack cereals. Probably the most injurious member of the order infesting stock is the *ox-bot* or *warble-fly*, of which the larvæ live in the skin of cattle, damaging the hide, and reducing the value of the meat ('licked beef'). *Preventive measures*, directed against insect pests, include the high farming and rational rotations also useful in connexion with fungoid infestations. The grease-banding and tarring of fruit-trees are means of arresting the ascent of wingless female moths (e.g. winter moth) from the ground, where the pupæ are found. *Spraying* and *dusting* are important remedies, the poisons used varying according as the pests possess biting (e.g. beetles) or sucking (e.g. plant lice) mouth-parts. The aim in the former case is to poison the food, and in the latter to block up the breathing pores of the insect or otherwise destroy it by contact. *Spiders*, destroying as they do many injurious insects, are decidedly beneficial. *Mange*, *scab*, and *itch* are examples of animal diseases due to the presence of these pests. Mites infesting plants are combated in much the same way as insects. The notifiable disease called *sheep scab* is caused by a parasitic mite (*Psoroptes communis*), and is dealt with by means of various dips. *Ticks* are large mites which suck the blood of domesticated animals, and are not only directly injurious in this way, but may also introduce the germs of diseases (Texas fever of horned stock, and probably louping-ill in sheep). In some parts of the world, e.g. E. Africa, they are exceedingly detrimental and often fatal to stock, but regular treatment with suitable dips seems likely greatly to further the interests of A. in such regions. The farmer has to contend with a host of parasitic worms, some of which are able to inflict serious losses. The notorious *liver fluke* (*Fasciola hepatica*) is sometimes found in large numbers in the liver and

hepatic ducts of sheep, causing 'liver rot.' The parasite has a very complicated life-history, and part of its existence is spent in a small water snail (*Lymnaea truncatula*) often found on damp low-lying land liable to be flooded. The best precautionary measures consist in thorough drainage and proper control of the drinking water. *Tapeworms* (*Taenia*), when adult, generally live within the small intestine of man or domesticated animals ('final hosts'), absorbing the digested food found therein. Two tapeworms highly injurious to stock live when adult in the intestine of the dog. The bladderworm stage of one (*T. caninus*) is found in the form of large cysts on the surface of the sheep's brain, and is responsible for the disease variously known as *staggers*, *gid*, or *sturdy*. The huge compound cysts of the other (*T. echinococcus*) are found in the liver or other abdominal organs of man and various hoofed mammals. It is clear that an accurate knowledge of the life-histories of parasites such as those enumerated is essential for coping with them successfully. Some of the lowly microscopic creatures known as *Animalcules* (Protozoa) are the cause of *malarial diseases*, part of the life history being passed within the bodies of *dapple-winged mosquitoes* (*Anopheles*), the bites of which cause infection of the blood of human beings. As the larvæ of mosquitoes live in stagnant water, it has been found possible, in some places, to get rid of malarial diseases by drainage, or by pouring petrolum into ponds infested by the larvæ. A number of particularly deadly blood diseases of human beings and stock are caused by Protozoa, which in a certain stage of their existence are known as *trypanosomes*. The chief agents of infection are flies and ticks. In tropical Africa the bites of certain *tsetse flies* (*Glossina*) lead to *nagana* or *fly disease* of horse and ox, and *sleeping sickness* of human beings. Most likely a *gad-fly* introduces the germs of *surra* into Indian ruminants. *Texas fever* of cattle in N. America, and probably *louping-ill* of sheep in Britain, are communicated by ticks.

From what has been said regarding pests of all sorts it will be gathered that there is almost unlimited scope for scientific research, and upon this almost entirely depends the agric. development of tropical regions now rendered unhealthy by malarial diseases, or uninhabitable by serious parasitic maladies such as sleeping sickness.

*A. during and since the First World War.*—During the First World War several temporary Acts were passed with a view to increasing the amount of home-grown corn in the country. These included the Small-Holdings Colonies Act (1916), which provided for the purchase of land by the State for experimental small-holding colonies; the Corn Production Act (1917), which made provision for payments to growers of corn where the average price of wheat or oats was less than the minimum, and for a minimum rate for agric. wages, and gave power

to the Board of A. to enforce proper cultivation; and the Agric. Land Sales (Restriction of Notices to Quit) Act 1919. The weakness of the United Kingdom, however, in this its oldest industry, was emphasised by the war. Notwithstanding that the command of the seas remained with the Brit. Navy in so far as the unrestricted Ger. U-boat warfare failed to account for more than a certain percentage of mercantile shipping, the shortage was much more acute than it would have been had A. been in a flourishing condition immediately before the war. In spite of various Acts, such as those designed to encourage town-dwellers to go back to the land, the state of A. in the United Kingdom grew steadily worse. A period of depression began in 1922. Corn markets were adverse, with the result that the acreage of ploughland gradually diminished. By 1927 the area of ploughland in England and Wales had declined by about 700,000 ac. since the opening year of the war, and in Scotland by some 20,000 ac. The state of A. in Great Britain, in face of adverse economic forces, became critical in 1927, and chief hope was reposed in agric. credits. By the Agricultural Credits Act, 1923, the Ministry of A. is empowered 'to organise agric. credit societies or, in other words, approved societies registered under the Industrial and Provident Societies Act, 1893, having for their object the making of advances to members for approved agric. purposes. The Agricultural Credits Act, 1928, provides for loans secured on farming stock or other assets, through a company formed out of public funds. Provision was made by the Agricultural Development Act, 1939, for increasing the resources of this company.

High costs and low prices in the first decade after the war spelt losses and a generally uncertain outlook for Brit. A., which led, in 1930, to persistent agitation for Gov. intervention. The large stocks of grain produced in Canada, the U.S.A., and Argentina had an increasingly detrimental effect on the prospects of A. in Great Britain, and in some quarters a tentative suggestion was made for reciprocal arrangements with the Dominions, whereby foreign wheat should be subject to a tariff for the benefit of both Dominion and homegrown grain. Other critics as emphatically advanced the theory that better marketing arrangements were the real panacea, and in any event a far more scientific remedy than the much-boomed policy of 'free trade within the Empire.' Similarly, in the U.S.A. A. became an urgent national economic problem requiring solution, according to different schools of thought, by such measures as the tariff, improved transportation, and the formation of a Federal Farm Committee to devise remedies in the way of co-operative marketing and clearing-houses for agric. products. As in England, there was a growing realisation of the ramifications of A. and an appreciation of the fact that it was by no means a single industry, capable of regeneration by a simple panacea, but rather a con-

geries of specialised and mutually exclusive industries, depression in any one of which must have its repercussion on the rest. Thus remedies by a single legislative measure were not widely advocated, while attention became more closely centred in scientific research and in investigation of the causes of depression.

The Wheat Act of 1932 secures to growers of home-grown millable wheat a standard price and a market. The registered grower is entitled to receive from the Wheat Commission a 'deficiency payment' representing the difference between the average and standard price—standard price being 10s. a cwt. The money is provided out of a Quota Fund controlled and managed by the Flour Millers' Corporation. By an amending Act, 1939, the minister can, through an *ad hoc* committee, vary the standard price if general economic and agric. conditions justify that course; and he also has power to suspend quota payments where the average price has ceased to be under the standard and having regard to the amount standing to the credit of the fund. Under the Ottawa Agreements Act, 1932, the Board of Trade, in consultation with the Ministry of A., may regulate the importation of frozen meat and chilled beef. By the Agricultural Marketing Act, 1933, the Board of Trade may regulate the importation of any agric. product if a marketing scheme dealing with that branch of the industry is either in force or in course of preparation; but the board's power is not exercisable in relation to live-stock or to meat—other than bacon (Livestock Industry Act, 1937). Measures were taken before 1939 to reorganise pig production and also to enhance the prices of agric. and market-garden produce by duties on imported produce. The area sown to wheat in 1939 was not far short of 20 per cent greater than it was at the end of 1931, but that under barley and oats tended to decrease. Generally speaking, it may be assumed, however, that world conditions before the Second World War produced a second industrial revolution in which supply had outrun consumption. Prices might be artificially raised through quantitative regulation of imports, combined with measures calculated to secure a better organisation of different sections of the industry; but the opinion was widely held that more drastic measures were required to put the country on a footing that would ensure that it could rely on itself for its food supplies for any length of time in an emergency. After the Second World War, however, the damage caused by the war and the dislocation of agric. production led, in 1946, to a serious fall in the world production of wheat. A large number of countries, including the largest producers of grain, had reaped abnormally small crops, and the world was faced with conditions which threatened famine, besides setting back all plans for reconstruction. But apart from abnormal conditions

modern A. always requires assistance from research in agric. science and from improvements in agric. machinery. Many farms in Great Britain have been worked out and would, under present conditions, prove too costly to restore to a profitable state of cultivation. Soil, too, even under rotation cultivation, needs replenishing with expensive manures, and the cost both of manuring and draining poor soil is prohibitive. Legislation to assist farmers to increase the fertility of their land is exemplified in the Agricultural Act of 1937, under which provision is made for financial aid to purchase lime and basic slag. That Act and the Agricultural Development Act, 1939, provide for securing farmers against low prices for oats, barley, and fat sheep by subsidy payments or through schemes for promoting sales and stabilising the market; for raising the limit of the quantity of wheat in respect of which deficiency payments under the Wheat Act, 1932, might be made at the full rate; and for making further grants for land drainage. Extended powers as to drainage schemes are given by the Agriculture (Miscellaneous Provisions) Act, 1943. Statutory provision for the better organisation of the livestock industry and related industries is made by the Livestock Industry Act of 1937. Under this Act a subsidy might be paid to producers of fat cattle, the importation of livestock and meat might be regulated, as, e.g. by quota restrictions or levies, and a commission was set up to develop and organise the whole livestock industry.

*The Agriculture Bill, 1946.*—In principle, a largely agreed measure arising out of wartime consultations. It came before Parliament at the end of 1946, as the most comprehensive and far-reaching effort that any Gov. has made to deal with A. and the use of land for food production. The Bill seeks to provide stability through guaranteed prices and assured markets. In the context Part I. of the Bill sets out the proposed machinery for promoting and maintaining the lasting basis for 'a stable and efficient agricultural industry capable of producing such part of the nation's food as in the national interest it is desirable to produce in the United Kingdom and of producing it at minimum prices consistent with proper remuneration and living conditions for farmers and workers in agriculture, and adequate return on capital invested.' The products to be covered by guaranteed prices and assured markets include livestock, milk, eggs, grain, potatoes, and sugar beet, but not horticult. crops, for which other means will be devised. As regards husbandry, the Bill seeks to encourage the farmer who takes good care of his land while obtaining a full output. The tenant who improves his farm is assured fuller compensation when he leaves; and as a corollary the tenant whose farming is not up to standard gets shorter shrift. An agric. land commission is proposed to manage land taken over by the Ministry of A. The co. agric. executive committees are continued as the ministry's agents on the same basis as before; and

there is also to be an agric. land tribunal for each area of England and Wales, to which will be referred questions of the dispossession of owners and occupiers on the grounds of bad estate management or bad husbandry, and such matters as directions served on owners to provide fixed equipment, consent to notices to quit, and the division of farms. The decision of these tribunals will in all cases be final. Another part of the Bill deals with the provision of more small holdings by co. councils for men with previous agric. experience.

*Organisation of Agricultural Education in Britain.*—Although in many ways Great Britain is still behind such countries as the U.S.A., Germany, Denmark, and Sweden, considerable progress was made before the First World War in agric. education, upon which the future of A. so largely depends. The twofold system of univs. and colleges for higher education and the co. council courses for young persons, which now prevail, were merely the putting into execution of plans which were far advanced before the First World War, but stopped by that period of disturbance. These plans envisaged the replacement of the pre-existing and chaotic work of a large number of authorities of various kinds by an imitation of the Scottish system of agric. provs., with depts. of the univs. at the head of each. Scotland has 3 such provs., under the univs. of Aberdeen, Glasgow, and Edinburgh. It was proposed to divide England into 12 provs., with a central institution at the head of each, the institutions being Aberystwyth Univ. Coll., Bangor Univ. Coll., Bristol Univ. (with the associated Royal Agric. Coll.), Camb. Univ., Harper Adams Coll., Leeds Univ., Midland Agric. Coll., Armstrong Coll., Newcastle-on-Tyne, Reading Univ. Coll. (now Univ.), Seale-Hayne Coll., Newton Abbot, Manchester Univ. (with the associated college at Holmes Chapel), and Wye Coll. (part of London Univ.). This organisation has now been adopted, and 2 other institutions have been added, namely Oxford Univ. and Nottingham Univ. Coll., making 14 institutions in all where the higher teaching and research are to be given, aided by experimental stations at Rothamsted, Woburn, and elsewhere. Closely correlated with, and looking for advice, to the central institution in each 'province' are the 'farm institutes' (as was proposed before the First World War), broadly similar to those which have for some time been estab. at Basing, Ridgmont, and Newton Rigg, and well known in other countries. The position of these institutes has been fixed in accordance with the nature of local farming, and with due regard to convenience of access. The univs. and colleges provide courses of 2 to 3 years in duration, with diplomas or degrees. As advisory centres they employ specialists in chem., entomology, and the like, as contradistinguished from the general education given by technical instructors under the co. councils. These latter bodies provide short courses for

boys and girls already on the land or intending to return to it. The farm institutes usually give a 6-months' winter course in practical A. to young persons of 16 years of age and upwards, and in summer courses in dairying and poultry farming. Some co. councils, however, have organised only a more economical and less efficient system of evening lectures and day classes, without the obvious advantage of facilities for actual practical training on neighbouring farms, where various 'demonstrations' and 'experiments' of agric. importance are conducted. Under the Agricultural Land (Utilisation) Act, 1931, for promoting the better utilisation of agric. land in Great Britain and the settlement of unemployed persons on it, the Ministry of A. is empowered to acquire and hold land for use as demonstration farms. All this work is under the control of the Ministry of A. and Fisheries, but the system is made complete by linking up certain activities of the Ministry of Education, especially the imparting of a 'rural bias' to rural elementary and secondary schools. This is particularly important, since the children of tenant farmers mostly receive their education at the latter, and the children of agric. labourers at the former. This concentration on a 'rural bias' takes the form of giving lessons in geography with special reference to the physical characteristics of the dist., effect of climate, and the like, but compulsory further education would greatly promote the ends in view.

**Agriculture and Fisheries, Ministry of.** The predecessor of this ministry was the Board of A. and F. which owed its origin to a special dept. of the Privy Council created in 1865 to look after and control the agric. interests of the country. The immediate cause of the appointment of this veterinary dept., as it was called, was the outbreak of the cattle plagues which ravaged England during the middle of the sixties of last century. In 1883 the term agricultural was applied to the committee and the board was actually formed in 1889. In 1903 the duties of the fisheries dept. of the Board of Trade were transferred to the Board of A. In 1919 an Act was passed reorganising the work of the board and giving it the title of Ministry. The Ministry is controlled by a minister who usually holds Cabinet rank. His appointment is political, and changes with a change of Gov. The presidency carries with it a salary of £5000 per annum. In addition, there is a parl. secretary, who has a salary of £1500. The Ministry has the responsibilities entailed by the Contagious Diseases Act, and acts in order to prevent the outbreak or spreading of these diseases amongst cattle, as was exemplified in 1912, when the dreaded foot-and-mouth disease (q.v.) broke out. It controls also the agric., horticult., and foresting interests of the country, being assisted in the latter case by the Forestry Commissioners, a body created under the Forestry Acts, 1919 to 1927. It has also indoor and outdoor animals depts., a fisheries dept., a veterinary dept., and an educational dept., which has now been developed much more rapidly than formerly. It controls also the Ordnance Survey of the United Kingdom. A special Welsh dept. was created by the Act of 1919, while Scotland has its own Ministry of A., estab. in 1912. The popular Kew Gardens (London) are controlled by the Ministry.

**Agriculture in U.S.A.**—Practically every known kind of field crop is cultivated in the U.S.A., but the cereals (Indian corn, hay, cotton, wheat, and oats in the order of their importance) represent three-fourths of the total value of all Amer. crops. The extent of arable land under cultivation is nearly 400 million ac., and pasture land 783 million ac. According to census returns the total acreage of farms was 1,054,515,000 and the improved acreage

was 513,914,000 in 1935 and the number of farms 6,812,000. Cash income from farm production in 1937 was 8,120,000,000 dols. (excluding gov. grants.) The value of farm property is approximately 57½ billion dols. The farm pop. in 1935 was estimated at 31,801,000. This figure was higher before the agric. depression of 1921-24, from which A. has only recovered in recent years. During this time most of the farmers' wartime prosperity was devoted to meeting post-war conditions—a larger market, lower prices, and less labour. A. in America has developed rapidly along the lines of mechanisation, and thus a greater production has been obtained on a smaller crop acreage and with fewer workers. The future tendency of A. is towards larger farms and greater technical improvements both in farm machinery and in the scientific care of crops and live-stock. The most stable and important of Amer. crops is Indian corn, the yield in the years 1935-37 being 2296, 1524, and 2644 million bushels, respectively, which represents more than half the world's supply. The 6 most productive states of the 'corn-belt' are Iowa, Illinois, Nebraska, Missouri, Indiana, and Ohio, but Indian corn is widespread over the whole of the U.S.A. The flourishing stock-breeding industry depends largely on the corn crop, of which about 85 per cent is fed to live-stock, chiefly hogs. The forage crops, which are second in importance, include pasture, hay, clover, alfalfa, etc. The third most important crop, cotton, is dealt with under that head. The wheat crop, fourth in importance, covers about 5½ million ac., principally in the states of Kansas, N. Dakota, Minnesota, Nebraska, S. Dakota, Washington, Illinois, Oklahoma, Indiana, Ohio, and Missouri. Amer. and Canadian wheat is called winter wheat or spring wheat, according to the season of sowing. Winter wheat represents nearly three-quarters of the Amer. produce, and the yield of both kinds was 574 million bushels in 1937. The U.S.A. is the largest wheat-growing country in the world, and in addition produces a quarter of the world's supply of oats, thereby equalling Russia. The average ann. oats crop is over 1000 million bushels, half of which is produced in Illinois, Iowa, Wisconsin, Minnesota, Nebraska, and Indiana. Other important Amer. crops with their average yield in millions of bushels are: barley (217), rye (44), rice (46), flax seed (9), and buckwheat (7). In addition, there are the legume crops, field beans, soy beans, and peas, while the white potato crop is 386 million bushels and the sweet potato crop 83 million bushels. Of the fruit production, apples and peaches form the largest share, being 185 million bushels and 70 million bushels respectively. In addition to field crops, the U.S.A. is the largest stock-breeding country in the world, the estimated figures for 1937 being 66 million cattle, 43 million swine, and 53 million sheep.

Tobacco, in 1937, was harvested from 1,706,000 ac. producing 1506 million lb. It is grown in over a score of states, but chiefly in N. Carolina, Kentucky, Virginia, Tennessee, S. Carolina, Georgia, and Pennsylvania.

*Agric. Education in the U.S.A.*—Agric. education in the U.S.A. has a long hist., and, like many sound movements, had its beginnings in the efforts of private individuals interested in the productivity of the land. Comparatively early in the last century vocational training in A., as indeed in other industries, was a feature of the manual labour schools in New York state. By the latter part of the nineteenth century co. agric. schools had become well estab., and in the first decade of the present century over 50 agric. high schools were in existence, while agric. courses were given in hundreds of ordinary high schools. The system now comprises agric. schools, dist. agric. schools, agric. depts. of high schools, and ordinary schools giving instruction in elementary A. At the apex of the system of agric. education in the U.S.A. are the agric. colleges or state colleges and univs., in direct association with the U.S. Dept. of A. These institutions are mainly concerned with research and experiment, this latter function being carried out at stations organised by the dept. under the Hatch Act of 1887.

*Agriculture, International Institute of.* This body, which has been in existence since 1905, now receives contributions from over 50 countries for the continuance of its activities in collecting and publishing all kinds of information on farming, crops and live-stock, production, trade in agric. products, wages, new diseases of crops, and agric. co-operative insurance and credits. The institute has its seat in Rome, in the Villa Borghese. The governing body consists of a General Assembly of delegates of the Member Govs. (over 60 in number), meeting biennially, and of a permanent committee of delegates, mostly resident in Rome, acting as its executive. There are special bureaux dealing with general statistics, agric. science, and agric. economics, respectively. Its library is one of the best stocked of libraries specialised in A. Attention is not restricted to the purely technical studies, special stress being also laid on rural economics and sociology, agric. statistics and legislation. Auxiliary sciences, such as botany, chem., and geology, etc., are well represented in the library. Information on agric. questions is supplied by the institute mainly through its various publications, issued mostly in Eng. and Fr. These, for many years, have included 2 year-books, the *International Year-Book of Agricultural Statistics* and the *International Year-Book of Legislation*, as also the *International Review of Agriculture* pub. monthly. In consequence of a resolution of the General Assembly of 1924, the institute took steps to promote the establishment of a world agric. census. Some 63 countries took part in the first census which covered the period 1920-30.

Consult *The International Institute of Agriculture: an Historical and Critical Analysis of its Organisation, Activities and Policies of Administration*, by A. Hobson, 1931. See also under AGRICULTURE.

**Agrigentum** (Gk. *Acragas*), now *Girgenti* (q.v.), a tn. on the S. coast of Sicily. It was founded by a Doric colony from Gela about 579 B.C., was at first free, but came under the gov. of the tyrant Phalaris c. 570-549, and later under that of Theron, 488-472. It flourished in wealth and luxury, and was one of the most splendid cities of the anc. world. It was, however, destroyed by the Carthaginians, 405, and, though rebuilt by Timoleon, it never regained its former greatness. In 210 it came under the rule of the Romans. It was the bp. of the philosopher Empedocles. There are remains of the temples of Jupiter, Heracles, Æsculapius, and Concord. The modern Girgenti is irregularly built, is a bishop's see, and does a small trade in corn, fruit, and sulphur.

**Agrimonia**, a genus of the Rosaceæ, commonly known as *agrimony*. It has medicinal properties, and is used in herb teas. *A. odorata* and *A. eupatoria* are found in fields and under hedges.

**Agrinion** (*Vrachori*), a tn. of Acarnania and Ætolia, Greece, 18 m. N. of Missolonghi. It has a considerable trade in tobacco. Pop. 11,890.

**Agriope** (Gk. *αγριοψος*, fierce-looking), a genus of acanthopterygious fishes, belonging to the family Scorpionidae of the order Amieidae. They are distinguished from allied genera by their suborbital plates, which extend backwards over the cheeks and thus protect them. The *A. forvus*, found near the Cape of Good Hope, exceeds 2 ft. in length, and is called a *zee-paard*, or sea-horse, by the Dutch colonists; the *A. verrucosus*, or warty A., also found at the Cape, has the skin of the head and body entirely covered with prominent conical pro-

tuberances; the *A. Peruvianus*, found near the S. Amer. coast, is 8 or 9 in. long.

**Agrippa, Heinrich Cornelius** (1486-1535), Ger. philosopher and occultist, had a stressful and troublous career as writer, soldier, physician, and lecturer. His chief works are the *De Incertitudine et Vanitate Scientiarum* and *De Occultis Philosophiæ*, 1531-33. See *Life* by Henry Morley, 1856.

**Agrippa, Herod**, see HEROD.

**Agrippa, Marcus Vipsanius** (63-12 B.C.), Rom. general and naval commander, came of a humble family, but by means of his own ability and the influence of his friend Octavius, afterwards the Emperor Augustus, attained to high position. After the murder of Cæsar he accompanied Octavius to Italy, where he distinguished himself in the first war against Antony. Later, as consul, he held the command in Gaul, defeating the Aquitani and inflicting severe punishment on the Ger. tribes beyond the Rhine. As commander of the fleet he was largely responsible for the defeat of Pompey, gaining signal victories at Mylae and Naulochus. At the famous battle of Actium he defeated the combined fleets of Antony and Cleopatra. By his third wife, the daughter of Octavius, he had Agrippina, afterwards wife of Germanicus. See C. Merivale's *History of the Romans under the Empire*, 1850-62.

**Agrippa, Menenius**, Rom. consul in late sixth century B.C. Famous for his conquest of the Sabines and Samnites, and as the supposed originator of the fable of 'The Belly and the Members,' used as an allegory to calm the rebellious plebs. See Livy, bk. ii., and Shakespeare's *Coriolanus*.

**Agrippina the Elder** (d. A.D. 33), daughter of M. Vipsanius Agrippa and Julia, daughter of Augustus, endeared herself to the Rom. populace by bravery displayed in the Ger. campaigns of her husband Germanicus. On the mysterious death of the latter, probably engineered by the jealous Tiberius, her popularity aroused the emperor's hatred, and she was banished to the Isle of Pandataria, where she is supposed to have starved herself to death. She was the mother of the notorious A. the Younger and Caligula. See Tacitus's *Annals*; S. Baring-Gould's *Tragedy of the Cæsars*, 1892; and J. B. Bury's *Roman Empire*, 1893.

**Agrippina the Younger** (A.D. c. 15-59), daughter of Germanicus and Agrippina, was mother of Nero by her first husband, (n. Dom. Ahenobarbus (d. A.D. 40). Her second husband, Crispus Passienus, she was accused of poisoning. She married thirdly her uncle, the Emperor Claudius, and induced him to set aside his own son, Britannicus, in favour of Nero. She then had him poisoned, and Nero became emperor under her regency. Tiring of her ascendancy, Nero had her slain. See S. Baring-Gould's *Tragedy of the Cæsars*, 1892, and J. B. Bury's *Roman Empire*, 1893.

**Agropyrum** (from Gk. *ἀγρός*, field, *πυρός* wild wheat), a genus of plants,

belonging to the order Gramineæ. *A. repens*, the quitch or couch-grass, roots at the nodes of its long rhizome, and is very troublesome to destroy in cultivated soil, rooting as it does wherever it is cut.

*Agrostis*, a genus of creeping grasses (order Gramineæ), of which 2 species, *A. alba* and *A. vulgaris*, are found in Britain, and are called respectively *marsh bent* and *fine bent*. *A. alba*, the Irish floricorn grass, forms a valuable pasture.

*Agtelek* or *Aggtelek*, a vil. of Gomór, Hungary, which is famous for its large stalactite cavern. It is second in size to the Mammoth Cave of Kentucky (*q.v.*), and is called Baradla (steaming-place).

*Aguadilla*, seaport in Puerto Rico, standing on a beautiful bay of the same name, 65 m. W. of San Juan. It has a large trade in coffee, sugar, and tobacco. Pop. 21,400.

*Aguado, Alexandre Marie* (1784-1842), famous Fr. financier, b. at Seville; was aide-de-camp to Marshal Soult in the Sp. war of Independence; left army in 1815 and entered the banking world. In 1823 he became the financial agent of Spain in Paris, and negotiated sov. important Sp. loans and the Gk. loan of 1834. In 1823 he was naturalised as a Fr. subject. He received from Ferdinand VII. the title of Marquis de las Marismas del Guadalquivir. D. at Gijón, Spain, leaving an immense fortune.

*Aguardiente* (burning water), a coarse kind of Sp. brandy, made from grain or potatoes, and flavoured with aniseed.

*Agua Calientes*, tn. and state, Mexico, so called from hot springs in the vicinity. The tn., 270 m. N.W. of Mexico city, has a considerable trade, and is noted for its beautiful fruit gardens and fine climate. Pop. (tn.) 82,200; (state) 133,000.

*Ague* (O. Fr. *ague*, sharp), a term applied to malarial fever, particularly to the variety in which a paroxysm of intense chill, causing shivering and chattering of the teeth, alternates with a hot stage, when the face is flushed and the skin hot to the touch. The cause is infection by a parasite associated with the mosquito, and the treatment consists of the use of quinine. See MALARIA.

*Aguesseau, Henri François d'* (1668-1751), native of Limoges, was in succession advocate-general (1690), procurator-general (1700), and chancellor of France. He lost the chancellorship in 1718, through his opposition to Law's system of finance, recovered it in 1720, lost it again in 1722, and assumed the office for the last time in 1737. According to Voltaire, he was the most learned magistrate France ever had. His works were pub. in 13 vols. See biographies by Boullée, 1849, and Monnier, 1864.

*Aguilar, Grace* (1816-47), novelist and Jewish historian, b. at Hackney of Jewish parents. Her chief works are: *The Spirit of Judaism*, 1842; *The Jewish Faith*, 1845; *The Women of Israel*, 1845; and the famous novel *Home Influence*, 1847.

*Aguilar de la Frontera*, tn., Sp. prov. of Andalusia, 22 m. S.E. of Cordova. Has the ruins of a magnificent Moorish

castle. The chief trade is in wine, corn, and oil. Pop. 13,000.

*Agulias*, seaport of Murcia, Spain, on Mediterranean, 38 m. S.W. of Cartagena. It exports lead, esparto grass, soda, grain, and iron ore, and has large smelting works. Pop. 17,078.

*Aguilera, Ventura Ruiz* (1820-81), Sp. lyric poet, b. at Salamanca; went to Madrid in 1843, and there occupied many official and journalistic positions under the liberal Gov. Among his works are: *Sátiras*; *Eros nacionales*; *Elegías*, 1862; *Armonías y Cantares*, 1865; *La Arcadia moderna* and *Legenda de Noche Buena* (1872). Selections from his poems, entitled *Inspiraciones* and *Poesías*, were pub. in 1865 and 1880 respectively, and his complete works at Madrid in 1873.

*Aguinaldo, Emilio* (b. c. 1870), Filipino revolutionary leader. At the outbreak of the 1896 rising he was mayor of Cavité Viejo, but, in consequence of the part he took in the rebellion, consented to go into exile at Hong Kong. He returned in 1898 to aid the U.S.A. against Spain, but turned against them on their purchase and annexation of the is., and attacked Manila in Feb. 1899. Fighting continued with varying success till Mar. 1901, when A. was captured by Gen. Funston at Palawan. He swore allegiance to the U.S.A. the next month, and retired into private life.

*Agulhas, Cape* (The Needles), the most southerly point of Africa, so called by the Portuguese from its sharp-pointed rocks. It is dangerous to shipping, on account of fogs, rocks, and uncertain currents. The Agulhas Bank, with an average breadth of 40 m., stretches for 150 m. from the cape to the Great Fish R.

*Agustina* (d. 1857), the 'Maid of Saragossa.' A vivandière of the Sp. army, who attained fame by her gallant behaviour during the siege of Saragossa by the Fr., 1808-9. See Byron's *Childe Harold* and Southern's *History of the Peninsular War*, 1823-32.

*Ahab*, son of Omri and king of Israel (918-896 B.C.), married Jezebel, the daughter of Ethbaal, king of the Sidonians, and through her influence introduced the worship of Baal. This and the subsequent persecution of the priests and prophets of Jehovah brought him into conflict with Elijah, who managed to hold his ground. Though lacking in moral courage, A. united considerable personal courage with a public spirit that evinced itself in a fondness for the construction of fine buildings. He twice defeated the Syrians, but was finally killed in battle with them at Ramoth-Gilead. See 1 Kings xvi. and xxii., and Kittel's *History of the Hebrews*, 1895-96.

*Ahanta*, a small dist. in the Gold Coast, Africa, noted for its gold. It is a Brit. possession.

*Ahasuerus*: 1. The traditional name of the Wandering Jew. 2. The name of several Persian kings mentioned in the Bible, of whom the best known, the husband of Esther, has been identified with Xerxes. The name is probably a title.

**Ahaz**, eleventh king of Judah (741-725 B.C.), being attacked on his accession by the kings of Israel and Syria, and also by the Edomites and Philistines, summoned to his assistance Tiglath-Pileser, king of Assyria, who exacted from him heavy tribute. See 2 Kings xvi., Isa. vii.

**Ahaziah**: 1. Son of Ahab and eighth king of Israel (896-894 B.C.), was, like his father, an idolater, and worshipped Baal and Astarte. When about to attempt to suppress the Moabites, who had revolted on his accession, he was fatally injured by a fall from a window. See 1 Kings xxii. and 2 Kings i. 2. Sixth king of Judah (885-884 B.C.), nephew of the foregoing, was killed in the insurrection which broke out under Jehu, the son of Nimshi. See 2 Kings viii., 2 Chron. xxi.

**Ahimelech**, Jewish high priest, who at Nob led David with the shewbread and gave him the sword of Goliath, thus assisting him to escape from Saul (1 Sam. xxi. 1-10). He was put to death by Saul (1 Sam. xxii. 11-20).

**Ahlen**, tn. of Westphalia, Germany, on R. Weser, 20 m. N.E. of Münster. The chief manufs. are linen and enamels. Pop. 25,400.

**Ahlqvist, August Engelbert** (1826-89), Finnish philologist, after studying at Helsingfors, founded the newspaper, the *Suometar*, travelled extensively through N. Russia and Siberia, and in 1863 became prof. of Finnish language and literature at Helsingfors. He pub. many works on philology, some poetry, and an account of his travels.

**Ahmed I.**, sultan of Turkey (1589-1617), succeeded his father, Mohammed III., in 1603. The most notable events in his career are the conclusion of the peace of Sitvatorok with Austria in 1606 and the unsuccessful war with Persia.

**Ahmed II.**, sultan of Turkey (1643-1695), succeeded his brother Solymun II. His forces, under Kiiuprili, were driven from Hungary after their bad defeat at Salankamen, 1691.

**Ahmed III.**, sultan of Turkey (1673-1736), succeeded his brother Mustapha II. The most notable events in his career are the war with Russia, the recovery of Morea from Venice in 1715, and the 2 defeats by the Austrians, at Peterwardein 1716, and Belgrade 1717. He was de-throned in 1730.

**Ahmedabad**, or **Ahmabad**, city and dist. of India, in prov. of Gujarat, Bombay Presidency. The city, 350 m. N. of Bombay, on the Sabarmati R., was founded by Ahmed Shah in 1412. It was ceded to the E. India Company in 1818, and suffered severely from earthquake in the following year. Though now in a state of decay, it retains many vestiges of its former magnificence, notably the Jama Masjid, or Great Mosque, built in 1421, the Ivory Mosque, the Ivory interior of which is lavishly decorated with jewels, and the modern Jain temple. From 1573 to 1600 it is said to have been the handsomest tn. in Hindustan, perhaps in the world, and in spite of being one of the most impor-

tant centres of the cotton trade with 74 mills employing 44,000 hands, besides its manufs. of pottery, paper, silk, and metal ware, it is still a most beautiful city. In 1615 it was a 'goodly city as large as London.' Pop. of city 314,000; dist. 900,000.

**Ahmed Fuad**, see **FUAD I.**

**Ahmednagar**, or **Ahmadnagar**, city and dist. of India, Bombay Presidency. The city, situated 120 m. E. of Bombay, was founded in 1494 by Ahmed Nizam Shah. It was captured from the Mah-rattas by Gen. Wellesley in 1803, but restored to them. It was finally ceded to the Brit. in 1817, by the treaty of Poona. Under Brit. rule its prosperity greatly increased and there is a large trade. It was the headquarters of the 11th Infantry Brigade. It is an important mission centre. Pop. 50,000; dist. 732,900.

**Ahmedpur**, or **Ahmadpur**, tn., India, state of Bahawalpur, 30 m. S.W. of tn. of Bahawalpur. Has manufs. of cotton and silk. Pop. 30,000.

**Ahmed Shah**, first monarch of Afghanistan (1747-73), was the son of Sammaun Khan, chief of the Abdali tribe. After the murder of his master Nadir Shah, he retired to Afghanistan, where he was elected ruler. He was a fine soldier and greatly extended the Afghan dominion.

**Ahriman** (**Angra Mainyu**, literally 'the Destroyer'), the spirit of evil, opposed to Ormazd, the principle of good, in the Zoroastrian system. Warfare must be waged between the two for 12,000 years, at the end of which A. will be defeated by Ormazd. A. is the source of evil, and has existed since the commencement of the world. See J. Darmesteter's *Ormazd et Ahriman*, 1877.

**Ahuachapan**: 1. Dept. in San Salvador, Central America. The fertile valleys of the Coast Range produce sugar, coffee, tobacco, cotton, and fruit. Pop. 64,000. 2. Cap. city of dept. of same name, 17 m. N.W. of San Salvador. Pop. 29,500.

**Ahwaz**, a Persian tn. on the Karun, 46 m. S. of Shush. Remains of an anc. tn. are found near it, including those of a citadel of vast dimensions. Pop. 50,000.

**AI** (Heb., heap), a Canaanitish city E. of Bethel. Abraham pitched his tent between Bethel and AI (Gen. xii. and xiii.), but the city is better known for its capture by Joshua in later times (Joshua vii. and viii.). Its ruins existed in the time of Eusebius and Jerome, but none are now to be found.

**AI** (sloth), see **BRADYCES**.

**Aicard, Jean François Victor** (1848-1921), Fr. author, b. at Toulon. His works, mainly poetical and dramatic, include: *Jeunes Croquances*, 1867; *Au clair de la lune*, 1870; *Les Rébellions et les apaisements*, 1871; *Poèmes de Provence*, 1873; *La Venus de Milo*, 1874; *La Chanson de l'enfant*, 1876; *Miette et Nore*, 1880; *Lamartine*, 1883; *Jesus*, 1896; *Talus*, 1902; *L'Âne d'un enfant*, 1903; *Légende d'un cœur*, 1903; *Benjamine*, 1906; *Maurin des Maures*, 1908, and *L'Illustre Maurin*, 1909, both trans. by Alfred Allinson, 1910; *Alfred de*

*Vigny* (Conférences, etc.), 1914; *Le Témoin* (poems), 1916; *Des cris dans la mêlée*, 1916; *Le Fameux Chevalier Gaspard de Besse*, 1919; *Forbin de Solières* (play), 1920; *Pages rétrospectives de la guerre sous-marine en Méditerranée* (c. 1923).

**Aidan**, St. (d. 651), a monk in the monastery of Iona, was in 635 sent by the abbot on the request of King Oswald of Northumbria to evangelize that country. Cormac, a monk previously sent from Iona on the same errand, had failed through his impatience and intolerance; but the saintly gentleness of A. brought forth much fruit, in spite of the opposition of Penda, heathen king of Mercia. A. was consecrated bishop, and estab. his see at Lindisfarne.

**Aide-de-Camp** (Fr. camp-assistant), an officer attached to the personal staff of an admiral or general, with whom he is in confidential touch when on active service, assisting him in all the military routine and looking after his comfort. The sovereign may have any number of As., and this position is given as an honorary distinction. The usual abbreviation is A.D.C.

**Aidin**: 1. Vilayet in Asiatic Turkey, known also as vilayet of Smyrna (Izmir). Chief tn., Smyrna. Pop. of A., 261,000. 2. Important tn. in vilayet of Smyrna in valley of Menderes, near site of anc. Tralles. Has tanneries and large trade in figs and cotton. The Gks. held it for a time after the First World War but lost it to Turkey in the Greco-Turkish War, 1921-22. Pop. 37,000.

**Aidone**, tn. in Sicily in prov. Caltanissetta, on the Serra Orlando Mt. Near A. are extensive remains of an unknown city. Pop. 7890.

**Aids**, under the feudal system, were payments due from vassal to lord under certain conditions.

**Aigues-Chaudes**, see EAUX-CHAUDES.

**Aigues Mortes** (Lat. *Aquæ Mortuæ*), a small tn. in the Fr. dept. of Gard, situated 3 m. from the Mediterranean. Saint Louis made it a port and sailed thence in 1248 and 1270 for the Crusades. It is now of little importance. Pop. 4511.

**Aiken**, co. seat of A. co., S. Carolina, U.S.A., 17 m. E.N.E. of Augusta, Georgia; a health resort chiefly visited by Northerners, and seat of the Immanuel Training School for negroes. Pop. 6000.

**Aikin**, John (1747-1822), b. at Kibworth, Leicestershire, studied medicine at Edinburgh and London, later taking the degree of M.D. at Leyden, 1780. Besides practising at Chester, Warrington, and London, he wrote voluminously. Among his works are the well-known *Evenings at Home* (written in conjunction with his sister, Mrs. Barbauld) and his *General Biography*, 1799-1815.

**Aikin**, Lucy (1781-1864), b. at Warrington and d. at Hampstead. She wrote *Lorimer*, 1814, a novel, but her reputation rests mainly on her court memoirs (a series of which the *Memoirs of the Court of Elizabeth*, 1818, is the first) and *The Life of Joseph Addison*, 1843.

**Ailanthus**, or **Ailanto**, is a genus of tropical trees which belong to the

Simarubaceæ. *A. glandulosa*, the tree of heaven, is cultivated in Britain; the leaves are like those of the ash. The wood is valuable to cabinet-makers.

**Ailleboust**, Louis de Coulonge (d. 1680), 3rd governor-general of Canada (1618-1651). It is believed that he landed in Canada with the founders of Montreal in 1642. Be that as it may, he represented the Montreal dist. in 1647 in the new colony's council at Quebec prior to succeeding Montmagny as governor-general in 1648. In his tenure occurred the destruction of the Huron nation by the Iroquois. A. belonged to the 'Compagnie de Montreal' formed in 1641. D. in Canada 1660.

**Ailly**, Pierre d' (1350-1420), Fr. theologian and prelate, was a famous leader of the Nominalists. He became chancellor of the Univ. of Paris, bishop of Compiègne, and papal legate in Germany. He took part in the Council of Constance.

**Ailsa Craig**, a rocky islet of columnar basalt off the W. coast of Ayrshire, Scotland. It is in the form of a cone, and rises abruptly from the sea to a height of 1114 ft. It has a lighthouse at the S. end.

**Aimard**, Gustave (1818-83), spent 20 years of his life in roving through Central America and Asia. He made use of the materials thus collected in writing novels of the Fenimore Cooper type, such as *The Trappers of Arkansas*, 1816, and *The Pirates of the Prairies*, 1878. Many have been trans. into Eng. see *Indian Scout*, Everyman's Library.

**Aimeo**, see EIMEO.

**Aimoin**, a Fr. Benedictine monk and historian, who d. in 1008. He wrote a hist. of the Fr. up to 654, and a life of Abbon, which gives an account of the manners and customs of the time.

**Ain**: 1. A Fr. riv. rising in the dept. of Jura, flowing through Jura and Ain into the r. b. of the Rhone, 18 m. above Lyons. 2. A dept. on the E. frontier of France, very mountainous in the E. and marshy in the N. Area, 2245 sq. m. Pop. 317,195.

**Ainabul**, see INEROIL.

**Ainger**, Alfred (1837-1901), b. in London, graduated from Trinity College, Cambridge, in 1860. In 1866 he was appointed reader at the Temple Church, in 1877 canon of Bristol, in 1894 Master of the Temple. He pub. sev. works, but he is best known as the biographer and editor of Charles Lamb. His works include *Crabbe*, 1903, in the English Men of Letters series, and various articles in the *Dictionary of National Biography*.

**Ainley**, Henry Hinchliffe (1879-1945), Eng. actor, b. at Morley, Yorkshire, descended from mining stock. While working in a Sheffield bank he became an amateur actor, and later went to Frank Benson for training and experience. George Alexander, struck with his fine physique and voice, cast him, still unknown to play Paolo in Stephen Phillips's tragedy *Paolo and Francesca* in 1902. As the romantic juvenile actor of the tn. he was soon conquering in America as 'The Little Minister' in Barrie's play.

But under Granville-Barker he obtained invaluable experience in styles as diverse as those of Gk. tragedy and Shavian comedy, passing from the name-parts in Euripides' *Hippolytus* and *Orestes* to that of Valentine in *You Never Can Tell*. Meanwhile at Stratford he kept up his Shakespearian work and in Granville-Barker's Shakespearian revivals (1912) at the Savoy he reached the highest point of his acting in his Leontes and Malvolio. He was also excellent as Joseph Surface and charming as Little Billee in *Trilby*. He had now perfected his vocal range, which made him the greatest verse speaker on the stage, while his majestic bearing enabled him to invest his parts with a physical quality denied to others. In 1913, under Barker, he reflected brilliantly the nervous realism of the shy artist Ilam Carve in Arnold Bennett's *The Great Adventure*. After serving as a runner in the First World War he was associated with Mr. Gilbert Miller in management at St. James's, his chief parts being Fedya in Tolstoy's *Reparation* and Antony in *Julius Cæsar*. During the next 10 years his most notable successes were in Milne's *The Dower Road*, Irvine's *The First Mrs. Fraser*, and James Bridie's portrait of an Edinburgh surgeon, *The Anatomist*. One of his later appearances was as Hamlet, in which his musical delivery compensated for his age. His last appearance on the stage was in 1932 though, in 1944, he read extracts from *Hassan* at the Poetry Society, a play in which he had taken the title-part in 1923.

**Ainmiller or Ainmuller, Max Emanuel** (1807-70), b. at Munich, where he was a glass-painter. Discovering various technical improvements, he extensively revived the art of glass-painting. His works include windows in St. Paul's Cathedral, London, and in Glasgow Cathedral.

**Ainsworth, William Francis** (1807-1896), b. at Exeter, graduated in medicine at Edinburgh in 1827. He then conducted some geological researches in the Auvergne Mts. and the Pyrenees, after which he travelled for some years in Asia, visiting Kurdistan. On his return, in 1838, he pub. *Researches in Assyria*, and later *The Claims of the Christian Aborigines in the East, 1843*, and *Travels in the Track of the Ten Thousand Greeks, 1844*.

**Ainsworth, William Harrison** (1805-1882), historical novelist, b. at Manchester, where his father was a solicitor. He was to have followed the same profession as his father, but he had little liking for it. He came to London to finish his studies and met there John Ebers, a publisher who was manager at that time of the Opera House; he thus met a great number of literary and musical people, and his charming manners found him many friends. In 1826 he married the daughter of John Ebers, and worked for some time in his father-in-law's business. He gave this up soon and devoted the rest of his life to journalism and literature. His first successful novel, pub. in 1834, was *Rookwood*, the hero

of which was Dick Turpin, and from that time on to 1881 he pub. about 39 novels. Some of these appeared in *Bentley's Miscellany*, *Ainsworth's Magazine*, and the *New Monthly*, while he was editor of these papers between the years 1840 and 1853. Among his friends were Dickens, Thackeray, Talfourd, and Cruikshank, who often visited him at his home in Kensal Green. His best-known novels are: *The Tower of London, 1840*; *Old St. Paul's, 1841*; *Lancashire Witches, 1841*; *Crichton, The Filch of Bacon, The Miser's Daughter, 1842*; *Windsor Castle, 1843*. See *William Harrison Ainsworth and his Friends*, by S. M. Ellis, 1910.

**Ain Tab**, a tn. of Asiatic Turkey, vilayet of Aleppo. It was once an important military post, and is now a flourishing centre of Amer. mission work. Trade, hides and leather. Pop. (Turkish, Armenian, and Gk.), 45,000.

AINUS

Paul Popper

**Ainus, or Ainos (man)**, a dying race now found chiefly in the N. of the is. of Yesso (Japan) and Sakhalin. They were probably the aborigines of the country, and early Jap. hist. tells of fierce conflicts with them. They are now very degenerate, and show few signs of intelligence. The A. are taller than the Jap., strong, and very hairy, though there is no ground for the tradition that their bodies are covered with hair. Their cheek-bones are high, their noses flat and broad, and their faces short. They are chiefly conspicuous for their dirtiness. They subsist on the products of fishing

and the chase and live in wretched huts, scantily furnished. Their prin. object of worship is the bear, though they pay no respect to the life of this animal, which they kill and skin without any fear, setting up its head in their vill. They believe, however, in a Supreme Creator and also in the immortality of the soul. Their religious notions are as vague as their knowledge on other subjects, for they have no written literature and are in consequence extremely ignorant.

The A. differ in physique, language, and customs from the other Asiatic races. During the last century they have been much studied and the bibliography of the subject is considerable. See I. L. Bird, *Unbeaten Tracks in Japan*, 1880; B. H. Chamberlain, *Aino Folk-tales*, 1888; R. Hitchcock, *The Ainos of Japan*, 1892; J. Batchelor, *The Aino and their Folklore*, 1901, and *Ainu Life and Lore*, 1927; G. Montandon, *La Civilisation ainoise*, 1937.

**Air or Asben**, a fertile but mountainous region of the Sahara, situated between lat. 17° and 20° N. and long. 7° and 10° E. The pop. consists mostly of Tuaregs. Cereals and dates are extensively cultivated, and vegetation is luxuriant. An important caravan passes annually through the tn. of Asben. A. is the most populous part of the Sahara. Chief tn. Agades (q.v.).

**Air**, the atmosphere we breathe (see ATMOSPHERE); the characteristic or soprano part of a musical composition (see ARIA, MELODY); the bearing or manner of a person; in the plural, affected manners.

Up to the middle of the eighteenth century A. was thought to be a simple elementary substance, of which all other gases were modifications. Hence oxygen was first of all spoken of as 'dephlogisticated A.', nitrogen as 'phlogisticated A.', hydrogen as 'inflammable A.', and carbon dioxide as 'fixed A.' The idea of modifications of the atmosphere is still preserved in the use of such terms as mountain A., 'sea A.', etc.

A. is now known to be a mixture of gases, consisting approximately of 4 vols. of nitrogen to 1 of oxygen, with smaller quantities of carbon dioxide, water vapour, argon, helium, neon, krypton, xenon, ammonia, dust, sulphuric acid, etc. Carbon dioxide, though present in small proportion (0.03 per cent. by vol.), is nevertheless of great importance, as it forms the chief food of green plants.

A. may be liquefied and even solidified by the application of great pressure combined with an extremely low temp. (see LIQUID GASES). Compressed A. is used as a curative agent (see AEROTHERAPEUTICS), as an explosive or propellant (see AIR-GUN), as a dielectric in a form of Leyden jar (q.v.), and as a motive power in various forms of machinery, such as the boring machines used in tunnelling through the Alps and elsewhere (see TUNNELLING).

**Air-balloon**, a term sometimes applied to balloons filled with hydrogen or coal-

gas. The use of such a term owes its origin probably to the fact that the first balloons were distended by means of heated air.

**Air-bath**, an oven heated by gas or steam, used in practical chem. for removing water from a substance.

**Air-bed**, a bed consisting of an envelope of rubber fabric distended with air. The bed is usually divided into compartments, into each of which air is pumped through a valve. When deflated, the bed can be folded up, so that it provides a portable as well as sanitary form of sleeping accommodation.

**Air-bladder**, or **Swimming-bladder**, a structure in some fishes which is filled with gas and serves as an organ of flotation. It occurs in the position occupied in air-breathers by the lungs, but is in most instances developed dorsally from the fore-gut, whereas the lungs are a ventral outgrowth. It is usually connected with the pharynx or the gullet by a duct, and therefore probably performs the duties of an accessory respiratory organ. It has been found that in a perch asphyxiated in stagnant water, the oxygen of the A. has been entirely replaced by nitrogen and carbon dioxide, although the normal proportion of oxygen is from 20 to 25 per cent. In some fishes the pneumatic duct is atrophied, so that the A. becomes a closed sac, whose function is entirely hydrostatic, that is, it serves to keep the sp. gr. of the fish the same as that of the water. The gases in the bladder are compressed or rarefied as the fish is subjected to greater or less pressure by its varying position with respect to the surface, and the quantity of gas is regulated by absorption or secretion, so that the sp. gr. of the whole fish is properly adjusted. In some instances there is a connection between the A. and the auditory organ, probably giving the fish a consciousness of the variations of pressure.

**Air-brake**, a contrivance to decrease the speed of a train, or to bring it to rest completely, by the use of compressed air. In the simplest form of the Westinghouse A., a steam-driven air-pump compresses air into a reservoir placed under the foot-plate of the locomotive. The reservoir is connected by a 3-way cock with the cylinder and piston actuating the brake-shoes in each coach throughout the train, the coaches being joined by flexible tubing. The brake is operated by turning the 3-way cock so as to allow the compressed air from the reservoir to act on the side of each cylinder necessary to drive the brake-shoes on to the wheels. The brakes are taken off by admitting compressed air to the other side of the cylinder. The improved form now in use has an auxiliary reservoir attached to each brake cylinder, with a triple valve connecting with the train-pipe. While the train is running the triple valve operates so that there is open connection between the train-pipe and the auxiliary reservoir and between the train-pipe and the brake side of the piston, whilst

the compressed air is shut off from the cylinder. Any sudden diminution of the pressure in the train-pipe causes the triple valve to shut off the auxiliary reservoir from the train-pipe and discharge its compressed air into the cylinder, so that the brakes are applied. Thus, if by the parting of any coupling or by any other breakdown in the apparatus the air in the train-pipe escapes, the train is automatically stopped, as well as by the deliberate action of the guard or driver. The brakes are released by admitting the compressed air from the main reservoir to the train-pipe, by which action the valve operates so as to admit compressed air to the brake side of the piston, at the same time re-establishing the connection between the train-pipe and auxiliary reservoir, which is therefore recharged.

**Air-chambers**, in plants, are cavities in the leaves or stems, or other parts, containing air. They are present in the parenchymatous tissue at the angles of adjoining cells. They are particularly noticeable in aquatic plants, e.g. white water-lily (*Nymphaea alba*).

**Air Council**. Estab. by the Air Force (Constitution) Act, 1917, to administer the R.A.F., to organise the defence of the realm by air, and to control civil aviation. It consists of one of the prin. secretaries of state, who is president; 1 pail. under-secretary of state, who is vice-president of the council, a chief of the air staff and senior air member of the council; air members respectively for personnel, supply and organisation, and training; the vice chief of the air staff; 3 additional members; and the permanent under-secretary of state. For some years the secretary of state for war acted as Air Minister, but a secretary of state for air was appointed independently of any other secretariat.

**Aircraft Carrier**. An armed vessel of the R.N., designed to carry aircraft and provide facilities for air operations while at sea. Article 4 of the London Naval Treaty, 1930, includes in the term any service vessel designed for the exclusive purpose of carrying aircraft and limited the tonnage of an A. C. to 27,000, but in view of Hitler's denunciation of the Anglo-Ger. Naval Agreement this, and indeed any other limitation on naval construction, ceased to be operative. Battleships and cruisers equipped with catapults for launching aeroplanes are to be distinguished from A. Cs. proper. At the beginning of the Second World War in 1939 the Brit. Empire had 8 A. Cs. of a total displacement of 126,000 tons and 7 'building and authorised' of a total displacement of 138,000 tons. The totals for other powers were: France, 2 with a displacement of 32,000 tons and 2 under construction of 36,000 tons total displacement; Germany, 2 under construction (39,000 tons total displacement); Japan, 11 (147,000 tons) and 2 (25,000 tons); Russia, 1 (9,000 tons) and 2 (24,000 tons); and U.S.A., 5 (120,000 tons) and 2 (35,000 tons). The

famous *Ark Royal* was a vessel of 23,000 tons with 16 4.5-in. guns. She was torpedoed and sunk in the Mediterranean E. of Gibraltar in 1941 (see *ARK ROYAL*). The *Courageous* (22,500 tons) and the sister ship *Glorious*, carried 16 4.7-in. guns. The *Courageous* was originally completed as a cruiser in 1917 but was converted between 1924 and 1928 and re-fitted in 1936. She also was torpedoed and sunk, Sept. 17, 1939, 515 men being lost. The *Glorious* was sunk off Norway in June 1940. Other A. Cs. are (1942) the *Hermes* (10,850 tons, 6 5.5-in. guns),

Central News

AIRCRAFT CARRIER, H.M.S. 'ILLUSTRIOUS'

sunk by the Jap. off Ceylon, in Apr. 1912; *Furious* (22,430 tons with 10 5.5-in. guns),  *Eagle* (22,600 tons, 9 6-in. and 4 4-in. guns), and the *Argus*, a training A. C. of 14,450 tons with 4 3-pounders. The Brit. A. C. *Illustrious* (23,000 tons), completed after the outbreak of war, rendered great service on Nov. 11, 1940, at the victory of Taranto, which restored naval supremacy in the Mediterranean to the Brit. Fleet, for the striking forces were naval aircraft flown from the carrier. On Jan. 10, 1941, the *Illustrious*, while conveying ships to Greece, was heavily attacked in the Central Mediterranean by 15 Junkers dive-bombers, and hit with a 1000-lb. bomb below the bridge, but, though shaken from stem to stern, she reached port safely. In the Guadalcanal campaign (Aug. 1942) the crucial campaign of the Pacific in the war against Japan, 3 A. Cs. formed part of the task

force' (independent tactical unit) which covered the Amer. landings, but were withdrawn as soon as possible owing to fear of a Jap. land-based air attack. There were, however, A. C. engagements off the E. Solomons (Aug. 23-25) and the Santa Cruz Is. (Oct. 26), in the latter of which the *Hornet* was sunk, leaving the damaged *Enterprise* the only allied A. C. in the Pacific, the *Wasp* having been sunk by submarine in Sept. But by Feb. 1943 the U.S.A. sent 5 more A. Cs. to the Pacific. After the lessons of Guadalcanal the attrition tactics were replaced by the adoption of the principle of achieving decided command of the sea by building up much larger task forces, and in this strategy the A. C. played its part. Until the series of operations which began at Tarawa, the A. C. had been used in small numbers, and regarded merely as a means of making planes available to surface ships as a protection for them when beyond easy reach of their own land-based aircraft. But the offensive successes of the Amer. A. C. in Feb.-Mar. 1942, at the Marshalls, Rabaul, Wake, Lae, and Salamaua showed the Amer. Naval Command what were the real potentialities of the carrier, and the result was an accelerated and expanded programme which bore fruit towards the end of 1943. For once the Amers. began to use carriers in large groups it became evident that their Navy had incorporated within itself the only truly mobile air force of any size in the world, an air force in which both the aircraft and their floating bases were capable of rapid movement and of achieving surprise; while Amer. naval fighter planes operating from A. Cs. proved tactically superior to the best land-based planes which the Jap. could send against them. The popular doctrine that carrier-borne air forces should not be opposed to land-based air forces because the floating base could be sunk was largely overcome by the very fact of concentration, which gave the Amer. task fleets air forces large enough to repel dangerous concentrations of enemy planes. In the Okinawa campaign over a 2-month period 8 large carriers, 2 light carriers, and 3 escort carriers were damaged, most of them by the Jap. *kamikaze* (suicide planes), a salutary reminder to the Amer. Navy that tactical problems are never solved conclusively. The *Eagle* A. C. was launched on Mar. 19, 1946. She is the biggest A. C. in the world. See also AERODROME.

**Air-engine**, a form of heat-engine in which the working substance is air. The essential parts of such an engine consist of a chamber placed so that one end can be heated by a furnace and the other cooled by a refrigerator. When hot the air is allowed to expand to push a piston; when cooled it is compressed to its original vol. by pushing a piston back. The difference between the work done by the hot air in pushing the piston and that done upon the engine by pushing the piston back is the net work done by the engine. Carnot imagined an engine in

which a vol.,  $V$ , of air at a low temp.,  $T_1$ , was compressed until its temp. rose to  $t$  and its vol. was reduced to  $v$ . It was then placed in contact with a source of heat whose temp. was also  $t$  and allowed to expand whilst its temp. remained constant; it was therefore necessary that heat should be abstracted from the source to account for the expansion. The air was then removed from the source and allowed to expand until its temp. fell to the original temp.  $T_1$ . It was then placed in contact with a refrigerator of the same temp.  $T_1$ , and compressed to its original vol., the temp. remaining constant, which means that a quantity of heat must be given out to the refrigerator. This was merely a theoretical engine, in which the difference between the quantity of heat taken from the source and that given up to the refrigerator indicated the amount of work done by the engine.

This principle was adopted by the Rev. R. Stirling, who invented in 1816 an A. in which a large plunger works in a cylinder, with a space at the top kept cool by a water-jacket, and a space at the bottom heated by a furnace. The distinctive feature of the engine is the 'regenerator,' a structure of thin metal plates or wire gauze, which connects the cold upper region with the hot lower region, so that the hot air in ascending may give out heat which may be taken in by the cold air in descending, thus supplementing the furnace and economising fuel. When the plunger is raised the cold air is forced through the regenerator to the bottom of the engine, becoming heated, and exerting pressure which serves to raise a motor piston. The plunger then falls: the heated air is forced up to the cold region, the pressure diminishes, and the motor piston falls. The whole work done by the engine is the difference between the work done by the motor piston and that required to move the plunger. The theoretical efficiency of such an engine is high, but in practice it does not work out so satisfactorily. A double-acting engine of a somewhat improved type, the result of the collaboration of Robert Stirling with his brother James, was installed in the factory of the Dundee Foundry Company, where it was used for about 3 years; but repeated difficulties connected with the heating vessels eventually caused its abandonment.

In 1853 an Amer., Capt. John Ericsson, fitted his ship, the *Caloric*, with an A. He used a regenerator, but experienced the same difficulties as his predecessors, and abandoned the attempt after 2 years' trial.

The more marked disadvantages of As. on the Stirling model are the great bulk of air used in engines of quite small power and the difficulty of transmitting heat to it. The surface to be heated is too large, there is great waste of heat through the chimney, and there is constant oxidation of the metallic envelope, owing to its being at a high temp. in contact with free oxygen.

Modern As. are usually of small power ;

they are, however, easy to work, and are especially suitable for pumping. Among them may be mentioned Messrs. Hayward and Tyler's 'Rider' hot-air engine. It has 2 cylinders and a regenerator consisting of thin iron plates. Coke is employed as fuel, and if the engine is used for pumping, the water may be utilised in the cooling-jacket. For a 1-h.p. engine the consumption of coke is about 9 lb. per hr. In the 'Bailey' engine there is 1 cylinder, in which both the motor piston and the plunger work. The engine is very simple in construction, and requires little attention in working. In a Fr. hot-air engine, the 'Bönler,' the air is first compressed by an air-pump and then driven through the incandescent fuel. A valve prevents the escape of the air during the ascent of the piston; it is then exhausted, a portion being blown into a small space surrounding the motor-cylinder, which tends to keep the cylinder and piston cool. This engine is made to give as much as 20 h.p.

**Air Force, Royal (R.A.F.).** This, the youngest of the three services, was constituted by Act of Parliament in 1917 by amalgamating the Royal Naval Air Service and the Royal Flying Corps, which last-named came into existence in 1912. These bodies were organised respectively by the Admiralty and the War Office, and rendered effective service during the First World War, but as from 1918 the amalgamated force was organised and controlled by the Air Ministry. The R.A.F. consists of the Royal Air Force, the Air Force Reserve, the Air Force Special Reserve, the Auxiliary Air Force, the Auxiliary Air Force Reserve, the Royal Air Force Regiment, the Royal Air Force Volunteer Reserve (numbering 5000 during Second World War), the Women's Royal Air Force (W.R.A.F.), formed in 1941, Princess Mary's R.A.F. Nursing Service, and the Air Training Corps. The Fleet Air Arm was transferred to the Royal Navy in 1937. The R.A.F. during the Second World War was organised into the Air Defence of Great Britain and the Overseas Commands and Air H.Q. The Air Defence of Great Britain during the war was divided into Commands as follows: the Bomber Command (q.v.) (h.q. High Wycombe); Fighter Command (h.q. Stanmore); Coastal Command (h.q. Northwood); Flying Training Command (h.q. Reading); Maintenance Command (h.q. Andover); Technical Command (h.q. Reading); Transport Command (h.q. Teddington), estab. in 1943 to collaborate with B.O.A.C.; and N. Ireland Command (h.q. Belfast). (Overseas) Mediterranean and Middle E. Command (h.q. Caserta and Cairo); Middle E. Command (h.q. Cairo); Air H.Q. at the following stations: Malta, Greece (Athens), the Levant (Jerusalem), Iraq and Persia (Habbaniya), Aden, E. Africa (Nairobi), E. Mediterranean (Alexandria), Egypt (Cairo), India (New Delhi), W. Africa (Accra), Burma (Calcutta); and the Air Command of S.E. Asia (h.q. Kandy).

Prior to the Jap. invasion of Brit. Malaya there was a Far-E. Command based on Singapore. Areas are subdivided into groups and wings, each containing a certain number of squadrons. In 1938 the strength of the Metropolitan Air Force was 123 squadrons, organised into 68 bomber, 30 fighter, 15 reconnaissance, and 10 Army co-operation squadrons. Twenty-seven squadrons were serving overseas. These strengths, however, were soon augmented in view of the international crisis of 1938-39, and of course augmented again beyond measure during the war.

Under the Brit. Commonwealth Air Training Plan (announced Dec. 10, 1939) provision was made for the training of 20,000 pilots a year, besides men for ground duties. Under this plan men from Britain, the Dominions, and other parts of the Empire were trained in Canada. Later the plan became the Combined Training Organisation, and was only terminated on Mar. 31, 1945. Provision was made for 93 training schools covering every aspect of air force work, and 60 new airfields. Special training was demanded by the complex character of air operations. Staffs for the flying schools necessitated highly skilled flying instructors and officers of administration, equipment, wireless engineering, and armament, as well as operators, instructors, and armourers, each of whom required special training in specially equipped schools. Provision had to be made also for the training of mechanics to do the work of overhauling and repairing the aircraft used by pilot pupils. Recruits in training depots received a general introduction to air force work. The next stage, in the initial training schools, was occupied in a 5-weeks' course in air-force law, mathematics, flight theory, mechanics, air armament, and physical training. After this the recruits were divided into 3 groups as pilots, observers, and wireless-operator air gunners. Pilots began in the elementary flying training schools with 7 weeks' instruction in the ground school and in the air. This was followed by 10 weeks with intermediate and advanced training squadrons, flying service types of aircraft. Some types of these schools concentrated on instruction in piloting fighter planes and others on training bomber pilots. Observers, who chart the course of a plane and aim the bombs on raids, spent 14 weeks at an observers' school learning air navigation, aerial photography, and reconnaissance duties, such as sketching, observation, and spotting enemy positions and concentrations, following this with 6 weeks at the bombing and gunnery school for special training in the use of bomb-sighting devices, as well as the handling of machine guns, and ending with 4 weeks in the bombing and gunnery school concentrated on the use of machine guns and training in repairing them. After the completion of this training the 3 groups formed an air-crew pool, from which some were chosen as instructors

and the rest assembled at embarkation depots. Once overseas, they received operational training preparatory to active service.

Under the regulations in operation before 1939 permanent commissions in the R.A.F. may be obtained either (i) through the R.A.F. (Cadet) College at Cranwell, or (ii) through a recognised univ., and temporary commissions by direct grant of what is known as a 'short-service' commission. A limited number of short-service officers are selected periodically for transfer to permanent commissions. The cadets' course at Cranwell lasts for 2 years, during which time cadets are taught to fly. All cadets who successfully pass out of Cranwell receive permanent commissions, commencing with the rank of Pilot Officer. Promotion to Flying Officer comes normally after about 20 months' service, and promotion to all ranks above Flying Officer is made by selection. Univ. candidates are gazetted to Pilot Officer rank with 12 months' seniority or 18 months if the candidate graduated with first-class honours, and promotion to Flying Officer follows in 6 months. Officers were given the opportunity of studying some branch of engineering or science that has its counterpart in civil life. By this means an officer avoided the risk of becoming so far a specialist in the science of aerial warfare as to be unfitted for any civil avocation on retirement from the force. During the war training in the R.A.F. attained so high a pitch of specialisation that many of its officers and men were necessarily trained in some branch of science. The other chief educational establishment is the Staff College at Andover. The chief pre-war training depot was at Halton. There were also 3 flying training schools, 1 central flying school, and schools of gunnery, ballooning, army co-operation, photography, and wireless.

The establishment for 1939-40 was 100,000, exclusive of those serving in India, which were paid for by the Govt. of India. This figure was augmented in the subsequent years of the war until in 1945 it reached over 150,000 flying officers, air gunners, wireless operators, flight engineers, navigators, navigation instructors, signallers, and armament, airfield construction, and balloon personnel. Units are made up of squadrons, groups, and wings. A single-engine squadron comprises 3 'flights' of 4 machines each (peace establishment) or 3 'flights' of 6 machines (war establishment). A twin-engine squadron consists of 2 'flights' of 5 machines each. 'Group' is practically synonymous with 'wing', but 'wing' is rather a wartime term denoting 2 or more squadrons, whereas 'group' is a peace organisation, larger than 'wing' in the sense that it comprises it; auxiliaries in the way of training schools as well as its service squadrons. A 'brigade,' also a wartime term, comprises 2 or more wings, or at least 4 squadrons, i.e. 48 machines (peace) and 72 (war).

In 1938 Great Britain had 104 regular and 19 auxiliary squadrons. Besides these there were 8 squadrons in India, 5 in Iraq, 7 in the Middle East, 1 in Aden, 4 in the Far E., and 1 in the Mediterranean. In 1939 there were 30 squadrons overseas, and 7 additional squadrons were in process of formation, so as to bring up the overseas strength to 500 front-line aircraft. This strength was greatly exceeded subsequently, as is shown by the fact that at the height of the bombing operations over Germany, the loss in 10 months during 1943-44 was 2500 aircraft or 18,000 men killed or taken prisoner, while the total casualties of the R.A.F. in the war were 112,296. The R.A.F. has 4 main classes of aircraft: bombers, fighters, bomber-transport machines, and fighter bombers.

The total number of machines in the R.A.F., including reserves, at the end of 1934, was only 1434; the total establishment being then 1500. Thus, at that date, Great Britain's A.F. was, numerically, inferior to those of France, U.S.A., Russia, Japan, and Italy; though Great Britain had a greater strength of trained flying personnel and a greater total strength of aircraft, including reserves, than any other country. In 1939 the first-line aircraft at home numbered 1750, and there were good prospects that the programme for the Metropolitan Air Force of approximately 2370 would be completed by 1940. In the 5 years 1939-44 Brit. aircraft production reached 10,000 heavy bombers, 17,700 light bombers, 38,000 fighter planes, and 40,000 other machines. Among the many V.C. awards to members of the R.A.F. were: F/O. Donald E. Garland (Belgium, 1940), W/C. A. B. Learoyd (Dortmund-Ems Canal, 1940), F./Sgt. John Hanna (1940), W/C. J. B. Nicholson (over Southampton, 1940), G/C. H. Edwards (Bremen, 1941), F/O. K. Campbell (Brest, 1941), F/O. L. T. Manser (Cologne, 1942), W/C. H. G. Malcolm (Tunisia, 1942), F./Sgt. Lt. H. Middleton (Turin, 1942), W/C. G. P. Gibson (Kuhir Dams, 1943), F./Sgt. A. Aaron (Turin, 1943), F./Sgt. W. Reid (Düsseldorf, 1943), P/O. C. J. Barton (Nuremberg, 1944), F/O. J. A. Cruickshank (anti-submarine, 1944), and W/C. G. L. Cheshire (Pathfinder, 1944).

See also AERIAL WARFARE: AIR RAIDS.

**Air-gun**, a gun in which the bullet is propelled by the energy of compressed air. There are many forms, but usually there is an air reservoir communicating with the barrel, which should be of small bore. The air is compressed by means of a spring, the trigger operates the valve, and the bullet is thereupon propelled by the elasticity of the compressed air. Most A.s. are capable of carrying a small bullet for a distance of about 60 to 80 yds.

The use of compressed air as a propellant in larger pieces of artillery has received much attention in America. In 1888 Capt. Zalinski, of the U.S. Artillery, introduced an effective pneumatic gun, from which shells charged with dynamite were propelled by air at 1000 lb. pressure, a store of which is carried in reservoirs

attached to the gun. With a 1000-lb. shell the gun has a range of 2400 yds., and great accuracy has been obtained in guns mounted ashore. The shore defences of New York and San Francisco include some of these guns, their great advantage being that the shells can be timed to explode under water. An attempt was made to use them on a gunboat in the Sp.-Amer. war, but without any striking success.

**Air-lock**, a chamber connecting the region of compressed air of a caisson (*q.v.*) with the outer atmosphere. When the outer door is opened to admit men or materials the air is at atmospheric pressure. The outer door is then shut and air pumped into the lock until the pressure is equal to that of the caisson, when the inner door is opened.

**Air Mail**. A. M. is entirely a post-1918 development, apart from a temporary service between Hendon and Windsor, operated in 1911. A regular service between London and Paris was estab. in Nov. 1919, which was operated by Aircraft Transport and Travel, using an Aéro 'D. H.' type of plane. The initial rate of charge was 2s. 6d. per oz., but this was soon reduced to 2d. In 1920 the service was extended to Brussels and Amsterdam, and 2 years later the Paris service included parcel post. Then followed daily services to Paris, Brussels, Stockholm, and Basle in summer time, while Rome was on the Europe route. Plans in preparation shortly before the Second World War covered every European cap. in the network of the Brit. A. M. services. A. M. service between Egypt and Iraq was operated by the R.A.F. in 1921, but in 1927 this service was transferred to Imperial Airways Ltd. (*q.v.*). In Mar. 1929 the Egypt-Iraq service was included in the newly inaugurated London-Karachi route via Italy, Greece, Egypt, and Iraq. Soon afterwards the Indian service was continued from Karachi to Lahore and also to Bombay and Madras, and then across India via Delhi and Calcutta through Siam to Singapore. In 1933 a further extension was made through Java to Port Darwin (Australia), and thence to Perth, and also a transcontinental service was begun to Sydney and Brisbane. In the following year Imperial Airways announced the preparation of a 7-8-day service to Australia. The other long-distance Empire route, the 8000-m. route from London to Cape Town, was opened in 1932. A trans-Atlantic A. M. service, connecting with the airway system of Canada, and a trans-Pacific service were then projected, and test flights were carried out in 1938 and 1939 between England and Port Botwood (Newfoundland) by seaplanes (as opposed to flying-boats, which it was planned to use later in conjunction with land planes for feeder services). Between 1924 and 1938 the Brit. A. M. increased from 100,000 letters to many millions annually. The aggregate weights of letters sent by A. M. for the years 1935-37 were, respectively, 419,100 lb.,

765,500 lb., and 1,490,900 lb.; while Empire services in 1937 totalled 670,000 lb.

The U.S. Gov. A. M. service is extensive, and unity of control over a continent has long given that Gov. advantages that have ensured progressive continuity of development. A day and night A. M. service operates between New York, Chicago, and San Francisco. Another long-distance foreign A. M. service before 1939 was the Fr. air-line to Brazil and the Argentine via Morocco and Dakar (W. Africa).

An international A. M. conference in 1927 resulted in a standardised route and a uniform practice generally. The Brit. Gov., the Union Gov. of S. Africa, and the Portuguese Gov. in 1935 arranged a bi-weekly service in each direction between England and S. Africa. This service was operated by flying-boats via Egypt and the Sudan to Kisumu and thence, via Mombasa, Dar es-Salaam, Beira, and Lourenço Marques to Durban. The boats were capable of a maximum speed of over 180 m.p.h., and a cruising speed of 150 m.p.h. Land planes also operated branch services connecting Kenya, Tanganyika Ter. and N. Rhodesia with the main service; and a branch service from Beira linked up N. Rhodesia and Nyasaland.

Before 1939 the development of New Zealand-Australian services was under consideration. A trans-Pacific project was in hand as also a service to the W. Indies. The scheme of development of empire air communications, as announced by the Air Ministry at the end of 1934, contemplated a schedule of 2 days to India, 2½ days to E. Africa, 4 days to the Cape, 4 days to Singapore, and 7 days to Australia.

Developments in aircraft construction during the war in 1939-45, and since then, have greatly reduced these scheduled times, besides making the trans-Atlantic A. M. a common feature. *See further under AVIATION, CIVIL.*

Information on A. Ms. to countries abroad is given in the current A. M. Leaflet, which may be obtained gratis at any post office or, by telephone, from the London Postal Enquiry Office; while local times of posting may be ascertained from the nearest head or branch post office. There are 2 kinds of Letter A. Ms.: (i) 'All-up' services, in which letters and post cards are sent by air at ordinary postage rates. Such correspondence should be posted in ordinary letter-boxes and not bear 'A. M.' label or markings; (ii) 'Surcharge' services, in which higher charges are made. The special blue A. M. label—or the words 'By Air Mail'—should appear in the top left-hand corner of each mail packet. Registration (but not insurance), express delivery, and the green-label system are in force, as well as the usual limits of size and weight. As to parcel A. Ms., the general parcel regulations apply; the special blue A. M. label must be affixed to the dispatch note close to the address, and the words 'Air Mail' should also be written on the cover, and postage must be prepaid.

The leading international lines are Brit. Overseas Airways Corporation; Air France; Pan-Am. Airways; K.L.M. (Royal Dutch Lines).

**Air Ministry.** The ministry formed to administer the R.A.F. (q.v.) through the Air Council (q.v.). It is modelled somewhat on the organisation of the War Office, with depts. under each of the prin. members of the Air Council. For purposes of recruiting and organisation there were in 1938 5 Area Commands under its control; the Northern, Midland, Southern, Western, and Scottish, with headquarters, respectively, at Catterick, Grantham, Stanmore, Gloucester, and Edinburgh. The enormous increase of the R.A.F. during the Second World War, coupled with the rapid completion of numbers of new aerodromes and the training of thousands of air personnel in Canada under the Air Training Scheme entirely transformed the organisation of air commands in Britain. The A. M.'s depts. include a meteorological office; scientific adviser's dept.; directorates of signals, armaments, operations, navigation, accident prevention, intelligence (research, technical, etc.), plans, policy, operational training, equipment, engineering, technical training and radio; and personnel branches.

**Air-pump,** a machine for diminishing or increasing the amount of air in a contained space. The term was originally applied to contrivances for producing a partial vacuum, but is now used without discrimination in connection with machines for producing a flow of air. The mechanism which provides a diver with a constant supply of air at a pressure proportionate to his depth in the water is called an A., and the term is also applied to machinery whose object is to provide a supply of compressed air.

The earliest device for exhausting air by means of a pump is associated with the name of Otto von Guericke. In 1650 he devised an apparatus for removing air from a vessel, called a receiver, which is connected with a barrel in which a piston works. Both the connecting pipe and the piston are fitted with valves opening away from the receiver. As the piston is pushed in, its valve opens and lets out the air contained between it and the valve at the bottom of the barrel. When the piston is withdrawn, its own valve shuts, and the other valve opens to allow the air of the receiver to extend into the barrel. The air thus becomes more rarefied at each stroke. Pumps on the Guericke model do not reach a high level of efficiency. The difficulty of working increases as the difference of pressure within and without the receiver increases; there is usually constant leakage at the valves, and when the process of exhaustion has reached a certain point, the pressure of the air left in the receiver is not sufficient to open the valves. An improvement was instituted by Papin and Hawksbee, who used a pump with 2 barrels, thus shortening the process of exhaustion. In Hawksbee's A. each piston is worked by a rack

and pinion, and owing to the fact that one piston works with the pressure of the atmosphere as the other works against it, the difficulty of working as exhaustion proceeds is not increased.

In Tate's A. there is a single barrel with a double action, the piston consisting of 2 disks joined together, forming essentially a piston just less than half the length of the cylinder. There is an outward-opening valve at each end of the cylinder, and the inlet is in the middle, so that air is expelled by both the forward and backward strokes of the piston.

A pressure gauge is usually attached to these pumps, consisting of a bent glass tube containing mercury, one end of which is closed, thus forming a kind of barometer. The closed portion, however, need not be 30 in. long, as it is seldom necessary to know the pressure inside the receiver until it is considerably less than that of the atmosphere.

The progress that has been made in modern electrical research and in its practical applications during the last 30 years has only been made possible by an enormous improvement in the design and technique of A. The modern 'high-vacuum' pump is capable of producing a pressure as low as a thousand-millionth of an atmosphere, which is the order of the pressure in a wireless valve and the modern Coolidge X-ray bulb. There are 2 types of such pumps: (1) the Gaede or molecular pump, (2) the Langmuir or mercury vapour pump.

The principle of the former is as follows: Inside a fixed cylinder there is mounted a concentric cylinder of a diameter only slightly less than the outer one. The latter cylinder can be rotated very rapidly about its axis by means of an electric motor. In the outer cylinder there are 2 outlets, one (A) communicating with the vessel to be evacuated, and the other (B) connected to a low-pressure chamber, i.e. one in which the pressure has been reduced to about  $10^{-6}$  of an atmosphere by means of an ordinary A. The movable cylinder rotates from A to B, and as its periphery is moving with a high velocity, comparable with that of the molecules, a one-way molecular traffic is set up in the direction from A to B, and the pressure in the vessel connected to A decreases very rapidly to the extremely low value mentioned above. It may be recalled that in the common filter pump a stream of water rushes past an outlet and drags the air from the tube connected to the funnel containing the liquid to be filtered. Langmuir's pump ingeniously adopts this principle, but with this difference: the stream is a stream of mercury vapour from mercury boiled under reduced pressure, and it rushes past an outlet connected to the vessel to be evacuated, thus dragging molecules of the air along with it. The stream of mercury vapour and air is then immediately cooled; the mercury condenses and returns as liquid mercury to the boiling chamber and the

air passes on to be carried away by an ordinary A. The efficiency of both these pumps, especially the latter, is truly remarkable.

**Air-Raid Precautions (A.R.P.).** Precautions against air raids on the civil population in a future war were ignored for the better part of 2 decades after the First World War. Undue confidence was reposed in the principle of collective security, and war-weariness seemed to postpone another Armageddon to the Gk. Kalends. But the devastating effects of aerial warfare on civilians were exemplified in the Italo-Abyssinian war of 1935-36, in the Jap. invasion of China in 1937-38, and in the Sp. Civil war of 1936-39; and with the increasing tension in the European political situation from 1937, public consciousness of the danger was awakened and by 1938 most countries had developed protective measures against explosive and incendiary bombs and gas attacks from the air.

In the United Kingdom the Air-Raid Precautions Act was passed at the end of 1937. The preparation of schemes for the protection of the civil population is the business of the Home Office working in conjunction with the local authorities. A.R.P. took the form of a free issue of gas masks to the entire pop., the provision of bomb-proof shelters, the formation of decontamination squads to deal with mustard or other liquid gases in the streets, instructions on the way to render refuge rooms gas-proof and the preparation of special fire-fighting apparatus. London, with its vast pop. and congested areas, presented peculiar difficulties, and plans were soon completed for at least a partial evacuation of the pop. Sound-detectors were perfected for warning the country of the approach of enemy aircraft and experiments with balloon wire-burriages were carried out. Fighter planes and anti-aircraft guns necessarily played a large part in resisting raiders during the Second World War as well also as counter-bombing raids on enemy soil. 'Blacking-out' experiments were made before the war (1939) in various towns, combined with fire-fighting and gas-decontamination practice.

But in spite of progress in the planning of civil defence, the vulnerability of ordinary citizens living and going about their business in crowded urban areas was and is still the potential Achilles' heel in time of war. Among precautions to meet this danger are splinter- and blast-proof shelters, the strengthening of basement in certain types of houses and the provision of communal and street shelters. The protection of works, offices, and public utility undertakings is covered by statute, but much remained to be carried out in practice. After the Second World War had been in progress for over a year, London's bitter experience of Ger. air-raids demonstrated the absolute necessity of a 'fire-watching' organisation. Had the efficient arrangements which were subsequently made been in operation earlier, millions of pounds' worth of property might well

have been saved from the devastation by incendiary bombs, especially in the raid of Dec. 1940. Thus, early in the hist. of air warfare on open cities, A.R.P. was necessarily of an improvised character. Sometimes, as in the case of the rock shelters of Malta, nature has provided a merciful means of protection. Again, in Hong Kong, the shelters were admirable. But experience suggests that in future wars, when the weight of bombs and bombers will be increased beyond measure, to say nothing of the development of the atomic bomb, A.R.P. of an altogether revolutionary and all-embracing character will become the first duty of the govs. of all states.

**Air Raids. First World War.**—The inviolability of the shores of Great Britain guaranteed by the supremacy of the seas was to a limited extent disturbed in the First World War by enemy attacks from the air. A few attacks were made in 1914. In 1915 Ger. airships of the Zeppelin type raided Norfolk, Northumberland, Essex, Suffolk, Yorks, E. London, and the home cos. The attacks were repeated in 1916 and extended to the midland cos., as well as to Lincs, Leicester, Durham, Cambs, Hunts, Notts, and as far W. as Cheshire and as far N. as Scotland. In 1917 and 1918 airship raids were very rare, and ceased altogether after Apr. 1918, the losses sustained by the raiders rendering such mode of attack abortive. Some Ger. airships were brought down in flames in England, and in Oct. 1917 only 4 out of 11 returned safely to Germany, the other 7 being wrecked over France and the Mediterranean. The number of airship raids were approximately 50, and according to the best available estimates the casualties among civilians in killed were: 217 men, 171 women, 110 children; the injured numbered 587, 431, and 218 respectively. Fifty-eight sailors and soldiers were killed and 121 injured.

Ger. aeroplane raids began in Dec. 1914, over Dover and other parts of Kent. There were 4 raids over the E. cos. in 1915, 16 over E. and home cos. in 1916, 27 over E. and home cos. and London in 1917, 8 in 1918, mainly over Kent, Essex, and London, the last being in June over Kent. The total casualties from these A. R. were: among civilians, killed, 282 men, 195 women, 142 children; injured, 741, 585, and 324 respectively; military personnel 238 killed and 400 injured. No co. was more raided than Kent, though Essex suffered severely. No fewer than 213 civilians were killed and 615 injured in 2 raids over Margate, Essex, and London on June 13 and July 7, 1917. By 1918 the R.A.F. had estab. a definite superiority over raiders, and this fact, combined with the pressure on the W. front, which necessitated the retention of Ger. machines over the lines, caused these raids to cease altogether nearly 5 months before the end of hostilities. The last A. R. on London was on May 19, 1918, this being the twenty-fifth raid on the cap., the

prin. damage during the whole period being done in Bethnal Green, Peckham, Lewisham, Lower Sydenham, Kilburn, Rotherhithe, City, and Poplar. In the City the most disastrous raid was that in which explosive bombs were dropped on the Central Telegraph Office. For the rest anti-aircraft guns and defensive planes kept the raiders too high to permit of damage to railway centres or points of military importance. Many bombs were dropped on Paris in the course of numerous raids, over 400 persons being killed and twice that number injured. In the first months of the First World War, the Allies only employed aircraft for reconnaissance work, for the direction of artillery fire, and for bombing the Zeppelin sheds of Düsseldorf or military positions. The Gers., however, initiated the policy of bombing open or undefended towns with the object of instilling terror into the inhab., but without any marked effect. By way of reprisal the Allies in the later stages of the war effected numerous raids into Germany, especially in the Rhine provs. Later, the R.A.F. organised and carried out raids of increasing intensity as far as Frankfurt and Stuttgart, and a great raid on Berlin would have been attempted but for the signing of the Armistice.

*Air Raids over Britain in Second World War.*—Daily A. R. on Britain began on June 18, 1940. General night attacks, but on no large scale, were meant to probe defences, and to make pilots familiar with the area. At the beginning of July daylight raids increased in strength, particularly against ports and shipping, suggesting that temporarily the enemy's purpose was not so much the destruction of Brit. air power as the tightening of the blockade, for airports and industrial plants were no longer the main targets. Southampton and Portsmouth were savagely raided, but attacks also ranged from E. Scotland all round the coast to the Bristol Channel. By the end of July the raids were increasing in intensity, but the numbers of hostile aircraft were still comparatively small. On Aug. 8 there was begun a series of mass daylight raids lasting a fortnight, the number of raiders rising ultimately to more than a thousand. These raids were still directed against ports and shipping, but attempts were also made to wreck airports and destroy defending planes. The battle of Britain (q.r.) showed, however, that the Gers. had no hope of conquering the R.A.F. by mass daylight raids. Damage had been fairly extensive in certain localities of London, but basic resources were not seriously impaired. At the end of Aug. it was evident that the Gers. had signally failed to crush the R.A.F. by direct assault on aerodromes and airports. Hence they were driven to indirect methods of attack, which Hitler pretended were in retaliation for the bombing of Berlin. The real motive for the mass assaults on London, which began on Sept. 7, was to paralyse a vital nerve centre by disrupting essential services. In the ensuing weeks London

suffered a bombardment from the air more severe than that of Rotterdam or Warsaw. The vast system of the London docks lay almost in ruins. Shops, residences, and utility services were seriously damaged, but the city's vital services continued to function and the morale of the people remained unbroken. The success of the R.A.F. fighter-pilots against the daylight bombers forced the Luftwaffe to change their tactics. The bombers now approached in solid formations with fighter-escorts in tiers above them or in mixed formations of fighters and bombers which spread out in the hope of scattering the defending planes before converging from different points and at different altitudes. But they continued to pay a heavy price, and sometimes lost a third of their raiding force. Of the 40 heavier raids by daylight between Sept. 5 and Oct. 6 about a score were directed at the London area. On Sept. 15 the Gers. made a supreme effort which proved to be the climax of their daylight raids, and the most triumphant day of all for the R.A.F. Five hundred Ger. bombers came over in 4 successive waves, but comparatively few penetrated the screen of Spitfires and Hurricanes to the city, and the Luftwaffe lost about 185 machines, and between Sept. 6 and Oct. 5 some 900 Ger. aircraft had been destroyed over Britain. The Gers. were now constrained to try to achieve their object by night raids, aided by parachute flares and incendiary bombs, and though they found it difficult to locate targets with any precision, their continuous bombing by mass assault wrought great havoc, especially in areas round the E. End docks. The defence now concentrated on a box-barrage, aided by new methods of prediction, and new combinations of searchlights and anti-aircraft fire. It still remained, however, to train fighter-pilots for night operations. But all these defences were still far short of giving immunity against the damaging effects of a protracted process of attrition. None the less the abandonment of *blitzkrieg* methods of air raiding meant that all hope of an immediate victory over Britain had gone, and the enemy now hoped by indiscriminate night bombing to demoralise the civilian pop., besides progressively destroying London or paralysing its commercial life. Occasionally they still sent over daylight raiders, but when they did so their losses always rose, and sometimes they tried daylight raids by fighter-bombers under cloud cover—'nuisance' raids, whose purpose was to increase the strain both on civilian morale and on the fighter-pilots of the R.A.F.

But if the damage to vital objectives was still a matter of chance the damage to London property generally was mounting in severity and extent. In Oct. London was still the main objective, but by the middle of that month there were scattered raids on provincial cities which sometimes bore the brunt of an attack. The failure to conquer England by destroying London had compelled the

enemy to turn his attention to the chief industrial areas, while periodically claiming that the raids were reprisals for R.A.F. raids. A full-scale attack on Britain being impracticable the Luftwaffe now tried the method of concentrating the maximum force on a single point of attack. Coventry was the victim of the first of these attacks. Some 500 planes bombed that city throughout the night of Nov. 14 with indiscriminate attacks, which destroyed the cathedral and the

his force. Severe as the raids were, the real test in the air lay in the future. The direct damage by A. R. to Britain was not so much a matter of spectacular destruction as of gradual attrition, and perhaps the most extensive damage to an important area in this sense was that done in the Sept. raids on the E. end of London when great quantities of food imports were destroyed. But the percentage of destruction of industrial plants remained small, and not one of the

*New Chronicle*

#### THE LONDON FIRE RAID OF DEC. 29, 1940

In the foreground is the spire of St. Bride's Church, and in the background the flame-enshrouded dome of St. Paul's Cathedral

centre of the city, but left industrial plant relatively untouched. This 'terror' raid was soon followed by similar attacks on other towns, though not on the same scale. Birmingham, Southampton, Bristol, Liverpool, Plymouth, and other towns were in turn the objectives of such concentrated raids several times. Sheffield experienced the first of a series of raids on Dec. 12. Manchester was raided on Dec. 22. But public morale was not shaken, and on Dec. 29 the Germans turned from high explosives to incendiaries. On that night thousands of incendiary bombs on the very heart of the city of London found its defenders unprepared, and many famous buildings were destroyed (see LONDON), and the disaster was paralleled only by the Great Fire of 1666. It was, however, significant that the raids were now always on a limited scale, the inference being that the enemy was still unwilling to use more than a fraction of

services upon which the life of the great cities depended had broken down entirely. The 'nuisance' raids of Oct. were probably intended to retard production by compelling workers to resort to their shelters, though this was offset to some extent by employing roof spotters. But inevitably there was some loss of efficiency through the disturbances in the normal routine of civil life. The demolition of dwellings, particularly in Coventry, Plymouth, and the river-side boroughs of E. London, also involved considerable inconvenience, especially as there was already a housing shortage. It was, therefore, true enough to say that the civilian, and particularly the London civilian, was in the front line. Air-raid wardens and the national fire-fighting services were repeatedly occupied in tasks of the most extreme danger, while the bulk of the population was exposed to perils which in past wars were experienced only

by the people whose land was actually suffering invasion. But the prospect of A. R. was foreseen by the Gov. before the war began. Besides air-raid precautions and an auxiliary fire service, adequate preparations were made for the care of raid casualties. Yet insufficient preparation was made for the contingency of homeless persons. Thus, in Poplar, where more than half the houses were hit, the rest centres could not shelter, clothe, or feed the 'bombed out'; and no efficient billeting organisation existed, while responsibility for various functions was distributed among many different local bodies. But at this time the chief problem was the provision of sufficient shelters, for which no real plans had been made either by the Gov. or by the local authorities. With the accommodation in the few deep public shelters utterly inadequate Londoners crowded into the tube stations to sleep in bunks on the platforms or on the stairs, while others sought refuge in warehouse basements. In these conditions the menace of disease was serious, especially as most shelters contained no heating installations. Some amelioration came with the provision of 'Anderson' shelters, and later by 'Morrison' indoor shelters; but Mr. Herbert Morrison (g.v.) continued generally to rely on dispersal through a combination of evacuation to safer dists. and surface shelters, and this, in the circumstances, was no doubt the most effective remedy. Throughout these months of the greatest strain the patience of the mass of the pop. was beyond praise, and indeed the spirit of the Brit. people remained prepared to endure whatever burdens the war might inflict, confident always in ultimate victory.

There was a lull in A. R. over Britain for some 6 weeks between Jan. and the beginning of Mar. (1941) owing to the fact that Ger. air activity was now subordinate to the U-boat warfare. In this connection large-scale A. R. were resumed, in Mar. 1941, against the areas of Brit. ports in the hope of dislocating their functions as such. This time the long-range Ger. bombers struck as far N. as Glasgow and the Clyde-side, where the mass technique tried out at Coventry was combined with that of the incendiary attack on London. The effect of these raids was to some extent diminished by the fact that fire-watching had been made a compulsory duty, and that the night-fighter defence and anti-aircraft technique had both been much improved. Considerable damage was, however, done to Plymouth, Southampton, Bristol, Cardiff, and Swansea, though none of these cities suffered the prolonged ordeal of London during the autumn of 1940, and in any case the Luftwaffe still lacked the resources to strike more than one major blow in a single night or on 2 successive nights. From Apr. to June 1941 the Luftwaffe persistently attacked the chief seaports on the W. coast through which Amer. supplies must come, and sometimes they bombed E. coast towns, notably Newcastle and Hull. Some of the ports were

heavily damaged, and made practically uninhabitable, though none was knocked out completely. The 3-day raiding of Plymouth on Apr. 21-23 sent a great number of the inhab. out into the open countryside, and after sev. more raids before the end of Apr. the state of Plymouth was even worse than that of Coventry. Portsmouth suffered a similar though less severe experience. Bristol's worst raid was on Apr. 11. Belfast was twice heavily raided in the same month. Liverpool was raided on May 2, and for a week thereafter; yet despite widespread damage the port did not cease to function. The inland industrial cities were also intermittently attacked; Coventry again on Apr. 8, Birmingham on the succeeding night. London had one of its most savage attacks of all on Apr. 16, a dusk-to-dawn visitation which was only exceeded in ferocity by the raid on the night of May 10 when the roof of the House of Commons was demolished (see LONDON). Manchester and the Midlands suffered sporadic raids in June. But by way of set-off the improvement made in radio detection (see RADIOLOCATION) soon made itself felt in an increasing number of enemy raiders being brought down by the Brit. night-fighters especially on moonlight nights, and on May 10 the Gers. lost 33 machines; while for the whole of May no fewer than 143 night bombers were shot down, a substantial advance on any previous figures for night time.

The extent and fierceness of this raid on London, following on the prolonged attack on Liverpool, and the increasing activity over the rest of the country, seemed to presage a full-scale Ger. air offensive by way of preliminary to an invasion, and the widespread attacks on Brit. air bases on May 11 seemed to confirm this impression; but in fact these raids were quickly followed by a lull—the lull before the Ger. invasion of Russia—though occasional savage raids were still made, and the 'hit-and-run' raids were continued. But generally speaking the practical cessation of Ger. A. R. over Britain was the corollary to the concentration of Ger. air-power on the Russian front, and the battered industrial cities and ports of Britain now enjoyed a valuable respite, in which to remove the debris and return to an approximation to normal activity. Moreover it was now the turn of the Ger. cities to experience the nature of an all-out air attack, for more bombs were dropped by the R.A.F. on Germany in June 1941 than had been dropped on Britain in Apr., the peak month of the Luftwaffe's effort, and the ensuing months showed that the Brit. attacks were on an ever mounting scale. Britain, in fact, had now secured relative immunity from large-scale A. R. There was a recrudescence on a minor scale in Apr. 1942, the so-called 'Baedeker' raids on Brit. cathedral cities, such as York, Bath, Canterbury, and Exeter, alleged to be retaliatory raids for the bombing of Cologne, Moscow, and Lubek. These 'Baedeker' raids involved over 800 civilian deaths against only 20 in the

previous month, but comparison with the figure of 6000 fatalities in Apr. 1941 shows how steeply the scale of Ger. A. R. had declined, and mostly less than 30 machines took part in these attacks. Enemy A. R. against Britain in 1943, described not inaptly as 'scalded cat' raids, were mostly carried out against fringe targets and on no occasion were they on a heavy scale. On a number of occasions fast fighter-bombers were used, doubtless to keep down losses. There was little activity by day and most of the night-raids were scattered.

A few days after the allied invasion of Normandy began (June 1944) the Gers. opened an attack against London and S.E. England with jet-propelled flying bombs (V1). The attack was not on the scale the enemy had hoped because the launching-ramps in the Pas-de-Calais and elsewhere and storage depots in France were subjected to persistent pounding from the air. When it was no longer possible to launch them from the ground the Gers. used obsolescent bombers to release them while flying low over the North Sea. Later the V1 attacks, as they were called (see *FLYING BOMB*), were reinforced by rocket attacks (V2), mainly from Dutch bases. As these missiles (see under *ROCKET*) are invulnerable during flight, the allied air forces, whenever possible, attacked them while they were in transit from the underground factories within the Reich to their launching sites. A great deal of damage was done by the flying bombs during an intensive period of some 80 days in June-Aug. 1944. Croydon was very severely damaged, 3 out of every 4 houses being more or less damaged, and some 211 persons were killed—a low death roll owing to evacuation and good shelter accommodation. The 13 worst-hit (in order of severity) bors. were in the S.E.: Croydon, Wandsworth, Lewisham, Camberwell, Woolwich, Greenwich, Beckenham, Lambeth, Orpington, Coulsdon and Purley, West Ham, Chislehurst, and Mitcham. Wandsworth was only a degree less badly damaged than was Croydon. The old parish church of St. Leonard's, Hastings, was completely demolished. The V1 rocket attacks began in the early autumn of 1944, and continued intermittently until the later part of Mar. 1945, when they were stopped by the Canadian liberation of Holland. S. dists., especially, suffered from this long-distance bombardment, by both V1 and V2 attacks, which ceased on Mar. 27, 1945, when the 1050th and last rocket landed in Orpington. Throughout this period flying bombs, but in no great numbers, continued to come over. One of the worst incidents of the war was caused by a rocket which fell on Smithfield mkt. buildings in Mar., killing 115 persons, and seriously injuring 122, while another rocket at Stepney in the last few days of the attacks killed 131 and injured 40. It is conceivable that the Gers., who were experimenting in Norway with 'heavy water,' might have developed attacks on

Britain with atomic bombs, but they were utterly defeated before they could conclude their experiments. The total number of civilian casualties in the United Kingdom through enemy A. R. from the outbreak of war was 146,760. Of these 60,685 were killed and 86,175 injured and detained in hospital. The detailed figures were as follows: Killed (or missing, believed killed), men, 26,920; woman, 25,392; children under 16, 7736; unclassified, 537. Injured and detained in hospital: men, 40,736; women, 37,816; children under 16, 7623. See also under the names of individual cities.

*Chief Allied Raids on Germany, 1943-1944* (the 1940-42 bombing of Ger. tns. is dealt with under *AERIAL WARFARE*, when policy was in the making and allied A. R. were not on a very large scale). Berlin was bombed 4 times by the R.A.F. in Jan. 1943—twice in daylight by Mosquito bombers. Heavy bombers of the R.A.F.—Lancasters, Halifaxes, and Stirlings—dropped 4000- and 8000-lb. bombs or 'block-busters' (q.v.) on Berlin on Mar. 3. Munich was hit with 500 tons from R.A.F. bombers, Mar. 11. On May 17 daring low-level attacks were made by Lancasters on the Eder and Möhne dams in the Ruhr: the walls of the dams were blasted with 1500-lb. mines and great damage was done by flood waters down the Ruhr valley. A heavy blow to Ger. war industry was dealt by the R.A.F. raid, June 11, on Düsseldorf, the administrative cap. of the Ruhr and notable for its iron and steel, heavy engineering, and armaments plants. Münster was bombed again almost simultaneously. Transcending all these raids was the raiding of Hamburg, which might well be named the battle of Hamburg. Probably the dominant motive for the tremendous destruction wrought there was to paralyse the submarine-building industry—a paramount consideration for the W. Allies. In the great raids between July 24 and Aug. 3, 9 sq. m. of Hamburg were utterly devastated, and more than 77 per cent. of the city's 15 sq. m. of fully built-up areas wiped out. Eight shipbuilding yards were either destroyed or severely damaged; oil, non-ferrous metal, and chemical works were destroyed; most of the city's centre was destroyed; and vast damage done in the dock area. The total Brit. losses were 87 bombers, averaging no more than 14 a raid. On Nov. 4, by daylight, Amer. Flying Fortresses bombed Wilhelmshaven—also a submarine centre; while the R.A.F. made a night raid on Düsseldorf. The Flying Fortresses did not always escape punishment: while on Nov. 7, in their attack on the non-ferrous metal centre, Düren, 25 m. S.E. of Cologne, accompanied by a Thunderbolt fighter escort, they lost no machines; in an earlier raid, on the ball-bearing plant of Schweinfurt, they lost no fewer than 60 aircraft, but they were then without long-distance fighter escort. Berlin was again bombed by the R.A.F. on the night of Nov. 26, while, in the day, a great force of Amer. heavy bombers

attacked Bremen. The range of the heavy bombers was now being extended—thus on Dec. 3 the R.A.F. dropped 1500 tons on Leipzig. The year closed with more attacks on Berlin by the R.A.F., and these were continued in the early months of 1944.

*Raids on Berlin.*—It may be said that the real air battle of Berlin began on Nov. 18, 1943, and there were 6 major attacks between that date and the end of 1943. The chief destruction was in the W. and central parts, including the Tiergarten and Charlottenburg dists. A number of factories in the Reinickendorf dist. and the Siemensstadt, together with administrative buildings in the Wilhelmstrasse, were either destroyed or greatly damaged. There were 9 more major raids in the air battle of Berlin up to Feb. 15 (1944), the culminating raid of Feb. 15 being carried out by 1000 bombers, chiefly Halifaxes and Lancasters, 2500 tons being dropped in half an hr., for the loss of 43 machines. The damage by this date was officially estimated at 326 major war plants, 775 out of 1500 smaller plants, 7 gas works, 3 power stations, and the main offices of 21 gov. depts. Organised industrial activity virtually ceased in Berlin at the end of Nov. (1943), and had not been resumed late in Jan. 1944. But the 15 raids cost the R.A.F. 465 bombers and 3000 men. On Mar. 6 strong Amer. forces, escorted by long-distance fighters, attacked Berlin by daylight, this being the first heavy attack by the U.S.A. Strategic Force on the Ger. cap. They lost 68 bombers and 11 fighters, but themselves destroyed 120 Ger. aircraft. The U.S.A. Strategic Force made another attack on Mar. 8, losing 38 bombers and 16 fighters. Yet despite its continuous battering, the Allies considered that Berlin still contained much of military and industrial importance, and on Mar. 24 one of the heaviest attacks theretofore was made by the R.A.F., when 2500 tons were dropped. The Luftwaffe offered a spirited defence and the R.A.F. lost 73 aircraft. The effectiveness of allied bombing was much increased by its continuity—Amer. day raids followed or preceded by Brit. night raids either on the same target or on others in the Reich.

*Wilhelmshaven, Leipzig, Brunswick, Stuttgart, Gotha, Frankfurt, and Oschersleben attacked.*—Some 1100 Amer. bombers made a great attack on Feb. 3 on the port and naval base of Wilhelmshaven—the Flying Fortresses being escorted by fighters—Thunderbolts, Lightnings, and Mustangs. The greatest daylight assault of the war up to that date took place on Feb. 20 when 2000 allied aircraft, including a large force of Amer. heavy bombers, following a night attack on Leipzig by 1000 Brit. bombers, also bombed Leipzig, together with many other targets, including Gotha, Bernberg, Brunswick, and Oschersleben. Stuttgart was also a much-sought target, on account of its aircraft factories and repair depots. There was a double attack on Feb. 22 by the R.A.F., who dropped 2000 tons at

night, and a day attack by the Amers. with nearly 2000 aircraft, and another attack on Mar. 15, when the R.A.F. dropped 3000 tons, this being the city's sixth battering by the R.A.F. The mounting scale of Amer. attack is shown by the fact that between Feb. 20 and Mar. 9 (1944) the Amer. heavy bombers dropped 17,000 tons of bombs on Ger. plants and, together with Amer. fighters, destroyed 1023 Ger. planes in combat. Frankfurt was assaulted by over 2500 R.A.F. bombers on the night of Mar. 18, only a few hours after 1500 Amer. fighters and heavy bombers had returned from day attacks on industrial and other targets in S. Germany—aircraft factories and other war plants in Augsburg, Landsberg, and elsewhere. Frankfurt was an important war-production city and rail centre, and Amer. heavy bombers and the R.A.F. attacked it twice again in the same month. Brunswick, too, was subjected to many and severe attacks in the early months of 1944. Essen, which had been so severely hit in the battle of the Ruhr in 1943 and had not been raided for a year, was dealt its heaviest blow of the war, by the R.A.F., on Mar. 26, the assumption being that much of the war plant had been since restored.

On Mar. 30 the R.A.F. suffered their heaviest loss—94 aircraft—of a total force of nearly 1000 which attacked Germany, with Nuremberg as the main target—not a small price to pay even for a successful attack on an important war-production centre. The Luftwaffe, however, sent up the greater part of their entire night-fighter force to defend Nuremberg, and probably day-fighters as well, and the attackers were opposed by hundreds of twin-engined and single-engined fighters, or as many as those encountered by the U.S. Air Force in their great daylight raids.

The first time that more than 1000 heavy bombers attacked Berlin was during the night of Mar. 24, 1944, when Lancasters and Halifaxes dropped more than 2500 tons of bombs; but on June 21 more than 1000 Flying Fortresses and Liberators, accompanied by 1200 Lightnings, Thunderbolts, and Mustangs, attacked targets in Berlin and at Basdorf on the outskirts of the cap.—the targets being FW-190 engine factories at Basdorf, and railway yards and factories in Berlin. This was the largest force of aircraft ever sent against Berlin targets; 43 bombers and 7 fighters were lost, but the enemy lost at least 50 planes. The appearance of Thunderbolt fighters over Berlin for the first time showed that heavy Amer. fighters then had a sufficient range to enable them to do a 1200-m. round journey. On May 12 (1944) over 750 Amer. heavy bombers hit 4 synthetic oil plants near Leipzig and one in Czechoslovakia, this being the deepest penetration by U.S. bombers from Brit. bases. Heroic resistance was met, 150 Ger. aircraft being shot down for the loss of 42 Amer. bombers and 10 fighters.

But in the tremendous pounding of Germany's industrial areas by Anglo-Amer.

heavy bombers, records were often established only to be broken again soon after, and in daylight on Nov. 16, 1944, R.A.F. bombers, operating in support of the Amer. armies, dropped the greatest load of bombs of all time—more than 5600 tons—to obliterate the Ger. centres of Duren, Julich, and Heinsberg. The heavy bombers' main targets towards the end of the year (1944) were railway marshalling yards and oil plants, particularly the great synthetic plant at Leuna. Early in 1945 the allied strategic bombers had matters all their own way over Germany. Their numbers were enormous, whether by day or night; thanks to radar (q.v.) they could hit targets which they could not see, and by means of a Brit. invention for dispersing fog they could go up and come down in almost any weather. By Mar. the R.A.F. were using bombs up to 10 tons in weight, the first of these being dropped in N.W. Germany on Mar. 14 on a viaduct. Mar. 18 saw the biggest daylight air attack on Berlin when 1300 Liberators and Flying Fortresses sent down 30-ton salvos of bombs every 30 seconds on railway yards near the centre of the city, and vast armament plants in the industrial suburbs. The greatest previous raid on Berlin by daylight was that on Feb. 26 (1915) when 1200 aircraft took part. But by this time the allied bombers had more or less razed most of the larger Ger. cities, and although the Gers. had planned a great fleet of fighter planes for defence, including very fast types using jet propulsion, the bombing nipped most of it in the bud, and left few defences against A. R. save *flak*. It may be noted here that in Feb. 1945 a tremendous air assault was opened against Ger. communications with Italy in preparation for the final land offensive which the Allies launched on Apr. 8. For air raids against Japan see under PACIFIC CAMPAIGNS or FAR EASTERN FRONT IN SECOND WORLD WAR. See also AERIAL WARFARE.

Air Records, see under AERONAUTICS; ATLANTIC FLIGHTS.

Air-sacs, bladder-like chambers communicating with the lungs in birds. They are situated all over the body and make the aeration of the blood much more complete than in other vertebrates. In most cases they communicate with spaces in the bones, rendering them pneumatic, thus serving to lower the sp. gr. of the bird. A. are also found in the chameleon. These also are a complication of the lungs, and can be inflated, increasing the bulk of the animal.

Airship, a form of aircraft consisting of a torpedo-shaped envelope sustained in the air by being filled with gas, either hydrogen or helium. Although the idea of As. is old, it was not until the eighteenth century that serious consideration was given to them, when experiments were made in France, and continued there solely until Count von Zepplin conducted them in Germany from 1893. The main difficulty of the pioneer work was expense, chiefly due to the size of

the vessel, whence the slow development of As. compared with aeroplanes. Further, this difficulty limited, and still limits, practical interest in the subject to govs. with large funds at their disposal. Before the First World War Great Britain had done little compared with Germany. A few non-rigid As. had been constructed, such as *Nulli Secundus*, *Beta*, *Gamma*, until Ger. progress alarmed the authorities, and the ill-fated *Maffly* was built. This was Britain's first rigid A., but it met with disaster on its trial flight. When the First World War broke out, Germany was well in advance of any other country, a fact which was demonstrated very clearly in their early air raids over England, and which made the Brit. Gov. again turn its attention seriously to them. In 1915 a number of non-rigid As. had been built for anti-submarine work. By a stroke of fortune the Ger. *L. 33* was brought down in England in Sept. 1916, in such a condition that it was possible to copy her design successfully in the Brit. *R. 33* and *R. 34*, completed in 1919. Under the Treaty of Versailles Germany was forbidden to maintain As. of over 1,000,000 cu. ft. capacity. Consequently she disposed of these As. in part payment of reparations to the Allies. In May 1926, however, this limitation was removed. Great Britain after the First World War, constructed a few As., notably the *R. 100* and *R. 101*. The *R. 34* successfully crossed the Atlantic both ways (see ATLANTIC FLIGHTS). The Imperial Conference decided that A. routes were to be prescribed between the various parts of the Brit. Empire.

*Design and Construction.*—There are great differences in design between non-rigid, semi-rigid, and rigid types of A. A non-rigid A. is one in which the internal pressure maintains the designed shape of the envelope without the assistance of a rigid keel. A semi-rigid A. has a rigid keel to distribute the load and assist in keeping the designed shape of a non-rigid envelope. A rigid A. has a rigid framework to maintain the designed shape of the hull. *Non-rigid A.*: As in the case of a kite balloon, the shape is maintained solely by the internal gas pressure. The type which survived others of simpler frame was designed by Torres in Spain and was manufactured in France. Although in outline the shape is only a streamlined balloon, the circular shape is distorted to form a trefoil section, having 3 equal lobes. In this way an internal system of triangular bracing is possible, and to this the dead weight of the car and engine are carried by ropes. The car is slung immediately underneath the envelope, rather to the front of the ship, provision being made for the engine at the rear of the car. A pressure airscrew is employed, or separate engine units may be installed. The ballonets in the lobes maintain the shape of the envelope when the internal pressure is varied. To assist the retention of the A.'s shape, ribs are generally fitted at the nose in radial directions and

taken back behind the plane of the nose. The ship is equipped with relatively large rudder and elevator planes, to the rear of which the rudder and elevator are respectively attached. The basket is fitted with a power plant and a propeller. The non-rigid A. or 'dirigible' balloon is the smallest of the types of A., and with increase of size the balloon becomes unwieldy and loses its shape. *Semi-rigid A.*: This type was introduced in order to relieve the envelope of a non-rigid ship from some of the strain arising from the connection of cabins, power cars, etc., thereby permitting an envelope of circular cross-section to be employed. For this purpose a keel consisting of a braced structure, generally triangular or rectangular in section, is suspended, immediately below the envelope, and to this the dead weights of the car and engine are transmitted. In modern designs—e.g., in the case of the *Norge*—the keel is practically enclosed in the envelope, so as to produce a good streamlined shape of low head resistance. *Rigid A.*: The much larger ships are all of this type, and it is the only type which is likely to have any practical use in the future. The rigid type was developed in Germany by Count Zeppelin, and consists of a framework of girders whose external form corresponds with the shape of the A., the covering being directly attached to the girders. The earlier rigidships were made with a relatively long central parallel portion and with a short head and tail; the parallel part underwent successive shortening until the modern perfect streamline shape was evolved. In order to obtain minimum resistance, the actual lines of the hull were determined from a consideration of the rates of change of curvature. Structurally the framework consists of a series of transverse hoops or rings connected to a series of longitudinal; both the rings and longitudinal are similarly constructed, frequently being triangular in section. The rings are polygonal, having approximately 25 sides. Provision is made for efficient connection between rings and longitudinal, while the whole structure is made rigid by a system of wire bracing. The space between 2 rings is occupied by a ballonnet, and there may be as many as 20 ballonnets in all. About half the bags are fitted with a manoeuvring valve on top, but each is supplied with an automatic valve which maintains the pressure at some predetermined amount, usually opening when the A. has reached an altitude of 20,000 ft. The navigating car is suspended near the nose of the ship and is fitted with the usual controls and instruments. There is also an aft car fitted out as an auxiliary control car in case of emergency. The engines are installed in the rear of these cars. The *Hindenburg* was the most modern rigid type of A., and made its first flight in 1926. Its length was 800 ft., maximum diameter 135 ft., gas capacity 6,700,000 cu. ft. The structure in its main conception was the same as has been successfully developed during the past 35 years. It

had 15 main transverse frames, each of which was a 36-sided regular polygon. Its passenger accommodation was arranged on 2 decks inside the exterior envelope. A control car and 4 engine gondolas were mounted externally. The outer fabric was doped with celloidin, mixed with aluminium powder on the outside to increase the heat reflection; on the underside the fabric was porous to assist ventilation. On its preliminary trial the ship attained 178 m.p.h. The *Hindenburg* was destroyed by fire in May 1937, when about to land at Lakehurst, New York, at the end of her first voyage of the year, 33 persons being killed out of a total of 97 on board. After the First World War the U.S.A. suffered serious A. losses in those of the *Shenandoah* and the *Akron*. The first of these losses did not retard development, and the authorities, profiting by experience, built mooring-masts across America, it having been found that operating A. from their sheds limited their use. But further loss came when the *Akron* (U.S. Navy A.) crashed off New Jersey on Apr. 4, 1933, in an electrical storm, with the loss of 71 of her 77 officers and guests aboard, including Adm. William Moffett, chief of the Bureau of Aeronautics. Her loss was in fact due to the same cause as that which destroyed the *Shenandoah*. The *Akron* was not so large as the *Hindenburg*—being 785 ft. long, with a gas capacity of 6½ million cu. ft. and diameter 132 ft. A sister ship, the *Macon*, was launched in 1933. Great Britain, France, Italy, and Japan, however, all decided to abandon A. construction; but Germany, in no way dismayed, kept the *Graf Zeppelin* on passenger transport service as late as 1938. Great Britain's worst disaster was the loss of the *R. 101* on Oct. 5, 1930. The A. had started on an official flight to India, but came down at Beauvais in France, being totally destroyed by fire; 48 of the company of 54 being burned to death, including Lord Thomson, secretary of state for air, A. M. Sir Sefton Brancker, and Maj. Richmond, the designer. The court of inquiry found that the accident was caused by a substantial loss of gas in bumpy weather. Had helium been used instead of hydrogen, the loss of life would not have occurred, but hydrogen was used because of its greater lifting power.

Consult V. C. Richmond, *Some Modern Developments in Rigid Airship Construction*, 1928; E. F. Spinner, *About Airships*, 1929.

**Air Survey**, see under SURVEYING AND LEVELLING.

**Air Transport**, see AIR MAIL; AIRWAYS, BRITISH; AIRWAYS, IMPERIAL; AVIATION, CIVIL.

**Air-valve**, an arrangement to prevent the compression of air where there is a bend in line of water-pipes. When the pipes are filling with water the driving of the air to the upper part of the bend might cause sufficient compression to stop the flow, if it were not allowed to escape. The valve is closed by a guided

float if the water itself reaches to the top of the bend.

**Air-vessel**, a chamber interposed between the pump and delivery pipes in single-acting pumps. The air in the chamber is compressed at each forward stroke of the pump, thus providing a pressure which serves to drive the water on during the backward stroke. As the water tends to absorb the air, the latter must be replenished from time to time.

**Aird, Thomas** (1802-76), b. at Bowden, Roxburghshire, and educated at Edinburgh Univ., was the friend of Carlyle and Hogg. His literary work, though praised by Carlyle, has never become popular. The best known is his poem *The Devil's Dream*.

**Airdrie**, tn. of Lanarkshire, Scotland, on the high road between Edinburgh and Glasgow. The development of coal and iron mines in the vicinity has caused great increase in its prosperity during the last century. Cotton-weaving and paper-making are also carried on. Pop. 26,000.

**Aire**, a riv. of Yorkshire; it has its source in the Pennine Hills, Lancs, but early in its course passes through the A. Gap into Yorks, runs through the S. part of the co. to join the Ouse near Goole, its length being 70 m. Airedale, through which it flows, is a picturesque valley lying between Malham Cove and Leeds.

The A. and Calder Navigation is a system of rivs. and canals serving the larger Yorkshire towns. Its chief branches are from Goole to Leeds and from Castleford to Wakefield.

AIREDALE

T. Fall

**Airedale**, a breed of large, rough-haired terriers forming the link with the hound group, and said to be a hybrid between the otter-hound and the Welsh terrier or a local terrier of the Aire Valley. It is the largest of the terriers and was first bred in 1853. It has a close, wiry coat of black and tan, short straight back and sloping shoulders, flat skull, forelegs perfectly straight, and

powerful jaws. A full-grown dog should weigh about 45 lb. It needs much open-air exercise on account of its strength and size, and is not suited for life in small houses in towns.

**Aire-sur-Lys**, tn. in the dept. of Pas-de-Calais, France, at the junction of 3 canals with the R. Lys, has a large trade in agric. produce.

**Airolo**, a vil. of Switzerland, canton of Ticino, at the S. end of the St. Gothard railway tunnel. Elevation 3800 ft. A bloody battle was fought here between the Fr. and the Russians in 1799. The tn. was almost destroyed by an avalanche in Dec. 1898. Pop. 1600.

**Airways, British**. An air transport company, with offices at Terminal House, Grosvenor Gardens, S.W.1., which before the Second World War operated services from Heston to Hamburg, Copenhagen, and Stockholm; Heston to Paris; Croydon to Berlin; Croydon to Hanover. Like Imperial Airways (q.v.), the company was given financial assistance by the Gov. for developing Brit. air routes overseas. It was the first Brit. air line company to operate regular night services. The Cadman Committee, in 1933 (see under AIRWAYS, IMPERIAL) recommended that B. A. should be entrusted with the development of European services other than those on the London-Paris route, which were to be operated by a new company combining the interests of B. A. and Imperial Airways. The Gov. also chose this company to operate the England-S. America air route via the W. coast of Africa. A number of 250-m.p.h. Lockheed 14 air liners were ordered for the inauguration of a regular passenger and mail service to Lisbon along this section. The night mail services of B. A. were operated from Croydon, all other services of the company were operated from their terminal airport at Heston, to which the company's fleet and maintenance organisation were transferred from Croydon and Gatwick in 1938. Under a Bill introduced in 1939 the undertakings of Imperial Airways and B. A. were transferred to a new State-guaranteed corporation, the Brit. Overseas Airways Corporation (B.O.A.C., q.v.).

**Airways, Imperial**. The first Brit. national air transport company, incorporated in 1924. It operated regular daily services in Europe from London to Paris, Brussels, and Cologne and, at certain seasons, Basel, Le Touquet, and Zürich. It had (1939) 8 weekly services to Egypt and back, 5 to India, 3 to Singapore and Central Africa, and 3 to Sydney via Egypt, Palestine, India, Burma, and Malaya. There was a weekly service between Khartoum and Lagos and a weekly service between New York and Bermuda; besides numerous other services and connections. In 1924-25 the company flew 11,395 passengers, 212,380 letters, and the aggregate m. flown were 853,042; by 1932-33 the totals were 53,080 passengers, 11,400,000 letters, 2,354,176 m.; by 1936-37, 64,771 passengers, 35,668,430 letters, 5,231,653

m. The Atlantic air route was subsequently under investigation by I. A. in collaboration with Pan-Amern. Airways. Flying boats were used on Empire air routes, but it was proposed to use land planes to supplement these services and also on the N. Atlantic route. It was granted a subsidy by the Gov. for the development of Brit. air routes overseas. In 1937 I. A. and associated companies had a fleet of 78 aircraft—31 flying-boats and 47 land planes—in operation and under construction. Some 8 improved flying-boats were being constructed (1938–1939), including 22-ton Ensign liners and the *Frobisher*, which was among the fastest passenger aircraft in the world. The flying-boat fleet of I. A. was the largest of any company in the world. They included *Heracles*, *Scylla*, and *Diana*, classes, used on the European routes, Imperial, on the services to Africa, India, and Australia; *Cavalier*, between Bermuda and New York. Serious accidents were few: in 1933 the *City of Liverpool* machine caught fire over Dixmude on the way from Brussels to London, all 15 persons on board being killed. Following some staff troubles, the Gov. appointed a parl. committee of inquiry under Sir John Cadman, as a result of whose report a whole-time chairman (Sir John Reith) was appointed. The air transport undertakings of I. A. were acquired on April 1, 1940, by Brit. Overseas Airways Corporation (q.v.).

**Airy, Sir George Biddell** (1801–92), an Eng. astronomer, b. at Alnwick, and entered Trinity College, Cambridge, in 1819. After a brilliant college career, he was elected Plumian prof. of astronomy in 1828. In 1836 he was appointed Astronomer Royal at Greenwich Observatory, where he made important researches in magnetism, meteorology, etc. Among his works are *Astronomical Observations, Tides and Waves*, 1842; *Ipswich Lectures on Astronomy*, 1851; *Treatise on the Errors of Observation*, 1861. Fuller information may be found in his *Autobiography*, 1896.

**Aisle** (Fr. *aile*, Lat. *ala*, a wing), any lateral div. of a church or other edifice. Generally in England there is only 1 aisle on each side of the nave, but on the Continent there are sometimes as many as 3.

**Aisne** (Lat. *Axona*): 1. A Fr. riv. rising in the Mouse dept. and flowing into the Oise near Compiègne. Length, 170 m. 2. A dept. in the N. of France. Surface, flat and undulating; soil, good; climate, damp and cold; cereals are generally cultivated. There are important woollen manufs. The dept. is watered by the Marne, Oise, and Aisne. Cap., Laon. Pop. 453,400.

**Aisne, Battles of the.** The valley of this riv., extending as it does from Compiègne and the vicinity of Noyon, through Soissons and the dept. of the Meuse to the Argonne forest and to within 25 m. of Verdun, was fated to be the scene of bitter fighting in any war in which the Ger. armies should invade France from the N.E. This proved to

be the case, though the character of the fighting was, no doubt, very different from what was contemplated by the General Staff of either side. There were 3 B. of the A., fought respectively in 1914, 1917, and 1918, but the Brit. armies were not especially involved in the second battle, which began a few days after the Brit. attack at Arras had closed.

**First Battle of the Aisne.**—The advance to the Aisne began with the allied victory of the Marne on Sept. 6, 1914, and continued until Oct. 1. When conditions stabilised, the trench warfare, which was to endure for 4 years, began. So far as the Brit. Army was concerned, this warfare was improvised, for the only heavy guns it had were a few batteries of old 6-in. howitzers and but meagre engineering stores. The compilers of the Brit. official *History of the Great War* conclusively refute the assumption that entrenchments had already been prepared on the Aisne heights in anticipation of retreat. On the contrary, when this, the so-called race to the sea, began, there was a moment when a real gap yawned between the Ger. First and Second Armies covered only by Ger. cavalry; and the Brit. First Corps, under Haig, was thrown into the attack with every prospect of success, but vainly as it turned out, because before the attack could be fully launched, the Ger. reserves, which were too late for the Marne battle, reached the gap and closed it. Indeed, no one had foreseen the deadlock which now ensued, nor envisaged the implications of scientific progress in the art of modern warfare whereby the hope of outflanking a line which could seemingly be endlessly extended was finally dispelled and the long routine of dreary trench fighting without tangible results set in. Such deadlock was certainly no part of the original Ger. plan, though the natural advantages of the regions of the *Chemin des Dames* and the forests of St. Gobain and the Argonne had suggested the provision of entrenchments in the rear in case of retreat. The allied forces continued their frontal attack in the vain expectation of outflanking the Ger. line, but as the battle proceeded, found that the Gers. were but fighting rearguard actions to cover their further and leisureed retirement.

The actual battle began on Sept. 13, the Gers. being then N. of the riv. with their guns concealed on the N. slopes. Despite the depth of the riv., Maunoury with the Sixth Army, attacking on the left from Compiègne, succeeded in getting sev. divs. across; the Brit. Army sustained the general attack from the point of junction with the Fr. at Soissons for a distance of 15 m. On the 14th, Maunoury captured Noviron and attacked the heights only to find, as did the Brit. after capturing Troyon, that the enemy positions on the high ground were invulnerable. On the 15th the Gers., counter-attacking, drove the Fr. from Noviron and the Brit. back to the riv. Marshal Joffre, who was then in supreme command, then began a

change of strategy, lengthening his left by forming 2 new armies, but the only result of this collision of equally balanced forces was to force them out westward, and the same result ensued in the opposite direction when the Gers. sought to outflank Gen. Sarrail on the Meuse.

**Second Battle of the Aisne.**—This battle was begun on Apr. 16, 1917, by Gen. Nivelle attacking the 'Hindenburg line' near Laon. His strategy was the antithesis of that of Joffre, whom he had succeeded, namely to deal a decisive blow rather than to wear down the enemy by attrition. He actually endeavoured to storm the Aisne heights in one supreme attack launched from 3 quarters simultaneously with the whole of his forces, the main offensive being in the vicinity of the lower ground before Laon. He captured the riv. banks from Soissons to Berry-au-Bac, together with 20,000 prisoners and nearly 200 guns, but he found the road to Laon impregnable. His disastrous strategy caused a reaction to the Fabian tactics of Foch and Pétain, the latter being appointed generalissimo in his stead, and once more the allied armies settled down to the more effective if protracted method of a war of attrition, in which the side which should eventually receive heavy reserves at the decisive moment would of necessity win the day.

**Third Battle of the Aisne.**—This battle was part of the Ger. offensive in Champagne, which extended between May 27 and June 6, 1918, the geographical limits, so far as the Brit. forces were concerned, being between the Chemin des Dames and the Montagne de Reims, E. of Verneuil. Ludendorff had recently held out hopes to Germany of a supreme and decisive effort before the Amer. armies could be thrown into the fray, inasmuch as he had driven a deep salient into the Brit. lines near Arras and the Ger. effectives still outnumbered those of the Allies. There was some justification for the high hopes entertained in Germany as to the outcome. The offensive against the Fr. was begun on the Aisne heights, this being the zone nearest to Paris and the Marne and the Paris-Châlons railroad. The Ger. preparations were made with dispatch and secrecy, and on May 27 the preliminary artillery bombardment began all along the line from the Ailette to the environs of Reims. Before the day was over, the Fr. had retreated from the heights N. of the riv. and the Ger. troops under Gen. von Boehn had crossed the riv. at Fismes, capturing numerous prisoners, guns, and other booty. Flushed with success, the Ger. command deepened its thrust from Fismes right to Château-Thierry on the Marne; but never for an instant did Marshal Foch allow his major strategy—the strengthening of his flank positions at Reims and Soissons—to be distracted, and before long the tide was destined to turn. (See also MARNE, BATTLES OF THE.)

**Aissé, Mademoiselle** (c. 1694–1733), Fr. letter-writer, b. in Circassia, captured by Turks, and sold in 1698 as a slave to

the comte de Ferriol, Fr. ambas. at Constantinople, who had her educated in Paris. She attracted much attention by her beauty and romantic story. *J.* in Paris. Her letters to Madame Calandrini, first pub. 1787, with notes by Voltaire, reveal her tenderness and fidelity. Other eds. appeared in 1846, by S. Ravenel, with an introduction by Sainte-Beuve, and in 1873, by E. Assé. See also her *Life* by Courteault (1900).

**Aistulf, or Astolf, king of the Lombards** 749–56, succeeding his brother Rachi. Captured Ravenna and the Pentapolis 751–2, and marched against Rome. The pope called to his aid Pepin, king of the Franks, who defeated A. in 754. A. again besieged Rome in 756, and was forced by Pepin to give up the exarchate of Ravenna and the Pentapolis to the pope. See Gregorovius, *City of Rome in the Middle Ages*, vol. ii., 1896.

**Aitken, James** (1752–77), known as 'John the Painter,' was apprenticed as house-painter in Edinburgh, but came to London and turned highway robber. He was concerned in the tea-duty riots at Boston, U.S.A., set fire to some storehouses at Portsmouth and Bristol when the fleet was about to sail for America, and was executed 1777.

**Aivalik, or Alvalik**, is a seaport on the gulf of Edremit, Turkey, N. of Smyrna. It was burnt by the Turks in 1821, but was soon rebuilt, and exports oil, olives, and corn. Pop. 38,300.

**Aix, a tn. in the dept. of the Bouches-du-Rhône, France**, the former cap. of Provence. Here C. Sextius Calvinus, the Rom. consul, founded a colony 120 B.C., giving it the name of Aquæ Sextiæ, on account of its mineral springs. It is a handsome tn. and contains the cathedral of St. Sauveur, the Palais, Museum, and Library, besides a univ. and school of art. It is the see of an archbishopric, does a considerable trade in olives, oil, and wine, and is engaged in cotton-spinning and tanning. Pop. 38,300.

**Aix, a fortified is. opposite the mouth of the Charente, France.** Here the Fr. were victorious over the Brit., 1806, and there was an indecisive naval battle in 1809. Napoleon on board the *Bellerophon* surrendered here to the Brit., 1815.

**Aix-la-Chapelle, see AACHEN.**

**Aix-les-Bains, a tn. in Savoie, France.** In the time of the Romans it was called Aquæ Allobrogum, and Aquæ Gratianæ or Domitiane. It is situated in a healthy valley, and its hot springs attract many visitors. Pop. 12,900.

**Ajaccio, cap. of the Fr. dept. of Corsica**, is situated on the W. coast of that is., on the N. of the gulf of Ajaccio. The house in which Napoleon I. was born (1769) is still preserved as national property. The chief employments are the anchovy and pearl fisheries, while much olive oil is exported. The city has a fine harbour and cathedral. Pop. 37,100.

**Ajaigarh, a hill fort of India**, giving its name to a state, in Bundelkhand. It was captured by the Brit. in 1809. It contains the ruins of sev. temples covered

with sculptures. The religion is Hindu. Area: 800 sq. m. Pop. 96,000.

**Ajalon**, the modern Yalo, is mentioned in biblical hist. as the scene of Joshua's defeat of the Canaanites, when he made the sun and moon stand still till the victory was complete. It was given to the tribe of Dan.

**Ajax**, son of Oileus, sometimes called the lesser A., sailed against Troy with 40 ships. On his homeward journey his vessel was wrecked; he escaped to a rock, but when he boasted that he would be saved in spite of the gods, Poseidon split the rock and A. perished (Homer, *Odyssey*, iv.). Virgil tells us that he excited the anger of Athena (*Æneid*, i.).

**Ajax**, son of Telamon, sometimes known as A. the Great, was one of the most renowned heroes of the Trojan war. He engaged in single combat with Hector (Homer's *Iliad*, book vii.), and defended the ships and killed many Trojans (*Iliad*, books xiii.-xvii.). He contested with Ulysses for the armour of Achilles, and when it was awarded to Ulysses, A. in madness killed himself (Sophocles, *Ajax*; Ovid, *Metamorphoses*).

**Ajlun**, a dist. or *liwa* of Transjordan. It is almost entirely occupied by a settled pop. rather than Beduin. In the mts. of A., in Biblical times, dwelt the tribe of Manasseh. On the foothills of these mts., 3 m. W. of Jerash, is a pleasant vil. Reimun, which has been identified with Ramoth-Gilead. Arx Ajlun was the crusaders' name for Qala'at al-Rabad—surmounting the vil. of A.—the most important of the Saracen fortresses in Transjordan. The headquarters of the *liwa* are at Irbid. There are local chambers of commerce at both Irbid and the vil. of A.

**Ajmer**, or **Ajmere**, an important city of India, in the native state of Rajputana, 220 m. S.W. of Delhi. It is situated at the foot of Mt. Taragarh in a picturesque valley; many of the streets are spacious, with fine temples. It contains the tomb of the Moslem saint Kwaja, much frequented by pilgrims, and is the cap. of the prov. of A.-Merwara. Pop. 120,000.

The prov. of A.-Merwara has an area of 2700 sq. m. and a pop. of 560,000, 80 per cent of whom are Hindus. The prov. was ceded in 1818.

**Ajodhya**, of which the glories are described in the *Rāmāyana*, was the anct. cap. of Oudh, and was situated on the r. b. of the Gogra near Fyzabad. Its ruins alone remain, overgrown with jungle. The modern tn. of the same name is chiefly notable for the annual fair of Itamarni, which attracts 500,000 pilgrims.

**Ajuntha**, or **Ajanta**, a vil. of Halderabad famous for its Buddhist cave hermitages excavated in the side of a rugged and densely wooded ravine some 4 m. from the vil. These caves, numbering about 30, comprise dwelling and meeting halls, have a cloistral appearance, and date back, in many cases, to 200 B.C.

**Ajuroca**, tn. of Minas Geraes, Brazil, on riv. of same name, 107 m. N.E. of Rio de Janeiro. The industries of the dist.

are stock-raising and the growing of tobacco, manioc, sugar, millet, and coffee. Pop. 6000.

**Akabah**: 1. An Arabian tn. on the E. side of the gulf of A., which has been identified with the biblical Elath. It is on the pilgrim route from Egypt to Mecca. 2. A gulf formed by a branch of the Red Sea between the peninsula of Sinai and the N.W. of Arabia. It is the anct. Sinus Atlanticus.

**Akbar** (the 'great,' his proper name being Jelal-ed-din Mohammed) was b. at Umarkot in 1542, when his father was fleeing to Persia from Delhi. He was the wisest and greatest of the Mogul emperors. In 1555 his father regained the throne, but d. in the same year. A. committed the care of the kingdom to a regent, Bahram Khan. At that time few of the provs. originally subject to the Mogul emperors were in submission, and Bahram reduced many of them. However, he was despotic and cruel, and in 1560 A. took the rule into his own hands. In 10 or 12 years he had conquered all India N. of the Deccan, and was able to devote himself to administration. His name as a ruler is inseparable from that of his minister, Abul Fazl, who later left an enduring record of the emperor's name in the *Akbar Nameh*. The pair ruled with wisdom and vigour, repressing vice with a firm hand. Roads were made, and commerce was encouraged in every way.

A.'s reign marks the beginning of a new epoch, and is one of the most important periods in the religious and literary hist. of India. A. was not firmly attached to the Mohammedan faith, and called for Portuguese missionaries from Goa to explain Christianity to him. Ultimately he adopted an eclectic kind of Deism, while allowing religious liberty to his subjects. He encouraged literature and estab. schools throughout the country. See G. B. Malleson's *Akbar* ('Rulers of India' series), 1890.

**Akeldama**, see ACELDAMA.

**A' Kempis**, Thomas, see THOMAS A KEMPIS.

**Akenside**, Mark (1721-70), was b. at Newcastle, and in 1739 was sent to Edinburgh with the object of studying theology for the Presbyterian ministry. A year later he gave up this object for the study of medicine, and in 1744 took his degree of M.D. at Leyden. On his return he practised in Newcastle, Hampstead, and finally London. His haughty and pedantic manner (satirised by Smollett in *Peregrine Pickle*) prevented him from gaining a large practice. His profession, indeed, would hardly have supported him had not his friend Dyson made him an allowance of £300 a year. He had pub. verses in the *Gentleman's Magazine* as early as 1737, but his literary reputation rests on his *Pleasures of the Imagination*, commenced in 1738 and pub. in 1744. Its didactic nature made it popular at the time; it was approved by Pope and tolerated by Gray. A. also wrote various medical treatises on dysentery. See his *Life* by Bucke (London, 1832).

**Akhissar** ('white castle'), a tn. in Asiatic Turkey, 50 m. N.E. of Smyrna. It was the anct. Thyatira, one of the 7 churches spoken of in the Apocalypse. It exports cotton, wool, etc. Pop. 12,000.

**Akhlat**, a tn. of Asiatic Turkey, on N.W. shore of Lake Van, 203 m. S.E. of Trebizond. Formerly the seat of the Armenian kings. Pop. 4800.

**Akhmim**, tn. of Upper Egypt, on Nile, 85 m. S.E. of Assiut. A steamboat and mail station, and long famous for textile manufs. Pop. 30,300.

**Akhmaton**, **Akhenaton**, or **Ikhmaton**, Pharaoh of the eighteenth dynasty, succeeding his father, Amenophis (or Amenhotep) III., as Amenophis IV. His reign was marked by religious fanaticism, the worship of all other gods being abolished in favour of the sun-god. He was especially opposed to the god Ammon, erasing his name from all monuments and abandoning Thebes for a new cap. at El Amarna, dedicated to Aton, the sun-god. He neglected other affairs, and his reign marks the end of Egyptian rule in Syria. He d. c. 1350 B.C., after reigning about 17 years. See A. E. P. Weigal, *Life and Times of Akhnaton*, 1910. See also EGYPT; TELL EL-AMARNA.

**Akhtirka**, tn. of Kharkov, Ukraine, on a small trib. of the Dnieper and 58 m. N.W. of the tn. of Kharkov. Pop. 27,000.

**Akibah**, **Ben Joseph**, see **AQIBA**, **BEN JOSEPH**.

**Akka**: 1. A pygmy negroid race inhabiting the African equatorial belt. The A. (Arab, Tikki-Tikki) are found along the upper course of the Aruwimi and W. of Lake Albert, and were discovered by Schweinfurth about 1872. They are yellow-brown in colour, and about 4 ft. 6 in. high, and live nomadically, apart from, though usually under the protection of, the taller races. 2. A vil. of the Sahara on the Moroccan border; one of the stations on the Morocco to Timbuktu caravan route. 3. Anct. name of Acro (q.v.).

**Akka**, see **ACRE**, **ST. JEAN D'**.

**Akkad**, see **ACCAD**.

**Akkerman**, see **CETATEA ALBA**.

**Akmoilinsk**: 1. Region of Kazakh, S.S.R. It is in the Kirghiz Steppe region of W. Siberia and lies between the Rs. Uln-Tai and Ishim on the W. and Irtysh on the N.E., but has a pop. largely nomadic, of only about 800,000. It may be divided into 3 parts; the N., a low brackish plain; the central, occupied by the Tarbagatai Mts., containing gold, copper, and coal, and interspersed with fertile valleys; and the S. desert. The chief industries are agriculture, cattle-rearing, and transport. 2. Cap. tn. of prov., on R. Ishim, 300 m. S.W. of Omsk. Pop. 12,700.

**Akola**, tn. in dist. of same name, W. Berar, India, on R. Morna, 55 m. S.W. of Ellichpur. Pop. 47,000.

**Akot**, tn. in Akola dist., W. Berar, India, 35 m. S.W. of Ellichpur. It has a large trade in cotton. Pop. 18,000.

**Akron**: 1. Cap. city of Summit co.

Ohio, on Ohio Canal, 38 m. S. of Cleveland, containing numerous factories and mills. Pop. 244,000. 2. Tn. in Erie co., New York; manufs. cement; pop. 1960. 3. Tn. of Plymouth co., Iowa, containing large flour-mills. Pop. 1324.

**Aksakov**, **Konstantin** (1817-60). Russian Slavophil writer, son of Sergei A., b. in Moscow. His idealism is a mixture of hallucination and real knowledge, though his theories are imbued with life as in *The Prince Lupovitsky* and in *Moscow Delivered*—two dramas which contrast the naturalness of the people with the corrupt culture of the upper classes. His works, historical, poetical, and critical, were collected in 5 vols. D. at Zante, Greece.

**Aksakov**, **Ivan** (1823-86). Russian writer and leader of the Pan-slavist or Slavophil movement, son of Sergei A. (q.v.). He began his literary career as a poet, but it was as a political publicist that he became famous. Like his father, he spent sev. years in the Gov. service before taking up writing. He reached the height of his influence in 1876-78, when he was the mouthpiece of the general enthusiasm for the liberation of the Balkan States. Next to Herzen his is the greatest name in Tsarist Russian political journalism.

**Aksakov**, **Sergei Timofievich** (1791-1859), Russian writer, b. in Ufa, Orenburg. His grandfather was an energetic pioneering squire who planted a colony of serfs in the Bashkierian region. A. took a situation as gov. clerk after obtaining his degree at Kazan. He joined the circles of literary contemporaries and was patronised by Adm. Shishkov, of whom he left a delightful character sketch. In 1830 he left the civil service and lived the easy life of a gentleman of comfortable means. His *Notes on Angling* (sport in Orenburg), 1847, and *Notes on Shooting in the Orenburg Country*, 1852, are written in a simple yet vivid style and were enthusiastically reviewed by Turgenev and Gogol. Some of his work shows the influence of Gogol, but his *Years of Childhood* and *Bagov the Grandson*, 1858, have the characteristics of Proust. *Natasha*, 1859 (uncompleted), is a record of his younger sister. Other works: *A Russian Gentleman* (trans. 1917) and *Chronicles of a Russian Family* (trans. 1924).

**Akureyri**, tn. of Iceland, on Eyjafjörðr. It has a good harbour and is an important trading centre. Pop. 4500.

**Akyab**, a dist., area 5136 sq. m., and tn. in the Arakan div. of Burma. After the cession of Arakan in 1826 A. was made the seat of gov., and rapidly grew from a small fishing vil. into a leading port, chief export rice, several large rice mills. Pop., dist. 576,340; tn. 36,569.

**Alabama**, the 'Cotton State,' one of the gulf states of the U.S.A., bounded on the N. by Tennessee, on the E. by Georgia, on the S. by Florida and the gulf of Mexico, on the W. by Mississippi, and having a gross area of 51,609 sq. m. In the extreme N. of the state is part of the fertile valley of the Tennessee: to

the S. of this lies a hilly region containing parts of the Alleghany and Cumberland ranges, in which coal and iron are found. The centre of the state is occupied by the Cane-brake or Black Belt, one of the most fertile cotton countries in the world. To the extreme S. is a low-lying, sparsely populated dist., very heavily wooded. The country is well watered, and the A. and Tombigbee are navigable rivs. The leading industry of the state is still agriculture. A. ranks as one of the leading cotton-producing dists., and Indian corn, tobacco, rice, and wheat are largely grown. There are large coal, iron, and steel industries in the N., and cotton manuf. and the lumber trade are considerable. The climate is warm and equable and very healthy except in the low-lying land in riv. valleys.

A. takes its name from an Indian tribe, which formerly inhabited this region. The ter. now constituting A. was first explored in 1540 by the Spaniard, De Soto, who passed through it from Florida to the Mississippi. The first permanent settlement was made by the Fr. on Mobile Bay in 1702, and was removed to the present site of Mobile in 1711. Towards the close of the seventeenth century France asserted her title to this region, basing her claim on the discoveries of Marquette and Joliet, who descended the Mississippi to the Arkansas in 1673, and of La Salle, who sailed down the Mississippi to its mouth in 1682. England, too, claimed the region N. of the gulf of Mexico, and the ter. now forming A. was included wholly or in part by the Carolina Charters of 1663 and 1665, and by the Georgia Charter, 1732. In 1763 the Fr., by the peace of Paris, ceded A. to Great Britain; Florida, then a part of A., being also transferred to Great Britain by Spain. The treaties of Versailles and Paris led to complications over A., between the U.S.A., Spain, and England, but at the close of the eighteenth century all the present area of A., except that portion lying S. of the thirty-first parallel, was ceded by Great Britain to the U.S.A. The Floridas were transferred by Great Britain to Spain at the same time. In 1795 Spain relinquished her claims to the ter. N. of the thirty-first parallel. In 1819, after Spain had virtually given up all claims to any ter. in A., A. became a state with boundaries as at present, and was admitted to the Union.

Disaster befell A. in 1837 as a result of the corruption of the note-issuing state banks, and the state's public debt reached over 3½ million dols. Further trouble occurred over the slave-holding question, the 'Alabama Platform' definitely pronouncing against any infringement of slave-holding rights. A., in 1860, together with other cotton states, seceded from the Democratic National Convention, and as a Confederate state sent out the bulk of its male white pop. to fight against the N. After the war the negro pop. gained the ascendancy and disfranchised the white voters, but financial disaster quickly followed,

the state debt reaching 26 million dols. in 1874. In 1901 a new constitution greatly curtailing the negro voting power was adopted. A. has 37 railways, 8 of them trunk lines. More than a third of the landowners are coloured; there are strict laws against the marriage of whites and negroes. Pop. (1940) 2,832,961, of whom 65 per cent are white. The state cap. is Montgomery (pop. 78,000); the seaport is Mobile. Prin. tns., Birmingham, Anniston, Selma, Bessemer.

**Alabama, The**, a Confederate cruiser in the Amer. Civil War which, causing immense loss to the commerce of the Federal States, gave rise to the celebrated Alabama Question, and led to strained relationship between the govts. of the U.S.A. and Great Britain. England accorded to the Confederates the status of belligerents, and was lax in the enforcement of strict neutrality. This very nearly precipitated a war between the 2 countries, which was only averted by arbitration. The A. was built in the yard of Messrs. Laird & Sons, Birkenhead, and the vessel, before coming out in her true light by being named after one of the seceding states, was known as No. 290, i.e. her number in the builders' yard. The crown law officers advised detention with a view to submission of the question to a court of law. Being apprised of the Gov.'s intention, the still incomplete A., on the pretext of making a trial trip, steamed down the Mersey and out to sea on July 29, 1862. She made for the Azores, where, under the direction of her commander, Capt. Semmes, she was equipped with arms and ammunition. Thus armed she sailed forth on Aug. 24. In all she captured some 68 vessels and inflicted direct damage to the extent of nearly £1,000,000. Finally, on June 19, 1864, the Federal warship *Kearsarge*, commanded by Capt. Winslow, caught the A. off Cherbourg, and after an hr.'s engagement, in which the latter vessel was reduced to a sinking condition. Capt. Semmes surrendered. The prolonged negotiations between this country and the U.S.A. eventuated in the treaty of Washington, 1871, by which it was agreed to refer the dispute to a court of 5 arbitrators, one each to be nominated by England, U.S.A., Italy, Switzerland, and Brazil. This court sat at Geneva in Dec. 1871, and awarded the U.S.A. £3,229,166, in respect of damage done by the A. and 2 other vessels, the *Florida* and the *Shenandoah*. The question is discussed in most works on International Law. See J. W. Dwinelle, *American Opinions*, 1870; M. Bernard, *Neutrality*, 1870; G. W. Lowrey, *English Neutrality*, 1863.

**Alabama River**, 315 m. long, rises in the state of Georgia. It flows through Montgomery, the cap. of Alabama, and unites with the Tombigbee to form the Mobile, a short riv. which flows into Mobile Bay, on which is situated the tn. of Mobile. It drains the greater part of the state of A.

**Alabaster**, a term applied to 2 different minerals. The A. of the ancients is said

to have derived its name from the tn. of Alabastron in Egypt. It is a hard, marble-like carbonate of lime formed by a stalagmitic process, and was in much demand for ornamental purposes. The 'alabaster box of very precious ointment,' mentioned in Matt. xxvi. 7, was made of this substance.

The A. of the present day is gypsum (*q.v.*), a hydrated sulphate of lime. It is a much softer mineral than the anct. A. and slightly soluble in water, but it is used for making ornaments, statuettes, etc.

**Alagoas:** 1. A state of Brazil, bounded on N. and N.W. by Pernambuco, of which it was originally part, on S.W. by Sergipe, and on the S.E. by the Atlantic. It has an area of 22,580 sq. m., and a pop. of about 980,000. The soil is fertile, and the country well watered, but agriculture is only sparingly carried on owing to the deadly climate. The chief products are sugar, tobacco, coffee, and cotton. Maceio is the cap. 2. Tn. in state of same name, near the coast, on Lake Mangaba. Formerly the cap. of the prov. Pop. 19,000.

**Alais (Alès),** tn. in dept. of Gard, France, on It. Gardon, 23 m. N.W. of Nîmes. It is situated on a productive coalfield, and has manufs. of silk, glass, and iron. A. sided with the Huguenots in the seventeenth-century religious wars, and was taken in 1629 by Louis XIII. and Cardinal Richelieu. A treaty signed here in the same year ended the war. Pop. 42,000.

**Alajuela,** cap. of prov. of same name, Costa Rica, 15 m. N. of San José. The centre of an important coffee and sugar dist., and the headquarters of many revolutionary outbreaks. Pop. 11,700 (prov.) 124,000.

**Alaleona, Domenico** (1881-1928), It. musical composer, b. in P'ceno. Won a place amongst modern It. musicians as a national composer of marked originality. His *Canzoni italiane* and *Laudi italiane* are collections which revive the songs of his people and make an attempt to reconstruct a basis for the symphony and for modern instrumental music. A. also contributed some important studies of It. musical hist.; his book (*Studi sulla Storia dell' oratorio musicale in Italia*, 1908, 1945, contains much valuable research.

**Alamanni, or Alamans,** see Alemanni.

**Alameda,** a residential city in Alameda co., California, 6 m. from San Francisco. Pop. 36,000.

**Alamo,** the 'Thermopylae of America,' originally a Franciscan mission, but used at the end of the eighteenth century as a fort. In the Texan War of Independence (1836) a party of Texans and Amers. numbering 180 held it against a large number of Mexicans under Gen. Santa-Anna. Continued assaults were repulsed from Feb. 23 to Mar. 6, when the Mexicans, having lost over 400 men, reduced the garrison to 5. These were captured and put to death by order of Santa-Anna.

**Alamos, tn.** in state of Sonora, Mexico,

125 m. N.W. of Sinaloa. The tn. is in the centre of an important silver-mining dist. Pop. 3000.

**Alanbrooke, Sir Alan Francis Brooke,** first Viscount (b. 1883), Brit. soldier, b. at Bagneres de Bigorre, France, son of Sir Victor Brooke, of Co. Fernanagh, Ireland. Educated abroad and at the Royal Military College, Woolwich, passing out into the R.F.A. 1902. Went to France in 1914 with the Secunderabad Cavalry Brigade. Adjutant, 2nd Indian R.H.A. Brigade, 1915; G.S.O.I.R.A., 1st Army, 1918. Commandant, School of Artillery, 1929-32; Army Instructor, Imperial Defence College, 1932-34; Commander, 8th Infantry Brigade, 1934-35; Inspector, R.A., 1935-36; Director of Military Training, War Office, 1936-37; Commander of Mobile Div., 1937-38; G.O.C. in Chief, Anti-aircraft Command, 1939; G.O.C. in Chief, S. Command, 1939-40; Commander of Second Army Corps, B.E.F., 1939-40; Commander-in-Chief, Home Forces, 1940-41. Chief of the Imperial General Staff, 1941-46. Field Marshal, 1944.

**Aland Is.** See AALAND ISLANDS.

**Alaouites (Alawites), Territory of the,** a dist. of Syria created by France as mandatory when pre-war Syria was partitioned into sev. states. In 1921 the then newly formed state of the A., together with those of Damascus and Aleppo, were made into a Syrian federation, but 3 years later the A. became a separate regime under a Fr. governor. See also SYRIA.

**Alarcón, Juan Ruiz de** (1588-1639), a Sp. dramatic poet, b. in Tlaxco, Mexico, d. in Cordova, Spain. He graduated in Mexico in 1606, and in 1622 went to Spain to fill a position under the council of the Indies. In 1628 his first vol. of 8 dramas was pub. at Madrid. The second vol. of 12 plays appeared at Barcelona in 1635. His work includes heroic drama, character-plays, and comedies of intrigue, and ranks very high in Sp. literature. His best-known play is *La verdad sospechosa* (imitated by Corneille in *Le Menteur*). Others are *Las pinedas oyen*, *El tejedor de Segovia*, and *Todo es ventura*. He received little contemporary appreciation, and treated his rivals and the public with great scorn.

**Alarcón, Fernando de,** a Sp. navigator in the sixteenth century. In 1540 he sailed from Acapulco to support the expedition under Vasquez de Coronado in search of the 7 cities of Cibola (Mexico). By exploring the gulf of California he proved that California was not an is. He also ascended the Colorado R. A report of the expedition occurs in Hakluyt's *Voyages*, and the earliest known map of the region was made by Castillo, one of his pilots. See Herrera, *Decade VI*, bk. ix., and Hakluyt's *Voyages*.

**Alarcón, Pedro Antonio** (1833-91), a Sp. novelist and statesman, b. at Guadix, d. at Madrid. He was intended for the Church, but soon took up journalism, writing for the *Eco del Occidente* of Cadiz, and after the revolution of 1854 editing *El Luligo*. He accompanied the Moroccan

campaign of 1859 as a correspondent, publishing in 1860 an excellent diary of his experiences. In 1864 he entered the Cortes as Liberal member for Cadiz, and later filled many important posts, including deputy member of council of state and ambassador. His short stories, poems, and essays were collected under various titles in 1871, 1875, and 1883. His later novels, many on religious subjects, were not so popular as his sketches and studies of rustic Spain. Among his works are: *Diario de un testigo de la guerra de Africa*, 1860; *Poesías serias y humorísticas*, 1870; *Cosas que fueron*, 1882.

**Alaric I.**, a great Visigothic chief of the fourth century. In 394 he commanded the Gothic allies of Theodosius against Eugenius. At the death of Theodosius in 395 he left the Rom. service, having become king of the W. Goths, and invaded Greece in 396. In 397 Stilicho drove him back to Epirus. In the same year Arcadius made him governor of Illyricum. In 400 he invaded Italy, but was defeated by Stilicho at Pollentia and Verona in 402. He then made a treaty with Honorius, but this having been broken, besieged Rome, and captured and sacked it in 410. He died in that year at Cosentia.

**Alaric II.**, king of the Visigoths, 484-507. He succeeded Euric to an extensive kingdom, and during most of his reign was at peace with the Franks. He was a wise and tolerant ruler, and ordered the compilation of the *Breviarium Alaricianum*, a selection from Rom. legal writers, for the use of his governors. His prosperity ultimately brought him into conflict with the Frankish king Clovis, who, on a religious pretence, made war upon A., whom he defeated and killed at Poitiers. See **GOths** and **VISIGOTHS**.

**Alarodian Languages**, the name applied by many philologists to the Caucasian group of languages, of which Georgian is the chief. The term is derived from the Alarodii of the classical geographers. See *De Brosset's Éléments de la langue géorgienne*, 1837, and *Sayce's Introduction to the Science of Languages*, 1880.

**Ala-Shan**, a prov. of S. Mongolia, occupying the S. part of the Gobi Desert. It is about 300 m. long and 480 m. wide, and is very sparsely inhabited by Oluts, the pop. being about 20,000. The dist. is an arid sandy plain, with occasional low hills and chalk downs. A little grazing is done where the absence of saline deposits permits. To the E. is the Ala-Shan, or Khara-Narim range, reaching 11,000 ft. The prov. was annexed by China in 1836.

**Alashehr**, a tn. of Asiatic Turkey, on the slope of Mt. Tmolus, 75 m. E. of Smyrna. It is the seat of a Gk. archbishopric, and has a considerable trade. It contains numerous remains of sculpture, and is supposed to be the scriptural Philadelphia. Pop. 40,000.

**Alaska**, ter. of U.S.A., occupies the extreme N.W. corner of N. America, with the adjacent is., being bounded on the N. by the Arctic Ocean, on the E.

by the Yukon dist. of Canada and Brit. Columbia, on the S. by the Pacific Ocean, and on the W. by Bering Sea and Straits. It was formerly known as Russian America. It has an area of 590,884 sq. m., and a pop. of 60,000, of whom nearly 28,000 are whites and the remainder chiefly Indians, with a few hundred Jap., Negroes, and Chinese. There is a floating pop. of 20,000 (excluded from the above) employed in the mines, on the railways, and in the canning industry. The country may be divided into 4 dists. The Pacific mt. belt, along the S. coast, contains 4 ranges, the Coast, the St. Elias, the Aleutian, and the Alaskan, apparently a continuation of the Coast Range of W. America. Sev. lofty peaks are found here, including Mt. Sanford, 16,200 ft.; Mt. St. Elias, 18,024 ft.; Mt. McKinley, 20,300 ft.; and Mt. Foraker, 17,000 ft. This dist. comprises the basins of the Copper and Sushitna Rs. The coast is deeply indented and precipitous, and bordered by numerous is. The Central Plateau, at an average elevation of 3000-5000 ft., is a rolling upland with deep channels trenched by rivs., the chief of which are the Yukon and the Kuskokwim. The Rocky Mt. system, which enters A. as a wide belt comprising sev. ranges, with peaks of 7000 and 8000 ft., merges into the Endicott Range, and dies away towards the Arctic Ocean. The Arctic slope, divided into the Anaktuyuk Plateau and the featureless coastal plain, is as yet very little known. But in 1938 a Harvard Univ. expedition led by Bradford Washburn discovered, during aerial reconnaissance, a huge inland icefield, which is now computed to be nearly 250 m. long and to be the source of the huge glaciers of A., such as the Bering glacier (30 m. wide) and the Malaspina (50 m. wide). The icefield is hemmed in by a maritime mt. range, whose peaks range from 10,000 to nearly 20,000 ft. above sea-level. This range extends from the Copper R. valley above Cordova to the Alek R. valley in the Yukon. The rivs. of A. are large, numerous, and navigable. The great system of the Yukon falls into the Behring Sea. The N. rivs. are comparatively unimportant. The chief industries of A. in the past have been fish and fur. The salmon fisheries are very fine. Whaling has lately fallen off considerably. The fur trade, comprising seal, sea-otter, and sev. varieties of fox, is also on the decrease. Reindeer have been brought in from Siberia, and there are now upwards of 400,000 head in the country, yielding an increasing tonnage of reindeer meat for export. The number of foxes is also increasing, and the value of fur-bearing animals exported reaches \$175,000 a year. Salmon-fishing is an important activity, and there are adequate stringent laws for the protection of the fisheries, on which some 30,000 persons are employed, the majority being engaged in salmon-canning. There are also valuable fur-seal herds on the Pribilof is., the estimated number of

animals being close on 800,000. Agriculture suffers from the shortness of the summer, but the soil appears to be rich, and experiments go to show that numerous hardy vegetables and sev. cereals may be grown in many parts of the country, while the abundance of grazing grasses offers possibilities of pastoral development. The timber resources are still untouched. The mineral wealth of A. has only lately been exploited. Gold was first found in 1861, and prospecting has gone on ever since, though as yet no veins of the richness of the Klondyke

S. &amp; G.

#### THE OLD PIONEER ROAD

A section, later abandoned, of the Alaska Highway, near Champagne, Yukon.

deposits have been found. Gold is worked chiefly in S.E. A., where a low-grade ore is found, on the Yukon R., and on the W. coast. Copper, silver, coal, lignite, gypsum, and marble are also mined. A. trades almost exclusively with the U.S.A., and to the Amer. N.W. states and Seattle the trade is an important one. During the decade 1931-1940 the value of A.'s shipments and outshipments (including gold and silver) was 951,000,000 dols. The range of climate is considerable. It has short, very hot summers and long, severe winters. The seat of gov. is at Juneau (4000); other important tns. are Ketchikan, 3800; Anchorage, 2300; Sitka, 1200; Fairbanks, 2100; and Nome, 1200. There are some 18 incorporated tns.; most of them are equipped with all modern advantages, such as electric lighting, and, in some

cases, an up-to-date means of water supply. The best harbour along the W. coast is at Teller on Port Clarence, near the W. tip of Seward Peninsula. A. was discovered by Vitus Bering (q.v.) in 1741. In 1867 it was purchased from Russia by the U.S.A. In 1906 A. received power to elect a delegate to the U.S. Congress. In 1912 a law was passed by the Congress conferring legislative power on A. and constituting Juneau the cap. of the ter.; it also created a railroad commission. The rail route from Seward to Fairbanks, projected in 1915, is now open, and the system comprises altogether 500 m. of track and connects the terminus with the coal-fields at Malanuska. The U.S. Gov. has secured the consent of Canada for a railroad survey of a line connecting the Canadian National railroad with the Alaskan railroad. The route extends from the vicinity of Prince George, Brit. Columbia, via the Rocky Mt. Trench to an intersection with the Alaskan railroad S.W. of Fairbanks. There are 4 national and over a dozen territorial banks, the total deposits of some 7,000,000 dols. The Gov. of A. is charged with the education of the whites, while education of the native elements is in the hands of the Alaskan div. of the National Bureau of Education. There is also an agric. college and school of mines at Fairbanks.

*Boundary Commission, 1903.*—The dispute between the U.S.A. and Canada began with a treaty between Russia and Great Britain in 1825, which laid down a boundary line for that part of the deeply indented coast which runs up from the Portland canal to Mt. St. Elias, embracing a narrow strip of coastline and the Alexander Archipelago; this line, which was to follow 'the tops of the mountains parallel to the coast, to meridian 141,' limited the strip to 10 marine leagues from the coast, following the windings of the coastline. In 1867 the U.S.A. purchased the Russian-Alaskan Company's ter., and then followed a period of disputes between Canada, the U.S.A., and Great Britain on the question whether the international line was to go across or round the indentations of the coast. An attempt to settle this dispute by a joint high commission in 1897 broke down, but in 1903 it was agreed to decide the question by a commission of 6 'impartial jurists' from Canada, U.S.A., and Great Britain. The commissioners were Lord Alverstone, Lord Chief Justice of England, Sir J. Jette, Mr. A. B. Aylesworth, of Canada, lawyers of repute; and Senator H. C. Lodge, Hon. Elihu Root, and Senator G. Turner, of the U.S.A. The decision, not signed by the Canadian representatives, favoured the Amer. contentions, giving Canada no access to the inlets down to the Portland canal, and only 2 of the is. claimed. In Canada much feeling was aroused against Lord Alverstone's vote as being dictated by Brit. policy in regard to the U.S.A., but the award has since come to be looked upon in Canada as a good workable compromise. See a series of articles in 1908-9 in the *University Magazine* of

Montreal. At the end of 1938, the Brit. Columbia Legislature voted 25,000 dols. for a preliminary survey of a proposed highway connecting A. with the U.S.A. through Brit. Columbia. The President of the U.S.A., at the same time, appointed a commission to study routes and costs. (see next section).

**The A. Highway.**—The A. Highway was opened on Oct. 29, 1942. It is 1671 m. long, and runs from Fort St. John, Brit. Columbia, following the general line of the airports which Canada had constructed at Fort Nelson, Watson Lake, and Whitehorse, and thence via Boundary and Big Delta to Fairbanks. The highway links A. and the U.S.A. There has been much joint effort between Canada and the U.S.A. for the development of A., particularly in relation to Brit. Columbia. On Jan. 23, 1943, the joint economic committees of the 2 countries undertook an international study of the vast region comprising A., the Yukon, and parts of the N.W. Ters. and Brit. Columbia. This followed other co-operative action, particularly the setting up by President Roosevelt and Mr. McKenzie King of a joint defence board, and later various other joint boards were set up in the economic field. The major aspect of this great joint effort was the programme for the defence of A. and its use as a base for offensive action against Japan. The Defence Board recommended and Canada constructed a long line of air bases uniting the interior of the continent with the advanced posts in A. and N. Brit. Columbia. The construction of the airway to A. presented a problem of supply which could be effectively solved only by the building of a road and the A. Highway was constructed by U.S. Army engineers and Canadian and Amer. contractors with altogether remarkable speed. An offshoot from the A. Highway was plotted from Champagne to the deep-water landing at Haines on Lynn Canal, thereby greatly enhancing the usefulness of the highway as a channel of distribution. Canadian airmen, operating from Alaskan bases, attacked Jap. shipping and installations in the Aleutians. The last link in the A. Highway from the N.W. tip of the N. Amer. continent to the Panama canal is under construction by the Amer. Gov. from the S. frontier of Mexico to Panama. The Highway forms part of the Inter-Amer. Highway extending for 16,800 m. from A. to Argentina. Numerous countries are involved in the road, which runs from Fairbanks (A.) through Brit. Columbia to Seattle, and leaves the U.S.A. at Laredo (Texas). The A. Highway also formed a 'N.W. passage' along which were transported vital supplies to Russia via the Bering Straits. See Benjamin H. Kizer, *The U.S.-Canadian Northwest* (Princeton), 1943.

**Alauda** (Lat., lark), belonging to the family Alaudidae of the Passeriformes, is a gregarious bird. The wings are broad and long, the tail is short, the head-feathers may form a crest. *A. arvensis* is the skylark, *A. arborea* the wood-lark.

**Alausi**, tn. on A. R., prov. of Chimborazo, Ecuador, 70 m. E. of Guayaquil. It is situated on a plateau of the Andes. Pop. 7000.

**Alava**, the largest and most southerly of the 3 Basque provs. of Spain, having an area of 1205 sq. m. and a pop. of 105,700. The cap. is Vitoria. Contains the valley of the Ebro, and much of the Cantabrian Range.

**Alawites**, see ALAOUTES.

**Alb**, a liturgical vestment of the Catholic Church, consisting of a white linen tunic with narrow sleeves and a hole for the head, and ultimately derived from the *tunica alba* of Rom. citizens.

Originally plain, in the tenth century embroidered bands were employed for borders and cuffs, and later 'apparels,' i.e. square patches of ornamentation, 4 or 5 in number, were used. Als. have reappeared in the Anglican Church with the ritual revival.

**Alba**, tn. in Cuneo, Piedmont, Italy, on R. Tanaro, 31 m. S.E. of Turin. It is the anct. Alba Pompeia, and contains numerous remains of anct. It. life, together with a fifteenth-century Gothic cathedral. Pop. about 9000; commune 18,300.

**Alba**, Duke of, see ALVA.

**Albacete**, cap. tn. of prov. of same name, Murcia, Spain, 134 m. S.E. of Madrid. Pop. 42,000. Has a considerable trade in cutlery and an annual cattle-fair. The prov. has an area of 5972 sq. m. and a pop. of about 334,400. The W. part is mountainous; the rest a tableland.

**Albaore**, see ALBICORE.

**Alba-Iulia**, or Alba Julia (Ger. Karlsburg), a tn. of Transylvania, 50 m. S. of Cluj. It has an old hist. and is built on the site of the Rom. colony of Apulum. A bishopric was founded there by Ladislaus I. in the eleventh century, and it is still the seat of a Rom. Catholic bishopric with a cathedral which contains the tomb of John Hunyadi. An interesting feature is the citadel which was built in the early eighteenth century by the Emperor Charles VI. In 1918 the union of Transylvania with

Rumania was proclaimed here. Pop. 12,000.

**Alba Longa**, an anct. tn. of Latium, Italy, on a ridge overlooking the Alban Lake, 15 m. S.E. of Rome. Said to have been founded by Ascanius, son of Æneas. Sev. generations of kings lived here, and it was the bp. of Romulus and Remus and the centre of the Lat. League. Destroyed by Tullus Hostilius, third king of Rome, and never rebuilt.

**Alban, St.**, the protomartyr of Britain, b. at Verulamium (now St. Albans) in the third century, and converted to Christianity late in life. He suffered martyrdom by the sword about 304. King Offa founded the famous monastery of St. Albans on the site of his birth or death in 795. The Rom. Church keeps his festival on June 22, and the Anglican on June 17.

**Albani**, a rich and famous Rom. family, coming originally from Albania and settling at Urbino in the sixteenth century. The fame of the house began with the accession of Giovanni Francesco A. to the papal throne in 1700, since when numerous members have been cardinals and other high church officials. Cardinal Alessandro A. (1692-1779) formed the celebrated art collection at the Villa A. at Rome, which was depleted by the Fr. The family died out in the nineteenth century.

**Albani, Francesco** (1578-1660). It. painter of the Carracci school, b. at Bologna, and d. there. He painted numerous altar-pieces, but preferred mythological or pastoral subjects. His 12 beautiful children served as models for many of his most famous paintings, now at Rome, Dresden, and in the Louvre. Opened a Rom. academy.

**Albani, Dame** (1851-1930), stage name of Marie Louise Emma Cecile Lajeunesse, a Canadian singer, b. at Chambly, Quebec. Trained in music by her father, who first appeared in public at Albany, New York, in 1863. After studying in Paris and Milan, she made her debut at Messina in 1870 as Amina in *La Sonnambula*. In 1872 she appeared in London with the Royal It. Opera, later visiting Paris (1872), U.S.A. (1874), St. Petersburg (1878), Berlin (1884), etc. In 1878 she married Ernest Gye, a theatrical manager. She later left opera for oratorio, and sang at all the chief festivals and before many European monarchs. On the eve of her retirement in 1911 she pub. her reminiscences, *Forty Years of Song*, and at her farewell concert at the Albert Hall received a purse of gold. In 1925 she was given a Civil List pension, and created a Dame of the Order of the Brit. Empire. In her 40 years' career she appeared in every role it is possible for a singer to fill: oratorio singer, operatic artist, and, later, ballad singer. Sir Arthur Sullivan's setting of her *Golden Legend* was inspired by her voice, and Gounod composed his *Mors et Vita* as an especial tribute to her.

**Albani, Matthias**, the name of 2 celebrated Tyrolean violin-makers. The father (1621-73) was b. at Bozen and was

taught by Stainer. The son studied the art of violin manuf. at Cremona and afterwards settled at Rome. The instruments he made between 1702 and 1709 are especially fine and considered by some the equal of Amati's.

**Albania**, an independent Balkan state made up of parts of the old Turkish provs. of Scutari, Yanina, Kosovo, and Monastir. Prior to 1939 it was a democratic monarchy which, before 1912, formed a part of the Turkish Empire. It consists of a very mountainous strip of land lying on the W. shore of the Balkan Peninsula, between Montenegro and the N. boundary of Greece. It is little explored and, probably owing to its rugged features and unsafe roads, remains unattractive to the traveller. The mts. of N. A. form the watershed between the Ægean and the Adriatic Seas; they consist of a high mass of rocky mts. which spread through Montenegro to the Adriatic. The highlands of A. may be described as lying in the N. and S., the mts. of central A. being of a more undulating character. Owing to the character of the mts., the rvs. which flow from E. to W. are not navigable. The chief rvs. are the Boyana and the Drin. The mineral wealth of A. is probably great, but the country is almost entirely unexploited. It has splendid forests, and produces wine and olive oil. The chief means of subsistence are cattle-rearing in the plains, sheep- and goat-rearing in the mts. The pop. of A. is roughly estimated at about 1,600,000. The chief tns. are Tirana, Scutari, and Yanina. As a race the Albanians are one of the most anct. in the Balkan Peninsula; they are noted for their sturdy independence and for the tenacity with which they have clung to their customs and traditions. The majority of the Albanians are Moslems, the remaining portion of the pop., roughly two-fifths, belong either to the Gk. or the Rom. Catholic Church. A number of interesting Rom. remains prove the existence of a Rom. influence in A. Two ports, the present Pöllina (Roin. Apollonia) and Durazzo (Rom. Dyrrachium), on the Adriatic coast, must have been thriving tns. during the days of Rom. authority, but have now fallen into disuse. The medieval hist. of A. is as interesting as it is varied. During the fourth and fifth centuries it was in the hands of the Goths, in the sixth century it again became part of the E. Empire under Justinian, and in the following century came under the sway of the Serbians, who held it, with a short break, until the fourteenth century. In the twelfth century for a short period the Normans, under Robert Guiscard, tried to form a kingdom there, and Michael Comnenus, after the settling up of the Lat. Empire, retired thither and tried to build up an independent kingdom. During the later portion of the thirteenth and the beginning of the fourteenth century the Angevin kings of Sicily ruled also the kingdom of A. The Serbians, however, re-estab. their power in the twelfth century and retained it until the

death of Dushan in 1360. Between the downfall of Serbian rule and the establishment of Turkish power, A. was ruled by native chieftains. During the fifteenth and sixteenth centuries, however, in spite of brave and prolonged resistance, A. gradually fell into the hands of the Turks. In the eighteenth and early nineteenth centuries attempts were made by individual Moslem chieftains to establish their independence in A., but with the fall of Ali Pasha in 1822 these attempts practically came to an end. At the conclusion of the Balkan war (q.v.) the treaty of London settled the independence of A., May 1913: a ruler was to be chosen by the powers, and, in Nov. 1913, Prince William of Wied (q.v.) was invited to take up that office. On Feb. 19, 1914, he notified the powers of his acceptance, and before entering upon his duties paid visits to the princely courts of Europe; these visits were not unconnected with the floating of a loan of £3,000,000 which was required to set up gov. in A. On Feb. 21, 1914, Prince William received at Scutari an Albanian deputation, consisting of Essad Pasha (q.v.) and a number of Albanian chieftains, who offered him the crown on behalf of the Albanian people, which he accepted. His position was beset with many difficulties, not least among which was the question of N. Epirus, where a revolt took place on his arrival in A. He was known in A. by the title of Mpret (said to be a modification of Imperator). It was evident, on the outbreak of the First World War, that there was no stability in this arrangement of a petty principality created by the influence of Germany with the object of furthering Austro-Hungarian policy in the Balkans. In Dec. 1911 Italy dispatched an expedition to Avlona on the Albanian coast as a set-off to Austrian aggrandisement in Serbia. The Entente in 1915 promised A. to Italy as part of the price of It. support in the war. Unaware of this, the Dual Monarchy, in the endeavour to purchase It. neutrality, offered Italy sovereignty over Avlona and a free hand in A. Later in 1915, however, after the Montenegrin cap. had fallen, the Austrians, under Gen. von Kovesse, marched southward into A., captured Scutari, and reached the heights of Tirana (Jan. 1916). Meanwhile Bulgarian troops had also crossed the frontier and occupied El Bassan. This double invasion overwhelmed Essad Pasha, the pro-ally head of the provisional Albanian Gov., with the result that the Its. evacuated Durazzo, but continued to hold Avlona, and so dominated S. A. Strategically, however, the advantage lay with the Central Empires, who had now safeguarded the then new Ger. railroad connection with Constantinople. After the armistice, the settlement contemplated the transfer of S. A. to Greece, Italy being acquiescent. provided Greece recognised an It. protectorate over the greater part of the country subject to a small northerly strip being ceded to Serbia.

Finally, however, at the conference in San Remo, 1920, A. was only mandated to Italy. Later, a republic was proclaimed with a constitution providing for a Parliament of 54 elected members and a Senate of 18 under a president (Ahmed Zogu or Zog, 1925). In 1927 Italy signed with A. a treaty of friendship and arbitration. In 1928 the Constituent Assembly proclaimed A. a democratic monarchy, Ahmed Zogu assuming the title of Zog I., King of the Albanians. In 1931 King Zog seemed to be following a policy largely independent of It. control, while accepting It. assistance in the modernisation of A., but an attempt at his assassination in that year compelled him to abandon that attitude, especially as he was convinced that the crime was inspired by Yugoslavs. In 1939 Italy suddenly invaded A., after air raids over the chiefs. King Zog fled the country and, soon afterwards, the country was proclaimed an It. protectorate. The It. move was generally interpreted as part of the Axis policy of encircling Yugoslavia, and also designed to give Italy still greater influence in the Mediterranean. In some quarters, however, the occupation was thought to have been actuated by It. fears of Germany's encroachment southward—the It. invasion following, indeed, closely on the Ger. seizure of the already truncated Czechoslovakia. In the course of the It. invasion of Greece in 1940 the Gks. captured various strategic points in A. and, but for Ger. intervention, would probably have driven the Its. out of the Balkans. In 1942 the premier of the Albanian 'puppet' gov. of A. announced a programme for complete 'fusion' of the Italo-Albanian union, indicating that A. would be entirely absorbed into the It. Empire. But the patriot forces eventually entered the cap. on Nov. 20, 1944, and Durazzo was liberated the following day, A. thereby regaining her independence. After the Second World War the Allies decided to reorganise the administration on representative lines. A. was declared an independent republic on Jan. 11, 1946. See BALKAN WAR, SCUTARI, and SERBIA. See J. C. Hobbhouse, *Journey through Albania*, 1813; M. Edith Durlam, *High Albania*, 1909; C. A. Chekrezi, *Albania Past and Present*, 1919; R. W. Lane, *Peaks of Shala*, 1924; R. Matthews, *Sons of the Eagle: Wanderings in Albania*, 1937; Julian Amery, *Sons of the Eagle: A Study in Guerrilla War*, 1948.

**Albano**, the name of a tn., lake, and mt. of Italy. The tn. lies 12 m. S.E. of Rome on the Via Appia, and is celebrated for the beauty of its scenery. Pop. 11,700. The lake and mt. lie 13 m. S.E. of Rome. The lake is 6 m. in circumference, and the mt. rises a little over 2000 ft. above the lake. The campanile of the cathedral was shelled and the church of S. Silvestro was badly damaged in the Second World War.

**Albans**, St., see St. ALBANS.

**Albany**, a Canadian riv. It rises in

Lake St. Joseph and flows into James Bay. Its total length is 500 m. It is navigable up to Martin's Falls. Fort A. stands at its mouth.

**Albany:** 1. The co. tn. of A. co. and cap. of the state of New York, U.S.A.; situated on the W. bank of the Hudson R. The first settlement was made here in 1614 by the Dutch, who called the place Fort Nassau. In 1664 it was occupied and named by the Eng. In 1754 there was held here the general conference of the states, in which plans for a closer union were mooted. It played an important part in the Amer. war of independence, and became the state cap. in 1797. It has a number of magnificent public buildings, among which may be mentioned the state capitol (1879), the costliest in the U.S.A., the city hall, the Federal Building, and the state museum of natural hist. The capitol was partially destroyed by fire in Mar. 1911, and many valuable documents were destroyed. It is an important railway and commercial centre. It has breweries, stone factories, cotton mills, clothing factories, and iron and brass foundries. Pop. 130,500. 2. The co. tn. of Dougherty co., Georgia, U.S.A., at the mouth of the Kinchafoona R., on the Flint R. Settled in 1836, and became a city, 1907. Pop. 19,000. 3. The co. seat of Linn co., Oregon, on the Willamette R. Manufs. wagons and furniture, and exports flour and grain. Pop. 5300. 4. The co. seat of Gentry co., Missouri; residential tn. and seat of Central Christian College (opened 1892). Pop. 3000.

**Albany**, situated in the co. of Platangeton, W. Australia, on the Princess Royal Harbour, 254 m. S.S.E. of Perth. Pop. 4000. Possesses the finest harbour in W. Australia. First settled as a penal colony in 1826, it became a municipal tn. in 1871.

**Albany**, Count, the assumed name of the 2 brothers John Sobieski Stolberg Stuart (1797-1872) and Charles Edward Stuart (1799-1830), who claimed to be descendants of the young pretender. Both served on the Continent under Napoleon till his final defeat, and then settled successively in London, the Scottish highlands, and Austria.

**Albany**, Dukes of, title created first in 1398 and bestowed on Robert Stewart, earl of Fife. The title has been revived at various periods in Brit. hist., being conferred on Darley by Mary Queen of Scots in 1565, held by James I., Charles I., and James II., again bestowed on the youngest brother of George I., on the younger brother of George III., and on the second son of George III. It was finally revived in 1881 by Queen Victoria for Prince Leopold (q.v.).

**Albany**, Leopold George Duncan Albert, Duke of (1853-84), the youngest son of Queen Victoria. He was known as Prince Leopold until created duke of A. in 1881, and he married Princess Hélène of Waldeck-Pyrmont, 1882. He was a liberal patron of literature and education. Always delicate, he d. at Cannes at 31 after a very short illness.

**Albany**, Louise Maximilienne Caroline, Countess of (1752-1824), the eldest daughter of Prince Gustavus Adolphus of Stolberg. Married to the young pretender in the days of his decline, her marriage proved most unhappy. In 1780 she fled from her husband and threw herself on the protection of Henry Stuart, her brother-in-law. She then lived quietly and happily, interesting herself in literature. In 1788 she was released by the death of Charles Stuart, and is said to have married the poet Alfieri. She visited England and the Eng. court, and was well received.

**Albategnius** (or **Al-Battani**), properly Mohammed ben Gebir ben Sinan al Battani, his surname being taken from his native tn. Battan in Mesopotamia (c. 850-929), an Arab chief and astronomer who, while following in general the Ptolemaic system, made sev. improvements thereon. His astronomical treatises were trans. into Lat. by Plato Tiburtinus early in the twelfth century, and printed at Nuremberg in 1537 and in 1645.

His writings comprise abridgments of Ptolemy and Archimedes with comments, a work on astronomy, chronology, and geography, a treatise on the rising of the constellations and various other points in astronomy, and an elementary treatise on astronomy and astrology.

**Albatross** (probable modification of *alcatraz*, frigate bird, but wrongly applied to other sea-birds, and so altered to *albitross* or *albatross*, in reference to *albus*, white; the word is not found before about 1680) is the *Diomedea exulans*, belonging to the *Procellariiformes*, or petrels. It is web-footed, has a strong, hooked beak, and is white and grey in colour. It lays a single white egg in a rocky spot. It is noted for its graceful flight, and is the largest seabird, measuring 10 ft. across the wings. It feeds on fish, and its home is the S. Ocean.

**Albay**, a city and cap. of the prov. of A. in the Philippine Is. It is one of the most important cities of the Philippine group. Built at the base of the picturesque volcano of Mayon (last eruption 1888), it is in the centre of one of the great hemp-producing dists. Large quantities of hemp are shipped to Manila; cocoa, sugar, and copra are among other products. Pop. 53,000.

**Albedo**, an astronomical term applied to the degree of light reflected from the surface of a heavenly body, e.g. the A. of the moon is that part of the sun's light which it reflects. It is designated by a fraction representing the ratio of light reflected to that received, its size depending on the nature of the reflecting surface. The A. of Mercury is about 0.11; of Venus, 0.50; of Earth, 0.20; of Mars, 0.26; of Jupiter, 0.62; of Saturn, 0.52; of Uranus, 0.62; and of Neptune, 0.52.

**Albemarle**, Dukes and Earls of, a variant form of the Norman name *Animale*. The first earldom was created by William the Conqueror, who gave his brother-in-law Odo of *Animale* the lordship of the Isle of Holderness in Yorkshire. In 1180 William de Mandeville,

son of the adventurer of Stephen's reign, succeeded to the title by marriage. During the century following it was held in conjunction with the earldom of Devonshire, and towards the end of the reign of Henry III. it lapsed to the crown. Revived subsequently by the royal prerogative, it was conferred on Richard Beauchamp, earl of Warwick, in 1419, and in 1660 the earldom was raised to a duchy and conferred on Gen. Monk by Charles II. The newly created title became extinct in 1688, but was conferred in 1696 again as an earldom on Van Koppel, a trusted follower of William III. See also MONCK, GEORGE.

**Albemarle Sound**, a large inlet on the coast of N. Carolina, about 55 m. long, and with an average width of 10 m. It received its name from the duke of A. of Charles II.'s creation.

**Albenga**, a seaport of Liguria, Italy, in the prov. of Genoa, near the Mediterranean. In Rom. times it existed under the name of Albengaunum, and belonged to the tribe of the Ligures Ingauni. Pop. 11,200.

**Albéniz, Isaac** (1860-1909), Sp. pianist and composer, b. at Camprodon, Gerona. A musical prodigy, he learned the piano as a child, appearing in public at the Teatro Romea, Barcelona, when only 4. He led a picturesque life for some years as a concert-giver in N. and S. America, and later went to the Brussels Conservatoire, where he studied under the auspices of King Alfonso XII. He failed as a musical comedy impresario, but throughout his vicissitudes, including heavy losses in financial speculation, he was fortunate in receiving, at crucial moments, the protection and influence of the best advisers, including the comte de Morphy, the Sp. musicologist. In musical reform, A. was an innovator, and with him came into existence the 'new Spanish school': while his name as a piano-composer is known in all countries. As pianist, he was specially famous for his rendering of the clavichords, Bach, Chopin, and Schubert. Eventually he gave up the piano to devote himself to composition. His operas include *Pepita Jiménez*, *Henry Clifford*, and *Merlin*; and among his other works are the orchestral suite, *Catalonia*, and a great number of piano works. See *A Dict. of Modern Music and Musicians* (1924).

**Alberni**, seaport on W. side of Vancouver Is., Brit. Columbia, with a large trade in lumber. The name is also applied to the inlet on which it stands, being an extension of Barclay Sound. Pop. 1800.

**Alberoni, Giulio** (1661-1752), was b. near Piacenza. His father was a gardener, and he himself became connected with the Church merely as a vergier. He, however, afterwards took priest's orders and came to Rome. Here he attracted the attention of the duke of Vendôme, and by him was taken to Paris in 1706. He became Vendôme's secretary, and accompanied him to Spain. He helped in the arranging of

the Sp. king's marriage to Elizabeth Farnese of Parma, and was rapidly pushed forward by the queen. By 1715 he had raised himself to the position of Prime Minister of Spain. His internal policy included many salutary and much-needed reforms. He reorganised the army, and realised that the power of Spain depended very largely upon the size and state of her navy. He also reorganised finances, and threw open the trade with the Indies. By his invasion of Sardinia in 1718 he provoked the Quadruple Alliance (England, Holland, France, and the Holy Rom. Empire). This resulted in his downfall, and in 1719 he was forced to leave Spain. Until the death of Pope Clement XI. he remained in hiding, but on his death took part in the papal election. He was even put forward as a possible occupant of the chair of St. Peter in 1721. He became legate of Ravenna and later retired to Piacenza, where he founded on the site of an old lazaret hospital the A. seminary. At his death he left large endowments for his school. See *Lives of Bersani*, 1862, and S. H. Smith, 1943; also *Lettres intimes de J. M. Alberoni adressées au Comte Rocca*, ed. E. Bourgeois, 1892.

**Albert**: 1. A div. in the N. part of Cape Colony, bounded on the N. by the Orange R., by tribes of which it is intersected. Area, 2650 sq. m. Pop. 17,000. 2. Tn. (formerly Ancere) in France, dept. of Somme, 17 m. N.E. of Amiens. Pop. 9250. In the First World War the tn. was lost by Gen. Byng's army on Mar. 27, 1918, during the supreme Ger. offensive launched on Mar. 21. Lost by the Fr. to the Gers. in Mar. 1940 and regained by the Brit. forces in Aug. 1944. 3. Riv. of Australia, crossing N. Queensland and falling into the gulf of Carpentaria. 4. The name also belongs to a co. of New Brunswick, on the bay of Fundy; to sev. vils. in N. America; and to a riv. in Victoria (Australia) flowing into the Pacific near Port Albert.

**Albert**, pseudonym of Alexandre Martin (1815-?), a Fr. mechanic who took a prominent part in the revolution of 1848. After this he was associated with Louis Blanc on the provisional Gov. After a period in prison he was released, and last appears in the Commune of 1871, after which he sinks into obscurity.

**Albert** (1490-1568), a cadet of the house of Hohenzollern, was, by the support of Maximilian, created grand master of the Teutonic Order of Prussia (1512). He became a follower of Luther and one of the leaders on the political side of the Reformation. He secularised the estates of the Teutonic knights and changed the mastership into a dukedom, becoming duke of Prussia. He estab. Lutheran churches and appropriated monastic property.

**Albert, Archbishop of Magdeburg** (1490-1545), was the younger son of John Cicero, elector of Brandenburg. Entering the Church, he became in 1513 archbishop of Magdeburg, in 1514 he became elector of Mainz, and in 1518 a cardinal. By the use of the services of John Tetzel

in the sale of indulgences, he may be said to have been directly involved in the commencement of the Reformation. From his friendship with Ulrich von Hutten, hopes were held out that he would definitely throw himself on the side of the Reformation; but he definitely placed himself on the side of Catholicism. He was, however, constrained to grant a certain measure of religious liberty in his dominions, owing to the great strides which the Reformation made in Magdeburg. Towards the end of his life he became more intolerant of Protestantism.

**Albert, Archduke of Austria** (1559-1621), surnamed the Pious, was the third son of the Emperor Maximilian II. Brought up in the Sp. court, he became cardinal-archbishop of Toledo, and later viceroy of Portugal (1594-96). In the latter year he succeeded the Archduke Ernest as governor of the Sp. Netherlands. His work in the Netherlands was chiefly directed against the power of France; in 1596 he captured Calais, thus inflicting a severe blow on the Fr.; he failed, however, to retain Amiens and retired to the Netherlands. In 1598 he renounced his orders and married the Infanta Isabella, receiving the sovereignty of the Netherlands, and in 1609 concluded a truce with the Dutch.

**Albert (Albrecht), Duke of Württemberg** (b. 1865). Ger. military commander, son of Duke Philip. Became colonel-general, 1913; field marshal, 1916. Commanded Fourth Army in neighbourhood of Alsace-Lorraine till end of First World War. He married, 1893, the archduchess Margarete Sophie of Austria (d. 1902), and he is titular successor to the last king of Württemberg.

**Albert, Margrave of Brandenburg** (c. 1100-70). A., usually known as A. the Bear, was margrave of the N. Mark, situated between the N. courses of the Elbe and the Oder. Later he acquired Brandenburg, the beginning of the modern kingdom of Prussia, and since that time Brandenburg has usually played an important part in Ger. affairs. Sometimes in rivalry, sometimes in harmony with Henry the Lion, he was an important factor in the civilisation of N.E. Germany. It is important to notice that the progress of Christianity in Germany coincided with the acquisition of ter.; that missionary and soldier worked side by side. A. the Bear may be said to be the forerunner of Prussian greatness.

**Albert, Prince Consort** (1819-61). Albert Francis Charles Augustus Emmanuel, the second son of Ernest, duke of Saxe-Coburg-Gotha, was b. on Aug. 26. Educated under a private tutor, he showed great diligence and ability, and devoted himself to natural science. He also showed a great liking for painting and music. The idea of his marriage with his first cousin (Queen Victoria) was first mooted by Leopold I. of Belgium, and was opposed in England by William IV. Prince A. first visited England in 1836, and although no formal engagement was

mado, an understanding was reached by the 2 cousins. During the following years Prince A. completed his education, travelling in various parts of Europe, and in the latter part of 1839 a formal engagement with Queen Victoria was announced, which was followed by their marriage early in 1840 (Feb. 10). His position, however, was one of great difficulty and needed the utmost tact. He was made regent in 1840 in case of the queen's death; he helped the queen with advice in her political duties, and only after his death did the full value of the work he had done become apparent. His interest in the working classes and in the prosperity and well-being of Great Britain is now recognised by all. He was president of the Exhibition commission, and it was due to his suggestion that the Great Exhibition was held in 1851. Taken ill at the beginning of 1861, he was seized with typhoid and d. on Dec. 14.

**Albert, Prince of Bayreuth** (1522-57), surnamed the Warlike, or Alcibiades, was a son of Casimir of Bayreuth and a member of the Hohenzollern family. In 1541 he received Bayreuth as his share of the family possessions, and is sometimes referred to as the margrave of Brandenburg-Kulmbach, after the name of the chief tn. of his principality. His restless youth marked him out for a military life, and he took part in many campaigns, sometimes for, sometimes against the Emperor Charles V. He was noted throughout Europe for his bravery and deeds of valour. His attacks on Franconia led to the formation of a league against him, and he was ultimately defeated. He was put under the ban of the empire and fled to France, where he took service under Henry II., dying shortly afterwards.

**Albert, Prince of Mecklenburg** (d. 1412), was called to the throne of Sweden in 1364 by the nobility who had deposed King Magnus. After a long war, peace was re-established in Sweden in 1393, when A. consented to give up his claim to the crown. He then retired into Mecklenburg, where he d. Margaret of Walde-mar, widow of Haakon, king of Norway, succeeded him, and united the 3 N. kingdoms under one sceptre.

**Albert I.** (c. 1249-1308) was the son of Rudolf of Hapsburg, the founder of the great Hapsburg dynasty, and first emperor after the Interregnum. A. was not elected emperor on the death of his father, but was passed over by the electors, from motives of fear and jealousy, in favour of Adolf of Nassau. Adolf proved himself too weak to rule well, and was deposed and slain by the electors led by A. In 1298 A. was elected and crowned. During the 10 years that he reigned he followed an energetic and ambitious policy which resulted in the reduction of Germany to obedience and the well-being of the Ger. people. He decided the succession question in Hungary and in Bohemia, settling the latter country upon his eldest son Rudolf, and thus making Austria the greatest power on the E. frontier of Germany. He was

treacherously murdered by his nephew John.

**Albert II.** (1397-1439), king of Hungary and Bohemia, and duke of Austria, succeeded Sigismund as emperor of Germany in 1438. He held a great diet at Nuremberg, in which the vehemence or secret courts were suppressed. He *d.* the following year, as he was preparing to take the field against the Turks, who were ravaging Hungary.

**Albert III.** (1414-86), elector of Brandenburg, surnamed Achilles, was *b.* in Nov. Quite early in his life he distinguished himself as a warrior. On the death of his father he received the ter. of Ansbach and took his place as one of the leading Ger. princes. After a war against Nuremberg he was forced to recognise their independence. In 1470 he became elector of Brandenburg. In 1472 he finally brought Pomerania under his rule. In 1473 he handed over his possessions in Brandenburg to his son and retired to his Franconian possessions. He was one of the greatest and most ambitious of Ger. princes.

**Albert of Belgium** (1875-1934). He succeeded his uncle, Leopold II., on Dec. 17, 1909. In Oct. 1900 he married the Duchess Elizabeth of Bavaria, and had 3 children. The eldest, Prince Leopold, duke of Brabant (the present king), was *b.* on Nov. 3, 1901; his second son, Charles Theodore, was *b.* in Oct. 1903, and his youngest child and only daughter, Marie José, was *b.* in Aug. 1906. He was popular with his subjects and progressive in his policy. In the First World War he shared the hardships and vicissitudes of his armies during the Ger. invasion. To all the overtures of the Central Empires whose govts. promised to restore to him his kingdom as the price of deserting the Entente, he turned a deaf ear. When, in Oct. 1918, the Allies renewed their victorious advance on the W. front, his troops had swept, within a fortnight, from Dixmude to the suburbs of Ghent, and on Nov. 13 he formally entered that city, Antwerp on the 19th, and Brussels on the 22nd. In Feb. 1934 he was killed in a mountaineering accident in the Meuse Valley, 40 m. from Brussels. See 'Albert, King of the Belgians' in Lt.-Gen. Galet's *The Great War*, 1931.

**Albert the Bold** (1443-1500), duke of Saxony, spent much of his early life at the court of the emperor. He attempted to obtain the crown of Bohemia in 1471 on the death of George. In 1464 he and his brother Ernest ruled jointly the possessions of their father, but in 1485, by the treaty of Leipzig, a division was made, and Albert founded the Albertine branch of the Wettin family. He was a skillful soldier, and took part in a number of campaigns. He was made hereditary governor of Friesland in 1498 by the emperor, but while making good his title he died at Emden.

**Albert Canal**, Belgium, completed in 1939, links Liège with Antwerp and the Scheldt. Length, 79 m.

Albert Dürer, *see* DÜRER.

Albert Edward, *see* EDWARD VII.

**Albert Edward Nyanza**, *see* EDWARD, LAKE.

**Albert Hall**, a large circular hall in S. Kensington, London, used for public meetings, concerts, oratorios, etc. Its seating capacity is over 10,000. It is situated opposite the Albert Memorial (*q.v.*), and its building was completed in 1871. It has one of the largest organs in the world.

**Albert, Lake** (formerly **Albert Nyanza**) (native name, Mwutan Nzige), a large lake of Central Africa, 100 m. long and 25 m. broad, situated in the lower basin of a great rift valley. It is intersected by 2° N. lat. and 31° E. long. Its position, but not its dimensions, was ascertained by Baker in 1864. The true, or White Nile, issues from the N. end of this lake, near the place where, on the E., the Victoria Nile enters, bringing the overflow of Lake Victoria. It is connected with Lake Edward on the S. by the Semliki R.

**Albert Lea**, city of Freeborn co., Minnesota, U.S.A., is the seat of the A. L. College for women. It is the centre and market of a flourishing agric. dist. Pop. 10,200.

**Albert Medal**, a decoration given for gallantry in saving life, instituted by Queen Victoria in 1866, in commemoration of her late consort.

**Albert Memorial**, a monument erected in memory of Albert, the prince consort, husband of Queen Victoria, in Kensington Gardens. It was designed by Sir Gilbert Scott.

**Albert Park**, National park in the Belgian Congo, situated in the Lake Kivu dist. Covers 7,000,000 ac.

**Albert, Saint**, *see* ETHELBERT.

**Alberta**, a prov. of W. Canada, estab. with its present boundaries by the Dominion Parliament in 1905. It covers an area of 255,285 sq. m., and has a pop. of 822,000. Its S. limit is the U.S. boundary; on the E. 110° W. long. separates it from Saskatchewan; on the N. it is cut off from the N.W. Ter. by 60° N. lat.; while on the W. the Rocky Mts. separate it from Brit. Columbia. Except in the S., where irrigation is necessary, the prov. is well watered. Its 2 great rivs., the Athabasca and the Peace R., flow N. and N.E. respectively until they meet the Slave R. coming from Lake Athabasca. The Slave R. then flows into the Great Slave Lake, whence, as the Mackenzie R., it drains into the Arctic Ocean. The Saskatchewan (N. and S. branches), with its tribs., drains the S. of A. into Lake Winnipeg, and thence, under the name of the Nelson R., into Hudson Bay. There are many small lakes, but Lake Athabasca and the Lesser Slave Lake are the 2 most important.

In the N. and S.E. the country is level and sparsely wooded, in the S. and S.W. near the Rocky Mts. it is broken, hilly, and more wooded. The centre is well watered and timbered, and is the chief agric. dist. Wheat, oats, and barley are especially cultivated here, and mixed farming is prosecuted with success. The

chief industries, however, are ranching and farming, carried on particularly in the N. The sugar-beet is extensively cultivated and much fruit is grown. The climate is on the whole healthful and invigorating. Since the prov. extends over 11° of lat. it naturally varies considerably, and these variations are accentuated by the various levels of the land. In the N. the cold is severe, but is moderated by the Chinook, a wind blowing from the Rocky Mts. which melts the snow in a few hrs. It is a moisture-bearing wind, and its influence is not entirely beneficial.

The prov. is rich in minerals. Great veins of both bituminous and anthracite coal have been found in A., and it is believed that over 25,000 sq. m. are underlaid with this mineral. Some 85 per cent of the coal resources of Canada are in A., and 25 per cent. of those of all N. and S. America. Coal production in 1937 amounted to about 5½ million tons. Petroleum is found in the Turner Valley in S. Alberta and in other parts in commercial quantities. The sands of the N. Saskatchewan R. have for years yielded some gold; there are large salt deposits in the N., and immense beds of tar sands in the district E. of Athabasca R. The mineral output was valued at about \$6 million in 1936.

Two-thirds of the pop. are engaged in agriculture. It is estimated that there are about 85,000,000 ac. of agric. land in A., of which, in 1938, about 13,410,000 ac. were under field crops. All the usual cereals are produced in large quantities, and alfalfa is also extensively cultivated. There is a large dairying industry. Important irrigation enterprises, which water an area of over 1,000,000 ac., are operating at Calgary, Lethbridge, Bassano, and Medicine Hat. Mixed farming and dairying are features of the central section of the prov. The raising of horses, beef cattle, and hogs is also a feature.

Lumbering is a large industry in N. A. Spruce, pine, poplar, birch, larch, and Douglas fir are the chief timbers. The great lakes of N. A. are stocked with fish, especially whitefish and pike. Trout and pickerel are also abundant. Fur trading is still an important industry, with Edmonton as the centre.

Secondary industries, which mainly supply local needs, comprise abattoirs and meat-packing plants at Calgary and Edmonton. Flour and saw-mills, brick-yards and tile-works, iron-works, harness factories, and stone quarries, are located at many points.

Railway development has been rapid since 1900. The lines of the Canadian Pacific railway run from Medicine Hat and from the E. through the Crow's Nest and Kicking Horse passes over the Rockies. The mts. are also crossed by the Canadian National railways via the Yellowhead Pass. The main line of the C.P.R. runs E. and W. through Calgary, and from there are branches to Edmonton and Macleod, with offshoots starting at

Lacombe and Wetaskiwin. Two through lines of the C.N.R. connect Edmonton with Winnipeg, Port Arthur, and other centres in the E., and with Vancouver and Prince Rupert in the W. Canadian National lines also extend to Calgary from E. and N., and there are also extensions westward into the coal-fields.

A., as other prairie provs., was severely hit by the economic depression of 1930-1932, and for years afterwards the people of the prov. were far from their previous degree of prosperity. This no doubt was partly due to over-cultivation of wheat and the impoverishment of the soil. See further under ABERHART, WILLIAM.

The gov. is vested in a lieutenant-governor, an Executive Council of 8 members, and a Legislative Assembly of 60 members elected for 5 years.

Cap. Edmonton (pop. 86,000), chief towns, Calgary (pop. 83,400), Lethbridge, Medicine Hat, Bassano, Strathcona, Red Deer. See L. Thwaites, *The Province of Alberta*, 1912; A. D. MacRae, *History of Alberta*, 1912; J. Blue, *The Province of Alberta*, 1924; and A. L. Burt, *The Romance of the Prairie Provinces*, 1930.

**Alberti, Leone Battista** (1404-72), It. architect, sculptor, painter, musician, and man of letters, was b. at Venice. He was for some time pontifical secretary at Rome, where some monuments of his skill remain, but his best work is generally held to be the church of San Francesco at Rimini. He also designed the churches of Sant' Andrea, Mantua, and Santa Maria Novella in Florence. He was one of the earliest revivers of classic architecture. He wrote works on the theory of painting and statuary, but his great work is the *De re edificatoria*, printed 1485. See Mancini, *Vita di Leo Battista Alberti*, Florence, 1882.

**Albertinelli, Mariotto** (1474-1515), b. at Florence, It. painter, was the pupil of Cosimo Rosselli, and fellow-students with Fra Bartolommeo, with whom he collaborated in sev. works. Among his famous paintings may be named a 'Visitation' at the Uffizi in Florence, and a 'Virgin and Child' in the Louvre.

**Albertite**, a variety of asphaltic coal found in Albert co., New Brunswick. It is soft, and a shiny jet-black in colour.

**Albertus Magnus** (1193 or perhaps 1206-80), one of the greatest scholastic philosophers of the Middle Ages. He studied science at Padua, entered the Dominican order about 1222, and taught theology at Ratisbon, Strasburg, Cologne, and Paris (1245). His works occupy 21 folios. St. Thomas Aquinas was his great pupil. His erudition was so extraordinary for the time as to comprise a very considerable knowledge of Arabian and Rabbinical literature. In natural science he followed Aristotle and Avicenna, agreeing with the latter over the impossibility of genuine metallic transmutation. See J. Sighart, *Albertus Magnus, sein Leben und seine Wissenschaft*, Ratisbon, 1857.

**Albertville**, cap. of a dist. in the Belgian Congo at the end of the railway from Kabalo (Upper Congo); situated on Lake

**Tanganyika**; connected with the E. coast by the railway Kigoma-Dar-es-Salaam. Important commercial and transshipment centre.

**Albertville**, a tn. in the dept. of Savoie, France, near Chambéry. The tn. is divided by the riv., and has important manufs., especially pottery. Pop. 6500.

**Al-Beruni**, see BERUNI.

**Alberus, Erasmus** (1500-53), a Ger. reformer and man of letters, was b. at Sprendlingen near Frankfort-on-the-Main. He went to Wittenberg in order to study theology, and there met Luther, whose cause he soon espoused. His chief weapon in defence of Lutheranism was literary satire. He also wrote hymns, some of which are still to be found in the Ger. Protestant Hymnal, but his memory is preserved chiefly by his fables.

**Albi** (Lat. *Albige*). Fr. tn., dept. of Tarn, possesses numerous interesting monuments of its varied hist. It is the seat of an archbishopric, and manufs. linen goods. Trade is in wine and aulse. The Albigenes took their name from this tn. Pop. 26,623.

**Albicore**, or **Albacore** (Portuguese *albacor*, from Arabic *al bahr*, the young camel), a large species of tunny. The name is also applied to other species.

**Albigenses**, or **Catharists**, those holding a heresy which appeared in the S. of France in the early part of the eleventh century. Their creed, eastern in its origin, was allied to that of the Paulicians, a Gnostic sect holding Manichaean doctrines. It is difficult to discover exactly what their teaching was, since there are practically no texts of theirs extant. They preserved a continuous and determined opposition to Rome and all Catholic doctrines and practices. In this alone can they be considered as precursors of Protestantism. The A. were zealous, and their doctrines, supported by the nobility of S. France, spread rapidly. They were condemned at various councils, including the Lateran Council of 1179, but these condemnations only increased their opposition. Innocent III. resolved to extirpate the heresy, and in 1198 he sent 2 Cistercian monks, Regnier and Guy, to try pacific measures. These failing, he ordered a crusade to be preached against the A., which was led by Simon de Montfort, and continued until politically ended by the treaty of Paris, 1229. The heretics were almost reduced, and the erection of an Inquisition soon completed the work. The A. are not heard of after the early fourteenth century. See C. Schmidt, *Histoire de la secte des Cathares*, etc.

**Albinism**, that condition of the skin, hair, and eyes in which there is a congenital absence of pigment. Albino is the name given to a person suffering from this defect. A. may be partial, when there are irregularly shaped white patches on the skin or hair, or complete, when the entire surface is unpigmented, including the hair and the choroid coats and irises of the eyes. The irises appear pink because in the absence of pigment the transparency of the iris and retina

allows the blood in the small veins of the eyeball to show through. This transparency of the iris constitutes a disability in sunlight, so that albinos usually pucker up their eyes and are often short-sighted or affected with nyctalopia; at night, however, their sight is better than normal, owing to the greater amount of light reaching the retina. A. occurs in all races of human beings, but particularly among negroes, whose race also shows a partial A. in which the black skin has white patches. It also occurs in nearly all classes of the animal kingdom, particularly among mammals. In some cases the A. is periodic and is restricted to the winter months, so that it enables animals in snow-covered countries either to approach their prey or to escape detection by their enemies; notable examples are the arctic fox and arctic hare. A. is partially hereditary, and occurs periodically in accordance with a regular system, which has been investigated by Mendel and others. The phenomenon also occurs among plants.

**Albinus, Bernhard Siegfried** (1697-1770)—original family name Weiss (Ger., white), of which A. is the Latinised form—great Ger. anatomist. He taught both at Leyden and Paris. He was b. and d. at Frankfort-on-the-Oder.

**Albion**, anct. name of Britain among Gks. and Romans. The name is perhaps of Celtic origin, but the Romans took it as connected with *albus* (white), referring to Dover cliffs.

**Albion**: 1. A city of Calhoun co., Michigan, U.S.A., on the Kalamazoo R. A college of the Methodist Episcopal Church is situated here. It is the centre of a grain dist., with manufs. of agric. implements. Pop. 8300. 2. The co. seat of Orleans co., New York, U.S.A., 30 m. from Rochester; exports apples, cabbages, and beans. Pop. 5600.

**Albion, New**, the name given by Sir Francis Drake to the dist. of Lower California, in N. America, which he visited in 1579. Later geographers, led by Humboldt, restricted the name to the dist. which Drake actually explored, between San Francisco Bay and the Columbia R. Name is no longer used.

**Albion Metal**, a compound formed from a sheet of tin laid on a sheet of lead, the two being combined by pressure between rollers.

**Albistan**, also called **El Bostan**, a tn. of Asiatic Turkey, near Marash. Pop. about 7000.

**Albite**, a silicate of soda and aluminium belonging to the feldspar group.

Its colour is pure white, whence its name (Lat. *albus*), and thus it can be distinguished from true feldspar, with which it often occurs. It forms a constituent of granite, and many crystalline rocks, either of primary or of secondary origin. Sev. varieties of A. are distinguished, e.g. periclino.

**Alboin**, king of the Lombards, succeeded his father about the year A.D. 565. At this time the Lombards dwelt in Noricum and Pannonia. In conjunction with the Avars, A. overcame the

Gepidae, whose king he killed. Rosamund, the daughter of the dead king, he took for his wife. About 563 he invaded Italy, meeting with practically no resistance save at Pavia, which he held out for about 3 years. During the siege he overran a great deal of N. Italy, ruling over the whole of Venetia, Lombardy, Tuscany, and Piedmont. In 573 he was murdered by his wife's paramour, Longinus, who was instigated to the crime by Rosamund, whom the king had insulted by forcing her to drink from the cup formed of her dead father's head. See Paulus, *History of the Lombards* (trans. W. D. Foulke), 1907.

**Albana**, a city of Italy situated on the E. side of Istria, near Pola. In the vicinity are lignite mines. Pop. about 15,000.

**Albani, Marietta** (1823-94), celebrated contralto opera-singer, was b. at Cesena, in the Romagna, and was trained first under Mme. Bertolotti at Bologna, and then under Rossini. Her first appearance, in 1843, at La Scala, Milan, was followed by brilliant successes throughout Europe and the U.S.A. She married first Count Pepoli (d. 1866), and secondly (1877) a Fr. officer, M. Zieker.

**Alborak** (Arabic *al burak*, from *baraka*, to flash, shine), the name given to an imaginary animal of a shining whiteness, on which, according to the Moslem tradition, Mohammed journeyed from the temple of Jerusalem to heaven.

**Albornoz, Gil Alvarez Carillo** (1310-1367), cardinal, b. at Cuencu, created archbishop of Toledo in 1337 by Alfonso XI. He fought against the Moors, but later went to Pope Clement VI. at Avignon, some say in flight from Pedro the Cruel. In 1350 this pope made him a cardinal, and in 1353 Innocent VI. sent him as legate into Italy to negotiate the restoration of the Church's temporal power. This he did, with the help of Rienzi.

**Albox**, a tn. of Spain in the prov. of Almeria. The tn. is noted for its biennial fairs. Pop. 10,000.

**Albrecht**, shortened from Adelbrecht, Old High Ger. Adalpraht.

**Albrechtsberger, Johann Georg** (1736-1809), Austrian composer, theorist, and teacher, b. at Klosterneuburg, near Vienna. Among his pupils was Beethoven, to whom he gave lessons in counterpoint.

**Albret** (*Lebret* or *Labrit*), an anct. lordship of France, of which the fame centres on the Château d'A., the castle of one of the most powerful medieval families of France. During the fourteenth-century wars many of its members espoused the Eng. cause. Henry IV., king of France, was the son of Jeanne d'A., queen of Navarre, who had married Anthony de Bourbon, duke of Vendôme.

**Albright** (*Albrecht*), **Jacob** (1759-1868), Amer. clergyman, b. near Pottstown, Pennsylvania. Converted to Methodism in 1790, he preached that faith among the Pennsylvania Gers. Latter-day adherents of the church he founded are known variously as 'New Methodists' and 'Albrights.'

**Albrizzi, Isabel Theotoki, Countess of** (1770-1836), b. at Corfu, d. at Venice. She was witty, and the keenness of her intellect brought her in contact with the renowned literary men of her day. Byron, whom she met at Venice, called her the Mme. de Staël of Venice. She is chiefly remembered by *Ritratti*, a series of portraits of famous It. contemporaries and criticisms of plastic art.

**Albuera**, Sp. vil. in prov. of Badajoz, 13 m. S.E. of tn. of Badajoz. Famous for the defeat of the Fr. under Marshal Soult by the Brit. and Portuguese, 1811. Pop. 800.

**Albufera** (Arabic, the water) is a lake in Valencia, Spain, separated from the sea by a narrow tongue of land, but with which it is connected by canal. It abounds in wild fowl and fish, and its revenues were given to the Duke of Wellington. The Eng. were defeated by Suchet near Albufera, 1812.

**Albufera, Duc d'**, see SUCHET, LOUIS GABRIEL.

**Albula Pass**, in the Grisons (Switzerland), connects the valleys of the Rhine and Inn. A railroad was completed across it in 1903, making the shortest route into the Upper Engadine. Highest point 7,590 ft.

**Album** (Lat. *albus*, white), a board (exposed in some public place such as the Forum), plastered or painted white, on which, in anct. Rome, were inscribed the public edicts and announcements. The name was extended to include the *Annales* of the pontifex maximus, the list of decurions, of jurors, etc. In modern times the name is applied to a notebook in which verses, sketches, autographs may be collected, or the larger books in which photographs are kept. In the Middle Ages any register or catalogue of saints, civil functionaries, etc., was called an A. On the Continent the term is now applied to the list of members of a univ.

**Albumazar** (*Abu-Maashar*), an Arab writer on astronomy or natural astrology, was b. at Balkh c. A.D. 805. His most famous work is entitled *De Magnis Conjunctionibus*. He also wrote *Introductionem in Astronomiam* and *Flores Astrologiae*. He held that the creation of the world took place when the 7 planets were in conjunction in the first degree of Aries, and that the end of the world will come with a similar conjunction in the last degree of Pisces.

**Albumen**, in plants, is a white substance which contains food material for the embryo, and is found in the seed. It is not a similar substance to the A. of an egg; the name was applied only by analogy, and a common name for it is *endosperm*. Plants are said to be *albuminous* (e.g. ash) or *cralbuminous* (e.g. pea).

**Albumin**, a term applied to a group of organic bodies of very complex structure. The chemical investigation and classification of these compounds is a matter of great difficulty, but there are certain important properties which are characteristic of the group generally. They

contain 5 elements, the proportions of which do not greatly vary in the different members of the group: Carboq., from 50 to 55 per cent; hydrogen, from 6.5 to 7.3 per cent; nitrogen, from 15 to 17.6 per cent; oxygen from 19 to 24 per cent; sulphur, from 0.3 to 5 per cent.

As. are colloidal substances, that is, they do not pass through parchment paper, and advantage is taken of this property to separate them from salts in solution. The addition of alcohol to the aqueous solution precipitates the A., and boiling with water produces coagulation. Different As. coagulate at different temps., and after coagulation all As. are insoluble in water and can only be made to dissolve by being treated with caustic alkalis or mineral acids.

The As. proper and the allied compounds are of great importance physiologically. With the exception of fats and mineral salts, all the dry material of animal bodies is made up of albuminous substances, or proteins, as they are sometimes called, according to the classification adopted. They are an essential part of every plant cell, and they form an indispensable constituent of human and animal food. The body can exist for a long time without fats or carbohydrates, but death is inevitable on the withdrawal of proteins from its nourishment. The chief proteins found in food-substances are egg-A. in white of egg, fibrinogen and hæmoglobin in blood, myosin in meat, caseinogen in milk, casein in cheese, and gluten in flour. In the process of digestion, proteins are split up into peptones, and these again into amino-acids. The products of digestion go mainly to the blood-stream for the building up or repair of the tissues.

Egg-A., or white of egg, is used as an antidote to poisoning by corrosive sublimate, sugar of lead, and copper sulphate, as it forms insoluble compounds with those substances. It is also used in the refining of sugar and for fixing light shades in the colour printing of textiles.

**Albuminoids**, a term of doubtful application. It is sometimes used as a generic term to denote those substances which resemble egg-albumin, such as myosin, casein, globulin, fibrin, and gluten. In anatomy, the term has another use, denoting the substances composing the connective tissues, as collagen, keratin, fibroin, elastin, etc.

**Albuminuria**, the presence of albumin in the urine. The immediate cause is the escape of the blood albumins from the blood-vessels into the renal tubules. There may be definite lesions of the kidney, or the condition may be due to a variety of causes. Accidental or spurious A. is due to the presence of blood or pus from hæmorrhage, or disease of the ureters, bladder, or urethra. Febrile A. is a condition accompanying many fevers and rarely lasts longer than the fever. Cyclic A. derives its name from the periodic appearance and absence of albumin in the urine. The albuminuric paroxysms are generally absent at night, and appear to be the result of the

assumption of the upright posture. A. is most common in growing youths of poor nutrition and anæmic tendency, may submit to careful treatment, but on the other hand may lead to degeneration of kidney structure many years later; hence the importance of an albumin test in connection with life-assurance risks. The simplest test is coagulation of the albumin. The urine is filtered to remove any turbidity, and if alkaline or neutral in reaction, a small quantity of acetic acid is added. A test-tube is filled about two-thirds full and the upper part of the column of urine carefully heated. Any turbidity that appears can be at once detected by comparison with the lower part of the column, and may be due to albumin or phosphates. If it is due to albumin, adding nitric acid will increase the turbidity; if to phosphates, the liquid will be cleared at once.

**Albumosuria**, a medical term used to denote a species of disease characterised by the presence of albuminous matter in the urine. It is often a symptom of bone disease, and is detected by the addition of nitric acid in the urine, which produces a milky turbidity, while in cases of the less serious disease, albuminuria, it produces opaline effluvia.

**Albuñol**, tn. in S. Spain, prov. of Granada, 40 m. S. of city of that name, near the coast of the Mediterranean, on which it has a port. It stands in a vine-growing dist., and exports almonds and wine. Pop. 2,800.

**Albuquerque**: (1) City of Spain, prov. of Badajoz, 9 m. from the Portuguese frontier. It has cotton and woollen manufs., and was once strongly fortified. Pop. 10,300. (2) Co. seat of Bernalillo co., New Mexico, U.S.A., on the Rio Grande, and at the junction of the Atchison, Topeka & Santa Fé and Pacific railroads. Gold, silver, and iron mines in vicinity. There are sev. important buildings and a brisk trade in wool and hides. Pop. 35,500.

**Albuquerque, Alfonso d'**, surnamed the Great (1453-1515), founder of the Portuguese power in the E., was b. near Lisbon and spent his youth at the court of Alfonso V. Being made viceroy of the Portuguese Indies, he took Goa, 1510, and then in rapid succession Malabar, Ceylon, Malacca, 1511, and later Ormuz, 1515. His rule was wise, firm, and humane. In 1515 Emmanuel recalled him, putting his personal enemy, Lopes Soares, in his place. He d. at Goa. See *Commentarios do Grande Afonso Dalboquerque* (Lisbon, 1557), written by his son; translation pub. by Hakluyt Society (1875-84).

**Alburnum**, or sapwood, is the wood lying immediately below the bark, in opposition to the duramen or heartwood in the central region. The duramen is the old wood which has grown harder, and incidentally darker, and has lost its functional activity; the A. is the new wood. Whitewood trees consist wholly of A., and are consequently fit only for temporary purposes.

**Albury**, tn. in New S. Wales, Australia

at the head of the navigation of the Murray R., from the mouth of which it is 1800 m. distant. It is 386 m. S.W. of Sydney by rail. A. is the centre of an important vine-growing dist. Pop. 12,000.

**Alcaeus** (c. 600 B.C.), contemporary of Sappho, was one of the first lyric poets of Greece. Of aristocratic birth, he was yet a fiery democrat, and vigorously opposed both the tyrant Myrsilus and the popular ruler Pittacus. He wrote odes in the Æolic dialect, using the measure which bears his name. Fragments to be found in Bergk's *Poeta Lyrici Græci*. Alcaics are of 2 kinds, the greater and the lesser. The greater alcaic is an 11-syllabled line of 5 ft., viz. either a spondee or an iambic, an iambic, an extra long syllable and 2 dactyls. The lesser has 4 feet, viz. 2 dactyls and 2 trocheics. The alcaic ode is composed of sev. strophes, each of 4 verses; the first 2 are always alcaics of the first kind, the third is an iambic of 4 feet and a long syllable, and the fourth verse is an alcaic of the second kind. This ode was much used by Horace.

**Alcahest**, or **Alkahest**, a term introduced into alchemy by Paracelsus to denote the unknown 'quintessence' of creation, the one real elementary form of matter. He considered this to be the universal solvent that the alchemists sought.

**Alcaide**, or **Alcayde** (Arabic *al kayd*, the head or leader), a Sp. word formerly used to denote the governor of a fortress or a castle, a gaoler or a warden.

**Alcala de Guadaira**, tn. of Spain, prov. of Seville, 7 m. E. of tn. of that name, supplies Seville with bread. Pop. 16,800.

**Alcalá de Henares**, anct. tn. of Spain, prov. of Madrid, on R. Henares, 17 m. E.N.E. of Madrid. Its famous univ., founded by Cardinal Ximenes in 1510, was removed to Madrid in 1836. It is the bp. of Cervantes. Pop. 10,600.

**Alcalá la Real**, city of Spain, prov. of Jaén (Andalusia), about 3000 ft. above the sea on N. side of the Granada Mts. In 1810 the Fr., under Count Sebastiani, defeated the Spaniards here. Pop. 21,400.

**Alcalde** (Sp., from Arabic *al cad*, the judge), general title for a judicial officer in Spain and parts of America settled by the Spaniards.

**Alcámenes**, a famous Athenian sculptor of the end of the fifth century B.C., possibly a pupil of Phidias. His best-known works are a 'Hephaestus' and an 'Aphrodite of the Gardens'.

**Alcamo**, tn. on Is. of Sicily, prov. of Trapani, at the foot of Mt. Bonifacio. Its buildings were erected chiefly by the Saracens, who possessed it until 1233. It has mineral springs. Pop. 52,000.

**Alcamo, Ciula d'**, see CIELO DALCAMO. **Alcañiz**, city of Spain, prov. of Teruel, Aragón, on R. Guadalupe, 60 m. S.E. of Saragossa, has fine anct. buildings and important alum works. A. was captured by the insurgents, in the Civil war, in Mar. 1938. Pop. 7500.

**Alcántara** (Arabic, the bridge) receives its name from the magnificent bridge

built by the Emperor Trajan in the early second century. The bridge, surmounted by a triumphal arch, is over 600 ft. long and 200 ft. high, and is composed of 6 arches. It was partially destroyed in the Peninsular war, but was lately reconstructed. Pop. 3600.

**Alcantara, Dom Pedro De**, see PEDRO I. and II.

**Alcántara, Knights of**, founded as the order of St. Julian, formed a military and monastic order for the defence of Spain against the Moors. The order was founded in 1156 and approved by Pope Alexander III. in 1177. In 1835 it was changed from an eccles. to a court order.

**Alcaraz**, tn. of Spain, prov. of Albacete, on slope of mts. of Albacete and 34 m. W.S.W. of tn. of that name. Above it is a ruined castle, and there are remains of a Rom. aqueduct. Important copper and zinc mines are to be found in the vicinity. Pop. 5300.

**Alcarria, La**, a productive dist. in the prov. of Guadalajara, Spain. The market centre for the grain and fruit of this dist. is the tn. of Brihuega.

**Alcaudete**, a Sp. tn. in the prov. of Jaén, Andalusia. Pop. 15,200.

**Alcázar**, the name of sev. palaces of the Moors in Spain, the most important of which are: the two As. of Cordova—the 'A. viejo' built by the Arabs, and the 'A. nuevo' built by Alphonso XI. The A. of Segovia contained many art treasures, statues, and historical relics. It was, however, destroyed by fire in 1862. The A. of Seville was built by the Arabs in the twelfth century, and has been enlarged sev. times, presenting a mixture of oriental and Gothic architecture. It contains many valuable curios. Toledo, had 5 As., of which the most beautiful was destroyed by fire in 1710, and that of Alfonso VIII. has been converted into a monastery.

**Alcázar**, a Sp. tn. in the prov. of Ciudad Real, New Castile. It is generally believed that this is Alce, the scene of the victory of Tiberius Sempronius Gracchus in 180 B.C. Pop. 14,700.

**Alcázar-kebir**, city of Morocco, an important caravan centre. Here, in 1578, Sebastian of Portugal was defeated and slain by the Moors. Pop. 35,000.

**Alcedo**, a genus of kingfishers which belongs to the family Alcedinidae, and is allied to the hoopoes and hornbills. *A. ispida* is the European species of kingfisher.

**Alcester, Frederick Beauchamp Paget Seymour**, first Baron (1821-95), an Eng. admiral, b. in London. Began his naval career in 1834, and commanded the *Alcester* in the Crimean war. He was commander-in-chief in the Mediterranean from 1880 to 1883, and directed the bombardment of Alexandria in 1882. For this and other services during the war he was created baron in 1882.

**Alcestis**, the subject of the tragedy of Euripides, was the daughter of Pelias and Anaxibia, and wife of Admetus, who won her by Apollo's aid. When the time came for her husband to die, she consented to give her life for him and

was eventually brought back from the lower world.

Alchemy, usually associated with the magic arts and with astrology, but in reality the beginning of our systematic chem. The origin of the word is variously given, being derived from the Gk. and from the ancient Egyptian, via Arabic. The art probably had its origin in Egypt, since Egypt possessed a civilisation and culture far in advance of those of any contemporary nation. It is therefore not surprising to learn that the earliest mention of A. is to be found in the records of the Egyptians. Legend after legend grew up and was perpetuated in some way or another by writings regarding the origin of this very mystical science. The origin is variously attributed to Hermes Trismegistus ('the thrice greatest'), to the fallen angels of the Book of Genesis (vi.), and yet again by revelation to Moses and Aaron. The origin through Hermes is the one which was most generally accepted, and also the one which has affected chemical language down to the present day (cf. 'hermetically sealed'). He was the Egyptian ideal of personified strength, the great god Thoth, and his divine art of A. was a secret revealed only to a sacred school of the sons of kings. Astrology and magic were the accompanying sciences of A., and that whole science was based upon the transmutation of metals, which seems from the researches of Berthelot, in his study of the third century A.D. Leyden papyrus (found in Thebes in the nineteenth century), to have undoubtedly originated in Egypt. During the fourth and fifth centuries the writings of the alchemists continued increasing until by the end of the fifth century we may say that speculative A. had reached its highest point in the Alexandrian schools. The results of the appearance of the Muslims in the civilised world did not at first promise to further the arts and sciences, but within a short time of their appearance the Muslim schools began to become famous, and the names of many Arabs and Persians are among the most notable of the alchemists. The most famous of these Muslim alchemists was Jabir ibn Hayyan, known to the west of Europe as Geber. His name is bound up with the chemical knowledge of the time, but much that has been attributed to him has been found to be spurious, and many of his so-called writings are writings of a much later date. His own ideas were very similar to those of the old Alexandrian philosophers, and he believed even in the influence of the planets on metals.

The theory of transmutation, although modified to a certain extent by the later alchemists, can be traced quite easily in the writings of the Gk. philosophers. All substances were ultimately composed of one elemental matter, and so the alchemist hoped to be able by the removal of all the foreign matter to obtain the *materia prima*. This theory of A. still existed amongst the alchemists of the Middle Ages; that they believed in it as

firmly as did the ancients cannot perhaps be definitely stated. Men such as Albertus Magnus, Roger Bacon, Arnold of Villeneuve (q.v.), and Vincent of Beauvais all held these beliefs. Roger Bacon, to quote only one example of this period, believed in the philosopher's stone, which was to turn the baser metals into gold, and also in the elixir of life. When it is remembered that numerous ideas of Roger Bacon were far beyond his time, it will be seen that the alchemistic ideas had a very strong hold indeed. To come down to almost modern times, certainly well into the seventeenth century, these alchemistic ideas were still held, at any rate from the academic point of view, by the chemists of the period. Among them may be mentioned Glauber (1603-1668), Robert Boyle (1627-91), and for some time Newton and Leibnitz, and even Dr. Johnson, who was interested in chem. The science has been adhered to by some right down to the present century, and recent alleged successful transmutations have been reported from Armenia and France. With the twentieth century and the research into radio-activity, artificial transmutation of certain elements has been accomplished on a small scale. The views of the alchemist certainly do not receive support here, but the essential principle underlying all the experiments of A. seems to have received some little encouragement. See also TRANSMUTATION OF THE ELEMENTS; ALBERTUS MAGNUS. See A. E. Waite, *Lives of the Alchemists*, 1888; M. Berthelot, *La Chimie au moyen âge*, 1893; E. O. von Lippmann, *Die Entstehung und Ausbreitung der Alchemie*, 1919; E. J. Holmyard, *Makers of Chemistry*, 1931; J. Read, *Prelude to Chemistry*, 1936, and *The Alchemist in Life, Literature, and Art*, 1948; K. K. Doberer, *The Goldmakers*, 1948.

Alciati, Andrea (1492-1550), It. jurist and poet, b. at Milan, d. at Pavia. He was prof. of civil law at Avignon, Pavia, and Ferrara. His refined legal criticisms make him founder of the 'elegant' school of law. He made commentaries on the Pandects and on the Justinian code. His criticisms of Rom. law were of a revolutionary nature. His book of moral sayings in Latin verse called *Emblems* (*Emblematum Libellus*) is famous.

Alcibiades (450-404 B.C.) was b. at Athens and was connected through his mother with the house of the Alcmaeonidae. He was left an orphan at a very early age, and this lack of proper control during his youth probably accounts for some of his later excesses. Socrates, who saved his life at Potidaea, and whose life he saved at Delium, obtained some influence over him and tried to eradicate his vices, but with very little effect. After the battle of Delium, 424 B.C., he married Hipparete, and at this time he began to turn his attention to public affairs. He wished to ally himself with the Spartans, but on their choosing his rival Nicias to negotiate for them in 421 B.C. he immediately became their enemy.

Instead of taking part in the Sicilian expedition of 415, he again joined them, escaping to their country because he was accused of the mutilation of the images of Mercury. He now became the enemy of the Athenians; but he soon forsook the cause of the Spartans and tried to get the Athenians to recall him, promising them an alliance with Tissaphernes, the Persian satrap. This plan was not successful, but he was eventually recalled to Athens by Thrasybulus. In 407 B.C., on his return to that city, he was completely restored to his former position, but had his command taken from him the next year. He then chose exile as his only means of safety, and in 404 B.C. he went to take refuge with Pharnabazus, wishing to go thence to the court of Artaxerxes. He was prevented from doing so, however, for while there his residence was set on fire. In trying to escape the flames he rushed from the house to fall pierced by the arrows shot by emissaries of the Spartans. See Thucydides, *Histoire d'Alcibiade* (Paris, 1873) by H. Houssaye, and Plutarch's *Lives*.

**Alcidæ**, the auks, belonging to the Charadriiformes, and are allied to sea-gulls. They have webbed feet and fly well. They live on rocks, lay a single egg, and feed on fish. *Alca impennis*, the great auk, now extinct, had short, useless wings; *A. torda* is the razorbill; *Fratercula arctica* is the puffin.

**Alcides**, see HERCULES.

**Alcinous**, in Gk. mythology a king of the Phæaciens, in the is. of Scheria, son of Nausithous and grandson of Neptune. He is celebrated in the *Odyssey*, the narrative of his reception and entertainment of Ulysses, who as an outcast on the shore of the is. was relieved by A.'s daughter, Nausica, being the main theme of bks. vi to xii of that poem. See also AUGONAUTS.

**Alciphron** lived probably during the second century A.D., though there is great doubt as to his exact century. He was a Gk. writer, and is noted especially for a collection of fictitious letters voicing the opinions of various classes of people on familiar subjects. The scene is laid in Athens, and the letters are written in the purest Attic dialect.

**Alcira**, a Sp. tn. in the prov. of Valencia. A., which consists of the tn. proper and 2 suburbs, was built by the Carthaginians, and in medieval times belonged to the Moors. It is believed to have been the Rom. tn. of Satabicula, and was originally a strong fortification, being very thickly walled. Its staple products are silk and fruit. Pop. 23,000.

**Alcylde**, see STRATHCLYDE.

**Alcmon**, son of Amphiaræus and Eriphyle, and brother of Amphilocheus. He took part in the expedition of the Epigoni against Thebes—in which also Amphiaræus participated at the cost of his life, having been induced to do so by Eriphyle against his premonition of misfortune. To avenge his life Amphiaræus enjoined his sons to kill their mother. A. did so on his return home and was pursued by

the Furies in consequence. He was first cured of his madness by the king of Psophis, whose daughter Arsinoë he married, and of his second fit of madness by the riv.-god Archelous, whose daughter Callirrhoe he also married. His treachery was discovered by Arsinoë's father, whose sons murdered him.

**Alcmæonidæ**, a noble family at Athens, who were driven out of Pylus in Messenia by the Dorians, and settled at Athens. Owing to the way in which Megacles, one of the family, treated the insurgents under Cylon (612 B.C.), they brought upon themselves the guilt of sacrilege and were exiled from Athens, c. 595. About 560 they returned, but were again expelled by Pisistratus. In 548 they agreed with the Amphictyonic council to rebuild the temple of Delphi, and won great popularity throughout Greece by executing the work in a style of grandeur much exceeding their obligations under the agreement. On the expulsion of Hippias in 510 they were again restored to Athens. They now joined the popular party, and Cleisthenes, who was then the head of the family, gave a new constitution to Athens.

**Alcman**, b. at Sardis during the seventh century B.C., was a lyrical poet of Gk. extraction. He settled in Sparta, where, among other kinds of poetry, he wrote in the Doric dialect parthenic choruses sung by the young girls of Sparta. He is said by some to have been the first writer of love poetry. The fragments of his poems which are extant are to be found in Berk's *Poetæ Lyrici Græci*, Leipzig, 1843.

**Alcobaca**, a tn. in Estremadura, near Lisbon, Portugal, at the conjunction of the Alcoa and the Baça. Its chief historic interest is a superb Cistercian monastery founded in 1143 by Don Alfonso. The old Gothic church holds the tombs of Alfonso I. and II. Sancho I., Pedro I. (q.v.), and his ill-starred mistress Inês do Castro. The library is extensive. Pop. 2400.

**Alcock, John** (c. 1130-1500), was an Eng. ecclesiastic. He was the founder of Jesus College, Cambridge.

**Alcock, Sir John William** (1892-1919). A distinguished Brit. airman who, with Sir Whitten Brown, made the first trans-Atlantic flight (see ATLANTIC FLIGHTS); but subsequently lost his life on a flight to France.

**Alcoforado, Marianna** (1640-1723), a nun of Beja in Portugal, and the author of the famous *Lettres portugaises*, 1669, a series of passionate love-letters written in 1625-27 to the young Noël Bouton, afterwards marquis de Chamilly and marshal of France.

**Alcofrabas Nasier**, the pseudonym used by Rabelais when he pub. *Pantagruel*. The name is an anagram of his own name, François Rabelais.

**Alcohol**, a term applied to a group of organic substances which may be regarded as derived from the hydrocarbons by the substitution of one or more univalent hydroxyl groups OH for the same number of atoms of hydrogen. The name A. is, however, usually applied to

one member of that group, ethyl A., which is present in varying quantities in wine, beer, spirits, etc.

The aliphatic A. series contains methyl, ethyl, propyl, butyl, amyl, hexyl As., etc., and their isomerides. The lower As., from methyl A. to butyl A., are mobile liquids, the middle As. are oily liquids, and the upper As. are waxy solids. The lower As. have a characteristic spirituous smell which becomes disagreeable higher up in the series. The most important members are methyl A. and ethyl A.

*Methyl A.* or *methanol* ( $\text{CH}_3\text{OH}$ ) is produced in the dry distillation of wood. The aqueous product of the distillation contains about 1 to 2 per cent of methyl A., which can be separated by fractional distillation after the removal of the acetic acid by hot milk of lime. Methyl A. is used in the preparation of aniline dyes and for the denaturation of ethyl A. It is now prepared synthetically, on a large scale, from carbon monoxide and hydrogen, which are made to react under pressure, at  $450^\circ\text{C}$ ., in the presence of metallic oxides; the latter act as catalysts.

*Ethyl A.* or *ethanol* ( $\text{C}_2\text{H}_5\text{OH}$ ) has been known from the earliest times as produced in the fermentation of grape juice. When pure it is a mobile colourless liquid with a characteristic odour. It solidifies at about  $-130^\circ\text{C}$ ., hence its use in thermometers intended to register low temperatures. It is miscible with water in all proportions, and burns with a pale blue non-luminous flame. In the laboratory it may be prepared by converting ethane into ethyl chloride and heating the latter with dilute alkalis under pressure. A. is always prepared for commercial purposes by making use of the process of fermentation (*q.v.*). Dextrose, or grape-sugar, decomposes in the presence of yeast-cells into A. and carbon dioxide, and the dextrose is obtained by making a pulp of any starchy material, such as potato, grain, rice, etc. By enzymes (*see* FERMENTATION) the starch is almost completely turned into maltose, which by combining with water is converted into dextrose. The weak solution of A. thus obtained is subjected to fractional distillation. The distillate or 'raw spirit' contains 'fusel oil,' which is contained in the higher boiling-point fractions. To eliminate the fusel oil, the raw spirit is diluted with water and filtered through charcoal, which absorbs some of the fusel oil. The filtrate is again distilled and collected in 3 fractions, that of the lowest boiling-point being fairly pure A. For most purposes it is unnecessary to get rid of the fusel oil; even beer and whisky contain a small quantity of this substance, which is supposed by some to improve the flavour; it is, however, undoubtedly injurious to health.

In the Brit. Isles a heavy excise duty is levied on 'spirits of wine,' but the Gov. allows certain exceptions in order not to hamper the various industries in which A. is used. Methylated spirit contains 10 per cent of partially purified

wood-spirit and a small proportion of paraffin oil, which render it undrinkable. It is also coloured with an aniline dye. This spirit is sold duty free, and in cases where the paraffin oil would militate against certain manufacturing processes, the spirit may be supplied to manufacturers denaturated with wood-spirit only. For laboratory purposes in univs. and colleges the sale of pure A. is allowed free of duty. Ethyl A. completely free from water and other impurities is known in chem. as 'absolute' A.

The great solvent powers of A. have made it of much importance in the preparation of lacquers, varnishes, and dyes. It is used also for the manuf. of chloroform, chloral, and iodoform, and as a fuel. Its solvent power also makes it valuable in the chemical laboratory, and it is used too for the preservation of anatomical specimens.

The most important fact in connection with A. is the part it plays in the preparation of alcoholic liquors. A vast mass of legislation and of administrative detail, great industries like brewing and distilling, and social and hygienic problems are all cognate to this subject. *See* BREWING, DISTILLING, DRUNKENNESS, EXCISE, LICENCE.

Alcoholic liquors may be divided into 2 classes: those which are distilled and therefore contain a large proportion of A., and those which are the result of fermentation without distillation, and therefore depend for their flavour mainly on the medium in which the fermentation takes place. Of the distilled liquors the chief are brandy, distilled from wine; whisky, from a fermented solution of malt; rum, from a fermented solution of sugar; and gin, from a fermented solution of malt, but flavoured with juniper. Those not distilled comprise beer, which is fermented malt solution flavoured with hops, and wine, which is fermented grape juice. Beer, with its modifications, stout, porter, and the various kinds of ales, usually contains from 3 to 7 per cent of A., and wines from 8 to 17 per cent. Port, sherry, and Madeira are what are called fortified wines, that is, they contain added A. besides that engendered by the fermentation.

The physiological effects of A. are well known. It is a powerful stimulant, increasing the flow of gastric juices when diluted, and in more concentrated doses producing a stronger and more rapid heart-beat. The possible effects of its continual use are catarrh of the stomach, affections of the liver and kidneys, degeneration of the brain, and delirium tremens. Notwithstanding its therapeutic value, medical men are increasingly unwilling to advocate its use, owing to the bad physical effects and the worse moral degeneration consequent upon the A. habit which might possibly be established.

**Alcoholism**, the condition of the body brought about by over-indulgence in alcohol. It includes a morbid state of the liver, kidneys, stomach, etc., but is particularly associated with a condition

of the nerves which gives rise to a persistent craving for alcohol. The desire for drink passes after a time into a physical condition in which the body demands its accustomed allowance of alcohol, and acute nerve troubles are generally the result of its being withheld. Such a condition, however, is merely temporary, and the body gradually accommodates itself to new circumstances. For diseases associated with the condition of A., see DELIRIUM TREMENS, INSANITY, EPILEPSY, and NEURITIS. The general aspects of excessive drinking will be found in DRUNKENNESS.

**Alcoholometry**, the determination of the proportion of alcohol in a liquid. If the liquid is known to contain only alcohol and water, its sp. gr. as shown by a hydrometer would enable the relative proportions of water and alcohol to be known. In hydrometers used for this purpose the graduations are often marked in percentage of alcohol instead of sp. gr. In Sikes's hydrometer the graduations are arbitrary figures, from which the corresponding percentage of proof spirit may be found by the use of a book of tables issued under the authority of the Commissioners of H.M. Customs and Excise. Atkin's hydrometer is provided with a series of scales which enables the strength of any 'wort,' or beer in the making, to be determined.

**Alcoran**, see KORAN.

**Alcott, Amos Bronson** (1799-1888), an American philosopher, b. in New Haven co., Connecticut. He opened in 1831 a small school in Boston which has been vividly described in *Recollections of a School*, a book written by Miss Peabody. His methods of education did not find favour at Boston, and finally he went to Concord, where he occasionally lectured to schools on philosophical subjects. He was the friend of Emerson, Thoreau, Hawthorne, and Carlyle. His theory was neo-Platonic. He was made dean of the Concord School of Philosophy in 1879. Of his writings the best known are: *Concord Days* (1872) and *Table Talk* (1877).

**Alcott, Louisa May** (1832-88), author, b. in Pennsylvania, the daughter of Amos Bronson A., *supra*. Her prin. works are stories written for girls, among these being *Little Women*, 1868, with a sequel, *Good Wives*, and *Little Men*, 1871. Before this, however, she wrote *Hospital Sketches*, 1863, letters describing her work in the hospital during the civil war of 1862-63; also *Aunt Jo's Scrap-book*, 1871-1879; *Jo's Boys and how they turned out*, 1886. See Ednah D. Cheney's *Louisa May Alcott*, 1889, and Lives by B. Moses, 1909; C. Meigs, 1935; and J. B. Wagoner, 1943.

**Alcoy**, a Sp. tn. in the prov. of Alicante. It has a picturesque situation, and is noted for its manufs. It is especially famous for its manuf. of paper, particularly that used for cigarettes; but there are also cotton, linen, and woollen factories. Pop. 34,000.

**Alcuin** (735-804), a celebrated A.-S. scholar. He was b. at York, and edu-

cated at the cathedral school there, apparently under the direction of the great scholar Elbert, whom he succeeded in the headship of the school. With Elbert he seems also to have made a journey to Rome. At Parma about the year 780 he met the Emperor Charles the Great, who gave him rich abbey and persuaded him to settle down at his court. This was part of Charles's plan for the civilisation and education of his Franks. He desired also his help in the creation of schools, and round A. grew up a school at the royal court composed of the young princes and nobles of the palace and sometimes even the great Charles himself. During the period of his greatness he seems to have visited England, to which he was passionately attached, but its stress and strife made it no place for the great scholar, and after 796 he settled down in the abbey of St. Martin at Tours. His works are not famous for their depth, but his letters to his various friends form perhaps the best reflection of the life and manners of his times that we have. A number of his letters are still in existence; his 2 chief correspondents were Arno of Salzburg and the emperor himself. Of his other works we have also quite a number, including a grammar and a number of Lat. verses. His life of Saint Willibrord, to whom he was related, is one of a number of the lives of saints written by him. See *Beati Flacci Albini seu Alcuini Opera*, Ratisbon, 1771; C. Werner, *Alcuin und sein Jahrhundert*, 1876; A. F. West, *Alcuin and the Rise of the Christian Schools*, 1893; G. F. Browne, *Alcuin of York*, 1904; E. M. W. Buxton, *Alcuin*, 1922; W. H. Howell (trans.), *The Rhetoric of Alcuin and Charlemagne*, 1941.

**Aleyone**, or **Halcyone**, was the daughter of Aeolus and wife of Ceyx. One legend says that she and her husband were changed into birds for calling themselves Zeus and Hera, and another that they were both changed into kingfishers after Ceyx was shipwrecked and A. had thrown herself into the sea in grief. 'Halcyon days' were supposed to be days of calm while the kingfisher (alecyon) was breeding in a floating nest.

**Aleyonacea**, a sub-order of Aleyonaria, an order of marine animals. They consist of a firm cartilaginous mass, throughout which calcareous spicules are dispersed. The surface is studded with hydra-like polyps, with tentacles. They are found attached to rocks and seaweed. *Aleyonium digitatum* is popularly called dead men's fingers; *A. gelatinosum* is phosphorescent and inhabits deep water.

**Aldan**, a navigable riv. of Siberia, and affluent of the Lena. It travels over a course of 1300 miles.

**Aldbrough**, a vill. in the W. Riding of Yorkshire, on the R. Ure. Remains of the anct. Rom. tn. of Isurium have been found in the neighbourhood.

**Aldebaran** is the Arabic name of a first-magnitude star ( $\alpha$ ) in the constellation Taurus, its exact magnitude being 1.1. It is of a light-red colour, and is one of the group of 5 called the Hyades.

It is sometimes called the Bull's Eye. The Romans knew it by the name of *Pallicium*, because it set for the last time visibly when the feast of Pales was being celebrated on April 21.

**Aldeburgh**, a tn. in Suffolk. It used to send members to Parliament, but in 1832 this privilege was taken away. Its church, containing a statue of Crabbe the poet, who was born there, and its moot hall are worthy of note. A. also has the distinction of being the first tn. in England to elect a woman to the office of mayor, this honour being conferred on Mrs. Garrett-Anderson in 1908. Pop. 2500.

**Aldegonde**, Philip van Marnix de St., see ST. ALIEGONDE.

**Aldehyde**, the name applied to a group of organic compounds prepared by oxidation of primary alcohols. The term is derived from alcohol *dehydrogenatum*—that is, dehydrogenated alcohol. When oxidised, the As. give fatty acids; formaldehyde produces formic acid, acetaldehyde produces acetic acid, propaldehyde produces propionic acid, and so on. Therefore the As. may be looked upon as intermediary between the alcohols and the fatty acids.

The lower members of the group are colourless, mobile, neutral volatile liquids, usually with an irritating smell. The higher members are odourless solids.

The As. may be prepared by oxidising the primary alcohols, or from the fatty acids by dry distillation of their calcium salts with sodium formate. All the lower As. form crystalline addition products when shaken with a concentrated aqueous solution of sodium hydrogen sulphite. In contact with an aqueous solution of hydrocyanic acid, *cyanohydrins* are formed, which may be converted into hydroxy-acids.

The chief members of the group are formaldehyde and acetaldehyde. *Formaldehyde* ( $\text{H}\cdot\text{CHO}$ ) is prepared by the oxidation of methyl alcohol. It is a product of the incomplete combustion of wood, peat, etc., and traces of it are found in the atmosphere. It is a gas at ordinary temps., but can be condensed to a colourless liquid and even to a white solid. Formalin is a 50 per cent. aqueous solution of formaldehyde; it is used as a disinfectant and for the preservation of anatomical specimens. *Formaldehyde* is also important as the source of bakelite and galalith, two useful substitutes for bone and ivory. The former is made from formaldehyde and phenol ('carbolic acid') and the latter from formaldehyde and casein of milk. *Acetaldehyde* ( $\text{CH}_3\cdot\text{CHO}$ ) is formed by the oxidation of ethyl alcohol. Commercially, acetaldehyde is obtained by causing acetylene ( $\text{C}_2\text{H}_2$ ) to combine with water ( $\text{H}_2\text{O}$ ) under the influence of a catalyst. It is a very volatile liquid with a penetrating odour, and on exposure to the air gradually oxidises to acetic acid. The term *aldehyde*, when used without qualification, often refers to this compound. *Acetaldehyde* is of importance in the chemical industry.

**Alden**, John (1599–1636), one of the Pilgrim Fathers who sailed for America in the *Mayflower*. In *The Courtship of Miles Standish* Longfellow tells the story of his courtship of Priscilla Mullens.

**Alder**, see ALNUS.

**Alderman**, a title handed down from A.-S. times, the word then being 'caldorman.' In those times the title was held by various distinguished persons, and in the very earliest times the ealdorinen came next to the king. These caldormen were nobles by birth, and their office was both civil and military. There were also special titles applicable to certain offices, such as 'aldermannus totius Angliæ,' 'aldermannus regis,' and others. They seem to have been at the height of their power during the time of Alfred the Great, and from then until the time of the Norman Conquest the nature of the office gradually changed, until the word was applied to men holding certain municipal offices.

In modern times A. are members of the tn. and city corporations, and hold certain powers in those places. The Local Government Act, 1933, provides that one-half of the number of the senior aldermen of a co. council must retire in every third year, being the year in which co. councillors are elected. In the City of London, which is divided into 26 wards, there are 26 A., and the lord mayor is elected from among the A. In England, Wales, and Ireland A. possess, by virtue of their office, certain judicial powers in their own particular cities and tns., but in America they have powers of legislation rather than of judicature except in some cases. As each Amer. city is governed under the laws of its own special charter, and as the provisions of these charters vary greatly, such an official as an A. has vastly different powers in different places. For example, Chicago is governed by supervisors, Boston by an elected council, Washington by commissioners, and New York by a board of A. directly representative of the popular vote. Broadly, however, A. in America form legislative bodies, and, though they have the powers of magistrates in some cases, these powers are of a restricted nature, relating particularly to civic business, the control of the police, and similar functions. In New York or in other Amer. cities where the A. are the controlling body, the powers of these officials are far greater than are usually associated with the office in England; but the mayor, who is their chief and who is elected by the whole city, has also a large authority in the initiation and veto of measures.

**Alderney** is one of the group of is. known as the Channel Is., and lies N. of Jersey and Guernsey. It is separated from the Fr. coast by a strait known as the Race of A., and to the W. of this is. lie the Casquets, dangerous rocks which have been the scene of many shipwrecks. The coast is mainly rocky, though on the N. there are bays. The tn. of St. Anne stands in the centre of this is., where the soil is very fertile. The is. itself is

subject to the jurisdiction of Guernsey, and belongs to Great Britain. A. was occupied in the Second World War by the Gers., who evacuated all the islanders and left it finally in ruins. Pop. 800.

**Aldersgate**, a ward and street of the City of London, the street running northwards from St. Martin's-le-Grand to Goswell Road. The old gate is mentioned about A.D. 1000 as Ealdredesgate, and was probably named after someone of that name, but Stow's opinion is that the name referred to its age. John Day, the Elizabethan printer, is said to have lived in the gatehouse, together with John Foxe (see Taylor's *London*). The gate was restored after being burned in the Fire of London but eventually taken down in 1761. The dist. was much damaged by Ger. air raids in 1940-41.

**Aldershot**, a tn. in Hampshire, England. At first only a small vil., it grew into importance owing to the establishment of A. Camp in 1854-55, on the borders of Hampshire, Surrey, and Berkshire, which is the largest permanent military camp in the United Kingdom. The barracks and grounds cover an area of nearly 3 sq. m. At first there were only wooden huts, but these were replaced by brick huts and barracks, and there is also a brick hospital. The bell in the tower of the Cambridge Hospital is made from guns captured at Sebastopol. The gov. grounds around are used for manoeuvres, and during the summer regular troops are encamped there, and Territorial Army units also go there for a fortnight. In the earlier years the troops quartered here were termed the 'Division of A.' In 1870 they and their station became the 'A. Dist.', and in 1901 the 'First Army Corps (A. Dist.)'. In 1902 the name was changed to the 'First Army Corps (A. Command)', and in 1904 it became the 'A. Command'.

It is estimated that about 3,000,000 men were stationed in the A. Command during the First World War; and it was from A. that most of the 'contemptible little army' went out to Flanders. The highest number stationed in the command at one period was 140,000. There were 60,000 troops on Laffan's Plain for Queen Victoria's Jubilee review, and nearly 100,000, including detachments from every part of the empire, on the occasion of Queen Victoria's Diamond Jubilee review. Pop. 34,300.

**Aldgate**, a ward and street of the City of London, the street, connecting Fenchurch Street with Whitechapel. The old gate, which was called Eastgate in the Saxon period and, later, Alegate, was the extreme E. gate of the City. Recent excavations establish that it was formerly the site of a Roman gate. It was rebuilt in 1608 and finally demolished in 1761. Chaucer lived in the old gatehouse under lease from the corporation (Taylor's *London*). The chief remaining old-time feature of A. is the pump.

**Aldhelm**, see EALDHELM.

**Aldine Press**, see under MANUTIUS.

**Aldred** or **Ealdred**, an Eng. churchman who became abbot of Tavistock about

1027; in 1044 he became bishop of Worcester, and in 1060 archbishop of York. He it was who carried on the negotiations with the Emperor Henry III. for the return to England of Edmund Ironside's son. He visited Jerusalem, being the first Eng. prelate to do so, about the year 1058. He surrendered to William after Hastings.

**Aldrich, Henry** (1671-1710), was an Eng. ecclesiastic, educated at Westminster School and Christ Church, Oxford, where he succeeded Massey as dean in 1689. He wrote *A Compendium of Logic*, 1817—used at Oxford for a long time; he also composed church music. He designed Peckwater Quadrangle and All Saints' Church at Oxford.

**Aldrovandi, Ulissi** (1522-1607), a celebrated It. naturalist, b. at Bologna. In 1553 he took his medical degree at Bologna, and occupied the botany and natural hist. chairs of that univ. He estab. the botanic gardens at Bologna in 1567, and also formed a natural hist. museum. He traveled in almost every part of Europe to collect information for his great work on natural hist., the first vol. of which was pub. in 1599. The complete work was not pub. until 1608. He was imprisoned as a heretic at Rome, but was afterwards released.

**Aldstone**, see ALSTON.

**Aldus**, see MANUTIUS.

**Ale**, generally a synonym for beer (*q.v.*). The application of the term varies according to locality, but it is never used to denote the black beers, stout, and porter. Mild A. is beer with a good proportion of sugar and a fairly dark colour. Pale A. usually differs little from what is known as bitter beer; it is light in colour, and has a pronounced hop flavour. The term ale often has a connection with the periodic or festive nature of brewing or drinking, as in Oct. A., Whitsun A., audit A., harvest A., and bridal (originally bride-ale).

**Aleatory Contract** (Dice-players' Contract), a legal term used of an agreement involving risk of loss or the chance of gain and dependent on a hazardous event. Under this head are wagers and insurance.

**Ale-conner**, or **Ale-kenner**, is one who knows what good ale is. In anct. times in this country As. or ale-tasters (called *gustatores cerevisiae*) were appointed annually in the court-leet of each manor, in hors. and corporate tns., to see that the ale was good, and that it was sold at proper prices. In the city of London they are appointed to examine the ale and the measures in which it is sold.

**Alecto**, in Gk. mythology the sister of Megæra and Tisiphone. These 3 sisters were known as the Erinyes or Furies, and pursued the guilty. The most famous victim of their vengeance was Orestes, pursued on account of the murder of his mother, Clytemnestra.

**Alehouses** were houses where ale was sold. In 1496 an Act passed 'against vacabounds and beggars' (11 Hen. VII. c. 2) contained a clause regulating A., and from that time different Acts were passed for that purpose. In 1528 a general Act

to regulate the granting of A. licences was passed (9 Geo. IV. c. 61), which repealed all former statutes on this subject. See LICENSING LAWS.

**Alekhine, Alexander** (1892-1946), chess-master, *b.* in Moscow, son of a Russian nobleman; studied law at the Univ. of Paris, taking doctor's degree. Formerly a Russian civil servant and a member of the Duma, his career was broken by the Revolution and he emigrated to France in 1921, and became a naturalised Fr. citizen. He won the title of master at chess in 1909, when, at 16, he took the prize in the St. Petersburg amateur tournament. In the Carlsbad international tournament of 1911 he attracted the attention of all chess players, tying for eighth place in a tourney which included nearly every great chess master of the time. In 1914 he tied for first place with Nimzovitch in the Russian national tournament, winning the title of grand master, and in the succeeding world tournaments he won third prize, and in the next tournament, at Mannheim, he was leading when the First World War broke out, and he was interned at Baden; but escaped and served on the Galician front, was wounded and spent some time in a hospital at Tarnopol, where he played a brilliant series of blindfold games the results of which are to be found in his books. From 1921 he dominated the chess world with a remarkable series of first prizes. Then, in 1927, he challenged the world champion, Capablanca, and won the title after a protracted match. As world champion he was even more successful than before. At San Remo in 1930 and Blea in 1931 he was sev. points ahead of his nearest rivals. He was the world's champion again in 1934 by defeating Bogoljubov; but in 1935, in the Netherlands, Dr. Max Euwe beat him (15½-14½ points), owing to his underestimating his rival's powers and his lack of adequate training for the match. But in 1937 he beat Euwe (17½-12½ points). After these triumphs his skill seems to have waned, and in the Avro tournament he was equal fourth, fifth, and sixth, behind Keres, Fine, and Botvinnik. His last big tournament before the Second World War was at Buenos Aires in 1939. Arrangements had been completed for a championship match between him and Michael Botvinnik, the Russian champion, when he *d.*, this being the first occasion in the hist. of the game when the holder has *d.* while still champion. At his best period he was perhaps the greatest player the world has ever seen. The variations in the openings he discovered and popularised are many, and he was one of the best and most lucid annotators, as many be seen from his books, *My Best Games of Chess, 1908 to 1923*, and *My Best Games of Chess, 1924 to 1937*.

**Alemán, Mateo**, a famous Sp. novelist, was *b.* at Seville about the middle of the sixteenth century, and *d.* in Mexico about 1610. He was the author of the famous and popular novel entitled *Guzmán de Alfarache*, Madrid, 1599. This work, which was trans. into Eng. in

1622, is one of the many novels called *picarescas* which about that time appeared in Spain, and professed to describe the life and manners of rogues, vagabonds, and beggars. The Sage's *Guzmán de Alfarache* has no resemblance to the novel by A. In 1604 A. pub. a life of St. Antonio de Padua, and in 1609, in Mexico, pub. *Ortografía castellana*.

**Alemanni, Alamanni, or Alamans** (Old Ger. *alle mann*, all men), a warlike confederacy of sev. Ger. tribes which was formed between the Danube, the Rhine, and the Main about the second century A.D., and from the third to the fifth century was frequently at war with the Romans. Caracalla (A.D. 214), Severus, Maximinus, Postumus, Julian, and Valentinian were successively their opponents, but they were not crushed until Clovis defeated them utterly in the battle of Tolbiac, 496. At one time they extended their dominions to the Vosges and to the Alps. It is from this people that the Fr. derived the words *Allemagne* and *Allemand* for Germany and a German respectively.

**Alembert, Jean le Rond d'** (1717-83), was *b.* in Paris, and obtained his name from St. Jean le Rond, the church near which he was found when a baby. In 1711 he became a member of the Academy of Sciences, and in 1713 pub. his work, *Traité de dynamique*, explaining 'A.'s Principle.' He helped Diderot to prepare his *Encyclopédie*, and was in 1751 admitted to the Académie Française. See M. Müller, *Essai sur la philosophie de Jean d'Alembert*, 1926.

**Alembic**, an apparatus, now obsolete, used by alchemists for distilling.

**Alemtejo** is the largest prov. in Portugal. It is very mountainous in the E., and is watered by the Tazus, the Guadiana, and the Sado. In the E. there are extensive forests, and the valleys are fertile. In the W. there are large treeless plains where sheep and goats are reared. The other productions include cereals, wine, fruits, and oil. The iron and copper mines are worked but little. The cap. and chief tn. is Évora. Area, 9300 sq. m. Pop. 588,000. See Borrow's *The Bible in Spain*, 1843.

**Alençon**, a Fr. tn. in the dept. of Orne, and its cap. Its church of Notre-Dame—of the fifteenth century—is noteworthy for its architecture, and there are remains of the old castle of A. This tn. is noted also for its *point d'Alençon* lace. Pop. 17,700.

**Aleppo** (Turkish, *Haleb*), the cap. of the district of A., N. Syria, situated on the Kuweik in a fertile valley, but beyond is the Syrian desert. It was formerly the great trade centre between Europe and Asia, and exported silk, cotton, and woollen goods to the E. The discovery of the Cape route to India damaged its trade; and its capture by the Turks, 1517, the earthquake of 1812, the plague of 1827, and the cholera of 1832 added to its ruin. Nevertheless it was recovering from its misfortunes, and before 1914 was still an important commercial centre. During the advance

of Gen. Maude against the Turks after the capture of Bagdad in Mar. 1917. A., together with Mosul, became the pivotal positions of the Turks' last lines of resistance. But for the intense heat in Mesopotamia at that time and the occurrence of the Russian revolution, there is little doubt that Gen. Maude could, in conjunction with the Russian forces, have trapped the whole Turkish army. The tn. was eventually taken on Oct. 26, 1918, by Gen. Allenby, the Ger. general, Liman von Sanders, with the Turkish general staff fleeing to Alexandretta. After the war the tn.

**Alesius, Alexander** (1500-65), a Scottish divine, b. at Edinburgh and educated at St. Andrews. He was a strong supporter of the Reformation, settled in Wittenberg, where he became a friend of Luther and Melancthon, and signed the Confession of Augsburg.

**Alessandria**, the cap. of the prov. of A. in Piedmont, N. Italy. It is a fort. tn. and a railway and trading centre. It was built in 1168 by the Lombard League as a bulwark against Frederick Barbarossa. The citadel is a very strong fortress, and there is a beautiful cathedral. The manufs. consist of linen and woollen

I. W. Hutchison

ALEUTIAN ISLANDS: UNALASKA VILLAGE AND DUTCH HARBOUR

and ter. of A. were united with Damascus to form the single ter. of Syria under the Fr. mandate. A. is a centre of the silk industry and tobacco production. The railway from A. to Rayak (200 m.) was opened in 1926. The Iraq oil pipe-line has one of its 2 termini at A. Silk and cotton goods, leather, wheat, and other grains, carpets, tobacco, and wine are exported through Latakia, its port. Pop. (tn.), 255,000, which consists mainly of Gks., Armenians, Jews, and Muslims. In 1939 the sanjak of Alexandretta was ceded by France to Turkey. See Kemal-Eddin, *Chronique d'Aleppo* (1097-1146), 1884; A. Russell, *Natural History of Aleppo*, 1794; *Cambridge Ancient History*, vol. II, 1924.

**Aleschans**, see ALISCANS.

**Alesia**, usually identified with Alise-Sto. Reine, was the scene of Caesar's victory over Vercingetorix in B.C. 52, which victory completed his conquest of Gaul. From 1862 to 1865 and onwards excavations have been made at Alise-Sto. Reine, and a statue of Vercingetorix stands near that tn.

goods and macaroni. Pop., prov., 755,000; tn., 79,000. Area of prov. 1970 sq. m.

**Aletschhorn** is one of the highest peaks in the Bernese Alps, being 13,721 ft. It was first ascended by Tuckett in 1859. The Aletsch, between 12 and 13 m. long, is the largest glacier in Switzerland, and at its E. extremity is the Marjelen Lake.

**Aleurone Grains**, or proleil grains, are solid granules of proteid substance which act as reserve stores of food for the embryonic plant. They occur in the general protoplasm of the plant but especially in the seeds. In shape they are round or oval, and they contain mineral matter in the form of a *globoid* of lime and magnesia or a crystal of calcium oxalate. In oily seeds, such as the brazil-nut, there is also a *proleil crystalloid*.

**Aleutian Islands**, a chain of about 150 is., extending westwards from the peninsula of Alaska towards Kamchatka, the greater number of which belong to the U.S.A. They were first explored by Russians in 1768, and Captain Cook in

1778 made further explorations. The is. are mostly barren—attempts have been made at cultivation, but with little success. Many of the mt. summits are volcanoes. The largest is, Unimak, which contains 2 active volcanoes, and, excepting Attu, is the nearest to the mainland of Alaska. The only industries are fishing—whale and seal—and hunting. Unalaska is the chief is. for trade. It has a good harbour, par. church, and trading establishments. The exports are fish and furs. The inhab. are of Eskimo origin, and they belong to the Gk. Church. In June 1912 the Jap. made a descent on Attu, the westernmost is., under cover of a raid on the Amer. base at Dutch Harbour. At this time the A. I. (apart from Unalaska), were undeveloped, unfortified, and uninhabited for the most part, but they are of strategic importance, for Attu is the bit of Amer. ter. nearest to Japan (1200 m.), and the occupation by Japan put her within 1000 m. of the Alaskan Peninsula. The occupation of Attu was soon followed by an equally unopposed occupation of Kiska, which has a good harbour. But in Aug. the Amers., by rapid construction, estab. a defended air station on one of the Andreanovski group, the next in the chain to Rat Is., of which Kiska is the chief. From this airfield the Amer. bombers frequently raided Kiska. Pop. 1083.

**Alewife**, the popular name of a Malacopterygious fish belonging to the Clupeidae, probably so called from a fanciful resemblance to the stout hostess of an ale-house. It is 8–10 in. long, and is common in N. America. It is related to the herring and sprat, and is used for food.

**Alexander**, a Jewish prince, son of Aristobulus II. and grandson of Jannæus, was taken captive in Judæa by Cn. Pompeius, but escaped. He was defeated near Jerusalem, 57 B.C., by Marcus Antonius, who had been sent against him by Gabinius, governor of Syria. A., however, conquered Judæa, put many Romans to death, and besieged the rest in Garizin. At last he was defeated by Gabinius, and beheaded by Metellus Scipio by the order of Pompey, 49 B.C. See Josephus, *Antiquities of the Jews*, xiv. 5, 6, 7.

**Alexander I. of Bulgaria** (1857–93) (Prince A. of Battenberg). Nephew of the Tsar A. II. of Russia, he was, on the proposal of Russia, elected first sovereign prince of Bulgaria (1879). He met with considerable difficulties owing to the opposition between the Russophil conservative elements and the patriotic nationalist party, and, finally, in 1886, was compelled to abdicate.

**Alexander I.**, king of Epirus (336–326 B.C.), was the son of Neoptolemus and brother of Olympias, the mother of A. the Great. In 332 he went to Italy to aid the Tarentines against the Lucanians and Brutii. He was defeated and slain in battle in 326, near Pandosia, on the banks of the Acheron in southern Italy.

**Alexander II.**, king of Epirus, son of Pyrrhus and Lanassa, succeeded his father 272 B.C.

**Alexander, King of the Hellenes** (1893–1920), second son of King Constantine, on whose dethronement he ascended the throne of Greece, June 14, 1917. His gov., with Venizelos as Premier, enjoyed the confidence of the W. powers. He married in Nov. 1919, Aspasia Manos, an Athenian lady, who bore him one posthumous child—a daughter. During his reign the boundaries of Greece were much extended. He d. of blood-poisoning, Oct. 25, 1920, as result of a monkey-bite, at Tatoi.

**Alexander I.**, king of Macedonia (c. 505–454 B.C.) was the son of Amyntas I., whom he succeeded. He had to submit to the Persians, and, though he secretly favoured the cause of the Gks., he accompanied Xerxes in the invasion of Greece, 480 B.C.

**Alexander II.**, sixteenth king of Macedonia (369–367 B.C.), was the son of Amyntas II., whom he succeeded. He reigned only one year and a few months.

**Alexander III., or the Great** (356–323 B.C.), was the son of Philip II. of Macedonia and his wife Olympias. He was b. at Pella, and received his education partly at the hands of Aristotle, who seems to have invested him with a deep and lasting love for Homer, and partly in the court of his father, where the numerous coming and going of embassies must have given his education its practical side. Nor was his education in the art of war neglected, for at the early age of 16 he quelled a rising that had broken out at home in his father's absence. Quarrels occasioned by the repudiation of his mother and the marriage of a new wife by Philip II. caused his withdrawal from the court, and later his at least open reconciliation with his father. Whether A. was involved or not, it was during the period when he was under a cloud and likely to be ousted from his position as heir to the throne of Macedonia that Philip fell at the hand of the assassin in 336.

Recognised by the army, he had no difficulty in obtaining his father's throne; although the assassination caused some slight unrest and a tendency in the hill tribes towards revolt, he was in the same year recognised as generalissimo of the army of the Gks. against the Barbarians. Striking at the Barbarians of the N., and crushing a revolt in W. Macedonia, he was forced to strike at Greece, by a revolt of the Thebans. There was no hesitation in the policy he adopted, Thebes had revolted, therefore Thebes must be crushed, and to all intents and purposes Thebes was wiped out of existence. The Gk. alliance against the Barbarians was renewed, no hostility being openly shown.

Early in 334 A. crossed into Asia Minor, to attempt to carry out the great plan of the Gk. federation, the liberation of the Gk. cities from the tyranny of Persia. The defeat of the Persians at the battle of Granicus gave into his hand the headquarters of Persian gov. and almost all the Grecian cities. In most of the cities were estab. democracies under the supervision of A. and his officers. Only in the tus. held by mercenaries of the

Persians did he meet with any resistance. Ephesus and Miletus fell, and Halicarnassus surrendered after a prolonged siege. A. showed clearly, however, that he came not only as a liberator, but as a conqueror. The conquered provs. were placed under the control of Macedonian governors, A. himself received the submission of the Gk. cities of the seaboard, and even the inland uplands were attacked. The attempt to break down the conquest of A. by a naval attack upon Greece failed owing to the death of the Persian admiral (Memnon). A. now determined to attack the Persians in Syria, and passed down on his journey to N. Syria too quickly for interception by

*Glyptothek, Munich*

#### ALEXANDER THE GREAT

the Persian army dispatched by Darius III. In N. Syria, however, he found waiting an army under Darius himself. Slipping past the Persian army, he turned and routed them at Issus, while the Persians were making a vain attack to cut his line of communication. A. had set himself to conquer the whole of the Persian empire; the negotiations of Darius were useless, A. began the detailed conquest of Syria. Tyre, after a 7 months' siege, surrendered, and its inhab. were sold into slavery. Gaza met with the same fate, Syria was conquered, the road to Egypt lay open to him.

To the Egyptians A. came as a god, a liberator from an accursed tyranny. Here he met with no resistance, and here he stayed during the winter of 332-331. The city of Alexandria owes its existence to this great conqueror, who founded it at the mouth of the Nile. By his command of the coasts he had broken up almost entirely the naval power of Persia; he was free now to strike at the heart of the Persian empire. Again traversing Syria, he made his final arrangements at

Tyre, and then struck straight into the heart of Persia. Near Nineveh he found the army of Darius waiting for him, and here, at the battle of Arbela, he drove before him in complete route the last great army of the Persians. The treasures of the Persian empire were at his disposal, Babylon fell into his hands, the richest provs. were secured. At Susa he seized the treasury of the Persian royal house, an almost fabulous amount of riches. Even the mt. tribes were subdued, and learnt to regard the conqueror of Persia as their conqueror also. Pursuing the defeated king from place to place, A. at last came up with him S. of the Caspian, and here the fallen monarch was assassinated by the small band of followers who still clung to him. A. was still to meet with serious opposition. The crown of the dead king was assumed by Bessus, and A. had to turn back to put down the new revolt. But here also we find the beginning of the Macedonian opposition to A. He was no longer the king of Macedon alone, he had conquered a great empire, he had worshipped at the Egyptian temples, he had worn the dress of a Persian; he was no longer the Gk. captain-general, he was an oriental despot. The discontent showed itself in conspiracy, which was immediately put down by the execution of the ringleaders.

In 328 Bessus was at last captured and executed, and during the following year A. was busy putting down revolts and planting Gk. colonies. But the quarrel between A. and his Macedonian followers was still apparent, and showed itself in a number of gloomy incidents, amongst which can be numbered the murder of Clitus and the execution of Callisthenes, the nephew of Aristotle. By the end of 327 A. was preparing for his great invasion of India. Meeting with great opposition from the hill tribes, he succeeded in reducing most of their fortresses and reaching the Indus. Already by the time A. reached the Indus it had been bridged, and he immediately led his armies into the Punjab. Here, ending upon the hostility of rival kings, he easily obtained an ally, and reached the Hydaspes. Here he found King Porus awaiting his arrival, prepared to dispute his passage. Crossing the riv., he engaged Porus in battle, and was successful. Porus fell into his hands, and afterwards became one of his firmest allies. Moving slowly eastwards, A. had just reached the Gato of the Ganges, when the final movement in the Macedonian revolt came; the Macedonian army refused to move further eastwards. After a struggle lasting 3 days A. gave in and the return westwards began. The gov. of the E. Indus fell into the hands of the native princes, chief amongst whom was Porus; the W. portion of his Indian conquest remained in the hands of Macedonian governors. The Indus to its mouth still remained unexplored, and to this task A. now set himself. In 325 A. at last reached the mouth of the great riv., seeing for the first time the ocean.

The return from India was accompanied by great hardships, when the journey did not lie along the sea coast, but had to be undertaken inland. On his return A. applied himself immediately to administrative reorganisation. During his absence many abuses had grown up, many offices were held by incapables; it now remained for A. to set up in proper working order his empire. He attempted to a great extent to fuse the races of Macedonia and Persia, taking to himself Persian wives and inducing his generals and even the rank and file of the army to intermarry with the Persian race. The eyes of the world were all turned upon the greatest conqueror it had known, and A. received embassies from all parts of the known world. Another great enterprise had been planned from Babylonian fleets had been built, and armies especially trained, when A. developed fever. The disease was not regarded seriously at first, but rapidly became worse, and 10 days after the outbreak of the disease the Macedonian army were allowed one by one to pass through the chamber of the dying prince in order to bid him farewell. On the following day he *d.* (323). See *Anabasis* of Arrian and the *Lives* by Q. Curtius Rufus and Plutarch; also Jacob Abbott, *History of Alexander the Great*, 1848; J. W. MacCrimmon, *The Invasion of India by Alexander the Great*, 1893; D. C. Hogarth, *Philip and Alexander of Macedon*, 1897; A. E. P. Weigall (1933), and L. V. Cummings (1940), *Alexander the Great*; H. Lamb, *Alexander of Macedon: The Journey to the World's End*, 1917.

**Alexander** (1461-1506), king of Poland and grand duke of Lithuania. He became grand duke of Lithuania in 1492 and king of Poland in 1501.

**Alexander**, the name of 8 popes: Alexander I. (106-115), Alexander II. (1061-73), Alexander III. (1159-81), Alexander IV. (1254-61), Alexander V. (1469-10), Alexander VI. (1492-1503), Alexander VII. (1655-67), Alexander VIII. (1689-91).

**Alexander I.** (1061-73) was the nominee of Hildebrand, whose policy he carried out in preparation for the accession of Hildebrand himself (Gregory VII.). He it was who sanctioned the Norman invasion of England and sent the sacred banner to William the Conqueror.

**Alexander III.** (1159-81) succeeded Adrian IV.; his appointment was opposed by Frederick Barbarossa. Held the third Lateran Council, 1179. Sanctioned Henry II.'s invasion of Ireland, and humbled the same king after the murder of Becket. Spent the latter part of his pontificate in exile, being driven from Rome by the republic.

**Alexander VI.** (1492-1503) (Rodrigo Borgia), *b.* in 1431 in a little Sp. vil. near Valencia, was by the influence of his uncle, Calixtus III., rapidly advanced in the Church. He became successively bishop, cardinal, and vice-chancellor, and served in the Rom. court under 5 popes. During this period he acquired wealth, influence, and position. His 2 out-

standing sins were his love for gold and women. In an age when immorality was not regarded as a serious vice he called down on himself the censure of the Church. His children by his mistresses seem to have formed the basis of his ambition, since for them he did all that he possibly could. By a system of judicious and gigantic bribery he became pope on the death of Innocent VIII. At first his period of power was quiet and satisfactory, but he soon left no doubt as to his exact policy. A system of nepotism began, which even in an age of nepotism frightened his contemporaries by the lengths to which he went. To advance his son, to make a splendid marriage for his daughter, he was prepared to spend the wealth of the Church or to destroy the peace of Italy. The secularisation of the Church was carried to unheard-of lengths. The Church was to A. merely a means of carrying out his schemes for the advancement of his family. Even if all the stories of his poisonings and immoralities cannot be accepted, there still remains no doubt that he was guilty of many. He was a great patron of art, and during his pontificate many treasures of art were produced for him. He employed Raphael, Michelangelo, Pinturicchio, at one period or another. He *d.* on Aug. 18, having dragged down the Church to the lowest depths to which even in the Renaissance days she had descended. His most famous, or infamous, children were Giovanni, duke of Gandia (1474), Cesare (1476), and Lucrezia (1480). See BORGIA.

**Alexander**, the name of 3 emperors of Russia: Alexander I. (1777-1825), Alexander II. (1818-81), Alexander III. (1845-94).

**Alexander I.**, son of Paul I., was *b.* on Dec. 28. No Russian monarch has ever had such weird and contradictory characteristics. The irreligious court of Catherine II. made him a freethinker, the teachings of his tutor made him a disciple of the school of Rousseau, his military training gave him full possession of the Russian ideas of autocracy; of such a strange medley was the character of A. formed. Succeeding to the throne in 1801, he proceeded to undo the policy of his predecessor, and renounced the armed neutrality of the N. By 1808 he had after a desperate resistance come over to the side of Napoleon. But the campaign of 1812 completely upset his high-strung and nervous temperament, and henceforward he poses as the peacemaker of Europe. After the coyness of Vienna his great plan was the confederation of Europe, and for this purpose was formed the Holy Alliance. But the action and reaction of Europe after 1815 alarmed him, and a revolutionary Germany caused him to modify his liberal ideas. Towards the end of his reign he was greatly under the influence of Metternich, and the final act was reached with the tsar proclaiming himself the natural defender of the Christian Church in the Ottoman empire. In 1825 it was announced that he had *d.* in remote Crimea, though whether he really *d.* or

only disappeared is still a debated question (Pares).

**Alexander II.** (1818-81), the eldest son of Nicholas I. Six years after his accession he emancipated the serfs (1861). His foreign policy raised Russia to a high place in the councils of Europe, and at the same time strengthened her resources. He was assassinated in Mar., the victim of a nihilist plot, the actual body responsible, 'The Will of the People,' being one of the then 2 main Socialist parties, but in fact the assassination was the work of not more than 100 persons (Pares).

**Alexander III.**, second son of the Emperor A. II., was b. on Mar. 18, 1845. He reversed to a certain extent the liberal policy of his predecessor, and proceeded to rule on autocratic lines.

**Alexander 3** (kings of Scotland).

**Alexander I.** (usually surnamed the Fierce), fourth son of Malcolm Canmore, succeeded his brother Edgar in Jan. 1107. He ruled over Scotland N. of the firths of Forth and Clyde, the kingdom of Cumbria being given as an appanage to his younger brother David. He succeeded in establishing firmly the royal authority in the N. During his reign the independence of the Scottish Church was established. He married Sybille, a natural daughter of Henry I., and *d.* childless in 1124.

**Alexander II.**, son of William the Lion, succeeded to the Scottish throne in 1214. From the time of his accession he was in communication with the still disaffected N. barons, and, despite the stipulations in Magna Charta on behalf of the Scots, he joined forces with the barons when hostilities again commenced. He laid siege unsuccessfully to Norham, and the N. barons did homage to him. He retreated before the army sent against him by John, an army which successfully laid waste the border cos. of Scotland. This border war continued until 1217. In 1216 A. showed still further his hostility to John by making a special journey to Dover to pay homage for his Eng. possessions to Louis of France. He married the daughter of King John (Joanna) in 1217, and during his reign the definite boundaries of the 2 kingdoms seem to have been fixed, though no formal frontier was drawn. The usual quarrels during the reign of Henry III. with regard to the homage question resulted in a treaty at Newcastle in 1244, by which A. II. pledged himself not to enter into any treaty hostile to his 'hege lord,' Henry III. He *d.* in 1249, and was succeeded by his son, Alexander III.

**Alexander III.** succeeded in 1249 and ruled until 1286. He was successful in bringing the W. Is. under his power in 1263. The later period of his reign was devoted to administrative reforms, which limited the power of the barons and brought Scotland a period of peace and prosperity, such as that country was not again to enjoy for some time. He was killed in 1286 by falling over the cliffs near Kinghorn, and left as his heiress his granddaughter, the Maid of Norway.

**Alexander I.**, king of Syria (150-146 B.C.), surnamed Balas. He pretended to be a son of Antiochus IV., Epiphanes, and usurped the throne of Syria from Demetrius I. Balas was, however, defeated and dethroned by the son of Demetrius, who came to the throne as Demetrius II.

**Alexander II.**, king of Syria (128-122 B.C.), surnamed Zebina or Zabinas, was sent by Ptolemaeus Physcon, king of Egypt, to usurp the throne from Demetrius II. Demetrius was defeated and Zabinas came to the throne. He, however, refusing the ann. tribute to Ptolemaeus Physcon, was attacked by the Egyptians and put to death.

**Alexander** (1888-1934), king of Yugoslavia; b. Dec. 4, at Cetinje; second son of Prince Peter Karageorgievich (Karagorgievic). A's mother was a daughter of Nicholas, reigning prince of Montenegro. His early days were passed at Geneva, where his father lived in exile. The family being favoured by Russia, A. was sent to St. Petersburg in 1899, to be educated. In 1909 he rejoined his father in Serbia, where the latter was now king. A's elder brother George having been obliged to renounce his claim to the succession, A. was recognised as heir. He distinguished himself in the Balkan war of 1912; and he was appointed regent by his father, June 24, 1914. He was with the Serbian army in its retreat before the central powers; then headed the Serbian Gov. in exile at Corfu, and visited the W. Allies' camps. He returned to his army; and at the Yugoslav National Council at Zagreb, Dec. 1, 1918, he was appointed regent. His father dying Aug. 16, 1921, A. became king. He married, June 8, 1922, Marie, daughter of King Ferdinand of Rumania. On Jan. 6, 1929, owing to parl. difficulties, he suspended the constitution, and created a dictatorship. He was assassinated in Marseilles on Oct. 10, 1934, by a Croat subject a few moments after he had disembarked there. M. Barthou, Fr. foreign minister, who was in the same motor-car, was also killed by the bullets of the assassin who was killed on the spot by a Fr. officer. A. had gone to France for negotiations on the question of the Adriatic in its bearing on Fr. foreign policy, the immediate object of the negotiations being to find means of establishing closer contact between Italy and Yugoslavia as the essential preliminary of a *rapprochement* between France and Italy.

**Alexander, Albert Victor** (b. 1885), Brit. labour politician. b. at Weston-super-Mare, son of an artisan engineer, educated at St. George technical classes. Secretary, parl. committee, Co-operative Congress. Chief clerk for higher education, Somerset Co. Council till 1920. For some years a Baptist lay preacher. M.P. (co-operative) Hillsborough div. of Sheffield, 1922-33 and since 1935. Parl. secretary to the Board of Trade, 1924. P.C., 1929. First Lord of the Admiralty, 1929-31, in Ramsay MacDonald's first Gov., and, again, in 1940, in the national Gov. of Mr. Winston Churchill and in the

Labour Gov. in 1945; minister of defence, 1947.

**Alexander Nevsky** (1220-63), grand duke of Vladimir, second son of the grand duke of Yaroslav. Was ruler at Great Novgorod, and spent the early part of his life in fighting against the Gers, and Poles, who were continually endeavouring to win it from Russia, which was still suffering from the great Tatar invasions. His most memorable battle was fought against the Swedes on the banks of the Neva, and resulted in the total rout of the Swedes and the bestowal of the name Nevsky (of the Neva) on the young prince, 1240. He spent the rest of his life in endeavouring to ameliorate the lot of the Russians and relieve the distress occasioned by the Tatar invasion. On his death he was canonised by the Gk. Church.

**Alexander Obrenovich**, king of Serbia (1876-1903). Proclaimed king under a regent on abdication of his father, Mar. 1889. Took the gov. into his own hands in 1893. He aroused great opposition by his marriage to Mme. Draga Mashin in 1900. Murdered together with his queen by military conspirators.

**Alexander Severus**, Rom. emperor (A.D. 222-35). He was the son of Gessius Marcianus and Julia Mamaea. About the year 221 he was adopted by his cousin, the Emperor Heliogabalus (or Elagabalus) and given the title Caesar. The next year he succeeded to the imperial throne. He was noted for his piety and his justice; he numbered amongst his advisers Paulus and Ulpianus. Although a pagan, he held in high regard the doctrines of Christianity, and hated the vulgar ostentation of the Rom. court. He crushed the Persian revolt under Artaxerxes in 232. Two years later he set out for the Rhine, but was assassinated in the neighbourhood of Mainz, a victim to a military conspiracy in 235.

**Alexander of Ægæ**, a Peripatetic philosopher at Rome in the first century A.D., who was tutor to the Emperor Nero.

**Alexander of Aphrodisias** in Caria lived at the end of the second century and the beginning of the third century A.D., was a celebrated Peripatetic philosopher, and the greatest commentator on Aristotle.

**Alexander of Hales**, surnamed Doctor Irrefragabilis, a celebrated doctor of theology, b. in Gloucestershire, during the thirteenth century. He was trained in the monastery at Hales, where at an early age he became an archdeacon. He studied, as did most students, in the schools of Paris, and became a celebrated teacher there. Suddenly, about 1222, he entered the order of the Franciscans, and remained in it until his death in 1245. His most celebrated work is *Summa Theologie*.

**Alexander Polyhistor**, an anct. Gk. writer and philosopher of the first century B.C.

**Alexander the Ætolian** was a Gk. poet who lived at Alexandria in the reign of Ptolemy Philadelphus (285-247 B.C.).

**Alexander, Archibald** (1772-1851), an Amer. Presbyterian divine, b. in Virginia. In 1791, after being licensed to preach, he became known as a great and eloquent revivalist preacher. He afterwards became prof. in the newly created Presbyterian seminary at Princeton, where he remained until his death. Amongst his theological works may be mentioned the *Outlines of Moral Science*, 1852, and *A History of the Israelitish Nation*, 1853.

**Alexander, Bishop of Lincoln** (d. 1148). A. was the nephew of Roger, bishop of Salisbury. He became archdeacon of Sarum, and later bishop of Lincoln (1123). Visited Rome in 1125. Took side of Stephen in civil war, although he had sworn allegiance to Maud. Suspected of disloyalty, he was arrested, imprisoned, and dispossessed of his castles. He again visited Rome, and probably crowned Stephen in 1146.

**Alexander, Boyd** (1873-1910), noted as a Brit. explorer, b. at Cranbrook, in Kent. He took part in the famous A. - Gosling expedition (1904-7), which crossed Africa from the Niger to the Nile. It was during this expedition that his brother, Claud A., and his fellow explorer Gosling both lost their lives as a result of the hardships which they had to endure. In 1909 A. began his last, ill-fated journey. After passing Lake Chad in safety at Wadal, just on the borders of the Brit. sphere of influence in the Sudan, he was attacked by natives and killed.

**Alexander, Cecil**, see under Alexander, William (1824-1911).

**Alexander, Sir George** (1858-1918), actor and theatrical manager, b. at Reading. He was educated for a city life, but his enthusiasm as an amateur actor soon led him to the stage. He started at the Theatre Royal at Nottingham at the age of 21, and 2 years later joined Sir Henry Irving at the Lyceum. He became a manager in 1890 at the Avenue Theatre, and in the following year opened at St. James's. On the stage he could play the lover to perfection, avoiding both bathos and inawkishness.

**Alexander, Field Marshal Sir Harold Rupert Leofric George, Viscount of Tunis and of Errigan** (b. 1891), Brit. soldier, son of 4th Earl of Arundel, and educated at Harrow and Sandhurst. In First World War he held a commission in the Irish Guards and was in the Mons retreat. Five times mentioned in dispatches. While still in his twenties he was put in command of the Baltic Landeswehr, a force of some 2000 men of Ger. stock, mainly Baltic barons and retainers, who were left behind in Riga after the Ger. evacuation. In 1934 he was given the command of a brigade in India, and served in 2 campaigns on the N.W. Frontier. His name first came to be known in his own country when he was appointed to the command of the First Div. (1938). Two years later it was his task to control the final stages of the Dunkirk evacuation (1940), which he did

with conspicuous gallantry and success. After holding the S. Command for a time he was appointed to command the army in Burma, where his skill contributed to staving off any further Jap. advance in that country (1942). In Aug. 1942 he succeeded Gen. Auchinleck as commander-in-chief, Middle E. Here his presence was quickly felt, for very soon his strategy had its reward in the great victory of the Eighth Army under Gen. Montgomery at El Alamein, which completely reversed the position in Egypt and Libya; and this was followed by a series of victories on a smaller scale which took the Eighth Army into Tunisia, by which time A. had for some time been in command of the 18th Army Group in that country. In May 1943 the entire Axis Army under Gen. von Arnim was destroyed or taken prisoner. Commanded the allied armies which defeated the It. and Ger. armies in Italy in 1944-45. C.S.I., 1936; K.C.B., 1912. Promoted general, 1942. Field Marshal, 1944. After the war he was raised to the peerage and appointed governor-general of Canada. See also AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN; ITALIAN FRONT, SECOND WORLD WAR, CAMPAIGNS ON.

**Alexander, Sir James Edward** (1803-1885), a celebrated Brit. soldier and traveller. He joined the E. India army in 1820. In 1825 he became an officer in the Brit. army, and later took part in the Kafir war and the Crimean war. Amongst other things, to him largely is due the transfer to England of Cleopatra's Needle, 1877.

**Alexander, John White** (1856-1915), a celebrated Amer. artist, b. in Allegheny, Pennsylvania. Amongst his works may be mentioned 'Miss Dorothy Roosevelt,' 'Pandora,' 'Rodin,' 'Walt Whitman,' 'The Quiet Hour,' 'A Ray of Sunlight.'

**Alexander, Samuel** (1859-1938), Brit. philosopher; b. at Sydney, N.S.W. Educated Wesley College, Melbourne; Univ. of Melbourne; and Balliol College, Oxford. First class in classical and in mathematical moderations, 1879; first class Lit. Hum., 1881. Scholar of Balliol, 1878. Fellow of Lincoln College, 1882-93. Gifford lecturer, Glasgow, 1916-18. M.A., Hon. LL.D., St. Andrews and Birmingham; Hon. D.Litt., Durham and Liverpool. His philosophy attaches great importance to Awareness; which, though different in kind from its objects, is derived from them—paralleling the results of chemical reactions. A. thus arrives at Emergent Evolution: the emergence of totally new things from combinations of the old. Space-time, the original matrix, gave birth to matter in varying forms; which in turn gave birth to mind. From mind, God is expected to emerge. (See his *Space, Time, and Deity*, vol. II, especially p. 399). Publications include: *Moral Order and Progress*, 1889; *Locke*, 1908; *Space, Time, and Deity*, 1920; *Spinoza and Time*, 1921; *Beauty and other Forms of Value*, 1933. He received the Order of Merit on the king's birthday, 1930.

**Alexander, Sir William** (1577-1640), Earl of Stirling. One of the lesser Scottish poets, received grant of Nova Scotia, became later secretary of state for Scotland, a position he continued to hold until his death. Amongst his works are *Tragedie of Darius, Aurora, Crenus*, and *Julius Caesar*.

**Alexander, William** (1824-1911), Protestant bishop of Armagh and primate of all Ireland, was b. Apr. 13, at Londonderry, and received his education at Tunbridge Grammar School and at Oxford (Brasenose College). He held a number of livings in the N. of Ireland before being made bishop of Derry and Raphoe in 1867. He became primate of all Ireland in 1896. He was the author of a number of theological works, and was also distinguished as the writer of *St. Augustine's Holiday and other Poems*, 1886. His wife, Cecile Frances Alexander, is famous as the author of the hymn *There is a Green Hill far away* and of numerous other well-known hymns.

**Alexander, William Lindsay** (1805-1881), a Scottish divine. He became recognised as a master of classical erudition. He ed. in 1861 the 3rd ed. of Kitto's *Biblical Encyclopedia*. From 1877 was principal of Edinburgh Theological Hall.

**Alexander Archipelago**, a congeries of is., over a thousand in number, off the coast of Alaska, U.S.A.

**Alexander Land**, a dist. in the Antarctic, lat. 68° 43', long. 70-75°, discovered by Bellingshausen, 1821.

**Alexandra**, a div. of Natal situated between the rivs. Umzimkulu and Umkomansi. It has a pop. of about 23,000, mainly coloured.

**Alexandra Caroline Marie Charlotte Louise Julie**, queen of King Edward VII. of Great Britain and Ireland, was b. Dec. 1, 1844. She was the eldest daughter of King Christian IX. of Denmark. She was married Mar. 10, 1863, and thence until the death of Queen Victoria in 1901 she was Princess of Wales. Probably the first time she was seen by her (future) husband was at Spire in 1861. The children of the marriage were 5, 2 boys and 3 girls. The eldest son, Albert Victor, Duke of Clarence, d. in 1892, and his brother reigned as George V. A.'s eldest brother became Frederick VIII. of Denmark; the second, Prince William, became King 'George' of Greece at the age of 18 (assassinated at Salonika 1913); the third, Valdemar, was an officer in the Dan. Navy. Her sister Dagmar married Alexander III. of Russia; and Thyra, the youngest, married Ernest Augustus, duke of Cumberland and titular king of Hanover. A. was much loved in England for her beauty and benevolence; and d. at Sandringham Nov. 20, 1925, in the sixteenth year of her widowhood. See Sir G. C. A. Arthur, *Queen Alexandra*, 1934.

**Alexandra Feodorovna** (1872-1918) (Alix Victoria Helen Louise Beatrice), last tsarina of Russia, b. June 6, 1872, at Darmstadt, youngest child but one of Louis (IV.), grand duke of Hesse. Her

mother (Alice, daughter of Queen Victoria) dying when A. F. was 6, A. F. was brought up partly in England. She married Tsar Nicholas II. (*q.v.*) Nov. 27, 1894. On July 30, 1904, an heir was born: Alexis; whose delicate health occasioned the subjection of A. F. to Rasputin (*q.v.*). During the First World War she influenced Nicholas's policy for the worse. When the empire fell, she shared his captivity. Slaughtered with him at Ekaterinburg (Sverdlovsk) July 17, 1918.

**Alexandria Land**, see NORTHERN TERRITORY.

**Alexandra Park**, a place of recreation in N. London. It contains the A. Palace, and was opened in 1863. The present building was erected in 1873 as the first was destroyed by fire. Ger. internees were employed there during the First World War. After the war attempts were made to renovate and utilise the palace, and the organ now installed there is one of the finest in England. The N.E. tower of the palace has been removed to make way for a television mast installed by the B.B.C., who have taken over all this corner of the building for television broadcasting. The A.P. racecourse adjoins the grounds below the front terrace.

**Alexandre, Aaron** (c. 1766-1850), a noted Bavarian chess-player. He visited nearly all the European caps, and was the author of an *Encyclopædia of Chess* and a book of *Chess Problems*.

**Alexandrescu, Grigore** (1812-85), poet of Rumania. He took an active interest in the politics of his country. His poems were collected and pub. under the title of *Original Poems, Elegies, and Fables*. His attack on the gov. and the oppressors of the people brought about his confinement in a monastery, but in spite of the fact he pub. his famous poem entitled *The Year 1840*.

**Alexandretta**, or Iskanderun, a tn. of Asiatic Turkey. The sanjak of A. was formerly included in the dist. of Aleppo, N. Syria, but is now the vilayet of The Hatay. It owes its importance to its proximity to the Helian Pass. It is the main port for the region, and has an extensive trade in tobacco, silk, cereals, liquorice, and textiles. Its climate is insalubrious owing to the marshy ground and the absence of purifying winds. Towards the end of the First World War it was occupied by Brit. and Fr. troops. After the war the sanjak of A., in recognition of the special interests of the large proportion of Turks in its pop., was accorded a special administrative regime. But in 1936 a dispute arose between France (as mandatory of Syria) and Turkey respecting the position of the Turkish pop. in the sanjak of A. under the terms of the Franco-Syrian treaty, which the Turkish gov. held to be incompatible with the Franco-Turkish treaty of 1921. After reference to the League of Nations the two govts. in 1937, agreed to a settlement by which the sanjak should remain within the orbit of Syria but with full

internal autonomy. Later, Turkish troops entered the sanjak in pursuance of an agreement with France that equal forces of Fr. and Turkish troops should assure order during elections to the new Assembly, which met in 1938. The name of the sanjak was changed to The Hatay. On June 23, 1939, France agreed to the complete cession of the sanjak to Turkey in consideration of the conclusion of a Franco-Turkish pact of assistance, and the Fr. garrison was withdrawn a few days later. Pop. 25,000.

**Alexandria**, a tn. of Dumfries, Scotland. It owes its existence to the cotton, bleaching, and printing industries there carried on. Pop. 10,359.

**Alexandria**: 1. A city of Madison co., Indiana, U.S.A., about 46 m. N.E. of Indianapolis. Its products are chiefly agric. The manuf. of glassware is a very important industry. Pop. 4000. 2. A port and city of A. co., Virginia, U.S.A. It is accessible to the largest vessels, for the riv., which forms its harbour, though 100 m. from the mouth of the Potomac, is fully a m. wide. Pop. 33,500. 3. A city of Rapides Par., Louisiana, U.S.A. Pop. 27,000.

**Alexandria**, the chief seaport of Egypt. It was founded in 332 B.C. by Alexander the Great, and was for over 1000 years the cap. of the country. It is situated on a strip of land separating the Mediterranean from Lake Marcotis.

*The Cap. City.*—In ant. times A. was divided into 3 dists. These contained respectively the Jews, in the N.E.; the Egyptians in the W., a dist. called Rhacotis; and the Gks., who lived in that part of the tn. called Bruchelion. This was by far the most beautiful part of the city. Originally the tn. was built upon a mole called Heptastadium, which joined the isle of Pharos to the mainland. Since then sedimentary deposits have added considerably to the width of the mole. A. was erected after a plan executed by the architect Democritus. It was intersected by 2 broad roads, running at right angles. The buildings in the Bruchelion quarter contained the royal palaces of Ptolemies, the Great Theatre, which was afterwards utilised as a fortress by Caesar during the siege after the battle of Pharsalus, the Poseicleion, or temple to the god of the sea, the Timonium built by Antony, the Emporium or Exchange, the temple Caesareum, now lying underneath the new sea-wall, the Gymnasium, the Palestra, the Mausoleum of Alexander, and the Museum and Library. The Necropolis lay to the W. A feature of the tn. was the number of subterranean cisterns running along the spaces under the houses and capable of holding a supply of water sufficient to last the whole pop. a year. At the height of its prosperity it contained, according to Diodorus, approximately 300,000 free citizens, while it is probable that a larger number still represents the number of slaves. The actual development of A., and the very high place it held among the most magnificent cities of the world, were due

to the interest and activities of the Ptolemies, who aimed at and succeeded in making it surpass in majestic beauty only by Rome and Antioch. Placed as it was between the E. and W., it became a centre of commerce, to which position it owed its great commercial supremacy. In 30 B.C., on the death of Cleopatra, the last of the Ptolemies, it fell into the possession of the Romans. It was now at the zenith of its glory. A great centre of Hellenism, at the same time commercially prosperous to an extraordinary degree, and also the fountain of culture and intellect, A. can be said to have held at this time a position of unique and glorious splendour. For a long time it remained in the enviable position as the world's first port. During the reign of Caracalla it sank considerably in its commercial greatness, and the rise of Constantinople only served to hasten its fall. Meanwhile Christianity had been introduced, and quickly had made headway. By the end of the second century it had taken hold of a large number of the people. The subsequent struggle between Christianity and heathenism saw many bloody affrays; but Christianity eventually triumphed, and in 389 the Serapeum, the last seat of heathenism, was captured and used thenceforth as a Christian church. The decline of A. was now more rapid. Cairo was chosen by the Egyptian caliphs to be the cap. of Egypt; the passage round the Cape of Good Hope was discovered, together with the finding of America; such significant events as these proved factors of deleterious influence upon A. Its decay seemed imminent. In 1517 it fell into the hands of the Turks, and presented but a shadow of its former beauty. Those monumental triumphs of majestic architecture so long the just pride of the Gks. were now nearly all in ruins, and the number of its inhab. had fallen to the surprisingly low number of 6000. Compared with the former pop. of over 600,000 the change is made all the more startling.

Signs of progress, however, were presently visible under Mehemet Ali. Much of its lost ground was recovered, so that to-day, while it may never again present the imposing spectacle it once was, and though the dignity of its learning has faded, yet its commercial prosperity is rising gradually, and it is once more recognised as one of the most significant of Mediterranean ports. Notwithstanding the loss of trade incurred by the cutting of the Suez Canal, ample recompense was found in the consequent advance of Egypt's commerce. In 1882 Arabi Pasha incurred Brit. displeasure by his maltreatment of the Europeans during his rising, and a Brit. fleet was dispatched. The bombardment of A. followed, and it is a regrettable fact that of the few remaining emblems of antiquity most were utterly destroyed. This was not all. A few days later the tn. was sacked and a disastrous fire ravaged a large portion of it. Among the scanty objects of antiquity that re-

main are Pompey's Pillar (so called in error) and 2 obelisks called Cleopatra's Needles, one of which is on the Thames Embankment, while the other is in New York.

*The Modern City* is built partly upon the isthmus which developed from the original mole by means of silt deposits, and partly upon a T-shaped peninsula. The cape to the W. is Ras et-Tin, while the E. cape is Pharos or Kait Bey. The Mahmudiya canal, connecting A. with the Nile, runs at the S. of the tn., and by a series of locks enters the harbour. Its climate differs from that of the surrounding country. An almost incessant rain is experienced during the winter, while the summer is rendered temperate by sea breezes. The chief exports are cotton, grain, beans, rice, etc. The relics of antiquity are the so-called Pompey's Pillar, 88 ft. high, and the catacombs of Kom esh-Shuqafa and the contents of the Museum of Graeco-Rom. Antiquities. All traces of the bombardment, etc., in 1882 have disappeared and the tn. is again quite prosperous, but it suffered damage in frequent It. and Ger. air-raids in the Second World War. In 1937 the pop. numbered 682,000, of whom over 570,000 were Egyptians; the Europeans were chiefly: 40,000 Gks., 25,000 Its., 18,000 Brit., and 10,000 Fr. In the summer the Egyptian gov. and court and the diplomatic corps moved from Cairo to A.

**Alexandrian Codex**, a MS. of the O.T. and N.T., in Gk., now in the Brit. Museum. The MS. is in 4 vols., large quarto, the N.T. being the last vol. It is written on vellum, in double columns, in uncial or cap. letters, without spaces between the words, accents, or marks of aspiration. The letters are round and well formed, a few words are abbreviated, and the MS. is in fairly good condition. There has been much contention as to its date, but it is probable that it was about 450. In 1628 it was sent by Cyrillus Lucaris, patriarch of Alexandria and of Constantinople, to Charles I., and was placed in the Royal Library. In 1753 it was transferred with this library to the Brit. Museum. A facsimile of the O.T. was pub. by the Rev. H. Baber of the Brit. Museum (1816-28), and of the N.T. by Dr. Woide (1786), and a second ed. by Spohn.

**Alexandrian Library**, a collection of books formed by Ptolemy Soter, the first king of Egypt; and probably the largest which was made before the invention of printing. It is said to have been founded about 284 B.C., in consequence of the suggestions of Demetrius Phalerus, who had seen the public libraries at Athens. Demetrius was appointed superintendent of the new establishment, and busied himself diligently in collecting literature of all nations, Jewish, Chaldee, Persian, Ethiopian, Egyptian, etc., as well as Gk. and Lat. Eusebius says that at the death of Ptolemy Philadelphus there were 100,000 vols. in the library. It was situated in the quarter of Alexandria called Brucheion. Philadelphus purchased

earliest; and Callimachus, of whose works only a few hymns, epigrams, and elegies remain, was the greatest. Amongst the lyric poets were Phaeocles, Hermesianax, Alexander of Aetolia, and Lycophron. Epigrams were also written by the Alexandrians, and Timon the philosopher was the author of 3 books of lampoons. Tragedy, too, played an important part, but none of the works of the 7 great dramatists who were known as the Alexandrian Pleiades has been preserved. Theocritus was a celebrated bucolic poet, and his *Idylls*, which are pictures of the country life of the ordinary people, greatly influenced Rom. poets, especially Virgil. Besides the poets there were the critics and grammarians of the A. S., who gave to the world the anc. Gk. writings in a form perfectly intelligible, for they devoted their time to criticism, the explanation of words, and the arrangement of the texts. Amongst these great critics were Zenodotus of Ephesus, Aristophanes of Byzantium, Aristarchus of Samothrace, Alexander of Aetolia, Lycophron, Callimachus, and Eratosthenes. Mathematics, astronomy, geography, and medicine were also treated by the A. S. Of the mathematical school Euclid was the founder; and his pupils included Archimedes, whose inventions and discoveries were very important; Apollonius of Perga, the author of a work on conic sections; Hipparchus, the celebrated astronomer, whose catalogue of the stars is preserved by Ptolemy; and Eratosthenes, who wrote on astronomy, geometry, geography, and history.

*The School of Philosophy.*—The members of this school brought together the philosophies of the E. and the W., and the Jewish notions of religion were very much influenced by Gk. ideas. On this subject the reader is advised to consult Philo Judeus. The founder of this Neo-Platonic system (see NEO-PLATONISTS) was Plotinus, who was born about A.D. 203, and whose writings his disciple Porphyry rendered in their present form. Another celebrated teacher of this system was Proclus, sev. of whose works are still extant. The Gnostics (*q.v.*) were a sect who endeavoured to unite Christian and E. ideas. Clement of Alexandria and Origen showed leanings towards that heresy. Philo Judeus made attempts to reconcile the Jewish scriptures with the doctrines of the Platonic philosophy and sev. of his works have been handed down to us.

**Alexandrina, Lake**, a shallow lake in S. Australia, near the mouth of the Murray R.

**Alexandrine Liturgy**, known also as the Liturgy of St. Mark, because he is said to have arranged it for the use of Christians in Egypt.

**Alexandrine Mosaic**, decorative work said to have been invented by Alexander Severus, Emperor of Rome (A.D. 208–235), and named after him. It was employed in the embellishment of friezes and panels. In the mosaic are embedded precious stones and jewels.

**Alexandrine Verse**, a species of verse much employed by Fr. poets, especially in poetry of the heroic or epic order. Each line in the A. consists of 12 syllables, and strictly speaking, and following the Fr. model, it should be divided into 2 hemistichs, the sixth syllable ending a word. The name A. would appear to be derived from an old Fr. poem about Alexander the Great, written in this metre towards the end of the twelfth century. Others attribute the name to Alexandre de Bernay, joint author of the above. Generally the A. line is used in rhymed couplets, and was so employed by Edmund Spenser to finish off each of his stanzas, but it has also been used by itself alone as the concluding line, and sometimes in the body, of Eng. 10-syllabled verse. Pope rallied against it in his well-known couplet:

'A needless Alexandrine ends the song,  
That, like a wounded snake, drags its  
slow length along.'

But for all that he employed it not infrequently. The longest and best poem in our language written wholly in As. is Drayton's *Polyolbion*.

**Alexandriya**, a tn. in the Ukrainian, S.S.R., Russia, situated on the Ingules, an affluent of the Dnieper. The dist. is very rich in iron ore.

**Alexandropol**, see LENINAKHAN.

**Alexandrovsk**, (Ukraine, see ZAPOROZHE.

**Alexei Mikhailovitch** (1648–76), a Russian tsar of the house of the Romanovs. He was the father of Peter the Great, whom he had by his second wife. His reign was harassed in 1648 by an insurrection. He undertook 2 campaigns against the Poles, and met with considerable success. During his reign he introduced many violently radical changes, both legislative and religious. Nonconformity with the latter gave rise to dissensions.

**Alexei Petrovitch** (1690–1718), the eldest son of Peter the Great, b. at Moscow. His openly expressed opposition to the reforms introduced by his father, Peter the Great, caused him to be excluded from the line of succession. He entered a monastery, but shortly afterwards escaped. He was sentenced to death, but later was pardoned. The strain of his trial caused his death in prison. His son, Peter II., succeeded Peter the Great.

**Alexeiev, Mikhail Vassilievitch** (1857–1918), appointed chief of staff in 1915 by the Grand Duke Nicholas Nikolaievich. A. extricated all the N. armies from the Ger. trap then closing upon them, and when Vilna was evacuated (Sept. 1915) he marched them in safety across Russia along the route of Napoleon's invaders in 1812. He was a fine administrator and made great efforts to maintain discipline in the army. In this connection he did effective work in securing more efficient control over raw peasant reserves by the Russian War Office, thereby preventing them from falling in thousands into the hands of the enemy.

Amidst all the intrigues of a pro-Ger. court and the wild policy of disloyal demagogues A. stands out as a great Russian patriot and soldier. Though dismissed by the Soviet under Kerensky for his opposition to the 'no annexation, no indemnity' clause in the note to the Allies of the Provisional Russian Gov. of Miliukov (1917), and replaced by Brussilov, he was the real brain of the Russian command in staff work, and it was through his remarkable talents as a staff officer that the new under Gens. Brussilov and Ruzsky won a series of brilliant victories against the Austrians, capturing successively positions of great strength at Halicz, Brzchany, and Tarnopol, storming Lemberg (Sept. 1914), reducing the fortress of Przemyśl (Mar. 1915); previously he had traversed the Carpathians to the very gates of Cracow. He was afterwards restored to the chief command, but soon afterwards, when the Soviet became all-powerful, went into retirement to organise the anti-Bolshevik armies, but in Oct. of the same year he d. of pneumonia.

**Alexiad**, a life of the Byzantine emperor, Alexius Comnenus, written by his daughter, Anna Comnena, and her husband, Nicephorus Bryennius. The work is 1 of the treasures of the Byzantine collection, and consists of 15 books written in modern Gk. The substance of the work is the hist. of the first crusade and the defence of Alexius against the charges of his enemies. From this life Scott drew his material for his novel, *Count Robert of Paris*.

**Alexinatz**, a tn. of Yugoslavia on the Moravitz. Pop. 6,000.

**Alexis Angelus**, name of Alexis III. (1195-1203) and Alexis IV. (1203-4), Byzantine emperors. Under Alexis III. Constantinople was taken by the Venetian and Fr. crusaders.

**Alexis, Willibald**, the pseudonym of the Ger. novelist, Georg Wilhelm Heinrich Haring (1798-1871), who was b. at Breslau. The work that brought him into prominence is a literary curiosity. It was an historical romance entitled *Walladmor* (1823), pub. as being a work of Sir Walter Scott. De Quincey trans. the novel into Eng., and Scott himself approved of it. Two more romances were pub. under the same pretence, *Die Geächelten* and *Schloss Avalon*, 1827. His other noted works are *Cabanis*, 1832; *Der Falsche Woldemar*, 1842; *Haas Jürgen* and *Hans Jochem*, 1846-48. See H. F. Kohler, '*Walladmor*' von Willibald Alexis, 1915.

**Alexius Comnenus** (1048-1118), a ruler of the Byzantine empire. He proved himself the most able of these rulers. His military prowess and the deep affection with which his soldiers regarded him alone delayed the inevitable breakup of the empire. He reigned for 37 years. See the various *Histories of the Crusades*; the collection of the *Byzantine Historians*; and particularly the *History* of Anna Comnena.

**Alexiyevka**, a tn. in the Voronezh region of the R.S.F.S.R. The tn. is situated

on the Tikhaya-Sosna, an affluent of the Don. Sunflowers are cultivated in the dist. Pop. about 20,000.

**Alfa**, a variety of sparto grass indigenous to N. Africa. It attains a height of 3 to 4 ft., and is used largely in the manuf. of paper. It is sometimes called halfa.

**Alfadir**, i.e. all-father, a common appellation of Odín in the Scandinavian mythology.

**Alfalfa**, the Sp. name for *Medicago sativa* or lucerne, called also in England medic, or purple medic, and, in the U.S.A., Sp. clover, Fr. clover, and Brazilian clover. The plant has a wide distribution in the Old World, and was introduced into America by the Sp. pioneers. It is now grown in the prairie provs. of Canada. The plant is cultivated for forage. It has small purple flowers resembling the flowers of the cultivated pea.

**Alfarabi**, an oriental philosopher who was b. at Farab by the Oxus. He studied at Bagdad and afterwards travelled. Ultimately he settled at Bagdad and lived a life marked by simplicity and retirement. The caliph honoured him and gave him a pension. He d. in 950. He wrote prodigiously upon nearly every scientific subject known. He is famous as the first writer to attempt an encyclopedia. The MS. of this first encyclopedia is in the Escorial library.

**Al-farghani**, see ALFRAGANIUS.

**Alfieri, Vittorio** (1749-1803), eminent It. dramatist: b. at Piedmont, his early education was imperfect. Succeeding to a great fortune, he travelled in a profitless manner, becoming enamoured more than once of ladies already married. The most famous of these was the wife of Charles Edward Stuart, with whom, after her unhappy husband's death, he lived. In order to forget a passionate grief that had been caused by a former love disappointment he took up literature. Among his plays, which appear to have been inspired more by political emotions than artistic promptings, are the *Abele*, the most successful; *Cleopatra*; *Filippo*; *Polinice*; *Saul*; *Agide*; *Bruto*. He also wrote a number of satires and sonnets, and a masterly autobiography.

**Alfold**, also called Pusztas, a great plain of mid Hungary stretching from the Danube to the Carpathians. The plain is rich in fruit and pasturage.

**Alfonsine Tables**, see ALPHONSINE TABLES.

**Alfonso** (the name of 5 kings of Aragon). **Alfonso I.** (1104-34), married to the widow of Raymond of Burgundy in order to unite the 2 great Christian states against the Moors. His violent quarrels with her led to civil war. He gained the title of the Battler from his great battles with the Moors.

**Alfonso II.** (1162-96), christened Ramon, adopted this name in order to please the Aragonese. He was ruler of Aragon and ter. in S.E. France. Held Leon in the work of reconquest.

**Alfonso III.** (1285-91), a weak king who could not hold his nobles in check.

*Alfonso IV.* (1327-36), a weak king whose reign is colourless.

*Alfonso V.*, the Magnanimous (1416-1458) king of Aragon, Sicily, and Naples. A patron of men of letters and one of the conspicuous figures in the Renaissance. Had a great liking for the classics, and his court was the recognised centre for wandering scholars.

*Alfonso* (name of 11 kings of Leon and Castile). Of the first 2 kings of this name very little is known. They ruled between the years 740 and 840. To the first the title of 'the Catholic' was given; to the second, his grandson, the name 'the Chaste.' Later legend purports to tell us much more than we can gather from contemporary or reputable records.

Of the next 3 As. we are also able to gather very little, but during their period (866-1028) we get the beginning of organised resistance to the Moorish invaders, and also the beginning of an organised Aragon. Especially can this be noted of A. V. (999-1028).

*Alfonso VI.* (1065-1109), a leader of organised resistance to the Moors. He brought Spain nearer the papacy, and endeavoured, by spreading Fr. influence, to civilise Spain.

*Alfonso VII.* (1126-57), 'the king of the men of two religions.' He strove after the unity of Spain and protected the Moors. He was killed in trying to check a Moorish rising.

*Alfonso VIII.* (1158-1214), king of Castile and leader of the Christian coalition that broke the power of the Moors. He married a daughter of Henry II. of England.

*Alfonso IX.* (1188-1230), king of Leon. The only important feature of his reign is the quarrels which his marriage brought him into with the pope.

*Alfonso X.* (1252-84) 'El Sabio' (the Wise), a learned king, who gave great encouragement to the study of astronomy. His policy, however, led to frequent quarrels with his nobles, and his attempt to obtain the empire led to much severe and unpopular taxation.

*Alfonso XI.* (1312-50), the Avenger, is noted chiefly for the severe manner in which he repressed his rebellious nobles, and for the defeat of the last Moorish invasion from Africa.

*Alfonso* (name of 6 kings of Portugal).

*Alfonso I.* (1112-85) succeeded in establishing the independence of Portugal, which up to this time was a dependency of Leon. A great warrior and a man of gigantic stature, he distinguished himself in many battles against the Moors.

*Alfonso II.* (1211-23), noted chiefly for his endeavours to weaken the power of the clergy, for which he was excommunicated, and for the code of law which he introduced.

*Alfonso III.* (1248-79) His reign was taken up principally in fighting the Moors.

*Alfonso IV.* (1325-57). Wars with Castile and the Moors occupied most of his reign. Civil war broke out between himself and his son Pedro as a result of

the barbarous murder of Inez de Castro (Pedro's wife).

*Alfonso V.* (1438-81), usually called 'Africano,' a name which he gained for himself by invading the territories of the Moors in Africa.

*Alfonso VI.* (1656-67). Forced by his vices to abdicate in 1667, he retired to Terceira, where he d. in 1675.

*Alfonso XII.*, king of Spain (1875-1885) was b. Nov. 28, 1857. In 1868 he accompanied his mother into exile, and in 1870 she abdicated in his favour. While continuing his education at Sandhurst in 1874 he issued a manifesto proclaiming himself the only representative of the Sp. monarchy. In the following year he entered Spain, being received everywhere with enthusiasm. He married his cousin, the Princess Maria de las Mercedes, and on her death an Austrian princess, Maria Christina. He d. of phthisis in Nov. 1885, having shown himself in his short reign to be a tactful and fearless sovereign.

*Alfonso XIII.* (1886-1941), king of Spain, son of A. XII., b. posthumously, May 17. His mother, Queen Maria Christina, formerly an Austrian arch-duchess, acted as regent during his minority. He assumed control of the gov. in 1902. In 1906 he married Princess Victoria Eugenie of Battenberg, niece of Edward VII., and narrowly escaped assassination on the day of his marriage. An heir to the throne, named A. (Count Covadonga) was b. in May 1907 and d. in 1938. There are 3 other sons and 2 daughters. During A.'s minority, Spain lost its colonial empire as a result of war with the U.S.A. Later features were its neutrality during the First World War, and its campaign in Morocco—which created trouble at home that led to the suspension of the constitution in 1923. His assassination was attempted sev. times. In 1930-31, following the death of the dictator, Primo de Rivera, the Republican party rapidly gained in political influence until, in Apr. 1931, they carried the day at the polls. To avert the danger of civil war A. left the country, though he refused to renounce his monarchical rights. He and the royal family were allowed by the Republican Gov. to leave Spain unmolested, and A. settled in Rome. Later, he formally abdicated. Of his 4 sons, the 2 eldest, the Prince of the Asturias and the Infante Don Jaime, renounced their rights to the succession in 1933, the youngest, the Infante Don Gonzalo, was killed in a motor accident in 1934, and the third son, Don Juan, was named in 1941, by A., as successor to the Sp. crown 'when Spain judges it opportune.' See S. Erskine, *Twenty-nine Years: the Reign of King Alfonso XIII. of Spain, 1931; Don Alfonso XIII.: a Study of Monarchy*, by Princess Pilar of Bavaria and D. Chapman-Huston, 1931.

*Alford*, a vil. in Aberdeenshire where the Covenanters were defeated by Montrose, 1645.

*Alford*, a mkt. tn. 22 m. N.E. of Boston, Lincolnshire; pop. 2500.

**Alford, Dean Henry** (1810-71), Eng. divine and scholar. He showed early promise of extraordinary abilities, for at the age of 10 he had written sev. Lat. odes and a hist. of the Jews. He entered Cambridge in 1829. Shortly afterwards he issued his first vol., entitled *Poems and Poetical Fragments. The School of the Heart and other Poems* followed. His great work, his *Greek Testament* in 4 vols., was pub. between 1849 and 1861. In 1841 he became vicar of Wymeswold in Leicestershire. His scholarly and erudite *Chapters on the Greek Poets* now appeared. In 1857 he was ordained dean of Canterbury. Among the many hymns he wrote is 'Come, ye thankful people, come.'

**Alford**, see MAISONS-ALFORT.

**Alfraganus, or Al-farghani**, an Arabian astronomer who fl. in the early part of the ninth century. He was the first among the Arabian astronomers to enumerate the small stellar groups, and he wrote a treatise on the elements of astronomy.

**Alfred the Great** (871-900) was b. at Wantage, in Berkshire: the exact date of his birth is not known, and authorities differ between the years 843 and 849. The generally accepted date, however, is the year 849. In 853 and in 855 he was taken to Rome, where, on his first pilgrimage, he was hallowed by the pope, Leo IV. Even prior to his accession to the throne he was in continual conflict with the Danes, and he assisted his brother Ethelred right down to his death. He was the youngest son of Ethelwulf, and succeeded on the death of his elder brother. The first few years of his reign were constantly occupied in fighting the Danes under their great leader Guthrun. For 7 years A. fought, bargained, and treated with the Danes in a vain endeavour to give the wearied country a rest from the constant war and bloodshed which she had endured. In 878 A. was driven into the woods and swamps of Somerset, and remained in hiding at Athelney until he found himself strong enough to burst forth upon the Danes. At the battle of Edington in Wiltshire in 878, he utterly defeated the Dan. invaders after an obstinate and prolonged struggle, driving them back to their fortifications at Chippenham. A short siege followed, at the end of which the treaty usually known as the treaty of Wedmore was signed, 878. The Danes became Christians, the country was divided up, N. and E. of a line drawn roughly from Chester to London became the Danelagh, S. and W. remained Wessex. The victory at Edington arrested the flowing tide of Dan. conquest and brought nearer a united England. For the greater part of the rest of his reign A. was able to attend to the crying needs of the country. The army was reorganised, a navy recognised as an absolute necessity, justice was reformed, education received attention. By means of his navy A. was able to attack the Danes on the sea and in their strongholds, but this policy of a strong

navy was not followed closely enough by his successors. To his court A. invited learned men from all parts of Europe, men whose learning would be of use to him in his great scheme for the education of the people of England. Chief amongst these men we may mention Asser, Werfrith, and Plegmund. From his reign dates the beginning of Eng. prose writings, to which he by his own toil and the work of his school added not a little. The epitome of Orosius, the *Consolation of Boethius*, the *Pastoral Care* of Gregory, and Bede's *Ecclesiastical History* are all translations by A. himself. He issued also a code of laws, compiled on the lines of the code of Ina and Offa. The latter part of his reign was again taken up in fighting the Danes under Hasten, and desultory fighting seems to have taken place right up to his death in the year 900. See Stubbs, *Alfred the Great*, 1901.

**Alfred**: 1. a vil. in Alleghany co., New York, U.S.A. On Pine Hill is A. Univ., associated with which is the New York State School of Clay-working and Ceramics. There is now also a State School of Agriculture in connection with the univ. 2. A co. of S. Australia on the E. border, bounded on the N. by the Murray R.

**Alfred of Beverley**, see ALURED.

**Alfred Ernest Albert**, duke of Saxe-Coburg and Gotha, and duke of Edinburgh (1844-1900), was the second son of Queen Victoria. On the deposition of Otho he was unanimously invited by the Gks. to become their king, but political difficulties of long standing rendered it impossible. Was rear-admiral in 1878, and commander-in-chief at Devonport (1890-93). He succeeded to the duchy of Saxe-Coburg and Gotha in 1893.

**Alfreton**, a tn. in Derbyshire noted as a mkt. centre. It is 14 m. from Derby. The chief industry is coal mining, but there are hosiery factories, and earthenware is manufactured. Pop. 21,000

**Alfura Sea**, see ARAFURA.

**Alfuras, or Harafuras**, the aboriginal inhab. of Celebes, but inhabiting also Buru, Ceram and New Guinea, and said to be of Malay extraction.

**Algæ** (Lat. *alga*, seaweed), with the fungi, form the large group of the vegetable kingdom known as the Thallophyta; they have many characteristics in common, and the lichens are a curious link between them, as they are partly algal and partly fungoid in construction. While, however, A. possess chlorophyll—sometimes masked by other colours—the fungi are devoid of this pigment. Both A. and fungi have as their body a *thallus* (hence *Thallophyta*), which is always a comparatively simple structure, never differentiated into root, stem, and leaves. According to the colouring matter they contain, the A. are divided into green A. or Chlorophyceæ, brown A. or Phæophyceæ, red A. or Rhodophyceæ (sometimes Floridæ), blue-green A. or Cyanophyceæ, and Diatoms (Diatomaceæ), yellowish brown in colour.

Plants in this group reproduce either sexually or asexually, in the latter case frequently by means of ciliated spores which are able to move in the water. In the sexual reproduction the gametes sometimes unite in isogamous conjugation, i.e., with similar gametes; but others have heterogamous conjugation, when a male unites with a female gamete to form the new plant.

The *Pleurococcus* is a well-known green alga which occurs as a unicellular plant on damp wood. It multiplies by cell-division, and often many cells will be found together; it also reproduces by biciliate spores and isogamously. *Spirogyra* is usually found in slimy masses in ponds and lakes, each plant consisting

GROUP OF DIATOMS

of sev. cells united to form a filament, each cell being complete in itself and the filament having no attachment and showing no distinction of base and apex. Such a filamentous alga was said, in the time of Linnaeus, to belong to the genus *Confervae*, or jointed A., but this is too wide a name for present-day discoveries. The *Spirogyra* conjugates in an isogamous manner; 2 neighbouring filaments send out processes from their cells which fuse on meeting, and form a tube through which the contents of one cell, contracted into a gamete, pass over into the other cell and there unite with a similar gamete. The *Edogonium* is a filamentous green alga which grows attached to stones in ponds. It reproduces by means of a multiciliate spore which moves in the water and finally attaches itself to a stone and forms another filament, or it reproduces sexually by means of an oogonium and antheridium. These 2 sexual organs may occur on the same filament, or one kind may be peculiar to a single filament. The antheridium, which is formed by cell-division, produces 2 spermatozooids

which have a large nucleus and many cilia. The oogonium forms a rounded protoplasmic ovum, and the spermatozoid swims down a passage to the ovum; the resulting oospore gives rise usually to 4 zoospores with cilia, and these break free, swim about, and finally form a new plant.

From the 3 examples of the Chlorophyceae given above it will be seen that the green A. vary greatly both in structure and as regards their reproductive processes. Other well-known types, such as the *Ulothrix* found in running water, the *Faucheria* common to damp earth and the soil of potted ferns and other plants, and the *Chlamydomonas* found in ditches and ponds, show different structures again. The Phaeophyceae and Rhodophyceae consist nearly entirely of seaweeds (q.v.), and the Cyanophyceae are regarded as doubtful A.

The *Cyanophyceae* consist of very simple plants growing in both fresh and sea water. Neither nucleus nor sexual reproduction has been observed in connection with them. They reproduce by means of spores or by div. of a filament at a cell called a *heterocyst*, i.e. a large cell which contains food material.

The Diatoms are most important constituents of the plankton, i.e. the surface life of both fresh and salt water, where they form the final link in the food chains of fish. Diatoms are remarkable in possessing a siliceous external skeleton, often beautifully ornamented, and composed of 2 halves, which fit together like a lid on a pill box. The fossilised skeletons form deposits of kieselguhr, which is used as an absorbent in the manuf. of dynamite. See D. H. Scott or F. T. Brooks, *Structural Botany*, part II., 1932; F. Wille, *Freshwater Algae*, 1887; F. Oltmanns, *Morphologie und Biologie der Algen*, 1904-5, 1922-23; C. S. West and F. E. Fritsch, *British Freshwater Algae*, 1927; F. E. Fritsch, *Structure and Reproduction of the Algae*, 1935-45.

**Algardi, Alessandro** (1602-51), an It. sculptor and architect, was a pupil of Giulio Cesare Conventi. He first worked in Mantua, but afterwards went to Rome, where he executed 2 statues in stucco for the Capella Bonaiuti in the church of San Silvestro. His prin. works are: the colossal group in marble, representing the decapitation of Saint Paul, for the church of the Padri Bernabiti at Bologna; the monument of Leo XI., and 'Attila checked by Saint Leo,' in St. Peter's; and the bronze statue of Innocent X.

**Algaroba, or Algarroba** (from Arabic *al*, the, and *kharrub*, carob-tree, or *Algarrobo*, a tn. in Andalusia), the carob-tree, *Ceratonia siliqua* (q.v.) and bean; also certain S. Amer. species of *Prosopis*, of the sub-order Mimoseae. known as the mesquite-tree.

**Algarotti, Francesco, Count** (1712-64), an It. philosopher and writer on art. He was educated at Rome and Bologna. He became acquainted with Voltaire in Paris, and the relationship assumed a long friendship. He now produced in

*Parla Newtonianismo per le donne*, a work on optics. In 1740 he was made a count of Prussia by Frederick the Great.

**Algarve**, the smallest and most southerly prov. of Portugal. Till 1253 it was in the possession of the Moors. Its area is 1937 sq. m.; its pop. 295,000. Fruit and wine are abundantly produced. The chief industries of the people are fishing and salt-making. Faro is the chief tn.

**Algebra**, a system of mathematical calculations where quantities are designated by symbols, usually letters of the alphabet. In ordinary A. the same operations are carried on as in arithmetic, but the symbols being capable of a more generalised and extended meaning than the figures used in arithmetic, it facilitates calculation where the numerical values are not known, or are inconveniently large or small, or where it is desirable to keep them in an analysed form. Addition is denoted by + and subtraction by -;  $a + b$  and  $a - b$  therefore indicate the addition and subtraction respectively of the quantities represented by  $a$  and  $b$ . The results may enter into subsequent calculations as  $(a + b)$  and  $(a - b)$ . Multiplication is denoted by  $\times$ , or by putting the symbols together, thus  $a \times b = ab$ ; division is denoted by  $\div$  or the use of the frac-

tional form, thus  $a \div b = \frac{a}{b}$ . Involution, or the multiplication of the same quantity, is shown by the use of small numbers, or indices; thus  $aaaa = a^4$ .

Therefore  $a^4 \times a^2 = a^6$ ;  $a^3 \div a^2 = \frac{1}{a}$  or  $a^{-1}$ .

Evolution is denoted by the use of radical signs or of fractional indices; thus the seventh root of  $a = \sqrt[7]{a}$  or  $a^{\frac{1}{7}}$ .

Negative quantities commonly enter into algebraic calculation. Thus if the value of a symbol be represented by the distance in a given direction of a point from a fixed point, the corresponding negative symbol represents an equal extension in the opposite direction. Unreal quantities, such as the square root of a negative quantity, can also be symbolised and used in A.

A. was probably known in a rudimentary form to the anc. Egyptians, but the earliest western work on the subject was written by Diophantus of Alexandria about A.D. 350. The Hindus had developed A., however, to a point far beyond the achievements of Diophantus. From them the Arabs brought the system to the W., and Mohammed ben Musa, c. A.D. 820, wrote a work entitled *Al-jabr wa'l-muqābala*, from which the word 'algebra' has been derived. In 1202, an It. merchant, Leonardo of Pisa, reintroduced the study of A. into Europe, where it had declined since the fall of the Rom. empire. The solution of cubic equations and bi-quadratic equations was accomplished by the sixteenth century, and in the seventeenth Franciscus Vieta used symbols for known quantities as well as unknown, and introduced such terms as *affirmative*,

*negative*, and *coefficient*. Descartes, the famous Fr. philosopher, connected A. with geometry in 1637, and did much to extend the theory of equations. The discovery of logarithms by Napier and of the calculus by Newton and Leibniz, and the development of differential equations by Gauss and Riemann prepared the way for Einstein's theory of relativity, and for a modern higher A. which has proved to be the tool and to some extent the inspiration of recent research in the fields of atomic energy and radio.

**Algeciras**, a Sp. tn. in the prov. of Cadiz, situated on the bay of Gibraltar. Charcoal and tanned leather are extensively produced. The tn. is noted for its oranges and bullfights, but is chiefly memorable for the conference of the powers held there in 1906. This arose out of the unsettled state of Morocco, due to the deposition of Abd-el-Aziz by his brother, Mulai Hafid, who succeeded him as sultan. In the agreement of Algeciras, signed on Apr. 7, the powers entrusted France and Spain with the duty of creating a gendarmerie and pacifying the country. The Agadir incident, which during 1911 taxed the resources of European diplomacy, arose from what was alleged to be a practical repudiation by Germany of the Algeciras agreement. In the Sp. Civil war, 1936-39, it was bombarded by republican war-ships, Aug. 1936. Pop. about 13,000.

**Alger**, Russell Alexander (1836-1907), Amer. soldier and politician, b. in Medina co., Ohio. At the outbreak of the Civil war he enlisted in a cavalry regiment and was distinguished in the Gettysburg campaign. He was secretary of war under McKinley, and was criticised for extravagance; he replied in his book, *The Spanish-American War* (1901). Was elected senator 1903.

**Algeria**, a country of N. Africa and a Fr. possession. It lies between  $4^{\circ} 36'$  W. to  $6^{\circ} 16'$  E. long.;  $37^{\circ} 6'$  N. to an undefined S. limit, about  $30^{\circ}$  N. Its boundaries are, on the N. the Mediterranean, on the W. Morocco, on the S. the Sahara, and on the E. Tunis. The former political divs. of the country were three, Oran on the W., Algiers in the centre, and Constantine in the E. but the colony of A. is now organised in 2 great divs., N. A., 80,000 sq. m. in area, and S. A., 142,000 sq. m. N. A. comprises the Civil Ter. and the Territoire de Commandement, but the latter is rapidly becoming merged in the former. It contains 17 arrons., 276 coms., and 76 mixed coms. in the Civil Ter. and 2 mixed coms. in the military ter. In S. A. are the 4 ters. of Ain-Sefra, Ghardaia, Tuggurt, and the Sahara oases, organised under a decree of 1905. By a law passed in 1919 the status of Fr. citizens was given to natives over 25 years of age and monogamous, who are farmers or property owners, or who are not illiterate or who served in the First World War. The 3 depts. of A.—Oran, Algiers, and Constantine—form an integral part of France, under a governor-general.

The physical features of A. divide

the country into 3 divs., viz. in the N. the Tell, consisting of mt. masses divided here and there by deep and fertile valleys; in the middle a region of steppes, a mountainous table-land broken at intervals by brackish lakes, called shotts; in the S. is the Algerian Sahara. The Tell contains the following mt. chains, collectively called the Coast Mts., but separately comprising the Blidah, Jurjura, and Little Khedija. Parallel to these are the Middle Atlas Mts. The Tell is the most populous region and is on the average 47 m. broad. The steppe, or middle region, possesses the largest streams, which empty themselves in the Mediterranean, through gaps in the Coast Mts. They are of no available value, being choked and considerably diminished in size during the summer. In irrigation, however, they are of more value.

The climate of A. is generally warm, though the varying altitudes cause a wide range of temp. The coast enjoys a very mild climate. The rainy season is prolonged over a period extending from Dec. to Mar. From May to Oct. a hot, dry climate is experienced, rendered very extreme by the *sirocco*, a wind that proves a great affliction, both on account of its great heat and of the fine sand it carries. During the day the temp. is very different from that felt at night. Generally the climate is healthy, and many improvements in the shape of irrigation, the draining of Lake Hallula, and the planting of forests conduce to more salubrious conditions than naturally would be found.

Agriculture is an important activity and there are sev. agric. banks supported partly by gov. funds. The greater part of the State lands have now been appropriated to colonists, the chief crops raised being wheat, especially in Tell, and most of the ordinary cereals and root crops. In the centre of the country, or the old prov. of Algiers, fruit and vegetables are cultivated extensively, and tobacco, flax, and cotton are also important products. Sericulture, which is subsidised by the Gov., is in an experimental stage. The chief fruits are orange, lemon, date, banana, almond, olive, fig, pomegranate, and all are grown in abundance, largely on account of the boring of artesian wells, which has made it easy for fruit-bearing trees to flourish. The grape is also cultivated, and the wine yield is now nearly 300,000,000 gallons a year. There is a fair amount of timber from the state forests for industrial purposes. These forests contain pine, oak, cedar, pistachio, carob, olive, and myrtle trees. The exports consist mainly of wine, wheat and other cereals, sheep and oxen, skins, fruits, phosphates, cork wood, asparto grass, iron and zinc ores. In the steppes inexhaustible supplies of alfalfa are grown. Iron, copper, zinc, quicksilver, and lead mines are worked.

The pop. is (1936) 7,235,000, of whom 987,000 were Europeans and 6,248,000 natives. Of the native inhab. the chief

are Arabs and Berbers, the former being found chiefly in the S., while the latter inhabit the dist. of Tell. A number of Moors, though not pure, are found on the coast. In the tns. negroes, originally slaves, fill the menial positions of labourers and servants. The natives are entirely Moslem, but Islam is found in its purity only among the Arabs. The Jews have for the past decade or more been regarded as Fr. citizens, and their rabbis, like the Protestant pastors, receive

E.A.A.

AN ARAB CAID, ALGERIA

gov. grants. The Rom. Catholic Church has an archbishop and 2 bishops. There is a univ. at Algiers attended by some 2000 students, and, besides the usual faculties, there are special schools for the fine arts, commerce, and agriculture. Some 50,000 native children attend the 550 Moslem schools, and there are also higher Moslem schools in the 3 chief tns., besides a system of primary and secondary schools. Before the Second World War the military force in A. and Tunis comprised the 19th Army area of 3 divs. Both Fr. residents and natives were obliged to serve; and the troops might be stationed in N. Africa or sent on colonial expeditions, but they belonged to the 'Metropolitan,' and not to the 'Colonial' Army. The strength of the army in A. and Tunis in 1938 was approximately 71,000, but, in 1939, in consequence of It. policy respecting Tunis, it was greatly increased.

Animal life in A. contains, among domestic animals, camels and sheep,

horses and mules. Sheep form the chief wealth of the Arabs. Wild animals are leopards, few, however, in number, jackals, hyenas, Algerian apes, boars, brown bears, and the red deer. periodic visits of locusts are responsible for great damage.

Algiers (pop. 264,000) is the cap. and prin. port. Oran (195,000) is the cap. of the dist. of that name, and a flourishing seaport. The inland cap. of Constantine (107,000) is a tn. of the same name. Other ports are: Bona (83,000), Philippeville (65,000), Blidah (40,000), Bougie (31,000). The inland tns. are: Tlemçen (52,000), Sidi-bel-Abbes (51,000), Mostaganem (37,000), Sétif (36,000), Mascara (32,000), and Biskra (8000), El Wad, Tuggurt, and Wargla. Commerce is confined to Fr. vessels. There is a large coasting trade. The chief exports are those of oxen, sheep, and horses. In 1939 there were 3000 m. of railroad open for traffic. Communication exists by rail between the frontiers of Morocco and Tunis, and between Algiers, Oran, and Constantine by branch lines, in the same system being many of the smaller tns. There is a regular air service between Oran and Morocco, and between Oran and Alicante in Spain.

From 1876, A., formerly under military despotism, became governed by a civil governor-general. The post was ornamental till 1900, when direct authority over customs and smaller matters was vested in his person. To-day all the services are under his administration, with the exception of those of the Treasury, Education, Justice, and Worship, which are under their respective ministries in Paris. The budget, which is prepared by the governor-general, is entirely separate from the Fr. national budget. The governor-general is assisted by a consultative council of 15 official members and a superior council of 60 members. A. sends 3 senators and 10 deputies to Paris. The whole legislation is conducted in the Fr. chambers, but such subjects as are not within this power are regulated by decree of the president of the republic.

*History.*—In early times the inhab. of A. comprised the Numidians in the E., and the Moors in the W. Under the Romans the cities of the W. formed practically colonies of Rome. About A.D. 440 the Vandals conquered A., and relapse into a condition of barbarity followed. Social advancement found impetus in the immigration of the Muslims. Algiers was built c. 935 by an Arab prince named Zelri, whose family held control of A. till 1148. The Almohades then took possession of it. In 1269 it was broken up into a number of small ters. There settled in A. in 1492 the Moors and Jews who had been expelled from Spain. In order to seek revenge, piracy was adopted and extensively followed. The Sp. monarch Ferdinand punished them by taking Algiers in 1509. At this time a prince of A. sought the aid of a famous Turkish pirate named Horuk Barbarossa. At

this point Turkish power in A. may be said to have begun, for, with the treachery necessary to his trade, Barbarossa slew the amir whom he had come to help, and massacring his followers, estab. himself sultan of A. A period of success attended him, but finally he was taken and beheaded. The monarchy was then given to his brother, who, under the protection of the Ottoman court, and with the aid of a Turkish army, drove out the Spaniards, installed a military absolutism and piracy. Various expeditions, under the Eng., Dutch, Fr., Spaniards, and Amers. successively, failed to check piracy till 1830, when Algiers was bombarded into submission by a Fr. fleet. Gen. Clausel now endeavoured to establish order. A fierce and intrepid opponent rose in the person of Abd-el-Kader, who organised a holy war to such advantage that the Fr. general was forced to send for reinforcements. Clausel's successor, Gen. Lamaremont, severely punished the Kabyles, a branch of the Berbers, and a different state of things now prevailed. Constantine was subdued and a governor-general appointed. In 1847 Abd-el-Kader surrendered. A series of insurrections of the Kabyles gave the Fr. considerable trouble, but order was ultimately restored. During the Franco-Prussian war it became necessary to withdraw most of the troops from A., and the opportunity was seized to revolt against the military despotism then in vogue. Since 1883, however, order has been preserved and the natives have maintained a friendly attitude. The hist. of A. has in every sphere been a chequered one and neither general success nor failure can be spoken of. France's Algerian problem has always been complicated by the fact that A. was distinguished from every other Fr. colony in that it has been looked on as 'the prolongation of France' and as a sort of training ground or experimental station for Fr. colonisation elsewhere. The actual success or failure of A. as a detailed experiment in colonisation is insignificant in comparison with the wider influences which the country has exercised on France and the other Fr. colonies in shaping policy. As regards general development, A. has led all the other Fr. colonies in obtaining economic enfranchisement; but this has been offset by the fact of the proximity of the motherland, with consequential control in all branches of economic activity.

On Nov. 8, 1912, a great expeditionary force from Great Britain and U.S.A., under the supreme command of Gen. Eisenhower (q.v.), landed at various ports in A. (and Fr. Morocco). The cease fire was sounded by the Fr. under orders from Adm. Darlan (q.v.) on Nov. 11. Darlan was assassinated soon afterwards. See also *under AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN.*

Consult S. H. Roberts, *History of French Colonial Policy (1870-1925)*, 2 vols., 1929; C. Southwirth, *The French Colonial Venture*, 1931; also W.

Sloane, *Greater France in Africa*, 1924 (descriptive); and W. B. Worsfold, *France in Tunis and Algeria* (descriptive) 1930.

**Alghero**, a seaport on the W. coast of Sardinia. Coral diving and fishing form its chief industries. A convict settlement is estab. there. Pop. (1901) 10,779.

**Algiers** (Fr. *Alger*), the cap. of Algeria. The name is derived from *Al-jezair*, an Arabic word meaning islands. To form a harbour, which after heavy expense provides good accommodation, 4 is. were joined together. A. is situated on the slopes of a hill at the summit of which is

is Port Elizabeth, the W. arm ends in Cape Recife.

**Algol**, or **Beta Persei**, a star of second magnitude. It is the best-known variable star, changing from magnitude 2.3 to 3.5 during a period of 68 hours 49 minutes owing to being eclipsed by a dark companion star. Vogel estimated that A. is 1.2 times the size of the sun, and its dark companion about the same size as the sun, and concludes that the distance between their 2 centres is 3,200,000 m. A. has a helium spectrum, and though Al-Sufi classified it as a red star in the tenth century, it is now a brilliant white.

ALGIERS, FROM THE MARINA

E.N.A.

a fortress called the Kasbah, which belonged in former days to the beys. The city consists of 2 parts, 1 of which is old, while the other is a marked contrast by reason of its modernity. The modern tn. possesses many splendid streets, and the general air is quite European. The public buildings of most importance are the Kasbah, the gov. offices, the palaces of the governor-general and archbishop, the Rom. Catholic cathedral, and the church of the Holy Trinity (the Eng. church). The tn. was founded in the tenth century, and from 1530, when the Turkish pirate Kheir-ed-Din expelled the Spaniards, until its conquest by France in 1830 it was a nest of piracy, exacting tribute from all the maritime nations. It is third in importance among Fr. seaports and a coaling station, and distributes the grain, esparto grass, wines, oil, etc., of Central Algeria. Sheltered from every wind, it is a favourite winter resort. In 1937 the pop. was 264,000, comprising a medley of all nationalities, the Europeans numbering 182,000.

**Algoa Bay**, a broad inlet of E. S. Africa. Bartholomew Diaz made it his second landing-place. In the S.W. angle

**Algoma**, an extensive dist. in the prov. of Ontario in the dominion of Canada on the N. shore of Lake Huron. The ter. has great mineral wealth, being rich in silver and copper. The Canadian Pacific railway passes through the dist.

**Algonkian**: 1. System, a geological term used to denote a stratum of rocks that overlies the basal system, and is succeeded by the series of the Palæozoic system. In the region of Lake Superior these rocks, consisting of quartz, limestone, sandstone, etc., contain very valuable iron and copper deposits. 2. Stock, a group of N. Amer. Indians embracing more tribes than any other group. In the group originally there were various tribal confederacies, though no real union of the tribes of the entire group existed. The A. tribes were the first N. Amer. Indians to come in contact with the Eng.

**Algonkin**, or **Algonquin**, a branch of the Algonkian family of Indians. The term was once applied to the Weskarini, a small tribe of the Ottawa valley, but later included the Nipissing and others. In the seventeenth century they were driven out of the St. Lawrence region by the Iroquois; some fled to Michigan, others

to the N.E., but returned. They are said to have numbered 4000 at the coming of the white man; to-day there are about 2000, mostly of mixed blood, restricted to reserves in E. Ontario and W. Quebec.

**Alguazil**, a Sp. title conferred upon judges in former times. The pure function of it has been lost, however, and any officer connected with the execution of justice bears the name. See A. R. Le Sage, *The Adventures of Gil Blas* and G. Borrow, *The Bible in Spain*.

**Alhakim I.**, emir of Cordova (796-822), drove the Franks beyond the Pyrenees. A. II., caliph of Cordova (961-976), won many victories over the Christians, and extended the influence of the Muslim creed.

**Al-Hakim-ibn-Otto**, fl. c. 760, an impostor who came as a prophet to Meshed the cap. of Khorassan. He always uttered his prophecies from under a veil, and was called Al Mokanna—the Veiled One. Moore has immortalised him in his poem *Mokanna, or the Veiled Prophet of Khorassan*.

**Alhama**, a tn. of S. Spain in the region of Granada. It derives its name from the baths which form to-day one of its few remaining monuments of antiquity. Byron trans. a ballad which describes the fall of the tn. entitled *Ay de mi, Alhama*. Pop. 4900.

**Alhambra**, an anc. fortress and palace of the Moorish monarchs of Granada. The name is derived from *Kal'at-al-hamra*, meaning the red castle, because of the colour of the bricks of which the walls were composed. It is surrounded by a massive wall, strengthened here and there by lofty towers. Of these, that called the Hall of the Ambassadors is the most famous. It was built during the years between 1218 and 1351, and although most of the artists are unknown, the painting of the interior has been traced to Yusuf I. The building is situated in a position of rare natural beauty. The most striking feature is a park of Eng. elms, brought there by Wellington in 1812. Scattered over most of the buildings is a species of lace-work which, when closely observed, bears, intricately worked into its design, transcriptions from the Koran, besides specimens of Arabic poetry. See Calvert's *Granada Present and Bygone*, 1908.

**Alhambra**, tn. in Los Angeles co., California, U.S.A. It stands at the entrance to the San Gabriel Valley and is virtually a residential suburb of Los Angeles. Near its tn. limits are the remains of the famous San Gabriel Mission founded in 1771. Pop. 30,000.

**Alhassan Ibn Mohammed Alwazzan**, see LEO AFRICANUS.

**Alhazen**, an Arabian mathematician of the eleventh century. He was b. at Basra, and d. in Cairo in 1038. In order to avoid a task the ease of which he had boasted to the caliph Hakim, he feigned madness till that monarch's death. He had a great reputation as an authority upon optics.

**Alhucemas**, a settlement on the bay

of that name, comprising 6 is., belonging to Sp. Morocco. Pop. 370.

**Ali, or Ali-ben-Abu-Talib** (600-61). the fourth of Mohammed's successors. Born at Mecca in 600, he married his cousin Fatima, daughter of Mohammed. In 650 he was made caliph. The young widow of Mohammed, however, rebelled, but the insurrection was crushed. In 661 A. was assassinated. His rule is noticeable in that 2 parties were formed in the state, a result which arose from the different supporters of the struggling parties in the rebellion. They were Shiites and Sunnites respectively. A. is looked upon as having possessed a reputation for wisdom. A. had by Fatima 3 sons, Hassan, Hussein, and Mohsen. Hassan succeeded his father for a short time in the gov., and with him terminated, according to the Arabic historians, the legitimate caliphate, i.e. the succession of those caliphs who had been appointed by the free choice of the faithful.

**Ali, Hyder**, see HAYDAR ALI.

**Ali Pasha** (1741-1822), the Lion, was b. in Albania. The early death of his father affected his mother so much that she became imbued with one idea, namely vengeance. To this idea her son was constantly educated. He showed very shortly that many of the wild impulses in his mother's temperament were inherited, for he murdered his brother in order to ensure his own position, and later, upon a charge of poisoning, killed his mother. He helped the Turks during the Austro-Russian war. A career of cool impudence, deliberate betrayal, and high daring ended in his being killed by Sultan Mahmud. He certainly extirpated the robbers and other criminals and rendered his country secure from all depredations but his own. He was a Muslim only by name: but he fully protected the Gks. and other Christians in the exercise of their religion, and allowed them to have schools and even a lyceum and library. He treated all nationalities alike: the Turks liked him least because he would not allow them to ill-use the rest of the people.

**Alias**, a name given to a second writ when the previous one has been impossible to deliver or failed in effect. The term, however, has been corrupted, and applies now to false names used by criminals.

**Alibi** (Lat. *alibi*, elsewhere), the plea of a person who, charged with a crime, alleges that he was elsewhere when the crime was committed, and thus could not be guilty.

**Alicante**: 1. A prov. in S.E. Spain, formed in 1833 of dists. of provs. of Valencia and Murcia. The surface is very diversified and the climate is temperate. Cereals are largely grown and great attention is given to rearing of silk-worms. In the Sp. Civil war, 1936-39, A. was raided by insurgent aeroplanes on May 25, 1938, 240 persons being killed and over 1000 injured. Area, 2096 sq. m. Pop. 553,700. 2. The cap. of the prov. of that name, and one of the chief seaports of the country. Popular

health resort, and is an episcopal see. Pop. 73,600.

**Alicata**, called 'l'Amata' (the Beloved), is a fortified tn. on the S. coast of Sicily, and does a considerable trade. Here Regulus defeated the Carthaginians at the naval battle of Ecnomus, 256 B.C. It was sacked by the Turks, 1543. Pop. 22,000.

**Alice**, a tn. in Cape Colony, near Fort Beaufort. Situated in its vicinity is the mission station of Lovedale.

**Alice Maud Mary, Grand Duchess of Hesse** (1843-78), the second daughter of Queen Victoria. As a child she was fond of all manner of sports, and her childhood passed without any prominent incidents. In 1862 she married Prince Louis of Hesse, who succeeded his father as Grand Duke Louis IV. in 1877. During the short illness of her father the princess nursed him with the greatest care, and after his death devoted herself to consoling her mother. Her letters, ed. by Dr. Sell, give a delightful impression of her as mother, daughter, and wife.

**Alice Springs**, a telegraph station, N. Ter., Australia, 994 m. from Adelaide, S. Australia, in 23° 38' S. lat., 133° 37' E. long. It is the terminus of the Port Augusta-Alice Springs railway (598 m.), a railway controlled by the Commonwealth Gov.

**Alicudi**, see LIPARI ISLANDS.

**Alien** (Lat. *alienus*, foreign), one who, resident in one state, is by birth or naturalisation the subject of another. The privileges and disabilities of As. in England have long been the subject of many statutes, one of the earliest being that passed in the reign of Edward III. The law as it at present stands is based on 2 Acts, the first, the Naturalisation Act 1870 (33 Vict. c. 11), and the second, the Aliens Act 1905, regulating the immigration of As. The former Act revised the whole legislation concerning As., removing many disabilities. Formerly an A. could not hold land even on leasehold tenure (if we except the special Scottish statutes of 1553 and 1607 granting this privilege to Fr. and Eng. subjects respectively), but the Act of 1870 removed this disqualification. An A. is, however, precluded from voting for, or becoming a member of, Parliament or a municipal body unless he has been naturalised, in which case, of course, he ceases to be an A. Neither can an A. own or hold any interest in a Brit. ship, but with this exception he may own, acquire, and dispose of all manner of real or personal property in the same way as a natural-born Brit. subject. On the other hand, the former privilege of an A. of being tried by a jury *de medietate linguae*, i.e. a jury in criminal proceedings of which one-half are foreigners, has been abolished, but he can sit on a jury after 10 years' domicile in England or Wales. Five years' residence in the United Kingdom is necessary to qualify for naturalisation (*q.v.*). On obtaining his (or her) certificate of naturalisation he becomes a natural-born Brit. subject, except that, unless there exists a treaty or law to

the contrary, he may if he returns to his former country still be regarded by the laws of that country as its subject. The son and grandson of an Eng. father, even if born abroad, are Eng. subjects. This is not affected even if the mothers were foreigners. The children of Eng. women by As. are As. unless born in this country, but a woman no longer becomes an A. merely by reason of marrying a foreigner unless she acquires the nationality of her husband. This is the effect of the Nationality and Status of Aliens Act, 1933, which was passed in conformity with the policy declared at the League of Nations Assembly, 1931, by the National Gov. in favour of removing all disabilities of married women in the matter of nationality; and uniform legislation on the point has now been passed by all the dominion Govs. It is to be noted that, where a certificate of naturalisation is granted to an A., his wife, if not already a Brit. subject, will not be regarded as having acquired Brit. nationality unless she actually declares within 12 months, her desire to possess that status. A foreign woman, on marrying a Brit. subject, becomes herself a Brit. subject.

Although the number of As. in the United Kingdom is very small, being but 2 per cent of the pop., and smaller than in any European country except Spain, it has been thought advisable from time to time to restrict the influx of As. In 1792-93 Lord Granville's ministry carried the Alien Acts enabling the Crown to deport the A. subjects of states at war with England, the Act at that time being directed against France in particular. The Alien Act 1905 aimed at excluding from landing in this country persons suffering from incurable disease, feeble-minded persons or lunatics, criminals, and persons so poor as likely to become a charge on the rates. In keeping with the traditional attitude of this country towards the right of asylum, the immigrant who can prove that he is fleeing his country to avoid religious or political persecution is exempted from the clause relating to lack of means, and, in 1938-39 numerous Jewish, Austrian, and Czech refugees were given temporary or permanent asylum in England and the dominions. The Act defines an immigrant ship as one carrying more than 20 A. steerage passengers. Such a ship can only discharge her human freight at ports where immigrant officers are stationed. Any immigrant rejected by the immigrant officer at the port of debarkation can appeal to a board appointed by the home secretary. The home secretary is empowered to expel from the country any A. convicted of a criminal offence whom the judge recommends for deportation, but the judge has no such power. This was exemplified in the case of the notorious anarchist Malat-ta, 1912, whom the home secretary refused to expel although a recommendation to this effect was made by the common serjeant, who tried him.

Under the **Aliens Order** (made under

the Aliens Restriction Acts 1914, 1919) any A. coming from outside the United Kingdom must obtain the leave of an immigration officer to land in the United Kingdom. This leave is refused in various cases, e.g. where the A. has no means of subsistence, or, though seeking work, cannot produce a permit issued by the Ministry of Labour. Resident As. must be registered, and deportations on certain grounds can be ordered by the Home Office, e.g. in the case of an A. convicted of felony or living in insanitary conditions. These restrictions are provided for in the Aliens Restriction Act 1914, as amended by the Act of 1919. The Act of 1914 was essentially a wartime measure, but the effect of the Amending Act of 1919 is to make its provisions, as amended, virtually perpetual. Where expulsion is ordered, the secretary of state must pay the whole or part of the A.'s expenses of deportation, including the maintenance of the A. and of any dependants he may have with him.

An aspect of the A. question which has, for many years, been of political importance, is the attempt of countries peopled by European stocks to keep out yellow and other coloured persons. Especially is this the case in the U.S.A. and the dominions of Australia and S. Africa; Australia carrying it to the length of putting a poll-tax of £100 on coloured immigrants. Australia, Canada, and the U.S.A. prohibit the immigration of contract labour. Under various Acts, the quota of A. immigrants into these countries, and into S. Africa, is in a fixed ratio of A.-S. to S. European persons. The present table of quotas for intending immigrants into the U.S.A. was introduced in July 1929. It changed the old basis of calculation entirely, and reverted to a calculation based on an estimate of the racial divs. when the U.S.A. became a nation, or, in other words, the Act went back to the ancestors in the census of 1790. Previously to 1929 a percentage of the nationals of the 1890 census was taken as the quota. The new quota reflected an important change of policy, which was designed to keep out all As. save a quota loaded in favour of the Nordic countries, and the motive of the new policy was the fear that 'Old America,' mainly A.-S., was being overwhelmed with other nationals. Probably 70 per cent of the U.S.A. pop. have Brit. blood in their veins, and the present quota gives a preference to the solely Brit. Only the consular officials of the State Dept. have power to issue the essential passport visas. The status of As. in the U.S.A. is determined principally by state laws, though these have to be congruent with Federal treaties with foreign powers. An A. does not possess political rights, nor is he subject to the political duties of a citizen, yet may be required to serve in the militia or police of the state. The laws of the states relative to ownership of real estate by As. vary, but in the majority of cases an A. may buy, sell, and devise real property. A friendly A.

may contract, sue, and be sued in the state and Federal courts while allowed to remain in the country, but may be expelled or deported at any time, subject to treaty stipulations. An A. enemy is not allowed to maintain any action in the courts of the U.S.A. (but he may be sued), nor can he enter into valid contracts with citizens. The percentage of A. pop. in the U.S.A. varies very much with the locality, from 2½ per cent to nearly 40 per cent.

**Alienation**, in law a term used to denote the voluntary transfer of estates from one person to another by conveyance and not by inheritance.

**Alif**, the first letter of the Arabic alphabet (see ALPHABET) and also of the word Allah (God). The letter is used as a symbol for the Almighty.

**Aligarh**, a city and dist. in United Provs. of India. It became a fortress in 1759 under Sindhia acting for the Fr., and was stormed by the Brit. in 1803. There is a Moslem Univ., founded 1920. Area of dist. of A. 1957 sq. m.; pop. 1,300,000; city, 113,000.

**Alignments**, an archaeological expression used to denote the arrangement of rows of menhirs or upright stones in parallel lines. Famous examples are at Carnac in Brittany, and at Callernish in the is. of Lewis in Scotland.

**Alima**, a trib. of the Lower Congo.

**Aliment**, Alimentary Allowance, see ALIMONY.

**Alimentary Canal**, the name given to the whole digestive tract from the mouth to the anus. It includes the mouth, oesophagus, stomach, intestines with the caecum, rectum, and anus. See separate headings.

**Alimony** is the sum of money ordered by the court to be paid by either the husband or wife in a divorce case or judicial separation towards the maintenance of the other party. It must be proved that the person against whom the order is made has the means to pay. The amount may be agreed between the parties, otherwise one-fifth of the joint incomes is generally allowed. An order for *permanent* A. may be obtained by a wife who has obtained a final decree of judicial separation.

**Allen**, N. Wales, see ALLEN.

**Alington**, Cyril Argentine (b. 1872), dean of Durham. Educated at Marlborough and Oxford and served as an assistant master at that school and at Eton before becoming headmaster of Shrewsbury in 1908. In 1916 he became headmaster of Eton and dean of Durham, 1933. Author of: *A Schoolmaster's Apology*, 1914; *Eton Fables*, 1921; *Why we read the Old Testament*, 1923; *An Eton Poetry Book*, 1925; *More Eton Fables*, 1927; *Elementary Christianity*, 1927; *The Abbot's Cup*, 1930; *Final Eton Fables*, 1933; *Eton Faces—Old and New*, 1933; *Lionel Ford*, 1934; *Things Ancient and Modern*, 1936; *A New Approach to the Old Testament*, 1937; *The New Testament: A Reader's Guide*, 1938; *The Kingdom of God*, 1940; *Poets at Play*, 1941; *In Shabby Streets*, 1942.

**Aliphatic Compounds** form one of the great divs. of organic compounds. They are so called on account of the fact that the fats are among the most typical members of this div. (Gk. *ἀλειφω*, fat). A. Cs. are characterised by the open-chain skeleton of carbon atoms in their molecules, as contrasted with the closed-ring skeleton found in aromatic and heterocyclic compounds. All A. Cs. may be regarded as ultimately derived from methane or marsh-gas,  $\text{CH}_4$ , by processes of replacement. Among the principal members of the group are the *paraffins* (including methane, ethane, pentane, petrol, paraffin oil, lubricating oil, vaseline, and paraffin wax), the *olefines* (e.g. ethylene,  $\text{C}_2\text{H}_4$ ), *acetylene* ( $\text{C}_2\text{H}_2$ ), the *alcohols* (q.v.), *ether*, *chloroform*, *acetic* and other acids, *esters* (e.g. ethyl acetate or acetic ether), certain classes of *amines* (q.v.), the *carbohydrates*, such as starch, sugar, and cellulose, and of course the *fats* themselves. In general properties, A. Cs. are distinguished from aromatic compounds in numerous ways, particularly in their behaviour with nitric acid and sulphuric acid.

**Alipur**, an important suburb of Calcutta, containing some of its finest public buildings.

**Aliscans**, or **Aleschans**, a medieval cemetery near Arles that gave the name to a *chanson de geste* of the Carolingian epic cycle. The most important episodes are the 2 battles at Alyscamps (Elysi Campi) near Arles. In the first battle William 'Court Nez' is beaten by the Saracens, but in the second he takes his revenge.

**Alishan**, **Leon**, Armenian poet and historian, b. at Constantinople in 1820. He occupied a chair in the Raphael College at Venice. He is considered the greatest Armenian poet. His works include *Popular Songs of the Armenians*, historical monographs, translations of Eng., Ger., and Fr. poetry. His knowledge of hist. was extensive, and he wrote a *History and Geography of Armenia*.

**Alison**, **Sir Archibald** (1792-1867), the younger son of the Rev. Archibald A. H. in Shropshire, studied at Edinburgh Univ. Called to Scottish bar in 1814. Toured the Continent and was made an advocate-depute for Scotland in 1822. Became prominent as an authority on politics and law. Pub. *The Principles of Criminal Law of Scotland*, 1832-1833. Among his other works are a *History of Europe during the French Revolution*, 1842, and *Principles of Population*, 1840. Created baronet in 1852.

**Aliwal North** is a tn. and dist. of S. Africa on the Orange R. It is a trading and agric. centre for the N.E. part of the Cape Prov. and the adjacent regions of Basutoland and Orange Free State. It contains many fine buildings and avenues; pop. 6297, a quarter of whom are whites.

**Aliwal South**. See MOSSEL BAY.

**Alizarin**,  $(\text{C}_{15}\text{H}_8\text{O}_4(\text{OH})_2)_n$ , an  $\alpha$ -dihydroxyanthraquinone, a derivative from anthraquinone, known to the

ancients, as extracted from madder-root, and used by them for dyeing. It is now prepared synthetically from anthracene. A. crystallises in dark red prisms and sublimes in orange-coloured needles, melting at  $290^\circ \text{C}$ . It is almost insoluble in water, but dissolves in alcohol. It yields with metallic oxides magnificently coloured insoluble compounds called 'lakes,' to which it owes its great value for dyeing purposes. Ferric oxide with A. gives a violet-black compound, chromium oxide a claret, calcium oxide a blue, and aluminium and tin give different shades of red.

**Aljubarrota** is the name of a tn. in Portugal. Here John I. of Portugal defeated John I. of Castile, and secured his country's independence, Aug. 14, 1385.

**Alk**, the resin obtained from the turpentine tree (*Pistacia terebinthus*), which grows chiefly in the region of the Mediterranean. In its fluid state it is called Cyprian or Chian turpentine.

**Alkalest**, see ALCAHEST.

**Alkali**, the name applied to a group of metals comprising lithium, sodium, potassium, rubidium, and cesium. These metals form hydroxides which are soapy to the touch and are easily distinguished from acids and neutral bodies by their action on litmus, turmeric, methyl-orange, and other indicators. The term is sometimes applied to the hydroxides only, but in the important A. manuf. it includes the carbonates, and is particularly associated with carbonate of soda.

The hydroxide and carbonate of the radical *ammonium* ( $\text{NH}_4$ ) are included among the As.

The word A. is derived from the Arabic *al-qali*, ashes, from the fact that soda and potash were derived from the ashes of plants; in fact, for centuries this was the only known method of manufacturing soda. In 1793 the Fr. Gov. were faced with the necessity of finding some method of soda manuf., as, owing to the effect of the revolution on commerce, France was cut off from the chief sources of the world's supply. In response to the Gov.'s appeal, Nicolas Leblanc elaborated a process which has now become obsolete (having been replaced by the ammonia-soda process, for which see below), but was very largely employed for over a century. It consisted in heating salt with sulphuric acid, and subjecting the sodium sulphate so obtained, mixed with coal and limestone, to a high temp. in a reverberatory furnace. The sodium carbonate was then dissolved out of the residual mass, and the solution evaporated, when crystals of washing-soda or sodium carbonate decahydrate,  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ , were obtained. The Leblanc process would have been given up long before it actually expired but for the fact that 2 important by-products, viz. hydrochloric acid and sulphur, were obtained from it.

**Ammonia-Soda Process**.—In this process, brine is saturated with ammonia and filtered. The filtrate is then

treated with carbon dioxide in a carbonating tower, consisting of a series of cylindrical compartments through which the brine slowly percolates. The carbon dioxide is blown in at the bottom of the tower, so that the following reaction takes place:  $\text{NH}_3 + \text{NaCl} + \text{H}_2\text{O} + \text{CO}_2 = \text{NaHCO}_3 + \text{NH}_4\text{Cl}$ .

The liquid sludge that flows out at the bottom of the tower is filtered in vacuum filters, and the residue of sodium bicarbonate left in the filters is then heated, when it splits up into sodium carbonate, steam and carbon dioxide:  $2\text{NaHCO}_3 = \text{Na}_2\text{CO}_3 + \text{H}_2\text{O} + \text{CO}_2$ .

The main advantages of the ammonia-soda process (sometimes known as the Solvay process, after its inventor, a Belgian chemist) are: (i) it yields a very pure product, (ii) it requires much less labour, (iii) there are no noxious by-products.

Caustic soda, or sodium hydroxide ( $\text{NaOH}$ ) is obtained by heating sodium carbonate solution with slaked lime:  $\text{Na}_2\text{CO}_3 + \text{Ca(OH)}_2 = \text{CaCO}_3 \downarrow + 2\text{NaOH}$ , and by the electrolysis of brine; chlorine is given off during the electrolysis, and this also is a valuable chemical product. Sodium and potassium hydroxides are white, deliquescent, crystalline solids easily soluble in water. Like all A.s., they neutralise acids to form salts.

In medicine the term A. is restricted to the hydroxides, which are used as caustics and for the neutralisation of acids. Ammonia is particularly valuable for counteracting the poison in the stings of insects, immediate application generally having the result of neutralising the acid. A. poisoning is treated by giving the patient dilute acid, such as vinegar. As an antidote to acid poisoning, the carbonates should be used; powdered chalk, or, in an emergency, whitening scraped from the wall or ceiling is suitable.

**Alkali Lands** are regions where the soil contains quantities of A. salts, e.g. in Nebraska, Montana, and New Mexico. Such soil requires very little rainfall, and to prevent damage to the estates caused by abundant rainfall the lands are carefully drained and treated with gypsum.

**Alkaline Earths**, a name given to the group of metals comprising *magnesium, beryllium, calcium, strontium, barium, and radium*. Formerly the known oxides of these metals were considered to be elementary substances, and were known as earths. The oxides possess an A. reaction and neutralise acids.

**Alkaloids**, organic substances of complex composition and basic character found in plants of certain families. The name persists from the old classifications of organic substances into acids, bases, and neutrals to correspond with the classification of inorganic substances. The old name of A. (resembling alkali) has been retained in the absence of a better mode of classification. Only a few A., such as *conine* and *nicotine*, are liquids; most of them are crystalline solids. They are alkaline in reaction,

possess a bitter taste, and are generally insoluble in water, but soluble in alcohol. Some of them are excessively poisonous, the general antidote being strong tea. They are obtained by cutting up the plants and macerating the mass with acidified water in a conical vat, where a layer of lint receives the percolated liquid. If a volatile A., it is separated with steam after making the mixture alkaline; if an insoluble A., it may be obtained by filtration, after which it may be purified by crystallisation. The more important A.s. are:

**Coniine**, occurring in spotted hemlock. It is a colourless liquid with a stupefying odour, and is very poisonous.

**Nicotine**, occurring in the tobacco plant. It is a colourless oily liquid with a characteristic odour, and turns brown on exposure to the air; very poisonous.

**Atropine**, occurring in 'deadly nightshade.' It is a crystalline solid, extends the pupil of the eye and is very poisonous.

**Cocaine**, occurring in coca leaves. It is a crystalline solid, soluble in alcohol, and is used as a local anæsthetic.

**Morphine**, constituting 10 per cent of opium (prepared from the capsules of *Papaver somniferum*). It is a crystalline solid, and is used as an anodyne and narcotic.

**Narcotine**, constituting 6 per cent of opium. It is a crystalline solid, and slightly poisonous.

**Quinine**, occurring in cinchona. It is an important antifebrile and is a specific remedy for malaria.

**Strychnine**, occurring in *Strychnos nuxvomica*. It is a crystalline solid, and causes death by tetanic spasms.

**Alkan** (real name **Charles Henri Valentin Morhange** (1813-88), a Fr. pianist and composer, b. at Paris. He is best known for his numerous pianoforte studies, which, if difficult, added materially to the technical resources of piano composition (Scholes).

**al-Khalil**, see **HEBRON**.

**Al-Khwarizmi**, Arabian mathematician, b. in Khorassan, who fl. in the ninth century. He studied and made important astronomical calculations at Bagdad. He wrote sev. books on mathematics, among which was one on Hindu arithmetic, containing dissertations on the quadratic equations, etc. The original name of the work is *Al-jabr wa'l-muqabala*, which was corrupted into Algebra. This book was the basis on which all subsequent medieval works on algebra were founded.

**Alkindi**, an Arab philosopher and mathematician, b. at Basra. He fl. in the ninth century. He trans. Aristotle, and is the author of sev. original treatises. The Arabs consider him the supreme philosopher and regard him as the father of heir philosophy.

**Alkmaar** ('all sea'), an anct. tn. of the Netherlands. It is situated on the N. Holland Canal, and is itself intersected by a network of canals. The church and town hall are in Gothic style. Pop. 33,000.

**Alkoran**, see **KORAN**.

**Alkyl**, a chemical term denoting radicals of the formula  $C_nH_{2n+1}$ ; the chief members are *methyl* ( $CH_3$ ), *ethyl* ( $C_2H_5$ ), *propyl* ( $C_3H_7$ ), and *amyl* ( $C_5H_{11}$ ). These radicals do not stably exist in the free state, but are present in such compounds as alcohols, esters, aldehydes, ketones, and alkyl halides.

**Alkyl Oxides**, see **ETHERS**.

**Allard**, Jean François (1783-1839), a Fr. general who first served under Napoleon. In 1815 he left France and went to Lahore, where he entered the service of Ranjit Singh. He organised the army according to the Fr. model, and was made generalissimo of the forces. He d. in India.

**All Fools' Day**, Apr. 1. The custom of sending one upon a pointless errand is supposed to have been a burlesque of the sending hither and thither of Christ from Annas to Caiaphas, and from Pilate to Herod.

**All-Hallows**, **All-Hallowmas**, or simply **Hallowmas**, the O.E. name for All Saints' Day, Nov. 1. See **ALL SAINTS' DAY**.

**All Hallows**, **Barking**, see **under BARKING**.

**All Saints' Bay**, on which stands São Salvador or Bahia, is situated on the E. coast of Brazil. It is 37 m. long from N. to S., and 27 m. wide in the widest part from E. to W., and is supposed to be large enough to afford anchorage for the navies of the whole world.

**All Saints' Day** (Nov. 1), called in O.E. **All-Hallows**, **All-Hallowmas**, or simply **Hallowmas**, is a feast in honour of all the saints, and was first definitely instituted in 835. The evening preceding All-Hallows is called *Hallowe'en*, and on this night ceremonies of Druidical origin—bonfires, bell-rings, and domestic merry-makings, in which lamb's-wool (ale or wine mixed with the pulp of roasted apples) was the prin. beverage—were once held. In England, Scotland, and Ireland fireside ceremonies were held, and the future was supposed to be made known. An account of these ceremonies is given in the poem of Burns entitled *Hallowe'en*.

**All Saints' Islands**, see **WEST INDIES**.

**All Souls' College**, Oxford, was founded by Henry Chichele, archbishop of Canterbury, 1437. In 1442 it was capable of receiving the warden and fellows, but it was not finished till the latter end of 1444.

**All Souls' Day**, a Rom. Catholic festival held on Nov. 2, which was first instituted by Odilo in the monastery of Cluny, 998, and the observance soon became general in all Rom. Catholic countries. On this day prayers and offerings are made for the dead.

**Alla breve**, a musical expression placed at the beginning of a piece, signifies that the time value of the notes is reduced to a half.

**Allah** (Arabic), the name used by Muslims to denote the Supreme Being. The word is a compound of 2 words, *al*, the definite article, and *lah*, God. The same word may be found in Arabic, Aramaic, Heb., and Old Arabic.

**Allahabad**, 'the holy city' of the Muslims, situated at the junction of the Rs. Jumna and Ganges in United Provs., India, and also gives name to the dist. The most prominent part of the city is the fort built by Akbar, who gave the name **A.** to the city. Frequent pilgrimages are made to the city by the Hindus. The prov. of **A.** was successively subject to the rulers of Delhi and Oude, but in 1801 was incorporated with the Brit. possessions. A fair is held annually in Dec.-Jan. In 1861 it was made cap. of the N.W. Provs.; and in 1887 the univ. was instituted. In front of the gateway inside the fort is the Asoka Pillar, 35 ft. high, on which are inscribed the famous Edicts of Asoka issued about 242 B.C. and a record of the victories of Samudragupta about A.D. 350. There are 2 cathedrals, a public library, a garrison; Muir College, and the Mayo Memorial Hall with a tower 147 ft. high. A high court of the Agra Prov., with a chief justice and 10 permanent judges, sits at **A.** On the chief day of the fair about 1,000,000 pilgrims bathe at the confluence of the rivs. Pop. 263,000.

**Allamanda**, a genus of tropical plants of the order Apocynaceæ. *A. cathartica*, a climbing plant with yellow flowers, from the W. Indies, has emetic and purgative properties, and is used as a cathartic.

**Allan**, David (1711-96), Scottish historical painter, b. at Alloa. Studied at Glasgow and Foulis's Academy, and later at Rome. Secured gold medal for his 'Origin of Painting.' Chief pictures, 'Highland Dance' and 'Scotch Wedding.' D. at Edinburgh.

**Allan**, Sir Hugh (1810-82), founder of the Allan Line (q.v.), was b. at Saltcoats in Ayrshire. He emigrated to Canada, and was one of the promoters of the Canadian Pacific Railway. He was knighted at 1871, and d. at Edinburgh.

**Allan**, Sir William (1782-1850), painter of historical scenes and studies of Russian life. B. at Edinburgh; educated at High School there. Studied art under Graham of the Trustees' Academy with Wilkie, Burnet, and Alexander Turner. First exhibited picture, 'A Gipsy Boy with an Ass.' Among his famous paintings are: 'Peter the Great teaching his Subjects Shipbuilding,' 'The Stirrup Cup,' and 'Knox admonishing Mary Queen of Scots.' In 1805 went to Russia, but returned to Edinburgh, 1814. Attacked by ophthalmia in 1830, he travelled widely for rest and change. D. in Edinburgh.

**Allan Line**, a Brit. steamship company founded in 1852 by Sir Hugh Allan. The ships touch the prin. Canadian ports and sev. ports of U.S.A. and S. America. Was amalgamated with the Canadian Pacific Steamship Company in 1916.

**Allantoin** ( $C_4H_6O_4N_2$ ), an organic substance found in the allantoid fluids of many animals. It is also formed in the oxidation of the uric acid with potassium permanganate, thus throwing light on the constitution of uric acid.

**Allantois**, a foetal membrane derived

from the mesoblastic and hypoblastic layers, characteristically developed in birds, reptiles, and mammals. In birds and reptiles it is developed from the lower end of the digestive tube, and has first the form of a small ovoid sac, but increases rapidly in size and makes its way into a space between the amnion and the serous membrane. It finally encloses the whole embryo and yolk-sac together with the remains of the albumin, which by this time has been largely absorbed. The A. serves as a respiratory organ, exchange of gases readily taking place through the porous shell; its cavity serves as a urinary bladder, excrement being discharged into it from the kidneys. In many mammals a connection is often estab. between the A. and the uterine wall, by which nourishment is conveyed to the embryo. At birth this connection becomes part of the umbilical cord and is cast off, whilst the part that remains within the body develops into the urinary bladder.

**Allatius, Leo** (1586-1669), a Gk., who was b. in the is. of Chios, where he founded a college, and d. at Rome. He was educated at the Gk. College, Rome, and after visiting his native country returned to Rome, where he was appointed librarian to the Vatican. He ed. MSS., trans. Gk. authors, and wrote original works. See his treatise *De Ecclesiæ Occidentalis et Orientalis perpetua Consensione*.

**Alleghany Mountains**, See APPALACHIAN MOUNTAINS.

**Allegheny**, a city in A. co., Pennsylvania, U.S.A., on the A. and Ohio R.; 1 of the chief manufacturing dists. of Pennsylvania. An important railway terminus, has large manufactories, public buildings, and higher schools of learning. Six bridges connect A. with Pittsburgh. Its industries include foundries, woollen mills, and locomotive works. In 1907 A. was annexed to Pittsburgh. In 1874 A. suffered from a fire which destroyed 200 buildings, followed by a flood causing many deaths. It has several Presbyterian theological seminaries. Pop. 131,000.

**Allegheny River**, see MISSISSIPPI RIVER.

**Alliegance** has been defined by Coke as 'the highest and greatest obligation of duty and obedience' of a subject, and a violation of A. constitutes the highest legal offence, namely treason. Every natural-born subject, every naturalised citizen, and every alien while within the kingdom, owes this duty to the king, his liege lord. Most public officials and many professional men are required to take the *Oath of Allegiance* when entering on their career. The claim of the popes of Rome to temporal power, particularly in the matter of releasing Catholics from A. to heretical sovereigns, was for about 2 centuries the cause of great difficulty in this country. The Oath of A., drafted in the reign of James I., required Catholics to reject this doctrine, and was considered by them to be unnecessarily offensive to their faith, but after long

controversy and not a little persecution it was freed from this objection in 1778.

**Allegory**, a Gk. word signifying the description of one thing under the image of another, derived from ἀλλος, other, and ἀγορεύειν, to harangue. In literature, a figurative discourse in which the writer or speaker conveys to the mind a parallel idea by its resemblance in its properties and circumstances to the subject of his ostensible discourse. In this respect it resembles metaphor, and A. has often been described as 'extended metaphor.' This is the most usual signification of the word, but it is also used for other forms of art, and may be applied to painting, sculpture, or the histrionic art. As painting, one may mention the famous picture of Prud'hon, 'Justice and Vengeance pursuing Crime,' and the many allegorical pictures of the great Eng. painter, G. F. Watts. The well-known picture of Holman Hunt, 'The Light of the World,' hung in St. Paul's Cathedral, is a good example of pictorial A. Reynolds-Stephens's group, representing Queen Elizabeth and Philip of Spain playing on a chess-board with ships as pieces, depicts in sculptural A. the struggle for sea supremacy between 2 nations. Returning to literature, in all branches of which one finds the use of A., it is important to realise the difference between A. and the fable. The fable, or, as it is sometimes termed, the apologue, has for its object the conveying of some moral precept or enforces some lesson for daily life, but an A. is by no means so limited in its scope. A further differentiation may be made that while, on the one hand, the merit of a fable lies in, and its lesson is emphasised by, its improbability, as, for example, Æsop's fable of the *Fox and the Viper*, where 2 inarticulate objects speak; on the other hand, the A. depends for its excellence on its fidelity and its detailed correspondence to actual existence. A. has always been used for the personification of abstract ideas, and for its value in this direction has been much employed to assist the mind in grasping abstract principles. This teaching of the abstract by the concrete was often employed by Christ and other biblical characters in the form of a parable, or short A., to bring home to their auditors in a more facile manner religious truths. But this personification of the abstract is not the whole function of A., and it has been employed to represent persons and countries. Thus, Edmund Spenser in his *Faerie Queene* depicts the Earl of Leicester, Sir Philip Sidney, and other Elizabethans, including the queen herself. Sir Thomas More, in his *Utopia*, sets forth by an A. about an imaginary country his opinion as to how a country should be governed, and Dean Swift, 2 centuries later, in his well-known A., *The Battle of the Books*, a satire on the ancients-versus-moderns controversy raised by Perrault, and *A Tale of a Tub*, satirises the shams and follies of his time. It is a fact not to be lost sight of that the indirect attack of abuses

by means of the A. was often the only method open to the would-be reformer. The use of A. dates from the earliest ages, and especially among the peoples of the E. It follows from the utility of A. for conveying more easily abstract ideas to the mind that philosophers should use it in the instruction of their pupils. Among those to employ this method of instruction one of the earliest was Plato, and nowhere does he employ it more effectively than in his famous A.—perhaps the most famous of all ancient As.—of the 'Cave,' which is to be found in his *Republic*. By means of an allegorical story of men in a cave believing that their shadows, thrown by a fire behind them on to the wall, are realities, he seeks to show the difference—a commonplace in all philosophical discourse—between the permanent 'idea' and the ever-changing phenomenal world of 'appearance.' The term to allegorise, i.e. to interpret the literal significance of a narrative, giving it an esoteric or more spiritual meaning, is the converse of the above. Among those to apply this method to the Scriptures were Philo the Jew of Alexandria, who in the time of Christ so interpreted the O.T., and his method was followed by the early Christian sect of the same city, notably by Origen (A.D. 185-254). The latter had the hardihood to explain, what is of course universally conceded to-day, that the story of the Garden of Eden and the Fall was an A. The Neo-Platonists similarly sought to arrest the decay of Gk. mythology at about the same time and by the same methods. A. passed into the Middle Ages, and took its place in the 'miracle' plays of the time, and in the 'moralities' of the fifteenth and sixteenth centuries. Among the best known of these 'moralities' is that called *Everyman*, an A. in which all men are personified in Everyman, who is called upon by God to give an account of his life. As was to be expected, the A. has played a large part in the development of poetry, and it was employed to such good purpose by Geoffrey Chaucer, the father of Eng. poetry, when he trans. the medieval *Roman de la Rose*, that he influenced for nearly 200 years the poets who followed him. Chaucer's contemporary, Langland, produced in 1362 a remarkable A., *The Vision of Piers Plowman*, in which he satirised the customs of his time. With Edmund Spenser's *Faerie Queene* (1590) A. again rises to great heights in poetry, but perhaps the best known of all As. in the Eng. tongue is the *Pilgrim's Progress* of John Bunyan (1678). This story of the journey of Christian from 'this world to the next,' and the story of the siege of 'Mansoul,' told in his book *The Holy War*, are written in the purest Eng. Another well-written A. is Addison's *Vision of Mirza*, which appeared in the *Spectator*. Of modern As. one may mention Olive Schreiner's *Dreams*, Jack London's *White Fang*, and Anatole France's *Ile des pingouins* in prose, and

Maeterlinck's *Blue Bird* and Edmond Rostand's *Chantecler* in drama.

**Allegretto** (It. dimin. of *allegro*), a musical term—a movement or time not so quick as *allegro*, but quicker than *andante*.

**Allegri, Antonio**, see CORREGGIO.

**Allegri, Gregorio** (1590-1632), musical composer, b. in Rome. He will always be remembered as being the composer of the famous *Miserere* written for 9 voices, and to-day sung in Holy Week in the Sistine Chapel.

**Allegro** (Lat. *alacer*, joyful, brisk), a musical term denoting a brisk, sprightly movement.

**Allen, Alin, or Alyn**, a trib. of the Dee, N. Wales. It rises in Denbighshire and flows through Flintshire into the Dee.

**Allen, Bog of**, is the name given to a series of morasses in the cos. of Kildare, Offaly, and Leix.

**Allen, Charles Grant** (1848-99), Eng. author, was b. at Kingston, Canada. Studied at Oxford, and graduated in 1870. Became schoolmaster in Jamaica, but made a permanent home later in England. Possessed good scientific knowledge and gift of expression. Chief works of science are: *Physiological Aesthetics*, 1877; *The Evolutionist at Large*, 1881; *The Evolution of the Idea of God*, 1897. Among his best novels are: *The Devil's Die*, 1888; *The Great Taboo*, 1890; and *The Woman who Did*, 1895.

**Allen, Henry T.** (1850-1930), Amer. soldier, b. at Sharpburg, Kentucky, U.S.A. Graduated U.S. Military Academy 1882. With the Mexican punitive expedition in 1916. Went to France as commander of the 90th Div. of the Amer. Expeditionary Force in 1917. Commander-in-chief of the Amer. army of occupation in the Rhineland, July 1919.

**Allen, Horatio** (1802-89), Amer. civil engineer, b. at Schenectady, New York. He made the first railway trip in America, operating the Stourbridge Lion b. 1829 at Honesdale, Pennsylvania. He was chief engineer of the S. Carolina railway and later the Erie railway, of which he was also president. He was consulting engineer to the Panama railway and president of the Amer. Society of Civil Engineers.

**Allen, Sir Hugh Percy** (1869-1946), Brit. prof. of music, b. at Reading. Began his musical career at Chichester Cathedral as assistant organist. In 1897-98 he was Organist at St. Asaph Cathedral. Conductor of the Bach Choir, London, 1901-20; prof. of music, Oxford Univ., from 1918; and director of the Royal College of Music, London, until 1937. As prof. of music at Oxford, A. did valuable work in widening the scope and practicality of the courses there; while as a choral conductor he was always highly successful.

**Allen, Ira** (1781-1814), first secretary of Vermont; b. in Cornwall co.; removed to Vermont, 1772, where he served as lieutenant under his brother Ethan, who captured the port of Ticonderoga from

the Eng. in 1775. As a member of the legislature he was zealous in asserting the independence of Vermont. He took an active part in the negotiation re the 'New Hampshire Grants.' In 1795 he visited Europe to buy arms, and was arrested at Ostend and brought to England, where he was charged with supplying arms to the Irish rebels. He was acquitted after litigation lasting 8 years.

**Allen, Karl Ferdinand** (1811-71), Dan. historian. He was prof. of hist. and archaeology at Copenhagen, and was a keen democrat. His chief works are a *Manual of Danish History*, 1840, and a *History of the Three Northern Kingdoms*, 1864-72.

**Allen, Ralph** (1694-1764), the Man of Bath, an Eng. philanthropist. He was acquainted with Pope and Fielding and he appears as Squire Allworthy in *Tom Jones*. His benevolence became proverbial.

**Allen, William** (1532-94), cardinal. b. at Rossall; educated at home and afterwards at Oxford. Graduated in 1550 and elected fellow in the same year. In 1556 chosen prin. of St. Mary's Hall, Oxford. His zeal for the Catholic faith offended the civil authorities and he went to Holland. He became priest at Mechlin in 1557, made a pilgrimage to Rome, and was created cardinal in 1587.

**Allenby, Field Marshal Sir Edmund Henry Hynman, Viscount of Megiddo and of Felixstowe** (1861-1936). Brit. soldier, educated at Haileybury and Sandhurst. Entered the Army in 1882, in Inniskilling Dragoons. Gained distinction as a column commander in the S. African War 1899-1902. Became inspector-general of cavalry, which post he held till 1914. In the First World War he won a brilliant reputation first as a cavalry leader, then as an army commander in France, and finally as the commander-in-chief of the Egyptian Expeditionary Force. A somewhat relentless soldier, yet scientific, who laid his plans with all the skill and foresight of the most learned prof. of a military college, his qualities, combined with an admirable physique and fearless character, are essentially those which go to the making of a perfect soldier. In France in 1914 he was conspicuous at Mons and in the Great Retreat, leading a cavalry div. with consummate skill, putting up a notable resistance at Hallebeke in the Ypres battle of Oct. 1914. He was then promoted successively to corps commander and army commander (3rd Army), and rendered valuable services at the battle of Arras (1917). In Egypt he took over the chief command from Sir Archibald Murray, who had, with painstaking preparation, succeeded in advancing as far as the N. edge of the Sinai Desert. The task which confronted A. was the capture of Gaza, a naturally strong position and artificially reinforced by cunning field-engineering work. To the accomplishment of this task he brought administrative ability of a high order, and a patient study of the vast problems of supply and transport,

the difficulty of which was enhanced by desert conditions. His strategy and tactics were masterly. Beersheba was captured and within 6 weeks of the commencement of his advance Jerusalem surrendered to the Brit. Army. Many of his troops were then transferred to France to repair losses, and he had perforce to spend much time in reorganising his army with less trained men, among whom were Indian troops. But again his organising capacity proved equal to his next task, which was the final overthrow of the whole Turkish Army, which he effected by executing one of the greatest campaigns of movement in the hist. of warfare, his army sweeping resistlessly forward beyond the Jordan Valley to Damascus and Aleppo, after a crushing victory in the battles of Megiddo (Sept. 18 to Oct. 31), 1918. For those services he was given a viscounty and Parliament voted him a grant of £50,000. In 1919 he was appointed to the post of high commissioner in Egypt, where the rise of the Nationalist party and the aspirations of Egypt to sovereign independence demanded the utmost tact, as well as great administrative capacity, to the end that a settlement might be effected which should safeguard Brit. interests without forfeiting the confidence of the Egyptian people. He returned to England in 1922, in which year Egypt was declared an independent kingdom. Named after him is A. Bridge (built in 1927) which crosses the Jordan, 1200 ft. below sea level, on the road between Jerusalem and Amman. *See also* EGYPT. *See* Viscount Wavell: *Allenby: Soldier and Statesman—A Study in Greatness*, 1910; *Allenby in Egypt*, 1913.

**Allende**, a tn. of Mexico in the Guajalato state, about 250 m. N.W. of Mexico and with a pop. of 16,000.

**Allenstein (Olaszyn)**, tn. of Poland (till 1945, E. Prussia) on R. Alle. Here the Russians and Prussians were defeated by Soult in 1807. The tn. has sev. breweries. During the First World War, the Russian armies, under their generalissimo, the grand duke Nicholas, when invading E. Prussia, in 1914, were opposed by 3 serious obstacles; the rivers, lakes, and marshes between Insterburg and Johannisburg, the 2 Ger. army corps at Königsberg and Allenstein respectively, and the line of the Vistula. Gen. Rennenkampf, defeating the Gers. at Gumbinnen, Aug. 17-20, drove them out of Königsberg, while another and larger Russian army broke through between the lakes and the Vistula and captured A. This, however, marked the limit of Russian success against Germany in the First World War, for at Tannenberg on Aug. 26 Gen. von Hindenburg completely routed them. (*See* TANNENBERG.) Pop. 42,200.

**Allentown**, co. tn. of Lehigh co., Pennsylvania, on the Lehigh R. Important manufacturing centre. Silk and silk goods are the most important industry. The tn. was settled first in 1751, and owes its name to John Allen, son of chief justice of the prov. Pop. 96,900.

**Alleppi**, or **Aulapalai**, in Travancore, India, is a seaport. First in commercial importance. Fine harbour, rajah's palace, and a Protestant church. Lies 33 m. S. of Cochin. Pop. 30,000.

**Allerion**, or **Alerion**, a heraldic device, consisting of an eagle with outspread wings, but without beak or feet. Example of it in Montmorency arms.

**Allestree**, or **Allestry**, **Richard** (1619-81), divine, b. at Uppington, Shropshire. His family came of good stock but were reduced in circumstances. He was educated at the grammar school, Coventry, and at Christ Church, Oxford. His early studies at college were interrupted by the civil war and he took service in the royal forces. When the parl. forces sacked the colleges, A. at great risk saved many Christ Church treasures. After military service he took orders. He was expelled from the univ. for refusing to submit to the authority of parliament. At the Restoration he was made canon of Christ Church and regius prof. of divinity in 1663. His most noted work is his treatise on *Privileges of the University of Oxford*.

**Alleyne**, **Edward** (1566-1626), actor, and founder of Dulwich College, b. near Bishopsgate, London. Married Henslowe's stepdaughter in 1589. In 1600 built, with Henslowe the fortune Theatre, London. In 1604 became master of the royal games of bears, bulls, and mastiffs. Retired from the stage, 1604. Building of college began 1613. Obtained royal charter in 1619 after some objection by Francis Bacon, Lord Verulam.

**Allgemeine Zeitung**, full title *Deutsche A.Z.*, formerly *Norddeutsche A.Z.*, a Ger. newspaper of world-wide reputation, was founded at Stuttgart in 1798 by the famous publisher, Johann Friedrich Cotta, in succession to his Tübingen venture, the *Neueste Weltkunde*, which had been suppressed by the authorities. On incurring the displeasure of the Duke of Württemberg in 1803 the paper transferred its headquarters to Ulm, and subsequently, in 1810, on that tn. becoming incorporated in Württemberg, to Augsburg. Here it first obtained wide influence and recognition, and gained the support of many distinguished statesmen and thinkers. In 1882 it was transferred to Munich, where it was pub. weekly. In subsequent years it did not maintain its old prestige. Until the revolution following the First World War it was the semi-official organ of the Ger. Gov., and as such, contained reports of ministerial speeches in the Reichstag, official *dé-ments*, and 'inspired' articles. In 1920 it was sold to Hugo Stinnes, and, later, was controlled by the Nazis.

**Allia**, also spelt **Alia**, is a small trib. on the l. b. of the Tiber, about 11 m. N. of Rome. Here the Romans were defeated by the Gauls in July 390 B.C.

**Alliaceae** **Plants** are those which belong to the *Allium* genus, or simply onion-like plants. The inflorescence is umbellate, and the various species have tunicated bulbs, or swollen underground buds, which are cultivated for culinary purposes.

**Alliance**, **Holy**, see **ALEXANDER I.**, **EMPEROR OF RUSSIA**.

**Alliance** is a union between nations or govts. formed by treaty, league, or agreement. Some definite aim, pointed out clearly in the agreement, has generally been the cause of an A. Thus in 1688 the Triple A. between Great Britain, Sweden, and the Netherlands had as its object the diminution of the power of Louis XIV. The Grand A. of 1689 was formed also for the same object. The Quadruple A. of 1814 between Great Britain, Austria, Russia, and Prussia was directed against Napoleon and his dynasty, and towards keeping back France within her boundaries. The object of the Triple A. of 1882 between Germany, Austria, and Italy was the preservation of European peace against any possible aggressive action of Russia or France. This led to the Dual A. of France and Russia, having as its object mutual help in case of any hostile action on the part of the afore-mentioned powers. Sev. attempts have been made to generalise the character of A. For example, the Holy A. of 1815 was an attempt to find in the teaching of the Gospels a common basis of a general league of the European govts., having as its object the preservation of peace. One of the most important As. of modern times was the offensive and defensive A. effected between Great Britain and Japan in 1902 and modified in 1905. The terms of this A. were pub. to the world. It terminated in 1921 as a result of the Washington Conference. On the outbreak of the First World War the Triple A. broke up owing to the refusal of Italy to act with Germany and Austria-Hungary. This removed from France a potential enemy in her rear whilst facing Germany and allowed her to concentrate her forces. Italy entered the war on the side of the Entente in the spring of 1915, which in some measure counterbalanced the ineffectiveness of Russia.

The Triple Entente, or informal A., before the First World War embraced Great Britain, France, and Russia, and was concluded in 1907. Although at this time a formal A. existed between France and Russia, there was no binding agreement between the 3 powers to take a common course should one be engaged in war. In order to strengthen this bond and to have a clear understanding on the matter, the 3 powers signed the pact of London on Sept. 5, 1914, each declaring that it would not conclude a separate peace or demand terms at the eventual peace conference without consulting the others. Japan signed the pact in Oct. 1914. When the Bolsheviks secured control in Russia they concluded a separate peace with the central powers in Mar. 1918 and broke up the Triple Entente. Great Britain's only A. now is with Portugal (providing for mutual assistance if either of the 2 countries were attacked; but it involved no obligation for Portugal to fight in the second World War, and she remained

neutral); though, in view of the menace of Germany's policy of European domination, Great Britain in conjunction with France in 1939, made pacts with Rumania, Greece, and Poland, guaranteeing their integrity, her policy being to form a peace bloc which should serve as an effective substitute for the collective security it was, at one time, hoped to procure under the Covenant of the League of Nations (q.v.). In the result the guarantees brought a Brit. declaration of war against Germany on the latter's invasion of Poland. An Anglo-Fr.-Turkish pact of assistance was signed on Oct. 19, 1939, valid for 15 years, which provided, *inter alia*, that Turkey was to aid Britain and France in the event of aggression by a European power leading to war in the Mediterranean, and if Britain had to fulfil her guarantees to Greece, but these undertakings were not, in fact, fulfilled. See further under EUROPE, *History during the European War, 1939-1945*. U.S.A. has no A. with any country. The Locarno treaties (1925) between Great Britain, Germany, France, Italy, Belgium, Czechoslovakia, and Poland contained mutual obligations designed to prevent wars of aggression among the signatories and to a limited extent constituted an A. or series of As., but their denunciation by Germany destroyed their value as a guarantee of peace in Europe. (See LOCARNO TREATIES.)

**Alliance**, a city of Stark co., Ohio, U.S.A. Manufs. iron and steel goods and organs. Pop. 22,000.

**Alliaria officinalis**, or *Sisymbrium alliaria*, commonly known as garlic-mustard, sauce-alone, or Jack-by-the-hedge, is a well-known cruciferous plant indigenous to Great Britain and many other parts of the globe.

**Allibone, Samuel Austin** (1816-89), Amer. author, b. at Philadelphia, Pennsylvania. His chief study was in bibliographical research, and he studied Amer. and Brit. literature. Became librarian of the Lenox library, New York City, in 1879. D. at Lucerne. Pub. 3 anthologies, and a critical dictionary of Eng. literature, which is still of great service.

**Allice**, see ALOSE.

**Allier**, riv. of central France, flowing into the Loire. Rises in the Margeride Mts. in Lozère. Moulins is the chief tn. on its banks. It is the boundary line between Cher and Nièvre.

**Allier**, a dept. of central France. Is a hilly and wooded dist. especially in S.E. Drained by the Allier, Loire, and Cher. Cereals grown and exported. Minerals in abundance. Area 2849 sq. m.; pop. 369,000.

**Allies, Thomas William** (1813-1903), Eng. historical writer, b. near Bristol. Became a fellow of Wadham College, Oxford, in 1833. In 1850 became a Rom. Catholic, after resigning the living of Taunton. Secretary of Catholic Poor Schools Committee. Wrote sev. books on Rom. Catholicism.

**Alligator** (Sp. *el lagarto*, the lizard), of family Crocodylidae and order Eusuchia, is a reptile of which there are only 2

living species, *A. lucius*, in the Mississippi and other large rivs. of America, and *A. sinensis*, in the Yangtsekiang. It differs from the caiman (q.v.) by having a bony septum between its nostrils, and its ventral scutes are thin, if at all, ossified; it differs from the crocodile (q.v.) by having a broad head, depressed and obtuse muzzle, unequal teeth, the fourth from the front on each side of the lower jaw being elongated and fitting into a cavity in the upper jaw when the mouth is closed, the hinder limbs lack a fringe of acute scales, and the toes are only slightly webbed. It is a carnivorous and piscivorous animal, and will devour dogs or pigs, but seldom attacks man unless molested. The strong tail by its lashing movement

ALLIGATOR

assists it in swimming, during which exercise it emits a loud bellowing. The eggs are deposited in layers in sand, and incubation covers a period of about 3 months. The female A. is a tender mother, providing food for her young and guarding them from their many foes, such as large fish and turtles. The skin of the A. is a valuable object of commerce, used in the manufacture of purses, cigarette-cases, and other articles, and the teeth are sold for ivory. From the Upper Cretaceous to the Pliocene period these animals ranged N. Europe.

**Alligator Apple**, or *Anona palustris*, is a compound fruit of the genus *Anona*, of the Custard-apple family. See ANONACEÆ.

**Alligator Fish**, the *Podothecus* of the family Agonidae, and order Teleostei. It is a small fish of the cold seas, and its body is covered with bony plates. *P. uciopenserinus* inhabits the Pacific Ocean.

**Alligator Lizard**, a name applied to sev. species of *Sceloporus*, family Iguanidae of the Lacertilia. The scales are flat and the heads are not spiny; they are viviparous. They are found chiefly in S. America.

**Alligator Pear**, see AVOCADO PEAR.

**Alligurr**, see ALIGARRH.

**Allin, Sir Thomas** (1812-85), a naval commander, b. at Lowestoft. A. took

a prominent part in the Royalist struggles. He was sent as commander-in-chief to the Mediterranean, where he captured sev. Dutch men-of-war. He brought the Barbary States to subjection in 1669. In 1670 he was controller of the navy, and in 1678 was commander-in-chief in the Channel. His life throughout was one of stirring sea-adventure.

**Allingham, William** (1824-89), a poet. He was b. at Ballyshannon, Donegal, Ireland, and worked in various custom-houses in England and Ireland until 1870. Became sub-editor of *Fraser's Magazine*. Was friendly with D. G. Rossetti. In 1850 pub. a book of poems, and in 1855 his *Day and Night Songs*. Married Helen Paterson in 1874. Wrote *Lawrence Bloomfield*, a narrative poem dealing with Irish social questions. His wife (1848-1926) was known for her success in water-colour painting, and was an associate of the Royal Society of Painters in Water-Colours. She ed., jointly with D. Radford, *William Allingham's Diary*, 1907.

**Alliteration** is the term used to signify the frequent recurrence in composition of words commencing with the same letter, or with the same vowel or consonantal sound. 'When to the sessions of sweet silent thought I summon up remembrance' (Shakespeare) is an alliterative phrase, so also is the fanciful line, 'I know that gnat is not a knight,' for the same consonantal sound 'n' is repeated. The use of A. as an embellishment of prose and poetic compositions was not unknown to Lat. and Grk. writers, but it is in the Celtic, Teutonic, and Finnish-Hungarian tongues that A. has flourished most. Indeed it is not too much to say that A. is one of the distinguishing features of Eng. poetry, and, judiciously used, its most considerable ornament. Though not much used in Eng. prose, it has nevertheless been employed by great prose writers, especially in rhetorical passages. Bunyan's great allegory, *The Pilgrim's Progress*, opens with the fine alliterative line, 'As I walked through the wilderness of this world,' and Mr. Bernard Shaw's Caesar, to give a modern example, when apostrophising the Sphinx, uses this striking alliterative passage: 'I wander, and you sit still; I work and wonder, you watch and wait; I look up and am dazzled, look down and am darkened, look round and am puzzled. . . .'

A. bulks large in A.-S. and early Eng. poetry, where it precedes the use of rhyme. A common form of it was in couplets, where the first 2 words of the first line and the first word of the second all began with the same letter. *Piers Plowman* of Langland, a fourteenth-century poet, is a long poem, written entirely in alliterative verse. With the rise of rhyme the use of A. receded, and most of the great Elizabethan writers were severe critics of its injudicious use. The satirist Churchill ridiculed and at the same time exemplified A. in his well-

known line about 'apt, alliteration's artful aid.' But 'aptly' used, as it has been by poetic giants like Shakespeare and Coleridge, it has taken a firm hold on the affections of the Eng. people, and has greatly enriched our literature.

**Allmers, Hermann** (1821-1902), Ger. poet and artist, b. at Rechtenfleth, near Bremen. His first publication was *Marschenbuch*, a study of Frisian peasant life. His best work is perhaps his tragedy *Elektra*. Others are *Dichtungen* and *Römische Schlendertage*.

**Alloa**, seaport and co. tn. of Clackmannanshire, Scotland, on the Forth, 6 m. E. of Stirling; has breweries, distilleries, glass-works, woollen manufs., etc. Pop. 18,200.

**Allobroges**, an anct. Gallic tribe, occupying the land between the Rhône and Isère, now Savoy and Dauphiné. Their chief cities were Vienna (modern Vienne), Genoa (modern Geneva), and Cularo (modern Grenoble).

**Allocution** (Lat. *allocutio*, a speaking to), a term denoting the formal address given by the pope to the College of Cardinals on any matter of eccles. or political moment, and affixed to the door of St. Peter's.

**Allodium**, or **Allodial Tenure**, is a legal term used to signify land which is the absolute property of its owner, free from any feudal tenure or obligation to a superior. Since the Norman Conquest there has been no allodial land in England, for the laws declare all land to be the property of the king. Before the Conquest the right was held to a certain extent, and it was common throughout the rest of N. Europe. In Scottish law the term is applied to movable property, crown, and eccles. property, and land bought under the Scots Land's Clauses Consolidation Act. The term is also to be found in the udal rights of the Orkney and Shetland Is.

**Allogamy** (Gk. *άλλος*, other, and *γάμος*, marriage), or cross fertilisation, the transference of the pollen of one flower to the pistil of another. There are 2 types—(1) Geitonogamy, in which the fertilised flower is on the same plant; (2) Xenogamy, in which it is on another plant.

**Allopathy**, usually applied to the orthodox method of therapeutics as opposed to homœopathy. Hahnemann, the inventor of the term and the promulgator of homœopathy, designated as A. that method of the treatment of disease consisting in the use of medicines the action of which upon the body in health produces morbid phenomena different from those of the disease treated. Homœopathy, on the other hand, consisted in the use of medicines which, by experiment on persons in a state of health, are known to produce morbid phenomena similar to those of the disease treated.

**Allophane** (Gk. *άλλος*, other, *φαίνεσθαι*, to appear), a hydrous aluminium silicate of blue, green, or brown colour, found in Saalfeld in Thuringia and Schneeberg in Saxony.

Allori, Cristofano (1577-1621), son of the painter Alessandro Allori of the Florentine school, was himself a painter. He studied under Paganini, one of the greatest colourists of the time. His most celebrated work is 'Judith with the Head of Holofernes' in the Pitti Palace, Florence. His works are distinguished by delicacy, rich colouring, and technical accuracy.

**Allotments.** An A., in England and Wales, is defined by statute as a piece of land, not more than 5 ac. in extent, which is cultivated as a farm or garden, or, in other words, it is a small agric. holding. 'A time there was ere England's griefs began, When every rood of ground maintained its man,' sings the poet Goldsmith; but that time began to decline in the fifteenth century, and continued till at the present day the great mass of the people are divorced from the land, and even those still engaged in agriculture work only as the hirelings of large landowners. In the spacious days before the rise of modern industrialism and before the numerous Inclosure Acts of the seventeenth, eighteenth, and nineteenth centuries, each cottager had his own small parcel of land which he cultivated, and in addition he had the right of turning his cattle, swine, and geese out to graze on the common land. The Georgian parliaments, consisting mainly of the representatives of the landed class, passed Inclosure Act after Inclosure Act, enclosing as much as 7,000,000 ac. of common land between 1760 and 1867. To compensate the cottagers for their lost grazing rights many of these Acts provided that garden As. should be reserved for them. This benevolent intention seems to have failed in the working, for while between 1845 and 1867 nearly half a million ac. of land were enclosed, only 2119 ac. were set aside for the poor. Alarmed by the rapid decline in the agric. pop. due to the lure of the tns., with their greater opportunities, higher wages, and less monotonous existence, the policy of the nineteenth century was to check the flow towards the tns. by giving the agric. labourer some inducement to remain in the country, so that Acts for the provision of As. and small holdings were almost as numerous as Inclosure Acts in the previous century. Incidentally it was also discovered that the parcelling of land into small holdings was a profitable thing for the landlord, the fork and spade husbandry of the A. being much more effective than the plough. In 1819 and 1831 were passed the first Acts making provision for As., and the series of Acts which followed were consolidated in the Small Holdings and Allotments Act, 1908. Most of these Acts aimed at giving compulsory powers to local authorities, and in some cases laid on them the duty, to provide As. The Parish Councils Act, 1894, gave a stimulus to this matter, and during the first 4 years of its working nearly 15,000 ac. were allotted by the councils to 32,000 tenants. An A. does not

generally exceed in size a quarter of an ac., the underlying idea being that its size should not exceed that which can be cultivated during the spare time of the labourer, but a small holding is the term applied to an agric. holding of from 1 to 50 ac. Additional powers have been conferred on local authorities by various Acts passed since the First World War. Under the Allotments Act of 1919 a co. council may acquire land for leasing to a par. council of A., but the A. may be let only to residents or to persons working on a co-operative system, or let to A. associations. Statutory powers are also given to local authorities to acquire land compulsorily for A., or, with the consent of the Ministry of Agriculture, land held by them for other purposes may be appropriated to A. Under the Act of 1925, the Public Works Loans Commissioners may lend to any 'approved society' (i.e. a society registered under the Industrial and Provident Societies Acts or under the Friendly Societies Acts) money to purchase land for A. Compensation for improvements is provided for by the Allotments Act of 1922, and, in this context, an 'allotment' means any piece of land, whether attached to a cottage or not, of not more than 2 ac., held by a tenant and cultivated as a farm or a garden or as both. For the purposes of the Act of 1925 an 'allotment' includes any piece of land of not more than 5 ac. Every local authority preparing a town-planning scheme must consider what provision ought to be made for reserving land for A. (including allotment gardens, i.e. A. not exceeding 40 poles and wholly or mainly under crops or vegetables for consumption by the cultivator or his family) and must at least once a year consider whether any and if so what lands within the area of the scheme are needed for A. (Act of 1925). By the Act of 1925 a bor. or an urb. dist. council may acquire land for future A. with the approval of the Ministry of Agriculture.

**Allotropy**, the property which some chemical elements possess of existing in different modifications under different circumstances. Sulphur may exist as octahedral or prismatic crystals, or as an amorphous powder, or yet again in a plastic form. Carbon may exist in any of the three forms, diamond, graphite, and amorphous charcoal or lampblack. Phosphorus may exist in red, yellow, or scarlet crystalline modifications. Oxygen is found as the ordinary constituent of air or as the ozone which is produced in the neighbourhood of an electric discharge. In this case, however, it is known that the combination of atoms in the molecule is different, as ozone is one and a half times as dense as oxygen; that is, the formula for oxygen is  $O_2$ , and that of ozone  $O_3$ . A. is not confined to non-metals; thus tin, silver, antimony, arsenic, and other metallic or metalloid elements exist in allotropic forms. A. is explicable on the assumption that the molecules of the different forms are of dissimilar structure.

**Alloway**, on the banks of Doon, 2½ m. S. of Ayr, in the co. of Ayrshire, Scotland, is the bp. of Robert Burns. The cottage in which the poet was b. has now been converted into a museum. Here also is the 'kirk' which he celebrates in *Tam o' Shanter* as the scene of the witches' dance, and the 'Auld Brig' over which Tam o' Shanter escaped.

**Alloxan** ( $C_{12}H_{10}O_8N_2$ ), or mesoxalyl-urea, an important decomposition product of uric acid. It is obtained by oxidising the uric acid with nitric acid. On treatment with alkalis it takes up 2 molecules of water, producing urea and mesoxalic acid.

**Alloxantin**, a substance formed by the reduction of alloxan by dialuric acid, or directly from uric acid by evaporating to dryness with nitric acid. Treated with ammonia, it forms a purplish-red dye, *murexide*, a test for uric acid being thus provided.

**Alloy**, a substance formed by the union of 2 or more metals. There are 3 ways of bringing about this union. The first is the compression of the powdered metals in a steel cylinder, but this does not lend itself to technical application. It is also possible to bring about the deposition of an A. by the electrolysis of a solution of a mixture of 2 metallic salts. The third method, that of the greatest commercial importance, is the fusion of the metals at a temp. high enough to form a uniform liquid. The observation of the temps. during the process of cooling has shown that at certain points the temp. remains constant for a short time, which seems to point to chemical combination taking place at those temps. Some As. therefore may be chemical compounds, definite proportions of the constituents occurring in each molecule, but the great majority of As. are certainly not in a state of chemical combination. Roberts-Austen has shown that metals diffuse in other metals just as a salt dissolves in a liquid, and sometimes at a greater rate. Thus a ball of gold immersed in a bath of molten lead at 550° C. quickly diffuses into every part of the liquid. Those phenomena, combined with the fact that all proportions of the metals may exist within certain limits, have suggested that an A. is analogous to a solution. The microscopic examination of As., however, shows that the different metals arrange themselves in patterns often of a most varied character, but that each metal is quite distinguishable.

Certain physical properties of an A. appear to be a mean of the corresponding properties of its constituents, while other properties are markedly different. The melting-point is usually lower than that of any of its components. This is seen in ordinary plumber's solder, consisting of tin and lead, which melts more easily than either of the metals composing it. Rose's fusible metal, consisting of 1 part of tin, 1 of lead, and 2 of bismuth, melts at 95°, although the lowest melting-point among its constituents is that of tin, viz. 232°.

Many of the As. are used in the arts and manufs. on account of the properties they possess which are wanting in the simple metals. Brass consists of 2 parts of copper and 1 of zinc, is hard and yet can be easily turned. Gun-metal contains 9 parts of copper to 1 of tin and is very tough and hard. Bell-metal contains 2 parts of tin to 8 of copper, and is harder and more sonorous than either of its constituents. Type-metal consists of 65 parts lead, 25 parts antimony, and 10 parts tin, is hard but not brittle, and is easily fusible. Bullets are covered with a hard envelope consisting of an A. of nickel and copper. An A. of 36 per cent of nickel in steel maintains a practically constant vol. through a great range of temp., and one of 43 per cent of nickel in steel possesses the same coefficient of expansion as glass, and therefore can be used instead of platinum for electrical connections through glass. A small quantity (up to 12 per cent) of tungsten alloyed with steel produces an exceedingly hard metal, used for making tools intended for cutting or planing steel.

**Allspice**, the dried flower-buds of *Eugenia caryophyllata*. See **EUGENIA**.

**Allston**, Sir Francis, see **CHANNING**, **BARON**.

**Allston**, **Washington** (1779-1843), Amer. painter and author, was b. at his father's plantation at Waccamaw, S. Carolina. In 1800 he graduated at Harvard, after which he visited London, Paris, and Rome (where he formed friendships with Coleridge and Thorwaldsen), for the purpose of studying art. In 1818 he finally returned to America. His pictures are numerous, the best-known being 'The Dead Man Revived,' 'St. Peter liberated by the Angel,' and his unfinished 'Isolshazzar's Feast.' He pub. a poem, *The Sylphs of the Season*, 1813, a novel, *Monaldi*, 1841, and *Lectures on Art*, 1850. See J. B. Flagg, *Life and Letters of Washington Allston* (New York), 1892.

**All the Talents**, the ministry organised by Lord Grenville in 1806, on the death of William Pitt, and so named in derision by the opposition party.

**All the Year Round**, a weekly periodical, of which Charles Dickens was ed. and which superseded *Household Words*. In it his *Tale of Two Cities* first appeared.

**Alluvion** (Lat. *alluvio*, a washing against), the legal term for land gradually formed by deposit from the sea or some other water. The process must be gradual. A. becomes the property of the owner of the land to which it is attached.

**Alluvium** (Lat. *ad*, towards, *luere*, to wash), or **Alluvial Deposits**, a name given to those accumulations of sand, earth, and loose stones or gravel brought down by streams and rivs. and spread out over lower lands, which are called *alluvial lands*. The term is sometimes also applied to the deposits at the mouth of a riv. entering the sea, when they are known as *marine alluvia* to distinguish them from the *fresh-water alluvia*.

**Allygurh**, see **ALIGARH**.

**Allyl**, an unsaturated organic radicle corresponding to the formula  $\text{CH}_2\text{:CH:CH}_3$ . The chief compounds are: *A. alcohol*, with the general properties of a primary alcohol; *A. iodide*, a colourless liquid with an odour of garlic; *A. bromide*, a heavy liquid obtained by treating *A. alcohol* with phosphorus tribromide; *A. sulphide*, or 'oil of garlic,' obtained by macerating garlic; and *A. isothiocyanate*, or 'oil of mustard,' occurring in black mustard seeds.

**Alma**, a small riv. of Russia, in the Crimea, flowing westward into the Black Sea. On its banks the combined armies of Britain, France, and Turkey defeated the Russians, Sept. 20, 1854.

**Alma-Ata**, cap. of the Kazakh S.S.R., Russian Central Asia, a garden city at the foot of a spur of the Tien-Shan Mts. It has fruit-preserving and textile industries. Pop. 230,000.

**Almacantar**, see **ALMUCANTAR**.

**Almac's**, in the eighteenth century the name of a famous club and suite of assembly rooms, founded about 1764 by one McCall, a Scotchman, of whose name *A.* is an anagram. The club was noted for its aristocratic exclusiveness and high play, and was situated in Pall Mall. From it sprang the still existing Brooks's Club. In 1765 McCall built a suite of assembly rooms in King Street, St. James's, and here balls of still greater exclusiveness were held for some years. In 1781, at McCall's death, they became the property of his niece, Mrs. Willis, and continued as 'Willis's Rooms' till 1890.

**Almada**, a tn. of Portugal in Estremadura, on the Tagus. Wine trade. Pop. 24,000.

**Almadén**, a tn. of Spain, prov. of Ciudad Real, in mountainous country 55 m. S.W. of Ciudad Real, is celebrated for its mercury mines, the most anct. in the world. Pop. 9,000.

**Almagest**, name of an important astronomical and mathematical work of Claudius Ptolemæus, or Ptolemy, one of the most celebrated savants of the Alexandrian school. This work was probably written between A.D. 140 and 150, in the reign of the Rom. Emperor Antoninus Pius, and was divided into 13 sections or 'books.' To distinguish it from other important works of the same author, it received the Gk. appellation *megiste*, 'the greatest,' from which its modern name, with the addition of the Arabic definite article *al*, 'the,' is derived. In it is set forth the theory of the solar system, designated the Ptolemaic system, which held the unchallenged sway in the realm of astronomic science during the Middle Ages that the works of Aristotle did in other branches of knowledge. According to this system the sun revolved around the earth, but the other planets revolved around the sun. The *A.* contained also a catalogue of 1028 stars.

**Almagra** (Arabic), a species of ochre of a dark red colour used as a skin paint and general dye.

**Almagro**, city of La Mancha, Spain,

prov. of Ciudad Real. Situated in a vine-growing dist., where lace-making is also pursued. Pop. 8700.

**Almagro**, Diego de (1475-1538), a Sp. soldier of fortune, said to have been a foundling in the tn. of *A.* In 1524 he joined Pizarro in a scheme for the conquest of Peru. Ultimately the two quarrelled over some ter., and in 1538 Pizarro had him executed.

**Almain**, a word derived from the Alemanni, a people of anct. Gaul, and used to denote Germany. The Fr. words *Allemand* and *Allemagne* are derived from the same source.

**Almali**, or **Elmalu**, tn., Asiatic Turkey, on the R. Myra, 25 m. from its entrance into the Mediterranean. It is situated in a valley of the Massicytus Mts., and has a considerable trade. Pop. 20,000.

**Alma Mater** (Lat., nourishing mother), the name given to a univ. to express its relation to those educated at it—its *alumni* or foster-children.

**Al-Mamun**, or **Abdallah III.**, a caliph of the Abbasid dynasty, was the son of Harun al-Rashid. After a war with his brother Amin, he came to the throne in 813. He rendered his reign illustrious by his encouragement of science and the arts, by his generosity and clemency, and by his own taste for letters. He estab. colleges, and caused the best works of other countries to be trans. into Arabic. Especially did he encourage astronomy, causing a decree of the meridian to be measured on the plains of Shinar. He d. in 833 in a campaign against the Gk. Emperor Theophilus.

**Almanac**, a book or table containing a calendar of the days, weeks, and months of the year, with the addition of notices of astronomical phenomena, of eccles. feasts, and similar useful information. Authoritative *As.* are pub. by the govts. in most countries, and from these the smaller ones are compiled. Such are the *Nautical A.* in Great Britain; the *American Ephemeris and Nautical A.* in the U.S.A.; and the *Almanach de Gotha*, pub. in Germany and France. The Berlin *Astronomisches Jahrbuch* and the Fr. *Connaissance des temps* contain additional astronomical information. These works are pub. some years in advance, and contain tables of the predicted positions of sun, moon, and planets, and of all the fixed stars used in navigation. Statistics of various kinds are also given. The *Almanach de Gotha* contains lists of the statistics of politics, pop., sovereigns, army, etc., for every state. More popular works are *Whitaker's Almanack* in England, containing much information, *Oliver and Boyd's New Edinburgh A.* in Scotland, and *Thom's Irish A.* for Ireland.

The hist. of the *A.* goes far back in the E. Its use is known of from the thirteenth century onward in England. The first printed *A.* is that of Purbach, 1450-61, and this was soon followed by the more important work of Regiomontanus, which covered the years from 1475 to 1531. The early *As.* generally took the name of 'Prognostications,' and

these prophetic As. had a huge circulation among the unlearned. In the reign of James I. the monopoly for their production was granted to the 2 univs. and the Stationers' Company. Of this type of publication are *Old Moore's* and, in America, *Poor Richard's A.* The sale of such works of fiction is now considerably restricted. Partridge, the A. maker of the Stationers' Company, has been immortalised by Dean Swift in the famous *Bickerstaff Papers*, 1708.

**Almandite** or **Almandine**, a variety of garnet, composed of silica, alumina and protoxide of iron, and either deep red in colour and transparent, brownish and translucent, or black (melanite). According to Pliny, it was named after Alabanda, a city of Caria where the mineral was cut and polished.

**Almansa**, a tn. of Murcia, Spain, prov. of Albacete, on Madrid-Alicante railway, has linen, cotton, brandy, and soap manufs. Near this tn. the Fr. under the duke of Berwick defeated the Brit. and Sp. troops on Apr. 25, 1707. Pop. 11,000.

**Almansur** (Arabic, the Victorious), **Abu Jaffar Abdallah** (712-775), second caliph of the Abbasid dynasty, succeeded his brother in 754. He founded Bagdad.

**Alma-Tadema**, **Sir Laurence**, O.M. (1836-1912), of Dutch extraction, was b. at Dronryp, Friesland, on Jan. 8. He studied painting first at the Antwerp academy, and later under Baron Leys. He followed Leys in devoting himself to the reconstruction of the past, painting chiefly classical subjects. About 1870 he settled in London and became a naturalised Englishman. In 1879 he was made a member of the Royal Academy, and he received knighthood in 1899. His work is remarkable for its archaeological accuracy and for his extraordinary power of painting marble. Some of his works are: 'The Education of the Children of Clovis,' 1861; 'Pyrrhic Dance,' 1869; 'The Vintage Festival,' 1876; 'The Seasons,' 1877; 'Roses of Heliogabalus,' 1888. He had the distinction of being one of the artists selected for the Order of Merit. See H. Zimmermann, *L. Alma-Tadema, his Life and Work* (London, 1886; G. Ebers, *L. Alma-Tadema* (trans. New York, 1886).

**Alme**, **Almeb**, or **Al-mal**, i.e. 'the learned,' is the name given by the modern Egyptians and Arabs to the Egyptian singing girls (not to be confused with the ghawāzī or dancing girls) who attend festivals, marriages, funerals, and other ceremonies. They are also found in Syria and other parts of the Ottoman empire.

**Almeida**, a tn. in Portugal, prov. of Beira, near the R. Côa, formerly one of the prin. fortresses of Portugal. In 1762 it was taken by the Spaniards, in 1810 by the Fr. Recovered by the Brit., 1811. Pop. 16,300.

**Almeida-Garrett**, **João Baptista de** (1799-1854), Portuguese poet and politician, b. at Oporto. He took an active part in the political movements of his country. Of his romantic plays *Gil Vicente* is con-

sidered the best national drama of Portugal. His other works include an epic poem called *Dona Branca, Romanceiro*, a collection of Portuguese folk-tales, and *Folhas caídas*, a vol. of lyrics.

**Almeirim**, a tn. of Portugal in the dist. of Santarém, an anct. residence of the kings of Portugal. Pop. 12,700.

**Almelo**, a tn. of Holland on the Vecht, near Deventer. It has linen industries. Pop. 34,000.

**Almería**: 1. Prov. of Spain, E. part of former kingdom of Granada. It is mountainous, with much mineral wealth. Area 3360 sq. m. Pop. 360,000. 2. Cap. of above prov., Mediterranean port 104 m. E. of Malaga, has good harbour defended by forts. It is an anct. city, very Saracenic in appearance. Exports fruit of various kinds, iron-ore, lead, etc. It was bombarded on May 31, 1937, during the Sp. Civil war, by Ger. warships as a reprisal for a Republican attack on the Ger. ship *Deutschland* near the Balearic Is. when 23 of the crew were killed and 83 wounded. Pop. 56,000.

**Almissa**, a dist. of Yugoslavia. The grape is the chief product of the country. Pirates formerly infested the coast. Pop. about 1700.

**Almodovar del Campo**, tn. of New Castile, Spain, prov. of Ciudad Real, centre of agric. dist., once a Moorish fortress. Pop. 7000.

**Almogia**, a tn. of Spain in the prov. of Malaga, with about 2500 inhab. Vines, figs, raisins, and other fruits are plentiful.

**Almohades**, a Berber dynasty that ruled N. Africa and the Moslem half of Spain during the twelfth and thirteenth centuries. The founder of the dynasty and the cult (the name, lit. *Al-muwahhidun*, means Unitarians—those laying particular stress on the unity of God, as opposed to the current anthropomorphism) was Mohammed ibn Tumart. He, with his lieutenant and successor, Abd-el-Mumin, dethroned the Almoravido dynasty (q.v.) and conquered N. Africa. The dynasty was fanatical and purely military, yet it retained its power intact until 1212, when its decline began in the defeat of Navas de Tolosa. The line ended in 1269.

**Almon**, the name of an affluent of the Tiber in anct. Latium, where those who sacrificed to Cybele purified themselves, and where every year the image of the goddess was laved.

**Almon, John** (1737-1805), a London bookseller and pamphleteer, was b. at Liverpool. His business premises were in Piccadilly. Among his publications were the *Parliamentary Register*, 1774, and the *General Advertiser*, 1784. In 1785 the Crown moved to try him for publishing the pamphlet *Juries and Libels*, but the prosecution failed. For merely selling a copy of the *London Museum* containing Junius's 'Letter to the King' he was fined and bound over (1770). His great friend was John Wilkes, whose correspondence he pub. with a memoir (1805).

**Almond** is a name applied to sev.

plants of different orders. The common A. is a species of *Prunus* (subgenus *Amygdalus*), and is known as *A. communis* or *P. Amygdalus*; it is grown in England for its pink flowers. It yields an oil, and the seeds are eaten as dessert. The tree is believed to be indigenous to W. Asia and N. Africa, but it has been very widely distributed over the warm temperate region of the Old World.

**Almond**, a trib. of the Tay, flowing into that riv. 2 m. above Perth. Most of its course is in Perthshire.

**Almondbury**, a vil. and par. of the W. Riding of Yorkshire, near Huddersfield, and 3½ m. S.W. of York. It has cotton and woollen mills. Pop. 8,300.

**Almonds**, Oil of, a substance squeezed out of the kernels of the A. tree. That produced from sweet As. contains a fixed oil, a glyceryl oleate, which is often used as a substitute for olive oil. Oil of bitter As. contains amygdalin, which in contact with water gradually undergoes decomposition into benzaldehyde, hydrocyanic acid, and dextrose. Benzaldehyde is often called 'oil of bitter As.', and is used for flavouring purposes and in the manuf. of various dyes.

**Almoner** (O.Fr. *almosnier*, Lat. *elemosynarius*), originally the officer of a religious house appointed to distribute to the poor the alms of the house, one-tenth of the revenue. Bishops and sovereigns also had As. In England the lord high A., usually a bishop, distributes, twice a year, the sovereign's bounty.

**Almonte**, a tn. in the prov. of Ontario, Canada, and a centre for the manuf. of woollen goods. Pop. 2,400.

**Almora**, tn. and dist. of the N.W. Provs. of India, Kumaon div. The tn. situated more than 5000 ft. above sea-level, was taken by the Brit. in 1815. Pop. of tn. 8000.

**Almoravides**, a Berber dynasty which ruled over Morocco and part of Spain during the eleventh and twelfth centuries. The line was founded by Abdallah ibn Yaseen, who about 1050 preached a holy war. Aided by his brother Abu Bakr, he conquered most of Morocco. On his death he was succeeded by Yusuf ibn Tashfin, who completed the conquest of Morocco and extended his power into Spain in 1086. He defeated the Christians at Sacrallas, but was then obliged to return to Africa. In 1090, however, he returned and took the complete control of Mohammedan Spain. The dynasty was supplanted in 1147 by the Almohades (v.v.).

**Almqvist**, Carl Jonas Love (1793-1866), Swedish author, was b. at Stockholm and d. at Bremen. He gave up good prospects to found a 'natural life' community in Wernmland. He soon relinquished this plan and took to school-teaching. In 1832 his true literary career began with the first of his series of romances, called *The Book of the Thorn-rose*. His succeeding works, lyrics, dramas, philosophical, æsthetic, moral, and educational works, show re-

markable versatility. In 1851 he fled to America, convicted of forgery and charged with murder. Later he returned to Bremen, where he lived under the name of C. Westermann till his death.

**Almshouse**, a house built and endowed for the support of those disabled from work by age or poverty. The most ancient example is the hospital of St. Cross, Winchester. The name 'hospital' is also used for As. in Scotland. In 1853 charity commissioners were appointed to put down the many abuses of the system.

**Almucantar**, a scientific apparatus consisting of a telescope borne on a float in a tank of mercury. The path of the float is a horizontal circle passing through the pole of the heavens. Clock connections are made by calculating the different azimuths cut by the transits of the stars. The instrument also gives the ascensions and declinations of the heavenly bodies.

**Almuñecar**, seaport of Spain (Andalusia), prov. of Granada, on the Mediterranean, a quaint city with many Moorish remains; pop. 4100.

**Alnus**, a genus of plants of the order Betulaceæ which grow in a temperate climate. *A. glutinosa* is the common or black alder, so called from the very dark hue of its bark. It inhabits swamps and meadows of Europe, the N. of Africa, Asia, and America; it is extremely common in Britain. It is not a very large tree, varying in height from 30 to 60 ft. The leaves are a rough oval, with serrated, or toothed, edges, and the flowers form small female catkins resembling cones and pendulous male catkins. The bark is valuable for tanning, while the young shoots dye various colours, particularly red and brown. The tree is not of much value as firewood, but it furnishes an excellent charcoal, second only to that of the black dogwood. The wood is extremely useful, being capable of enduring long immersion in water, and next to metal is the best material for water-pipes and underground purposes. Cabinet-makers employ it in the manuf. of what is known as Scottish mahogany.

Other species of A. are *A. incana*, the Turkey or upland alder, which is found all over continental Europe, and is noted for its non-glutinous leaves; *A. cordifolia*, the heart-leaved alder, which is a native of Naples; and *A. viridis*, the green alder, an inhab. of Central America.

**Alnwick**, on the Aine, cap. of the co. of Northumberland, England, 32 m. N.W. of Newcastle. It is a well-built tn. and contains interesting remains, such as those of its old tn. wall and various abbeys. Pop. 6900.

**Aloe**, a genus of succulent shrubs or trees of the order Liliaceæ, natives of the Cape of Good Hope and the is. of Socotra. The best As. grow on the *A. socotrina*, from the fleshy leaves of which plant the drug is obtained. The drug known as As. is bitter in taste, and procured from the inspissated juice of the leaves of many species of A. The finest sort, the Socotrine As., have their chief

sources in *A. lucida* and *A. perryi*; the very coarse *A. caballina*, or horse As., are used only in veterinary practice. The chief principle of As. is aloin ( $C_{12}H_{18}O_6$ ), which is a powerful cathartic, its chief action being on the rectum. It is also an emmenagogue and anthelmintic.

**Aloes Wood**, also known as Agila Wood, Agallochum, Eagle Wood, Paradise Wood, and Calambac, is the heartwood of *Aquilaria orata* and *A. agallocha*, found in tropical Asia. The innermost wood of these trees yields a fragrant resinous substance which is used in the E. as a perfume and as a medicine. It retains its fragrance for years, and was once more valuable than gold. It is thought to be the A. mentioned in the Bible.

**Aloides**, Otus and Ephialtes, according to the anc. Gk. legend the twin sons of Poseidon and Iphimedia, wife of Aloeus. They made war upon the gods, and in order to force an entrance piled Mt. Pelion on Ossa. They were defeated by the immortals, and their fate became a standing warning to insolent mortals.

**Along**, a magnificent bay in Annam, Indo-China, and offering a splendid shelter to ships. In the neighbourhood are famous coal-mines.

**Alonso**, see ALFONSO.

**Alopecia** (Gk. ἀλωπῆς, fox), the total or partial falling out of the hair, obtaining its name from the fact that foxes are subject to a disease which destroys their hair. See BALDNESS.

**Alopecurus**, a genus belonging to the Gramineæ, or grasses. *A. pratensis*, the meadow foxtail grass, grows abundantly in Britain, providing a rather coarse but valuable pasturage for cattle.

**Alora**, a tn. of Spain in the prov. of Málaga. It is the centre of a very fertile fruit-growing dist., and is famous for its 'Manzanilla olives.' Its mineral springs are much frequented. At A. are some fine medieval relics. Pop. 11,450.

**Alose**, or **Alice** (*Alosa commutis*), is the shad found in Europe. It belongs to the family Clupeidae, and is closely related to the herrings, anchovies, and pilchards.

**Alost**, or **Aalst**, tn. of Belgium in E. Flanders, on the R. Dender, here made into a canal. It contains the church of St. Martin, and manufs. lace and textiles. Pop. 42,000.

**Aloysia**, a genus of Verbenaceæ, common in America. The Brit. lemon verbena is *A. (or Lippia) citriodora*.

**Aloysius**, St., see GONZAGA, LUIGI.

**Alpaca**, a domesticated breed of cameloid mammals, derived from the wild guanaco. It is smaller than the llama, and is not, like that animal, used as a beast of burden. As. are kept in large flocks in the Peruvian Andes, and their wool is shorn annually. The wool varies in colour from black to dark yellow, and is lustrous, silky, and fine. It has been used by the Indians for cloth from time immemorial, but it was not properly introduced into England till 1836. The name of Sir Titus Salt is historic in its connection with the establishment of alpaca factories.

**Alp Arslan** (Valiant Lion), second Persian sultan of the Seljuk dynasty (1029-72). On embracing the Mohammedan faith, he took the name Mahomed ibn Daoud, to which his surname was afterwards added. His vizier, Nizam-al-Mulk, assisted him ably and founded many colleges throughout the kingdom. He came to the Persian throne in 1063, and pursued a career of conquest. He reduced Armenia and Georgia, and later won a great victory over the emperor of Constantinople, Romanus Diogenes, whom he took prisoner, but treated with great generosity. The sultan was assassinated by a prisoner whom he had condemned to death.

**Alpena**, city of A. co., Michigan, U.S.A., on Thunder Bay, at the mouth of Thunder Bay R., on the Detroit and Mackinac railroad. The city is a summer resort, and has good fisheries and tanneries, besides exporting lumber. Pop. 12,000.

**Alpenhorn**, or **Alphorn**, musical instrument used chiefly by the Swiss mountaineers to convey signals. It consists of a curved wooden horn with cup-shaped mouthpiece. The notes are the natural harmonics of the open tube.

**Alpes, Basses**-, a dept. in the S.E. of France on It. frontier, bounded on the N. by Hautes-Alpes, on the E. by Italy and Alpes Maritimes, on the S. by Var. It is drained chiefly by the Durance and its tribs. The surface is generally sterile and mountainous, but the valleys are fertile. Chief tn. Digne. Area 2685 sq. m.; pop. 83,000.

**Alpes, Hautes**-, a dept. in the S.E. of France, N. of Basses-Alpes. The dept. is mountainous throughout (chief peak Les Ecrins, 13,500 ft.), and is drained chiefly by the Durance. It is thickly wooded and has some mineral wealth. Cap., Gap. Area 2178 sq. m.; pop. 81,000.

**Alpes-Maritimes**, a dept. in the S.E. of France, bounded on the S. by the Mediterranean and separated from Italy on the N. and E. by the Maritime Alps. It is watered by the Var and its tribs. The climate, salubrious throughout, is particularly mild in the S., where are the well-known health resorts of Nice (the cap.), Cannes, Mentone, and Antibes. The olive, orange, lemon, mulberry, and citron flourish, whence the silk and oil industries are considerable. Tobacco is also raised. Another source of income is the exportation of flowers to be used in the manuf. of perfumes. Area 1450 sq. m.; pop. 448,000.

**Alph**, the imaginary 'sacred river' where Coleridge's Kubla Khan built his stately pleasure dome. The poet places the riv. in Xanadu, a genuine dis.

**Alpha and Omega**, written A and Ω, first and last letters of the Gk. alphabet. God, as being the beginning and end of all things, calls Himself in the Bible A. and Ω. The words are applied in general to the sum total or true essence of a thing.

**Alphabet**, from *alpha* and *beta*, the names of the first two letters of the Gk. A. The A. is the last, the most highly developed, the most convenient, and the most easily adaptable system of writing (see WRITING). It is a collection of a small number (generally between 20 and 30) of symbols called letters, intended to represent the various sounds used by the human voice in speech. Perfection has not yet been reached by any A., although this end does not perhaps seem very difficult of achievement. Perfection in an A. implies the accurate rendering of speech-sounds; each sound must be represented by a single constant symbol, and not more than one sound by the same symbol. As it is, all As. omit symbols for some sounds, representing these, when necessary, by combinations of other symbols, by the addition of diacritical points or other marks, and so forth, while, on the other hand, most of the As. contain redundant letters. An interesting instance in this connection is the representation of the sounds *sh* and *ch* (as in 'church') in various languages; while the Russian A. has a single symbol for the combination *sch*, Czech (another Slavonic language) would use for it the combination *šč*, Polish (again a Slavonic speech) represents it by four consonants (*szcz*)—and so does Eng. (the four consonants are *schk*, as in 'Ashchurch')—and Ger. would need as many as seven consonants for the transliteration of this combination, that is *schtsch*. Eng. has no single symbols to represent the sounds *ch*, *sh*, *th*, and so forth. On the other hand, some letters are used for two or more distinct sounds; in Eng., for instance, the letter *c* is sounded hard (=k) as in 'cross' and 'cursive', and soft (=s) as in 'precise' and 'cell', in addition to entering into the combination *ch*, and replacing the *k* in *ck*. Again, *q* and *x* are redundant; *q* only appears in the combination *qu*, and can always be represented by *kwo*; and *x* can always be represented by *ks*.

Alphabetic writing is now universally employed by civilised peoples, and no other system of writing has had so extensive, so intricate, and so interesting a hist. The story of the A. from the end of the second millennium B.C. until to-day, is, on the whole, not very hard to trace, though many details, and the origin of some individual As., are still uncertain. It is the pre- and proto-hist. of the A. that is still wrapped in obscurity, and the prin. problem—that of its origin—is still unsolved. Since classic times this problem has been a matter of serious study. The Gks. and Roms. held five conflicting opinions as to who were the inventors of the A.: the Phenicians, the Egyptians, the Assyrians, the Cretans, or the Hebs. In modern times, various theories, some not very different in part from those of ant. days, have been current. Some theories need not be seriously treated (such as that of the Nazi pseudo-scholars), as they are influenced by political considerations. The earliest modern view was that Egypt was the starting-place of

the A. The Egyptian theory has been subdivided into three theories—the hieroglyphic, the hieratic, and the demotic. The Egyptian view was revived in 1916 by Dr. (now Sir) Alan Gardiner and Prof. Sethe, dealing with the early Sinaitic inscriptions (q.v.). Many scholars hold the opinion that in the Sinaitic inscriptions we have to do with a stage of writing intermediate between Egyptian hieroglyphics and the Semitic A. This theory cannot be upheld, although it may be agreed that we have in the early Sinaitic inscriptions one of the earliest known attempts at alphabetic writing.

The attempts made to show that the cuneiform (q.v.) scripts, either the Sumerian or the Babylonian, or the Assyrian; or else the syllabary of Cyprus (q.v.), or the Hittite (q.v.) hieroglyphics, are the true parents of the A., may be regarded as even less successful. The Cretan theory, suggested by Sir Arthur Evans, had recently many adherents. It is certainly true that many alphabetic signs have a resemblance to Cretan linear characters, but the similarity is only external. The same may be said about the theory, developed by Sir W. M. Flinders Petrie, that the A. descended from the geometric prehistoric marks employed throughout the Mediterranean area from the earliest times. Most unlikely is also Sir John Evans's suggestion that the letters were once pictures used as ideograms.

The solution of the problem may come from Palestine, where, since 1929, various late Bronze Age inscriptions (seventeenth to thirteenth centuries B.C.) have been discovered, mainly at Lachish (q.v.). According to many eminent scholars, the writing of these inscriptions, termed early Canaanite (q.v.), constitutes an important missing link in the hist. of our A., representing the long-sought intermediate stage between the early Sinaitic and the earliest known N. Semitic forms. It is, however, possible that the early Canaanite script represents another effort of the second millennium B.C. to introduce an alphabetic writing. Similar efforts were probably: the cuneiform A. of Ras Shamra (q.v.), the anct. Ugarit; the pseudo-hieroglyphic syllabary of Byblos (q.v.), recently deciphered by the Fr. scholar Dhorme; and the scripts of a few enigmatic inscriptions of N. Egypt, of Balua' (Moab, Transjordan), and of the so-called proto-Arabic inscriptions found at Ur (Mesopotamia).

The prototype of the A. was not very different from that of the earliest N. Semitic inscriptions now extant, belonging to the last centuries of the second millennium B.C. These inscriptions were discovered, since 1923, at Byblos, and other places in Syria; also the Gezer (q.v.) 'calendar', belonging to the eleventh century B.C., and the Stone of Moshah (q.v.) or the Moabite Stone, belonging to the ninth century B.C., are written in the same character.

It is usually believed by scholars that practically all existing As. have a common origin, being descended from a Semitic

one, probably from the N. Semitic A. The known facts about this original N. Semitic A. may be summarised thus: it was used by the Syro-Palestinian Semitic peoples in the last centuries of the second millennium B.C. and during the first millennium. It consisted of 22 letters, which correspond roughly to the first 22 letters of the Gk. A., but all the Semitic letters expressed consonants only, and the method of writing was uniformly from right to left. The order, the names, and the phonetic values of the early Semitic letters are preserved in the modern Heb. A. At the end of the second millennium B.C. or at the beginning of the first millennium, with the definite or temporary decay of the great nations of the Bronze Age (the Egyptians, the Babylonians, the Assyrians, the Hittites, the Cretans), we enter a new historical world, in which Israel, Phœnicia, Aram, the Gks., and the S. Arabians played an increasingly important part. These conditions favoured the development of four main branches of the A.: the Canaanite, the Aramaic, the S. Semitic, and the Gk.

The Canaanite main branch may be subdivided into the two following branches: (1) Pre-exilic or Early Heb. (employed by anc. Israel, in the first half of the first millennium B.C.), with its three secondary branches, the Moabite, the Edomite, and the Ammonite, and its two offshoots, the Samaritan and the script of the Jewish coins; (2) Phœnician, which can be distinguished into Early Phœnician, Phœnician proper, and colonial Phœnician, out of which the Punic or Carthaginian, and neo-Punic, and probably also the Libyan and Iberian scripts developed. All the alphabetic scripts W. of Syria seem to have derived, directly or indirectly, from the Canaanite branch, whereas the hundreds of alphabetic writings of the E. apparently sprang from the Aramaic branch. The Aramaic A. probably originated in the tenth century B.C., but the earliest Aramaic inscriptions belong to the ninth to seventh centuries B.C. In the second half of the first millennium B.C., Aramaic became by far the most important and widespread script of the whole Near E. The direct and indirect descendants of the Aramaic A. can be divided into two groups: (1) the scripts employed for Semitic languages, of which six separate centres of development may be discerned, Heb., Nabataean-Sinaitic-Arabic, Palmyrene, Syrian-Nestorian, Mandæan, and Manichaean; the most important of them being Heb., in which the holy scriptures of the Jews are printed and the scrolls of the law are inscribed, and the Arabic A., which is after our own the most generally used in the world to-day; (2) the scripts adapted to non-Semitic tongues of central, S., and S.E. Asia, which can be divided into eight main groups: Kharoshthi, Persian or Iranian (including the Avesta A.), Sogdian, Kōk Turki and Early Hungarian, Uighur, Mongolian (including Kalmyk, Buriat, and the allied Manchu A.), Armenian-Georgian-Alban., as well as Brahmi, the mother-A. of the Indian and

Further Indian main branches. Indian writing and its origin constitute a story in themselves, and so do other branches, such as Iranian or Pahlavi, Mongolian, and especially Armenian, Georgian, and Alban. The S. Semitic group of As. remained mainly confined within Arabia, although a secondary branch spread westwards, and became the progenitor of the Ethiopic A., which through its offshoot, the Amharic script, is the only S. Semitic script still in use, and the only one in which a literature has been produced.

The earliest existing Gk. records in alphabetic writing go back to the eighth century B.C., but the introduction of the A. into Greece was doubtless much older than this. Between the two extreme views, that which assigns the invention of the Gk. A. to the fifteenth century B.C., and that which places it in the seventh or eighth century B.C., each century has its own advocates. Until recently, the date usually preferred was the ninth century; nowadays, an earlier date, such as the tenth or eleventh century, is commonly preferred. The Gks. had many local As.; many little states had each its own variant, and it was long before anything like uniformity was introduced. Indeed, only by the middle of the fourth century B.C. had all the local As. disappeared in favour of the Ionic, which thus became the common, classical Gk. A. of 24 letters. The Gks. made a few important changes, the most remarkable of them being: (1) the introduction of vowel-representation, consisting in the allocation of certain Semitic consonants to Gk. vowel-sounds; (2) the addition of certain letters for the representation of sounds not expressed by any of the Semitic letters, such as *ph*, *ps*, *kh*, and *x*; and (3) the different arrangements of the sibilants. Like the Semitic As., the earliest Gk. A. was written from right to left, a style which was later superseded by the *boustrophedon* direction of writing, that is alternately from right to left and from left to right, as the ox draws the plough, but c. 500 B.C. the method of writing from left to right was generally adopted. In the course of its long hist. the Gk. A. produced the following offshoots: the Asiatic As. (Lycian, Phrygian, Pamphylian, Lydian, and Carian), the Coptic A., with its Nubian derivative, the Messapian A. (in S. Italy), the Gothic A., invented in the fourth century by the Gothic bishop Wulfila, the two early Slavonic As. (Cyrillic and Glagolitic), with their descendants (Russian, Bulgarian, Serbian, Ukrainian, White Russian, and Old Rumanian), later adapted to numerous non-Slavonic languages, and the three Albanian As., which had very little, and only local, importance. However, the main importance of the Gk. A. lies in the fact that through its chief (direct or indirect) descendants, the Etruscan and Lat. As., and the aforementioned Cyrillic A., it has become the prototype of all the European As.

It is commonly believed that the Rom. character was directly derived from the

The first column contains the Modern Hebrew script, which phonetically corresponds with the Early Semitic alphabets (columns 2-3). These and the alphabets of the next three columns contain a few letters which have not passed to the other alphabetic systems or have changed their phonetic values. These letters are drawn in smaller type in the upper part of the square, in their alphabetical order.

*Russian.*—The following Russian letters have no exact equivalent in the Rom. alphabet or they are placed in different alphabetic position. В, meaning V (between B and G, which in the Russian alphabetic order takes the place of C), Жж, И, and Йй, variants of I or Y, Цц, Чч, Шш, Щш, Ъъ, Ыы, Ээ, Юю, Яя, Фе, Yr.

*Modern Hebrew.*—The Hebrew letters K, M, N, P, and S have also final forms, drawn on the left.

Gk.; this theory is unlikely: the Etruscan A. seems to have been the link between the Gk. and the Lat. The Etruscans, a people of uncertain origin and ethnic and linguistic affinities, were the leading power in Italy in the first half of the first millennium B.C. They gave their name to Tuscany and the Tyrrhenian Sea (the Romans called them *Etrusci*, and the Gks. knew them as *Tyrsenoi* or *Tyrrhenoi*). The probable date of the introduction of the A. into Etruria is the eighth century B.C., but only c. 400 B.C. did the classical Etruscan A. take its final form, having 20 letters, that is 4 vowels and 16 consonants. The following were the main offshoots of the Etruscan A.: the Picenian A. (on the It. Adriatic coast), the Venetic A. (in the modern Venetian region), the N. Etruscan or Alpine As., and various Italic As. (Oscan, Umbrian, Siculan, Faliscan, and especially Lat.). The origin of the Runes, the 'national' writing of the Teutons, especially of the N. Germanic peoples, offers many difficult problems. The most probable theory is that recently suggested and already accepted by many eminent scholars, that the Runes were derived from a N. Etruscan A., and were invented in the second or first century B.C. There were many local and chronological varieties, the following being the most important: Early or Common Teutonic or Primitive Norse (used mainly from the third to eighth centuries A.D.), the A.-S. or Anglian Runes (employed in England for about five centuries), and the Nordic or Scandinavian varieties (from about A.D. 800). The gradual displacement of the Runes by the Rom. character coincided with the introduction of Christianity and its increasing influence, but in some parts of Scandinavia the Runic scripts lingered on (in limited use, for charms, for instance) as late as the sixteenth or even the seventeenth century. The origin of the Oghamic A.—employed by the Celtic pop. of the Brit. Isles, particularly in S. Ireland and Wales, Isle of Man and Scotland—is still obscure. It seems to have been invented in the fourth century A.D., and mainly used as a cryptic script. The variety which was employed in W. Scotland is now known as Pictish Oghams.

The oldest existing records written in the Lat. or Rom. A. date from the seventh century B.C., but on the whole the Lat. inscriptions belonging to the seventh to second centuries B.C. are relatively few in number. The earliest inscriptions run from right to left, or vertically in *boustrophedon* style. Only from the first century B.C. onwards do they become so numerous all over the world that they cannot be counted. The Romans adopted 21 of the original 26 Etruscan letters, and at the same time varied the symbols a little. Their early A., therefore, ran thus: A B C (having the sound *g* or *k*) D E F Z H I K L M N O P Q R S T V X. At a later time Z was dropped, but a new letter was invented (consisting in the addition of a bar to the lower end of C, thus converting it into

G) to denote the voiced sound *g*, and was placed in the position previously occupied by *zeta*. In the first century B.C. the Gk. letters Y and Z were adopted (for the transliteration of Gk. sounds) and placed at the end of the A. Thus the classical Lat. A. became one of 23 letters. The only permanent additions of the Middle Ages were the signs J U W. J is *i* used as a consonant; U is a variant of V, which has secured separate recognition, U being used for the vowel-sound *u* to distinguish it from the consonantal *v*, for which V is employed; and W is *oo*, or double *uu* (UU—VV).

The Eng. A. is, strictly speaking, the adaptation of the Lat. A. to the A.-S. form of speech. (Also the other modern European As., with a few exceptions, are adaptations of the Lat. A. to Romance, Teutonic, Slavonic, and Finno-Ugric languages.) To the A.-S. A., however, three new letters were added, one of which, for the sound *th*, was borrowed from the Runes. Later the influence of the Normans caused these to be discarded. The vowels of the Eng. A. are like those of the Lat. A., but the sounds which they represent are very different (see SPELLING). The 'Gothic' A., known as black letter, a medieval variant of the Lat. A., employed in N.W. Europe, including England, until the sixteenth century, is still used in Germany. The modern Irish A. (known also as Gaelic or Celtic), consisting of 18 letters, 5 vowels, and 13 consonants, is a development of the Irish hand of the Lat. A., which is considered by some scholars as having been introduced from Gaul by St. Patrick, and was already used in Ireland in the sixth century.

The evolution of the A. and some specimens of modern As. is illustrated in the diagram opposite.

See I. Taylor, *The Alphabet* (2 vols.), 1883; H. Jensen, *Geschichte der Schrift*, 1925; F. Bodmer (ed. L. Hogben), *The Loom of Language*, 1943; A. C. Moorhouse, *Writing and the Alphabet*, 1946; D. Diringer, *The Alphabet, a Key to the History of Mankind*, 1948. See also bibliography to PALÆOGRAPHY and WRITING.

**Alpha Particles**, the positively charged particles of the alpha rays emitted from radioactive substances. Their velocity is several thousand feet per sec. or about one-twentieth that of light and they cause scintillations of light on impact with a phosphorescent substance. They are evidently atoms of helium which have lost their 2 outer electrons. A. Ps. are detected and measured by the ionisation they produce in a gas. See under RADIOACTIVITY.

**Alphege, St.**, an Eng. saint of the tenth century. Entered a monastery at Bath, and, in 984 was made bishop of Winchester. In 1006 he became archbishop of Canterbury. Martyred at Greenwich by the Danes in 1012. His tomb is in Canterbury Cathedral. The par. church of Greenwich is dedicated to him.

**Alpheus**, see RUPHEA.

**Alphonsine Tables**, an astronomical

work compiled by a body of celebrated Arabian, Christian, and Jewish astronomers in the reign of Alphonso X., the Wise, of Castile. They were completed in 1252, and first printed in 1483.

Alphonso, see ALFONSO.

Alphonsus, St., see LIGUORI.

Alphorn, see ALPENHORN.

Alpine Club, a society formed in 1857-58, united for the purpose of studying mountaineering, not only in the Alps, but throughout the world. It has been followed by many similar organisations throughout Europe and in the U.S.A. It commenced A. literature in 1859 with the publication of *Peaks, Passes, and Glaciers*. In 1863 it began to publish the *Alpine Journal*. The literature thus begun has grown to enormous dimensions.

Alpine Glow, the beautiful effect on the summits of certain A. peaks produced by rays of the rising and setting sun. The glow precedes the sunrise and succeeds the sunset.

Alpine Plants are those which grow in high altitudes, as on mts. which at a greater level bear perpetual snow. They are xerophytic plants, their conditions giving them a low degree of transpiration, and they exhibit most of the characteristics of Arctic plants. The flowers are more brightly coloured than those growing in lower regions, the roots are large, and the leaves frequently hairy, and often exist for long periods covered with snow; in themselves the plants are small and tufted. Most of the flowers are self-pollinated, owing to the scarcity of insects, though moths and butterflies are found at some high levels, e.g. the Alps, and vegetative reproduction is common. A. P. are generally shrubs and herbaceous plants. The most numerous of these are the various saxifrages, the edelweiss, rhododendron, campons, lady's mantle, violas, and primulas. There is naturally considerable variety among the flowers, as they live on damp or on rocky soil, and on damp soil such lower plants as mosses and liverworts abound. See A. F. W. Schimper, *Plant Geography*, trans. 1903. E. A. N. Arber, *Plant Life in Alpine Switzerland*, 1910; H. S. Thompson, *Alpine Plants of Europe*, 1911.

Alpini, Prospero (Prosper Alpinus) (1553-1617), a Venetian botanist, b. at Marostica. He studied at Padua, and became prof. of botany there. He did much valuable botanical research in Egypt. His chief works are: *De Plantis Egypti*, *De Medicina Egyptiorum*, and *De Medicina Methodica*.

Alpinia is a sub-tropical genus of Zingiberaceæ found in Asia and Australia. *A. galanga* yields a kind of arrowroot and galangale, which is largely used in the E., in the place of ginger.

Alpnach, or Alpnacht, a vil. of Switzerland, canton of Unterwalden on Lake A. (an arm of Lake Lucerne). It is notable for the now disused *Slide*, a wooden construction by which timber was sent down from Mt. Pilatus. Pop. 1700.

Alps (probably derived from a Celtic

word meaning 'high,' or connected with Lat. *albus*, white), a massive mt. range covering an area of over 80,000 sq. m., extending from the Mediterranean to the Danube, a distance of some 600 m. The width of the ranges varies from 80 to 150 m. It is the most extensive mt. system of Europe, forming, in fact, its backbone. Its length is cut up by valleys in all directions, and many of its component ranges run parallel, as in the Central A., or obliquely, as in the W. From very ant. times the div. of the A. has been threefold: the W. A., extending northward from the Mediterranean to Mont Blanc; the Central A., from Mont Blanc to the Brenner Pass; the E. A., from the Brenner Pass to the Hungarian plains.

I. The W. A. comprise the following prin. ranges: (1) The Maritime A., generally of no great height, but extremely broken and irregular. (2) The Cottian A., containing sev. peaks over 12,000 ft. high. The small group of Oisans to the W. of this contains the Pic des Ecrins (13,162 ft.). (3) The Graian A., generally higher than the Cottian, which attain in Mont Paradis a height of 13,300 ft. II. The Central A. are generally subdivided into a N. and a S. chain, running fairly parallel. They comprise many groups, of which the chief are the Bernese A. in the N. chain, and in the S. the Pennine, Lepontine, and Rhaetian A. It is here, in the neighbourhood of Mont Blanc, that the A. reach their greatest elevation and that the best-known peaks occur. In the Bernese A. we have Finsteraarhorn (14,026 ft.), Jungfrau (13,671 ft.), Monch (13,465 ft.), Eiger (13,040 ft.), Schreckhorn (13,385 ft.), and Wetterhorn (12,150 ft.). The Pennine A. contain Mont Blanc (15,732 ft.), Monte Rosa (15,151 ft.), Weisshorn (14,803 ft.), Breithorn (13,685 ft.), and Matterhorn (Mont Cervin) (14,780 ft.). The Rhaetian A. are at a lower level, though containing many peaks over 11,000 ft. high. The Ortler A. to the E. of these are slightly higher, Ortler Spitze itself being 12,800 ft. III. Of the E. A. the prin. chains are: (1) the Noric A., with the height of Gross-Glockner; (2) the Carnic A.; and (3) the Julian A.

The extreme inequality of the A. renders them easy to cross. Even in the highest part, the W. end of the Central Div., passes are numerous, and 5 railway tunnels now render travel easy. These tunnels are the Mont Cenis, connecting France and Italy; the Simplon, connecting the valley of the Upper Rhône with Lake Maggiore; the St. Gotthard, connecting Lake Lucerne and Lake Maggiore; the Brenner tunnel, connecting Munich and Innsbruck with Verona and Venice; and the Arlberg tunnel, connecting Switzerland and Austria. There are passes over most of these mts., among the more notable being the 2 St. Bernard passes and the Splügen.

The constitution of the A. is the result of much faulting and folding, mainly N.E. and S.W. Many upheavals have

occurred at different periods, and remarkable examples of thrusts are common. The higher ridges consist chiefly of crystalline schists associated with granite. The summits rise considerably above the line of perpetual snow, and the forms of vegetable life vary with the altitude from that common to Central Europe to that of the Arctic regions. The larger animals are becoming rare owing to the ravages of sportsmen, but the smaller fauna are numerous.

Glaciers occur chiefly in the Central A. They give rise to numerous rivs., of which the chief are the Rhine, Rhône,

made to pay. It was only by the summer of 1946 that all the services (with the exception of those sections traversing Ger., Austrian, or It. ter.) were reopened on the old scale, including the Furka, Grimsel, St. Gothard, Grand St. Bernard, and Maloja. To these were added a service over the new Susten Pass post-road, which now links the valley of the Reuss at Wassen, on the canton Uri side with the Bernese Oberland at Meiringen, through the Meiental, over the col between the Titlis and the Sustenhorn, past the Steingletscher, and down the Gaden valley to Innertkirchen on the

THE NORTH WALL OF THE EIGER (LEFT), AND THE MONCH

Po, and Danube. Their number is gradually decreasing, and must once have been very considerable.

The scenery of the A. is renowned throughout Europe and draws annually many tourists, who, before 1939, were gradually enriching the peasantry. The beauty of the lakes (such as Lucerne, Geneva, Brienz, Thun, Zürich, Constance, Maggiore, Como, Garda) and the int. views, together with the excitement and pleasure of int.-climbing, combine as attractions. Invalids may here seek repose and health in the sanatoria, such as Davos and St. Moritz; tourists may contemplate the natural marvels or give themselves up to the Alpine sports. The A. indeed deserve their name of the playground of Europe.

During the period of the Second World War there was naturally an absence of foreign visitors and many of the largest Alpine hotels went out of business for the duration of the war. Again, owing to changes of fashion in travel some of the largest, even before the war, could not be

Grimsel road. This fine motor road, a marvel of engineering, with a panorama of the finest Alpine scenery, should become one of the most popular of the great Alpine routes. It took 7 years to build, and is 18 ft. wide throughout its length, except at some of the angles and hairpin bends, where it widens up to 36 ft., and at the top of the pass it traverses the watershed by a tunnel a quarter of a m. long.

About no other geographical subject has so much been written as about the A. The various Alpine clubs all publish periodical papers, and these publications give good information. See also Tyn-dall's *The Glaciers of the Alps*, London, 1896, and *Hours of Exercise in the Alps*, 1873; Bonney's *The Alpine Regions of Switzerland and the Neighbouring Countries*, London, 1868; Ball's *Alpine Guide*, 3 vols.; Schlagintweit's *Untersuchungen über die physikalische Geographie und Geologie der Alpen*, Leipzig, 1850-54; Umlauf's *The Alps*, Eng. trans., London, 1889; F. Philosophical Society), 1936; J. J. Schatz, *Alpine Wonderland* (introduction by Sir C. Schuster), 1936; Leon W. Collet, *The Structure of the Alps* (2nd ed.), 1936; R. L. G. Irving, *The Alps*, 1939.

**Alps (Lunar)**, the name given to one of the chief lunar formations. It is really a wedge-shaped valley situated near the central line of the disk towards the north. This cleft is reckoned to be 83 m. long and from  $3\frac{1}{2}$  to  $5\frac{1}{2}$  m. broad.

**Alpujarras**, a mountainous dist. of Spain, lying to the S. of the Sierra Nevada. The valleys are extremely fertile and beautiful, and are inhabited by descendants of the Moors. 'Alpujarras' is the Moorish *al Busharat*, the grassland. The 4 largest vils. are Lánjarón, Orgíba, Trevélez, and Ugíjar.

**Alred**, see **ALURED**.

**Alruna**, a word etymologically connected with runes and used to denote a witch in anct. times. Sometimes the word was applied to images used in the black art.

**Alsace-Lorraine**, a dist. of France: it consists of Alsace and much of Lorraine, and is the region taken from France and added to Germany in 1871. It is bounded on the N. by the Bavarian and Rhenish Palatinates, on the E. by the Rhine, on the S. by Switzerland, and on the W. by the Vosges; has an area of 5605 sq. m. and a pop. of about 1,899,000 (1931). It is divided into Upper and Lower Alsace, and Lorraine. The dist., which is fertile and attractive, is generally undulating, and lies within the Rhine basin, being watered by the Ill, Moder, Saar, and Moselle, tribs. of the Rhine. A large proportion of the land is arable, and corn, flax, tobacco, wine, and fruit are largely produced. There is abundance of timber, and considerable mineral wealth, copper, lead, iron, coal, and rock-salt being mined, and silver has been found. The chief manufs. are textiles (especially cotton manufs.), chemicals, glass, and paper. The chief cities are Strasburg (pop. 175,000 in 1946), Mulhouse (6700), Metz (70,100), and Colmar. From the earliest times it has been a disputed ter. Originally inhabited by the Gauls, after the Rom. conquest it became largely Germanised. It became part of the Frankish empire, and after the tenth century of the Ger. empire, till part of it was ceded to France in 1648 at the peace of Westphalia. The remaining portion was seized by Louis XIV. in 1681, and secured by the peace of Ryswick in 1697. A few outlying dists. were secured by France after the 1789 revolution. Early in the Franco-Ger. war of 1870-71 the dist.

fell into the hands of the Prussians, and was immediately reorganised. It was formally ceded by the treaty of Frankfurt, much against the wishes of the inhab. In 1872, when obliged to make choice of nationality, 160,000 elected to be Fr., of whom 50,000 returned to France. In 1911 a local parliament or diet was estab. for A.-L.

Since the Franco-Ger. war of 1871 the deliverance of A.-L. from the Ger. yoke became an article of faith in the political creed of France. When the First World War broke out, the hope of regaining the lost provs. was reawakened in all its intensity, and even during the darkest days of 1917 when the issue of the war seemed in doubt, the passionate determination to settle the future of the provs. never wavered. When Moltke in 1871 insisted upon, and Bismarck, against his better judgment, acquiesced in, the annexation, the dominant idea in their minds was to secure a strategic frontier. At the same time, Germany probably unwittingly, also secured the largest deposit of iron ore in Europe and thereby in the ensuing 40 years built up her imposing fabric of prosperity and power. From the natural wealth of the ravished provs. Germany, in fact, derived that metallurgical ascendancy and the motive power for her industries upon which was founded no small part of her material progress, and, in consequence, her formidable naval and military strength. In actual figures, of the 2,800,000,000 tons of iron ore in all Germany before the First World War, Lorraine alone yielded some 2,000,000,000. Up to 1903 Germany had no need to import from abroad a single ton of ore, the supplies from Lorraine enabling her to maintain for over 3 decades an unrivalled industrial expansion. Without these resources Germany would, long before 1918, have exhausted her capacity for turning out the essential material of war. The Fr. people were by no means oblivious of these commercial advantages, but their ardent desire to recover the provs. was not primarily founded on the possibility of crippling the industrial power of Germany by depriving her traditional adversary of over 40,000,000 tons of ore a year. This transference of material resources was but the means to the accomplishment of the one permanent object—namely, to secure a boundary which, for the sake of future generations, should put an end once and for all to the perpetual menace of a Ger. invasion. Hence, throughout the vicissitudes of the First World War, the allied diplomacy was unequivocal in its assertion that when the time came for pourparlers, no lasting peace would be possible unless the restoration of A.-L. to France was made an indispensable condition.

Both on humanitarian and sentimental grounds the claims of France were indisputable, and it was from these grounds that the ardour of Fr. hopes during the 40 years after 1871 derived its impulse. But these same inspiring

motives were to a certain extent subordinated, during the war, which, by its very magnitude, threw into bold relief the greater issue of Germany's bid for world dominance. The relatively local question had in fact become a major issue for the whole of Europe, and it was axiomatic in the common policy of the Allies that the restoration of European equilibrium was not to be attained without the transfer of the 'lost provinces' to France.

If, however, the reinstatement was imperative as the solution of a question of modern practical politics, much justification for Fr. claims could be advanced on historical grounds. The Ger. plea that A.-L. ought always to have been Ger. ter. because the provs. formerly belonged to the Holy Rom. and Germanic Empire, was untenable, the subsequent long connection between the 2 provs. and France having so far eliminated all Ger. influences as to reduce the plea to a mere medieval archaism. From the standpoint of practical politics, however, it is useless to go further back than 1815, when the provs. on the l. b. of the Rhine were taken from France by the rest of Europe and given to Prussia with the object of checking Fr. aggrandisement. Cynicism prompts the retort that the war merely showed that the boot was on the other foot; but inasmuch as this transference had failed, by reason of the unsuspected and unscrupulous aggressiveness of Prussia, as a political measure of precaution to preserve the balance of power in Europe, it was recognised even before 1871 as an initial error. Yet the error was repeated in 1871, when the powers stood by while Germany, grown immeasurably in political stature since Waterloo, annexed, without the smallest pretext of adjusting the equilibrium of Europe, yet another considerable portion of her neighbour's ter., a portion embracing the most valuable Fr. iron-mines and most of her blast furnaces.

In the strategic concentration immediately before hostilities opened in the First World War, the Ger. Sixth Army of 5 corps under Prince Ruprecht of Bavaria was concentrated in Lorraine, E. of Metz. A detachment of *ersatz* (reserves) and *landwehr* troops was posted in the S. portion of Alsace. From this it was clear that an offensive in Alsace and Lorraine was intended as soon as possible. To disturb the Ger. concentration, the Fr. 7th Corps, stationed at Belfort, was ordered to advance towards Mühlhausen. One brigade reached Mühlhausen on Aug. 10th, 1911, but was driven back in disorder. After this the Fr. formed an army of Alsace and projected a second invasion. The army, moving on Aug. 15th, occupied the Vosges passes and reached Mühlhausen on the 19th. An army of Lorraine was also formed to watch Metz, and protect the flanks of the Fr. Second and Third Armies by driving the Gers. behind the outer works of Metz. These objectives formed part of the Fr. plan

for a general offensive on the whole W. Front, but the plan lacked the axiomatic merit of simplicity. When the Fr. had reached Saarburg the Gers. counter-attacked, drove the Fr. from the northerly passes and out of all but a small part of S. Alsace. In the course of 1915 a stalemate along the whole front resulted, which in Alsace involved give-and-take fighting on the high ground round Munster and very severe fighting for the massif known as Hartmannswillerkopf. No definite issue was reached and, as on the rest of the front, trench warfare succeeded the war of movement.

*The Treaty Settlement.*—Under Article 51 of the Treaty of Versailles A.-L. was restored to Fr. sovereignty as from the armistice of Nov. 11, 1918, and the provisions of the treaty establishing the delimitation of the frontiers before 1871 was restored. Free zones were estab. in the ports of Strasbourg and Kehl, in conformity with the navigation and railways clauses of the treaty, and due provision was made for reinstatement of inhabitants in Fr. nationality.

The Fr. Gov. re-introduced the old depts., Haut-Rhin, Bas-Rhin, and Moselle, and pursued, generally, a policy of assimilation. Fr. was introduced in the school curricula as a language of instruction and, in 1925, the Gov. proposed to control the Rom. Catholic Church by substituting Fr. lay legislation for the still valid Ger. laws. This proposal was dropped but it strengthened a Ger. autonomist movement and, in 1926, the *Elsass-Lothringer Heimatbund* or Home League of A.-L. was founded to promote political autonomy within the Fr. framework, an Alsatian Diet with a separate administration, equal language rights, and Ger. schools. In 1939 the autonomist party proper, called the *Elsass-Lothringische Partei*, had a number of representatives in the Fr. Chamber of Deputies who did not conceal their pro-Ger. sympathies. Ger. Nazi propaganda, in spite of Hitler's solemn renunciation of A.-L., was also very active in the provs. before the outbreak of the Second World War. Sev. autonomist leaders in A.-L. were arrested after war broke out, in Oct. 1939, and one of them, Charles Roos, was executed for espionage. Before 1940 there were about 1,500,000 Ger.-speaking people in A.-L., and while there are many who know no Fr., others are completely bi-lingual. Ger. was the prevailing language of the local press, and literature was produced in Ger., in the local Ger. dialect, and in Fr.

A.-L. was an occupied prov. in the Second World War. In 1940 the Gers. expelled tens of thousands of Frenchmen from Lorraine to make room for Gers. from the dists. subjected to Brit. bombing, giving them the choice of going to unoccupied France or to Poland. The persecution of the churches was carried out with special severity in Alsace, in 1941. Lessons in religion by priests and in private schools and divine service were forbidden. The theological faculty in Strasbourg Univ. was abolished, and the cathedral closed to divine service.

Germanisation of A.-L. proceeded apace in 1942. A decree was issued conferring Ger. citizenship on Alsace-Lorrainers who were serving in the Wehrmacht or S.S., or who were recognised as Gers. 'worthy of confidence.' Compulsory military service in the Ger. Army was introduced in Alsace on Aug. 26, and in Lorraine a week later for certain classes. Bürckel, the Ger. head of the civil administration in Lorraine, made strenuous efforts to Germanise the ter. Names of Fr. origin were suppressed and replaced by Ger. names and the use of the Fr. language was forbidden. But the Alsatians and Lorrainers resisted these attempts passionately and unanimously. Liberation came with the advance of the Amer. and Fr. forces in 1944-45. See further under WESTERN FRONT CAMPAIGNS IN THE SECOND WORLD WAR. See O. Lorenz and W. Scherer, *Geschichte des Elsasses*, 1886; R. Rouss, *Histoire d'Alsace* (22nd ed.), 1920; C. Spindler, *L'Alsace pendant la Guerre*, 1925.

Alsatia, the original name of Alsace, applied in the seventeenth century to the dist. of Whitefriars, between the Thames and Fleet Street, which was used as a refuge by debtors and criminals.

T. Fall

ALSATIAN

Alsatian, a large wolfhound, with stiffly erect ears and deep chest, so named because at one time it was used as a sheep-dog in Alsace. It is a hybrid of varieties of N. and S. Ger. sheep-dogs, and being intelligent, amenable to discipline, and readily trained, is often used as a police dog and a guide for the blind. Its popularity outside Germany and France is of comparatively recent date but, though a favourite both as companion and watch-dog, it is uncertain in temper; this, however, may result from improper feeding, lack of exercise or companionship, and absence of training or restraint. The height at the shoulder should be about 24 in., and 2 in. less in bitches. Colour may be varying shades of grey, brown, fawn, or black.

Al segno, a musical term of It. derivation, and meaning 'to the sign.' It directs the musician to revert to the sign ♯: and continue from there to the first double bar.

Alsen, is. in Little Belt, Baltic, off coast of Schleswig, about 19 m. long and 3-12 m. broad, with an area of about 120 sq. m. and a pop. of 25,000. Sonderburg, the chief tn., exports grain and fruit. Ceded to Germany in 1864, this originally Dan. is. was restored to Denmark in 1920.

Al Sirat (the Path), in the theology of the Mohammedans, is the name of a bridge extending over the abyss of hell, which must be passed by every one in order to enter paradise. It is described as being narrow like the edge of a sword.

Alster, riv. of Schleswig-Holstein, formed by confluence of 3 streams. Forms Great A. Lake near Hamburg, through which it flows into R. Elbe.

Alston, or Aldstone, a mkt. tn. and railway station in Cumberland, England, 29 m. E.S.E. of Carlisle. There are limestone quarries, and lead and copper are found in the vicinity. Coal is mined for lime-burning. Pop. 4000.

Alt, see ALUTA.

Alta (It., high), in music, generally used in addition to the word *ottava*, as *ottava alta*, an octave higher, *pü*, more, being by custom omitted.

Altai Mts., mountainous region of Tomsk (Siberia) and Mongolia, with an area of 53,000 sq. m. The highest ridge is the Saïughem, the mean elevation of which is about 5000 ft. The passes are few and dangerous. The valleys are very fertile, and there is great mineral wealth. The chief tn. is Barnaul.

Altair, an Arab word used to denote a star brighter than the first magnitude in the constellation of the Eagle (Aquila). The luminosity of A. is about 6 times greater than that of the sun, and it has a proper motion of 65" a century.

Altamaha, a riv. of Georgia formed by the junction of the Oconee and Ocmulgee and flowing into the A. Sound. It is 155 m. long, and is navigable for its entire length for boats drawing 5 ft. of water.

Altamira, a Sp. vil., in Santander prov., famous for its Paleolithic caves. In them in 1879 were discovered wall paintings representing bulls and deer. Believed to be over 25,000 years old.

Altamura, tn. of Apulia, Italy, 28 m. S.W. of Bari; it is of great antiquity, and has a fine Romanesque cathedral. Pop. 25,560.

Altar, a piece of religious furniture used for supplication and sacrifice. The use of the A. seems to have been almost universal in all times and among all nations. They have been found in Babylonian and Assyrian remains, and among Egyptian ruins. Early sacrificial hearths have been excavated in Palestine, and appear to be of the primitive description suggested in the early parts of the O.T. Later there were 2 kinds of As. in use among the Jews, for burnt-offering and incense respectively. In ant. Greece and Rome As. were again of 2 types: low pedestals which stood inside the temple before the sacred image, and large erections in the open air, used

for burnt sacrifice. In almost all circumstances As. have been considered as places of refuge, and frequently as fit places for the solemnisation of oaths. The earliest Christians had no As., but they came into use with the cessation of persecution, and were erected over the relics of martyrs. They were oblong in shape and placed in the axis of the church. In medieval times the numbers increased, the chief in each church being known as the 'high A.' After the Reformation, the Eng. Church replaced As. by movable communion tables.

**Altazimuth**, an important astronomical instrument for ascertaining the altitude (q.v.) and azimuth (q.v.) of celestial objects, whence the name. It consists of a telescope revolving on a horizontal axis, to the side of which is rigidly attached a vortical graduated circle (read by optical aid) for ascertaining altitude. This apparatus is capable of moving above a horizontal circle, also read by microscopes, by which the azimuth of a heavenly body is determined. It is sometimes called a universal transit, but as a rule in large instruments its horizontal motion is small, being confined to a few degrees each side of the meridian. The A. invented by the Dan. astronomer, Oleus Rømer, 1690, was capable of measuring all parts of the sky. All important observatories have this instrument, and Airy's A., erected at Greenwich in 1847, considered a fine instrument in its day, was replaced by a larger one in 1897.

**Altodmann**, a vil. in Baden. It was the favourite residence of the successors of Charlemagne.

**Aldorf**, cap. of canton Uri, Switzerland, lies in a fruit-growing valley, surrounded by imposing mts. It is the traditional scene of the exploits of William Tell, the liberator of Switzerland from the Austrian yoke. A monument to him stands in front of an old fifteenth-century tower. In the Tell Theatre (1899) Schiller's *Wilhelm Tell* is performed by A. residents in summer. Pop. 4200.

**Aldorfer, Albrecht** (1480-1538), Bavarian painter, engraver, and architect, b. and d. at Iatisbon, of which he was city architect and a burgher. His most famous picture is the 'Battle of Arbelis,' at Munich. His engravings on wood and copper rank next to those of Dürer.

**Altea**, seaport of Spain, 25 m. N.E. of Alicante, on the Mediterranean. It has a good harbour and some trade. Pop. 3200.

**Altels**, a well-known summit of the Alps, 11,930 ft. in height, and situated E. of the Gemmi Pass. Avalanches make the ascent very dangerous. First climbed in 1834 by a Swiss.

**Alten, Carl August** (1764-1840), Hanoverian and Brit. general. Served in Hanoverian army till its disbandment in 1803, when he came to England and entered the Ger. Legion, serving in Hanover and Copenhagen. He commanded in the Peninsular war, and at Quatre Bras and Waterloo. When the

Ger. Legion was disbanded he went to France, and later returned to Hanover, where he became minister of war.

**Altena**, tn. in Westphalia, Prussia, on R. Lenne, 18 m. S.W. of Arnsberg. It contains an anct. castle, and before 1939 had manufs. of iron, copper, brass, and nickel goods. Pop. 16,000.

**Altenavia**, the Lat. form of Altona (q.v.), a tn. in the prov. of Schleswig-Holstein, near Hamburg.

**Altenburg**, a tn. in Thuringia, Germany, formerly cap. city of duchy of Saxe-Altenburg, Germany, on R. Pleisse, 25 m. S. of Leipzig. It contains a famous ducal castle, built on a perpendicular porphyry rock, the scene of the abduction of Princes Albert and Ernest in 1455, and numerous fine municipal buildings. Before 1939 there were manufs. of brushes, gloves, hats, cigars, and woollen goods. Pop. 41,300.

**Altenessen**, a suburban dist. of Essen, Rhineland, Germany, lying 2 m. N. of that city, possessing coal mines and (in 1939) machine factories. Pop. 35,000.

**Altengaard**, seaport tn. in the prov. of Finnmark, Norway, at the head of the Alten Fjord.

**Altenstein, Karl, Baron von** (1770-1840), Prussian statesman, b. at Ansbach, and studied at Erlangen and Göttingen. He was head of the finance dept., and later minister of public worship and education, rendering great service to the univ.

**Altenstein**, a castle in Saxe-Meiningen, Germany, on the S. slope of the Thüringwald near Eisenach. It is associated with St. Boniface, 'the Apostle of Germany' (b. 680) and Martin Luther.

**Alternative**, a medicine that alters the processes of nutrition for the better, restoring, in some obscure way, the normal functions of the organs. The most important As. are arsenic, iodine and the iodides, and mercury.

**Alter Ego** (Lat.), signifies 'another I.' The phrase is used to denote Sp. viceroys when exercising regal power, and was used at Naples when the crown prince was made vicar-general during the rebellion of 1820. The words are used of a close friend.

**Alternate**. In geometry angles are said to be A. which are made by 2 lines with a third, on opposite sides of it. In algebra those terms of a proportion are said to be A. which are separated from one another by another term; thus in the proportion 2 is to 4 as 8 is to 16, 2 and 8 are A. terms, as also 4 and 16.

**Alternating Current**, in electricity, is one which flows for an interval of time in one direction followed by a flow in the opposite direction, or, in other words, a current flow in alternately reversed directions through or round a circuit. A simple A. C. is one which periodically passes through a definite cycle of changes of equal period  $T$  so that the number of cycles per sec., which is  $f = 1 \div T$ , remains constant at such a value as 50 cycles for power circuits (low-frequency currents for electric motors); or, e.g., 1,000,000 cycles for a

high-frequency circuit such as is used for 300-metre wavelength radio apparatus. The alternating pressure required to produce A. C. may be obtained from electrical machinery such as alternators, rotary converters, magneto machines, or from thermionic valve generators. A. C. is economical because it allows of transmission across long distances at high voltage and of step down to the required pressure by means of a transformer. A. Cs. are suitable for most domestic electrical appliances, such as heating, lighting, and radio receivers. See also ELECTRIC POWER GENERATION.

**Alternation of Generations** is a biological phrase which indicates a curious condition in the life-hist. of some animals and plants, which have both a sexual and an asexual stage of reproduction. It is not found in the lowest plants, but is seen in some of the intermediate ones very clearly, and in animals is best observed in low forms of existence. It is believed that this condition can be traced in the highest of animals as it can be in the highest of plants. In the vegetable kingdom the asexual plant which produces spores is called the *sporophyte*, the sexual plant which produces gametes (sexual cells) the *gametophyte* or *oöphyte*. In the ferns and horsetails the generation with which we are familiar is the sporophyte—in the fern the small brown bodies beneath the fronds are the asexual spores—and the sexual generation is not prominent; the gametophyte is a small green body growing on damp soil which gives rise to both male and female organs which produce again a fern as we know it. In the life-cycle of the mosses and liverworts the gametophyte generation is more conspicuous: the sporophyte is often seen rooted in the gametophyte as a brown stalk with a spore case at its apex. Among animals the Coelenterata exhibit alternation of generations very clearly: here the ovum which has been fertilised produces a polyp capable of giving rise to buds, which in their turn give rise to jellyfish which contain sexual elements. See D. H. Scott's *Structural Botany*, part II, 1907, for comparisons of gametophyte and sporophyte generations; see also J. J. Steenstrup's *Om Forplantning og Udvikling gjennem vekslede Generations Rækker*, 1842.

**Alternator**, the machine used in electricity to produce an alternating current. It is a species of dynamo.

**Althæa**, a genus of plants of the order Malvaceæ, which are common in Europe. *A. rosea*, the hollyhock, found wild in China, grows in Brit. gardens; *A. officinalis*, the marsh mallow, grows in marshes.

**Althein**, or **Asparagon**, a crystallisable white substance found in the root of marsh mallow and asparagus.

**Althing**, the parliament of Iceland, organised at Thingvellir in A.D. 928 to supersede the Norse Thing. It has 36 members, of whom 30 are elected by vote of the people, but the remaining 6 are appointed by the king.

**Althorn**, a tenor (E flat) or baritone (B flat) saxhorn (*q.v.*), often used instead of a Fr. horn in military and brass bands.

**Althorp**, see SPENCER.

**Altitude**, an astronomical term signifying the angle of elevation of a celestial body above the horizon. Thus if A be the position of an observer on the earth, A B the line of the horizon directly beneath the heavenly body, and C represents the planet or star, then the angle C A B is the A. of the star. As the circumference of a circle is divided into 360°, it follows that a star exactly overhead is of an A. of 90°, while one, as in diagram, half-way between zenith and horizon, is of an A. of 45°.

The A. of a star, as ascertained by a sextant, is used for calculating a ship's position at sea. See ALTAZIMUTH and AZIMUTH.

**'Altmark' Affair**. See under NAVAL OPERATIONS IN THE SECOND WORLD WAR.

**Altmühl**, a riv. in Bavaria and affluent of the Danube. It is 103 m. long. Charlemagne conceived the idea of connecting the riv. with the Regnitz and hence with the Rhine and Danube. This plan was executed by the Bavarian Gov.

**Alto** (It., high), or counter-tenor in men, is the highest pitch in the male voice; in women (contralto) and boys it is the lowest pitch of the voice. It originated in church music of the sixteenth century, and as it was too difficult for boys to learn to sing A., and women, according to the rule 'nullus taceat in ecclesia,' were not allowed to sing in church choirs, it was assigned to men of high-pitched voices.

**Alto Clef**, the clef with C on the middle line, is now used only for viola music, but formerly was employed for the alto voice.

**Alto di Viola** is an It. term for the tenor violin, so called because it used to take the highest parts, while the *basso di viola* took the lowest in instrumental music.

**Alton**: 1. A tn. in Hampshire, England, on R. Wey. Contains many breweries and sev. paper mills and iron foundries. Pop. 6200. 2. City in Madison co., Illinois, U.S.A., on R. Mississippi, 25 m. N. of St. Louis. The seat of a Catholic bishopric. It has numerous manufs., an oil refinery, a lead smelter, and limestone quarries. Pop. 30,000.

**Alton, Eduard Josef d'** (1772-1840), a distinguished anatomist and naturalist, was b. at Aquileia, near Trieste. His chief work is *Die Naturgeschichte des*

*Pferdes*. His son, Johann "Eduard d'A. (1803-54), was a prof. of anatomy at Halle, and wrote *Handbuch der Vergleichenden Anatomie des Menschen*.

**Altona**, formerly a city of Prussia incorporated in the city of Hamburg in 1937. It has fine municipal buildings, and before 1939 had numerous manufs., of which tobacco was among the chief. In 1640 A. became Dan.; in 1713 it was burnt by the Swedes; and in 1866 passed to Prussia. Pop. 242,000.

**Alton Towers**, a Staffordshire pleasure resort, famous for its gardens. It was once a seat of the Earls of Shrewsbury. The gardens, which extend as far as the Churnet R., are adorned with statuary, grottoes, ornamental fountains, and temples. The house contains a picture gallery and armoury.

**Altoona**, city in Blair co., Pennsylvania, U.S.A., 117 m. E. of Pittsburgh. It has large locomotive works, machine shops, and freight yards connected with the Pennsylvania railway. Pop. 80,000.

**Altorf**, see ALTENDORF.

**Alto-relievo** (It., high relief), a term applied to that mode of sculpture in which objects are made to project from their background to the extent of more than one-half their thickness, so that some portions of the figures stand free. See BAS-RELIEF.

**Altötting**, tn. in Bavaria, Germany, on R. Morren. It is an anct. Rom. Catholic place of pilgrimage, on account of a famous image of the Virgin. Pop. 5000.

**Altanstadt**, a vil. of Prussia near Lützen. Charles XII. of Sweden concluded the treaty here with Augustus II. of Poland, whereby the latter resigned the kingdom of Poland.

**Altringham**, or **Altringham**, a tn. in Cheshire, England, on Bridgewater Canal, 8 m. S.W. of Manchester, for which it raises fruit and vegetables. It has sawmills and an iron foundry, and manufs. yarns. Pop. 21,400.

**Altruism** (Fr. *l'altruisme*, from It. *altru*, of or to others), a word coined by the Fr. positive philosopher, Augusto Comte, and introduced by his followers into this country, where it has passed into general use. It is the antonym of *egoism*, and if the latter be defined briefly as 'each for himself,' A. stands for 'living for others.' The altruistic instinct is a social instinct or impulse in human nature, and is evidenced in kindness, veneration, and affection. It is not the exclusive possession of humanity, but manifested by many of the higher types of animals. It was this instinct or tendency in man that Comte wished to raise to a conscious principle, or an ethical ideal, which made the chief aim of human action that of seeking the welfare of others. Herbert Spencer in his *Data of Ethics* sought to show that in the course of social evolution egoism and A. would be conciliated.

**Altstätten**: 1. A tn. of Saint Gall, Switzerland. The Austrians took it in 1410. It has famous sulphur springs. 2. A tn. in Zürich.

**Altwasser** (lit. 'old water,' a name

which refers to the mineral springs), a vil. in the former Prussian prov. of Silesia. There were extensive iron foundries in the vicinity. Glass and porcelain were also manufactured here.

**Alum**, the crystallised double sulphate of aluminium and potassium, corresponding to the formula  $Al_2(SO_4)_3 + K_2SO_4 + 24H_2O$ . The name is also used to designate a group of bodies of the same general structure, where the first sulphate is that of aluminium, chromium, or ferric iron, and the second that of lithium, potassium, sodium, the ammonium radical, rubidium, caesium, thallium, or silver. The A. of the ancts. (Lat. *alumen*) included a group of astringent substances of which potash A. and the naturally-occurring aluminium sulphate appear to have been the chief. In the Middle Ages the manuf. was mainly in the hands of its., and a factory at Tolfa in the papal states continued producing up to a recent period. The raw material of the manuf. is A. rock, composed chiefly of alunite or A. stone. This is mixed with fuel in a furnace and after roasting exposed to the air. The mass is then lixiviated with hot water, the clear liquid drawn off and allowed to crystallise. A. is also made from A. shale, which is either allowed to decompose by exposure, or roasted. During the process, free sulphuric acid is formed, which acts upon the clay, producing aluminium sulphate, which is then dissolved out. Potassium sulphate or ammonium sulphate is added to the solution, when potash A. or ammonia A. is produced.

A. possesses a sweet astringent taste, and is used as a mordant in dyeing and in the manuf. of paper. Most As. have an acid reaction, but, if an alkali is slowly added to the solution, a precipitate is formed which is re-dissolved on stirring. If this be done until no more precipitate can be dissolved, the product is a neutral A., which is much used in dyeing, as it readily gives up alumina to the coloring matter.

**Alum Bagh**, a fort in India about 4 m. from Lucknow which, during the Indian mutiny in 1847, was used as a fortress by the rebels. It was taken by Havelock and Outram, and was later defended for a long period by the latter.

**Alum Root**, or *Heuchera Americana*, belongs to the order Saxifragaceæ and grows in N. America; it makes a valuable styptic. The term is also applied to the *Geranium maculatum*, of the order Geraniaceæ. A. R. is used for ulcers.

**Alum Shale**, a rock found in the Silurian and Devonian systems, and composed of iron pyrites, distributed through bituminous shale. It is used for the manuf. of aluminium sulphate.

**Alum Stone**, or **Alunite**, a double compound of potassium sulphate and basic aluminium sulphate. Mixed with quartz, it composes the alum rock from which alum (q.v.) is obtained.

**Aluminium** (written and pronounced in Canada and U.S.A. 'aluminum'), a metallic chemical element, symbol Al,

atomic number 13, atomic weight 26.97. The oxide alumina ( $\text{Al}_2\text{O}_3$ ) occurs in combination with silica in clays and felspar of all kinds, and is, therefore, widely distributed. The oxide is found uncombined in bauxite, corundum, emery, ruby, amethyst, sapphire, and topaz, the different colours being due to the presence of oxides of iron, cobalt, or chromium. Alumina was supposed to be an oxide long before separation into its elements was actually accomplished. A. was first produced in 1827 by Wöhler, who fused potassium and chloride of A. in a closed crucible, obtaining the metal in the form of a grey powder. Afterwards, Wöhler improved his method and succeeded in procuring the metal in a purer form in fused globules. In 1854 Deville tried the same process, but replaced the potassium by sodium, and the 'silver made from clay' of the Paris exhibition of 1855 drew much attention to the question of its economical production. The method used at the present day is the electrolysis of alumina. An iron pot, lined with carbon, is charged with cryolite and heated to about  $800^\circ\text{C}$ . by the electric current. For the electrolysis, a bundle of carbon rods is used as the anode, whilst the pot itself forms the cathode. The oxygen liberated combines with the carbon of the anode to form carbon dioxide, whilst the A. falls to the bottom of the vessel. More alumina is added and the process continued, the molten metal being drawn off from time to time.

A. is a tin-white metal which is malleable and non-magnetic, has a specific heat of  $.222^\circ$ , a sp. gr. of from 2.70, a coefficient of expansion of .0000238, and melts at  $658^\circ\text{C}$ . It is about as hard as silver under ordinary circumstances, but becomes harder on rolling. If pure, it does not oxidise easily on exposure to the air at ordinary temps., is soluble in hydrochloric acid, and forms numerous useful alloys. The properties which make A. such a valuable metal are its lightness, ease of working, non-poisonous qualities, and the fact that it is not affected by air. It is used for making cooking utensils, electric conductors, motor-car parts, and, in fact, for any purpose where saving in weight is a great consideration. The bulk of the metal is used in alloyed rather than pure form. Alloyed with a small percentage of magnesium, its hardness and toughness are considerably increased without making any material difference in its weight. See also DURALUMIN.

**Alundel Furnace**, a system of cylindrical furnaces used for the reduction of mercurial ores. Retorts of glass, called As., collect the condensed vapour.

**Alunno, Niccolò** (c. 1430-1502), an Umbrian painter of the fifteenth century who lived at Foligno. He excelled in expression, and some of his works are: The altarpiece at Deruta, 1458; a Madonna in the Duomo, Assisi, besides many other works at Assisi; an altarpiece at the church of San Niccolò, Foligno;

and 'The Saviour' and 'A Virgin of Mercy' in the Louvre. A bust of Christ in the National Gallery and a painting of Giotto, in the Univ. Gallery, Oxford, are ascribed to A.

**Alunogen**, the word used by Boudant to designate hydrous sulphate of aluminium, and popularly called alum rock. The chemical formula is  $\text{K}(\text{AlO})_2(\text{SO}_4) \cdot 3\text{H}_2\text{O}$ , and the sp. gr. is  $32.6$ . It is white with green shades through it. The substance is found in volcanic dists., and in mines and caves. From it is extracted alum proper.

**Alured, Alred or Alfred**, of Beverley, was an old Eng. chronicler and historian of the early part of the twelfth century, and treasurer of the church of Beverley. He wrote a hist. of Britain up to 1129.

**Aluta, or Alt**, a trib. of the Danube which rises in the Carpathian Mts., flows through Transylvania and Rumania, and enters the Danube near Nicopolis. The total length is c. 250 m.

**Alva, tn.** in Clackmannanshire, Scotland, at foot of Ochils, 7 m. N.E. of Stirling. It has woollen manufs. E. of the tn. is the picturesque Silver Glen. A. House is the seat of the Johnstones. Pop.: burgh 4107; par., 5120.

**Alva, or Alba, Fernando Alvarez de Toledo, Duke of** (1508-83), descendant of one of the noblest families of Spain, was a soldier from his youth. After fighting in Tunis, Germany, and Italy, he was in 1567 given, by Philip II., command in the Netherlands. Here he carried on a reign of terror till his recall in 1573.

**Alvarado, Juan Bautista**, a Californian who raised an insurrection against the Mexican Gov. in California and defeated the Mexicans in the decisive battle of San Buenaventura. From 1836 to 1838 he took the revolutionary title of governor, and from 1838 to 1842 was officially recognised by the Mexican Gov.

**Alvarado, Pedro de** (c. 1495-1541), Sp. explorer and adventurer, b. at Badajoz. His first command was in the Cuban expedition to Yucatan in 1518, and he served under Cortés in the conquest of Mexico, becoming famous in 1620 by the 'Salto de A.', a long leap by which he saved his life. In 1523 he was sent to subdue Guatemala, and was later appointed governor of that dist. by Charles V. In 1534 he made an unsuccessful expedition against Quito. He became governor of Honduras in 1537. In 1541 he was killed in an affray with the Indians near Guadalajara, Mexico.

**Alvarado**, seaport of Mexico, on riv. of same name, 40 m. S.E. of Vera Cruz. The port is too shallow to admit vessels of more than 13 ft. draught. Pop. 6000.

**Alvares, Fernam** (1540-99), Portuguese poet, b. in India. He was leader of 2 expeditions to the Coromandel coast. The most remarkable of his works is his *Lusitania Transformada*.

**Alvarez, Francisco** (d. 1540), a Portuguese traveller, was b. at Coimbra in the latter part of the fifteenth century. He was one of those sent by King

Emanuel of Portugal on an expedition to Abyssinia in 1515, and on his return to Lisbon, 1527, he wrote an account of his travels. This work, a copy of which is in the Brit. Museum, is remarkable for its simplicity and frankness.

**Alvarez, Don José** (1768-1827), an eminent Sp. sculptor, b. at Priego, Cordova. He first worked with his father, a stonemason, and obtained admission into the Academy of Granada, 1788. He afterwards became a member of the Academy of Cordova, and a student of the Academy of San Fernando, Madrid. In 1799 he received a pension from Charles IV. to study at Paris and Rome, and his statue of Ganymede, fashioned in 1804, gained for him the reputation of the greatest of contemporary sculptors. He was appointed prin. sculptor to the king of Spain, 1825. He also modelled portrait busts of Ferdinand VII., Rossini, and the duchess of Alba. A group representing the 'Defence of Saragossa' and a group of 'Antiochus and Memnon' are 2 of his chief works.

**Alvarez de Cienfuegos, Nicasio** (1764-1809), a Sp. writer, b. at Madrid. Of his tragedies the most famous are *Piloco* and *Loraida*. He was a member of the Sp. Academy.

**Alveary**: 1. A bee-hive. 2. The outer canal of the ear, *meatus externus*.

**Alvensleben, Konstantin von** (1809-92), a distinguished Prussian general, served in the Dan. war. He commanded in the Franco-Prussian war and won high distinction at Orleans and Le Mans. A fort at Metz was named after him.

**Alverstone, Richard Everard Webster, Viscount** (1842-1915). He was called to the bar in 1868, and became Q.C. 10 years later. In 1885 he became attorney-general in the Conservative Gov., though he was not a member of Parliament, and had not held the office of solicitor-general. He then entered the House of Commons as member for Launceston. He led the case as counsel for the *Tinies* against the Irish party before the Parnell Commission in 1889; he was Brit. representative in the Berlin Sea arbitration in 1893; and leading counsel in the Venezuela arbitration in 1899. In May 1900 he became master of the rolls—a position previously held by Sir Nathaniel Lindley—and was raised to the peerage. In Oct. of same year he succeeded Lord Russell of Killowen as lord chief justice; and in 1903 he was one of the 3 arbitrators on the Alaska Boundary question. Resigned in 1913 through ill-health and was made a viscount.

**Alvin, Louis Joseph** (1806-87), Belgian poet and librarian of Brussels library. Among his dramas are *Sardanapale* (1834), a tragedy, and *Le Folliculaire anonyme* (1835). He also wrote *L'Alliance de l'art et de l'industrie*, *Life of Louis Gruyer*, *Souvenirs de ma vie littéraire*, *Les Recontemplations* (a reply to Victor Hugo's work), *Le Commencement de la gravure aux Pays-Bas*, and *André van Hasselt, sa vie et ses travaux*.

**Alvincoy, Nicolas, Baron of** (1735-

1810), an Austrian commander, b. in Transylvania. He distinguished himself in the Seven Years War, and fought against the Turks in 1789. He was commander-in-chief of the Austrian army against Napoleon, but was defeated at Aroca (1796) and at Rivoli (1797), and lost Mantua. He was made governor of Hungary, and field marshal in 1808.

**Alwar**: 1. Native state in Rajputana, India, enclosed by Gurgaon, Patiala, Nabha, and Jaipur. Area 3024 sq. m.; pop. 700,000. 2. Cap. city of A. state, lying in a valley overlooked by a fortress. Pop. 48,000.

**Alyattes, king of Lydia** (c. 610-560 B.C.), estab. the Lydian empire. He made war against Miletus and against the Medes. At the Halys, where hostilities were intercepted by the occurrence of an eclipse of the sun, peace was concluded with Media, and the riv. was made the boundary between the 2 kingdoms. He greatly extended his empire before his death. His tomb is still in existence, but has been plundered by excavators. He was succeeded by Croesus.

**Alyn, N. Wales**, see ALLEN.

**Alypius** (fl. c. 360 B.C.), a Gk. authority on music and harmony of the age before Euclid. An ed. of collected fragments of his writings was ed. by Mark Meibom (*Antiquæ Musicæ Auctores Septem*) in 1652, and again by Jans (*Musici Script. Græce*) in 1895.

**Alyssum** (from the Gk. *ἄλυσσα*, madness, and a privative, a name given because according to popular belief it cured madness), a plant of the Crucifer order, found in the region of the Mediterranean and in N. Asia. The plant is cultivated in various varieties, e.g. *A. saxatile*, a rock-garden variety.

**Alyth, tn.** in E. Perthshire and co. of Angus, Scotland, on Burn of A. 26 m. N.E. of Perth. It has woollen, linen, and jute manufs. To the N.W. lies the forest of A. Pop. 1710.

**Alzey, a tn.** of Rhein-Hessen in Germany, on R. Selz, 18 m. S. of Mainz. An anc. imperial city. Had dyeing, weaving, and brewing industries. Pop. 9000.

**Amadavat, or Avadavat, *Estrilda amadava***, is a small singing bird which is to be found in the Indian Archipelago, about 5 in. long, carmine coloured, with the upper parts brownish grey and wings spotted white. Belongs to the Ploceidae family.

**Amadeo, Giovanni Antonio** (1447-1522). It. sculptor and architect; was b. at Pavia. In collaboration with others, he decorated the Certosa at Pavia. His monument of Bartolommeo Colleoni, a Venetian general, with its fine bas-reliefs and statue of the commander, in Bergamo, is one of the masterpieces of Renaissance sculpture. He also took part in the sculpture of the great octagonal dome of the cathedral of Milan. See Lübke, *History of Sculpture*, 1878.

**Amadeus**, the name of 9 counts and dukes of Savoy:

**Amadeus 1.** (d. 1078), the son of

**Adelaide**, marchioness of Susa, and of **Humbert I.**, count of Maurienne in Savoy, called the White-handed; some say he was the son of Oddo, **Humbert's** son. After his father's death he governed conjointly with his mother the states of Susa and Maurienne. This made him master of the great pass over the Alps into Italy, by Mont Cenis, from which circumstance much of the subsequent importance of his family was derived. He married a daughter of **Gerald**, count of Burgundy. **A.** was mainly instrumental in reconciling the Emperor **Henry IV.** and Pope **Gregory VII.**, and thus putting an end to the disastrous contest between the church and the empire. He *d.* soon after, and was buried in the cathedral of **St. Jean de Maurienne**.

**Amadeus II.** (1103-48) succeeded his father, **Humbert II.**, count of Maurienne. He accompanied **Henry V.** to Rome, where the latter was crowned emperor. As a reward for his fidelity **Henry** gave him the title of count of Savoy, and vicar perpetual of the empire. **A.** also took the title of marquis of Turin, and married the daughter of the count, or dauphin, as he was called, of Vienne, on the Rhone. **A.** accompanied **Louis VII.** of France to the Holy Land, distinguished himself at the siege of **Damascus**, and relieved **Acro**, which was besieged by the Turks. On his return from Syria he landed in the is. of Cyprus, where he *d.* at Nicosia of fever.

**Amadeus III.** (1233-46) succeeded his father, **Thomas**, as count of Savoy, and his brother inherited Piedmont. **A.** obliged the count of Genevois to acknowledge himself his vassal; he also conquered the Chablais and the Lower Valais, and sent troops over the Little **St. Bernard** into the valley of Aosta, and subjugated that country.

**Amadeus IV.** (1285-1323), called 'the Great,' succeeded his uncle **Philip** as count of Savoy. By his marriage with **Sybilla**, countess of Bugey and Bresse, these dists. of anc. Burgundy were united to his states, and he succeeded in otherwise extending his dominions. **A.** afterwards embarked for the E., where he assisted in the defence of Rhodes against the Turks in 1315. He *d.* at Avignon, where he had gone for the purpose of urging Pope **John XXII.** to proclaim a new crusade.

**Amadeus V.** (1329-42) succeeded his brother **Edward** as count of Savoy, and continued the war against the Dauphin of Vienne.

**Amadeus VI.** (1342-83), called the Green Count, son and successor of the preceding. In 1349 **Humbert**, last dauphin of Vienne, disgusted with the world in consequence of the death of an only son, gave up his title and principality to **Charles**, grandson of **Philip of Valois**, and retired into a Dominican convent. **A.** was not pleased at this cession, which gave him a much more formidable neighbour than he had before, and a war ensued, in which **A.** defeated the Fr. in 1354. A treaty was

concluded at Paris the following year, by which the count of Savoy gave up to France the dists. he possessed in Dauphiny beyond the Rs. Rhone and Guiers; and he, on his part, was acknowledged undisputed sovereign of Faucigny and the country of Gex, as well as suzerain lord over the counts of Genevois, all which titles had been till then subjects of contention between the counts of Savoy and the dauphins of Vienne. **A.** also obliged the marquess of Saluzzo to pay him homage, and thus extended his dominion on the It. side of the Alps. **A.'s** alliance was courted by the prin. sovereigns of his time. The Venetians and the Genoese had long quarrelled about the possession of the is. of Tenedos, in the Aegean Sea, but at last agreed to give full possession to the count of Savoy. **A.** in his old age was still thinking of another expedition against the Turks, but the Pope **Clement VII.** persuaded him first to accompany **Louis**, duke of Anjou, in his expedition to Naples, to which kingdom he was called by the adoption of Queen **Joanna I.** **A.** went in 1382 and shared in the first successes of **Louis**, who conquered the Abruzzi and Apulia. A contagious disease, however, spread through the army, and the count of Savoy was one of its earliest victims. He *d.* at Santo Stefano, in Apulia. He was the founder of the order of the Annunziata.

**Amadeus VII.** (1385-91), called the Red Count, succeeded his father, **A. VI.** He made the important acquisition of the country of Nice, by the unanimous wish of the citizens, in 1388, and the act was solemnly registered as a public document. He was killed by a fall from his horse.

**Amadeus VIII.** (1391-1451), son and successor of the preceding, was created first duke of Savoy in 1416 by the Emperor **Sigismund**, who declared the court of the duchy to be independent of the imperial chamber. **A.** waged war against **Filippo Maria Visconti**, duke of Milan, and took **Vercelli**, which he united to his dominions. He also annexed to them the country of Genevois, having purchased the rights of the various claimants after the extinction of the male line. Thus the whole of Savoy was finally united under one sovereign. He was also prince of Piedmont, baron of Vaud, lord of Nizza, Mondovi, and Valenza, duke of Aosta, etc. **A.** gave his subjects a code of laws called 'Statuta Sabaudie.' After 43 years' reign, and having lost his wife, **Maria Beatrix** of Burgundy, he retired in 1434 to the hermitage of Ripaille, a delightful spot on the Lake of Geneva, with 6 of his nobles, whom he created knights of **St. Maurice**. He entrusted the administration of his states to his son, **Louis**. For 5 years he lived at Ripaille, and here he mediated the peace of Arras between France and England. The council assembled at Basle, having deposed **Eugenius IV.** in 1439, called **A.** to the papal chair. **A.** at first refused, but being persuaded by the cardinal

of Arles, he assumed the pontifical dignity with the name of Felix V. At the same time he definitely abdicated his temporal sovereignty to his son Louis. In June 1440 the new pope proceeded to Basle, where he was solemnly crowned. France, England, Spain, Germany, and Lombardy acknowledged him as pope, whilst the rest of Italy and the Venetians supported Eugenius, who continued to reside at Rome. The schism lasted 9 years; but Eugenius having *d.*, the cardinals who were at Rome elected Nicholas V., when Felix himself proposed to renounce his rights to Nicholas, and thus terminate the scandal of the Church. He *d.* at Geneva.

**Amadeus IX.** (1465-72), duke of Savoy, succeeded his father, Louis. He was called the Pious, from his goodness and charity to the poor. He married Yolande of France, sister of Louis XI. He reigned only 8 years, and *d.* at Vercelli. He was succeeded by his son Philibert. Louis, A.'s brother, was for a while king of Cyprus, but his title to that kingdom was disputed. As heirs of Louis, however, the kings of Sardinia continued to assume the title of Cyprus.

**Amadeus**, a salt lake of S. Australia, surrounded by mts. and desert country. It was discovered in 1872 by Ernest Giles.

**Amadis de Gaula**, the hero of a famous medieval romance, owing its inspiration to the Arthurian cycle. Its date and origin are disputed, but it appears to have come from N. France through Provence to Spain, where it was well known in the fourteenth century. It survives only in a Castilian text, supposed to have been written by Montalvo towards the end of the fifteenth century. There is some evidence of an earlier Portuguese text. The oldest existing ed. appeared at Saragossa in 1508. It enjoyed a widespread popularity, being trans. into It. in 1510, into Ger. a little later, and into Fr. in 1548. Southey trans. it into Eug. in 1803.

**Amador de los Rios, Don José** (1818-1878), a Sp. writer, *b.* at Baena. His greatest work is a *Critical History of Spanish Literature*, 1861-65. He wrote besides works on Sp. art, a *History of the Jews in Spain and Portugal*, 1861, and a *History of the Town and Court of Madrid*. He was prof. of literature at the Madrid Univ. and a member of the Academy.

**Amadou** (Old Provencal *amadour*, lover) (*Polyporus fomentarius*), is a fungus which grows on old trees, and is used for stopping hæmorrhages. Boiled in strong saltpetre it forms the Ger. tinder of tobacconists.

**Amagasaki**, a seaport of Japan, situated at the bay of Asaka, on the is. of Hondo. It has a pop. of about 50,000.

**Amager**, is. of Denmark, in the Sound, and separated from Zealand by Copenhagen harbour. Christianshavn, on the N. end, forms part of Copenhagen. Possesses shipping and gardening industries. Area 25 sq. m. Pop. 100,000.

E.E. I

**Amakosa**, or **Ama-Xosa**, an important div. of the Bantu people. Their complexion is olive, nostrils broad, lips thick, hair woolly. They are sharp-witted and courageous. They inhabit chiefly Transkei, Tembuland, and Pondoland.

**Amalaric** (A.D. 506-531), the last Visigoth king of Spain, was the son of Alaric II. and grandson of Theodoric II. He was only 5 years old when his father *d.* in 506, but he was proclaimed king when he came of age. He married Clotilda, daughter of Clovis, king of the Franks, which marriage led to religious disputes and a war with Chilbert, king of Paris, the brother of Clotilda. The Spaniards were defeated in 531, when A. was killed.

**Amaldar**, a name used to designate the governor of a prov. under the Moslem rule in India.

**Amalekites**, an anct. tribe in S. Palestine, apparently connected with the Edomites, and including the Kenites, and frequently mentioned in the O.T. as foes of the Israelites. The references are disconnected and confused. The A. seem to have harried the Israelites' rear as they entered Canaan from Egypt, for which extermination was prophesied. They were defeated at various times by Joshua, Saul, David, and the Simeonites. The traditional hostility still appears in Esther.

**Amalfi**, seaport and archiepiscopal see, Campania, Italy, on the gulf of Salerno, 24 m. S.E. of Naples. Its situation is extremely picturesque, and it contains many interesting ruins and a fine Romanesque cathedral, dating from the eleventh century. In medieval times A. was of great importance, being an important centre for E. trade and an independent republic. In 1131 it was reduced by King Roger of Sicily and later taken by Pisa, after which it rapidly declined. In 1343 much of the town was destroyed by flood. The chief industry, paper manuf., is now disappearing, and the harbour is little used. Pop. 7600.

**Amalgam**, a mixture or compound of one or more metals with mercury. As. are usually obtained by direct union or by placing the metals with mercury into dilute acid. Those containing a large proportion of mercury are in a liquid form, but if there is a small proportion of mercury the A. is frequently found to crystallise. Tin A. is used for backing mirrors; tin and zinc As. are used for coating the rubbers of electrical machines; gold and silver As. are used for gilding purposes; and an A. consisting of gold, silver, copper, tin, and mercury, in varying proportions, is used for stopping teeth.

**Amalgamation**, the process of uniting or alloying a metal with mercury. It is by A. that gold and silver are extracted from the rocks in which they occur. A. processes cause the metals to combine with the mercury to form an amalgam.

**Amalia**: 1. Anna, duchess of Saxe-Weimar-Eisenach (1739-1807), *b.* at.

K

Wolfenbüttel, the daughter of the duke of Brunswick-Wolfenbüttel. Married Duke Ernest Augustus of Saxe-Weimar-Eisenach, and at his death in 1758 became regent for 17 years of her son, Carl August, in whom she and Wieland, his tutor, fostered a love of art and literature. She was distinguished by her wise rule, and especially by her patronage of letters and learning. Weimar became the literary centre of Germany, and the court was frequented by Goethe, Herder, and Schiller. 2. Elizabeth, landgravine of Hesse-Cassel (1602-51). The grand-daughter of William I., prince of Orange. In 1619 she married William V., landgrave of Hesse-Cassel, and after his death in 1637 ruled for many years as regent with great energy and wisdom.

**Amalteo**, Pomponio (1505-c. 1588), an It. painter of the Venetian school, was a pupil of Pordenone. His prin. works are the frescoes in the castle, and in the Santa Maria Church of San Vito, and in the church of San Francesco, Udine.

**Amalthæa**: 1. The nurse of the infant Zeus, represented as a goat, and from whom was taken the *cornu copie* (horn of plenty), which automatically filled itself with whatever its possessor desired. 2. The sibyl who brought to Tarquin the 9 books containing Rome's destiny.

**Amana**, township in Iowa co., Iowa, U.S.A., near Cedar Rapids. A. is the home of the A. Society, a Ger. religious communistic body, whose views and practices are closely related to the doctrines of Schwenkfeld and Boehme. Pop. 1500. Consult Bertha Schambaug's *Amana, the Community of True Inspiration*, 1908.

**Amana** (riv.), see ABANA.

**Amani**, in Tanganyika Ter., near Sigi. Here is the Anani Agric. and Research Institute, formerly the Ger. experimental station founded in 1902, in the Usambara Mts. It is now the head research and experimental station for the whole of Brit. E. Africa. Its scientific staff consists of the director, a plant pathologist, an entomologist, a soil chemist, a biochemist, a plant physiologist, a plant geneticist, and a botanist. The aim of the centre is to study problems requiring more prolonged research than can normally be expected from the technical staff of any single administrative dept., and problems arising in more than one ter. towards the solution of which the comparative method may be expected to make an effective contribution. (Report of the Imperial Agric. Research Conference, 1927; Hailey, *An African Survey*, 1938.) The experimental grounds range over an altitude of from 1300 to 3600 ft., with a rainfall of 75 in., and include a sub-station near Tengenji not much above sea-level. Associated with it is the Lyamungu Coffee Research Station.

**Amanita** is a sub-genus of the fungus *Agaricus* (q.v.). *A. muscaria* is a poisonous plant of a bright orange-red colour, with white swellings.

**Amanullah Khan**, b. 1892, ex-king of Afghanistan, third son of Habibullah Khan, on whose assassination he became amir in 1919. He adopted the title of king instead of amir in 1926, and his second wife, Surayya, a Damascus woman, whom he married in 1914, became queen consort, her official style being the Shah Khanum. Made war on Brit. forces in 1918-19. In 1928 made an extensive tour of Europe with Queen Surayya to study W. institutions, but the outcome of his reformatory zeal was disastrous and he lost his throne (see also AFGHANISTAN).

**Amapala**, only port on Pacific coast of Honduras; situated in Fonseca Bay. Its roadstead is deep enough for the largest vessels to lie within a few yds. of shore. Silver, timber, and coffee are exported. Pop. 3000.

**Amapala Gulf**, see FONSECA.

**Amputaland**, a protectorate in Zululand, created by proclamation of Nov. 22, 1887, and annexed to Zululand in 1897. It now forms part of the prov.

**Amarantus**, or **Amaranth**, is a genus of the order Amarantaceæ. It is found in tropical and temperate climates. Some of the species are well-known Brit. plants, e.g. *A. caudatus*, love-lies-bleeding.

**Amarapura**, former cap. of Burma, on R. Irrawadi, 6 m. N.E. of Ava. Founded in 1783, it suffered from fire in 1810, and from earthquake in 1839. In 1860 Mandalay became the cap. and A. has now fallen into ruins.

**Amara-Sinha** (fl. c. A.D. 375), a famous Hindu poet and lexicographer, was the author of a vocabulary of the Sanskrit language known as *Amara Kosha*. Little is known about him save that he was a Buddhist and that most of his works were destroyed by the orthodox Brahmins.

**Amargosa Desert**, see DEATH VALLEY.

**Amari, Michele** (1806-89), It. historian and orientalist, b. at Palermo, and entered the gov. service. His most famous work, *La Guerra del Vespro Siciliano* (1841), was prohibited, and he fled to France, where he studied Arabic and modern Gk. During the revolution of 1848 he returned to Italy, and was made vice-president of the committee of war in Sicily, later visiting France and England on diplomatic missions. He remained in Paris till 1859, when he again returned to Italy to fight under Garibaldi. He was minister of public instruction, 1862-64, and prof. of Arabic at Pisa and Florence till 1878, when he removed to Rome.

**Amarna**, see TEL AL-AMARNA.

**Amaru**, José Gabriel Condorcanqui (1742-81), a revolutionary of Peru, and known as the 'last of the Incas.' He was leader of the opposition party to the Spaniards, but suffered defeat, and he and his house were put to death with extreme cruelty.

**Amaryllidaceæ** is an order of monocotyledonous plants which differ from the Liliaceæ in having an inferior ovary. They grow best in tropical Asia, Africa,

and Brazil, but some are European. The perianth leaves are in 2 whorls of 3 joined, the stamens are the same, the ovary is trilobular and inferior; many of the plants have a well-developed corona. *Narcissus pseudo-narcissus*, the daffodil, and *Galanthus nivalis*, the snow-drop, belong to this order.

**Amaryllis**, a genus of Amaryllidaceæ (q.v.), so called from Virgil's shepherdess of that name. *A. belladonna*, the belladonna lily, grows in Cape Colony.

**Amasa**, son of the Ishmaelite Ithra and of Abigail, sister of David. He commanded Absalom's army; after his defeat by Joab he submitted to David and replaced Joab as the latter's chief commander. Joab treacherously slew him at 'the great stone of Gideon.' The name means burden. See 2 Sam. xvii. and xx.

**Amasia**, ant. tn. and vilayet, Asiatic Turkey, in valley of Yesil-Irmak. Formerly court of kings of Pontus. Exports silk and salt. Pop. 30,000.

**Amasis**: 1. Amasis I. (c. 1635-1578 B.C.), first Pharaoh of eighteenth dynasty. He expelled the Hyksos from Egypt and began conquests in Asia. 2. Amasis II. (570-526 B.C.), 28th Pharaoh of twenty-second dynasty. Fought against Nebuchadnezzar; conquered Cyprus, and had much communication with Greece.

**Amateur** is a Fr. word derived from the Lat. *amare*, to love, and means one who follows any pursuit from inclination, actuated by no desire for gain. The word was at first used to denote a person who had a particular aptitude for any art, or a penchant towards a scientific pursuit. In general, it meant any one who had a taste for the fine arts. This meaning of the word is not now so often used; with the rise of professionalism in all sports, A. is employed as the antithesis of professional. The monetary consideration still forms the dividing line between the two classes in all pursuits, but no general definition can be given which would apply to all As. Alike, as the governing bodies of various sports are by no means in accord as to what constitutes professionalism. Thus, the A. Athletic Association defines as an A. 'one who has never competed for a money prize or staked bet, or with or against a professional for any prize, or who has never taught, pursued, or assisted in the practice of any athletic exercises as a means of gaining a livelihood.' The rules of the A. Rowing Association are somewhat stricter. In addition to excluding any person who has competed for money, or with a professional, or taught for profit, their rules exclude also from being an A. oarsman, sculler, or coxswain any one who has ever been employed in or about boats or in manual labour for money or wages, and any one who is, or has been, by employment a mechanic, artisan, or labourer, or engaged in any menial duty. The rules of cycling differ somewhat, and certain competitions are allowed between As. and professionals. In cricket an

A. is, of course, not supposed to receive monetary rewards for playing, but the number of lucrative sinecures found for clever As. has caused it to be said that the difference in their case is that an A. receives much more money than the professional. The line is somewhat difficult to draw in golf, but an A. is generally considered to be one who does not play for or accept money prizes in competitions open to professionals.

**Amati**, the name of a family of It. violin makers and the founders of the Cremona school. Their instruments are now esteemed of priceless value. Andrea, the eldest, was b. c. 1520 and d. c. 1578. According to Fétis he was probably a pupil of one of the master violin-makers of Brescia—Gaspar da Salo or Maggini. But according to Dr. Fellowes's article in Grove (3rd ed.) he was not a pupil of these makers but a contemporary. In his instruments we can see the evolution of the violin out of the viol—in fact Andrea made viols as well as the newer violin. His workmanship far excels that of the older masters. Unfortunately the delicacy of the fabric he used in their manuf. has little favoured the preservation of Andrea's violins. They are strikingly original, but still preserve the antique Brescian upright sound-hole. The shape is extremely elegant, and the workmanship singularly fine. The belly and back of the violins are high in proportion to their other parts. The finish is amber varnish. This pattern produced exquisitely clear, sweet, and delicate tones, but the volume of sound was proportionately small. The tone of the fourth string was particularly weak. Andrea also made violoncellos and tenors. Andrea was succeeded by 2 sons, Antonio (1550-1638) and Geronimo (1551-1635), whose services to the craft were also signal. However, it was Nicolo (1596-1684), son of Geronimo, who was the greatest of the family. His violins have what the violins of the first lack—intensity and richness. This was acquired by using thicker wood and reducing the elevation. Stradivarius was the pupil of Nicolo. The fame of their descendant has somewhat eclipsed the renown of Andrea and his sons, but they will always be remembered for their pioneer work in the introduction of a new craft into Italy.

**Amatitlán**, a dept., tn., and lake in Guatemala. The tn. of A., situated on the lake, was once a flourishing centre for the manuf. of cochineal, but changes in the dyeing processes have killed its prosperity.

**Amato**, Giovanni Antonio d' (1475-1555) was a distinguished It. painter. He painted in oil and in fresco, but almost all his frescoes have disappeared, and his style is very similar to that of Perugino.

**Amato**, or **Amatus**, Joannes Rodericus (1511-68), often called Amatus Lusitanus, was b. at Castel-Branco, Beira, Portugal, and was an eminent physician. He travelled in France, the Netherlands, Germany, and Italy, and practised his profession in Ancona till 1555, and from

there he went to Pesaro and Thessalonica (Salonika). His 2 works, *Exegemet a in Prioris Duos Dioscoridis de Materia Medica Libros* (Antwerp, 1536), called in subsequent eds. *Enarrationes in Dioscoridem* and *Curationum Medicinalium Centuria Septem*, show an intimate acquaintance with the writings of the Gk. and Arabic physicians, and contain curious notices both in medicine and in natural hist.

**Amatol**, see EXPLOSIVES.

**Amatongaland** (Tongaland), a portion of the colony of Natal, situated on the E. coast of S. Africa, N. of Zululand and S. of Portuguese E. Africa. The inhab. are chiefly Tongas, a div. of the Bantu race, and number about 40,000. A. was annexed to Natal in 1897, being previously a part of Zululand. Prior to that time it was ruled by an hereditary dynasty under Brit. supervision. The area is 600 sq. m.

**Amatrice**, Cola dell', painter and architect of Naples, *fl.* in the first half of the sixteenth century. His work shows the influence of Raphael, Michelangelo, and the other masters, but does not reach their level of excellence. Among his paintings perhaps the best is the 'Death and Assumption of the Virgin,' in the Capitol.

**Amaurosis** (Gk. *ἀμαυρόσις*, dark) is total blindness where the outward appearance of the eye is unaffected, and usually caused by affections of the brain.

**Ama-Xosa**, see AMIAKOSA.

**Amaziah**, or **Amaziah** (c. 838-809 B.C.), literally means 'one strengthened by Jehovah,' and is the name of the ninth king of Judah, who reigned for about 29 years, succeeding his father Jehoash. He avenged his father's murder (2 Kings xiv. 5; 2 Chron. xxv. 3), and fought with the Edomites, gaining a great victory in the Valley of Salt, and taking *Selah* of Petra. He next declared war against Jehoash, king of Israel, but was defeated and taken prisoner. Jerusalem was also taken and plundered. A., after having recovered his liberty, was slain at Lachish, where he fled when a conspiracy was formed against him.

**Amazon**, the largest riv. in the world, flows through S. America. It has a great network of tribs. which drain and water a vast extent of ter. It is also designated by various savage names according to the localities through which it flows. To this riv., or a portion of it, the name *Marañon* is frequently applied. Though some hold that *Marañon* is of Indian derivation, modern geographers incline to trace it to the Sp. word *maraña*, which means (1), tangled underwood; (2), a tangled skein; and conclude that the word describes the tortuous course of the riv. or the rough country through which it flows. So also geographers tend to reserve the name *Marañon* for the more N. of the 2 head affluents of the A. The riv. was first discovered by Vicente Yañez Pinzon, a Spaniard. He called it the *Rio Santa Maria de la Mar Dulce*, afterwards corrupted into *Mar Dulce*. The word

A., the most general name for the riv., is said to be derived from the Indian word *amassona*, a boat-destroyer, because the riv. at certain places and in certain seasons is very dangerous; but the name may simply have been suggested by the encounters of the early Sp. explorers with the fighting women of savage tribes. Some difficulty in distinguishing the affluents makes the exact estimation of the length of the riv. itself subject to dispute. The maximum length given is 4000 m., and, with its tribs., the A. is said to possess 30,000 m. of navigable waterways; so great is the volume of water discharged from its mouth, that fresh water is said to be found on the surface of the ocean 40 m. out. The riv. and its tribs. drain an immense area—nearly one-half of S. America. The prin. tribs. are the Tocantins, the Xingú, the Tapajós, the Madeira, the Purús, the Ucayali, the Negro, the Yapura, the Nago, and the Morona. The Casiquiare, a unique natural canal, covering 180 m., connects the Orinoco with the Rio Negro, and is a most interesting natural phenomenon. The riv. with its tribs. to a large extent is navigable, but is rendered dangerous by floods and rapids, e.g. the tidal phenomenon called the bore or Pororoca in the main stream of the lower riv. The natural resources of the place have consequently been slow in development. The riv. flows through deep gorges and vast forest stretches which are but thinly populated. The climate is naturally hot and vaporous, but is rendered equable by trade winds which blow regularly through the dry season. The riv. abounds in fish, but eatable meat and fruit are difficult to procure in the locality. The A. is subject to ann. inundations. The waters rise early in Nov. and reach their maximum height in June, and then the volume decreases steadily till the end of Oct. The rise and fall of some of the affluents is not coincident. The riv. is navigable for ocean steamers for upwards of 2500 m., Iquitos, in Peru, being at the head of ocean navigation. Belém, or Para, on the Tocantins channel, and Manaus, on the Negro, are the 2 chief ports. The main channel of the A., though 50 m. wide, is dangerous to navigation owing to shifting is. and sand-banks; ocean vessels therefore use the Tocantins channel 200 m. to the S. In 1867 the riv. was opened to the commerce of all nations at certain points, i.e. Tabatinga on the A.; Cameta on the Tocantins; Santarém on the Tapajós; Borba on the Madeira; Manaus on the Rio Negro. The forest tracts which the great riv. divides are to a large extent undisturbed. Through the tangled growths the sun scarcely penetrates, and the fauna and flora are still incompletely classified, though several scientific expeditions have been made with that object. The most notable product of the basin is rubber, which early in the century was exported in large quantities. Being wild rubber and difficult to collect, however, it stood no

chance in competition with the rubber of the E. Indies as soon as the plantations came into bearing. During the First World War, therefore, when shipping was scarce and few imports could be relied upon, the inhab. of the A. basin turned again to the growing of sugarcane, corn, manioc, brazil nuts, cinchona, cotton, tobacco, ipecacuanha, sarsaparilla, and vanilla, all of which are now exported, especially sugar, in large and increasing quantities. Some rubber is also exported, chiefly from Belém and Manaus. So far progress in trade and agriculture has been hampered by the difficulty of obtaining food supplies and inadequate transportation facilities. The Mamoré-Madeira railway, 220 m. in length, which was opened in 1912, has reduced transport difficulties in one direction, by circumventing the 200 m. of rapids and falls of the great Madeira. Expeditions to study the industrial possibilities of the dist., as the Fleming expedition of 1919, and that of the Amer. Rubber Mission in 1923-24, give further promise of future development. As yet, however, the land is for the most part still virgin and very difficult of access. Further knowledge was gained of the ter. in 1924, when an expedition under Dr. Hamilton Iltis explored and mapped the Rio Negro with the aid of a hydroplane. The population of the A. basin is estimated at 1,500,000. See A. R. Wallace, *A Narrative of Travels on the Amazon and Rio Negro*, 1853; H. W. Bates, *The Naturalist on the River Amazon*, 1863; J. Orton, *The Andes and the Amazon*, 1870; H. M. Tomlinson, *The Sea and the Jungle*, 1912; J. F. Woodroffe, *The Upper Reaches of the Amazon*, 1914; K. G. Grubb, *Amazon and Andes*, 1930; P. Flemining, *Brazilian Adventure*, 1933; F. McDermott, *The Amazing Amazon*, 1933; A. S. N. Wadia, *A Thousand Miles up the Amazon*, 1936; and W. N. Merryman, *Northern Caballero*, 1941.

**Amazonas**: 1. The northernmost and largest prov. of Brazil and a federal state of the republic. It is watered by the Amazon, and has an area of 731,360 sq. m. The country for the most part is plain-land, covered with vast undisturbed forests, and subject to annual flooding. The chief products are india-rubber, brazil nuts, and cacao. Valuable vegetable products are also found. The cap., Manaus, is a flourishing tn. Pop. 450,000. 2. A N. prov. of Peru. Area 13,943 sq. m. The natural barriers of the country greatly impede trade, though Chachapoyas, the cap., has a fine cathedral and univ. Pop. about 65,000. 3. A ter. in extreme S. of Venezuela, adjoining 1. It is drained by the Orinoco and Rio Negro. It is covered with dense forests. Cap. Atures. Pop. 42,000.

**Amazons**, a mythical race of warrior women, associated with the riv. Thermodon in Cappadocia. They had no males in their tribes, and their unions with their male neighbours were only temporary and for the sake of the procreation of children, among which male infants

were destroyed or banished. In Homer the A. are said, in the reign of Iobates, to have invaded Lycia, but were conquered by Bellerophon. One of the labours of Heracles was to seize the girdle of the A. queen, Hippolyte. Among the most famous of the legends of the A. are those of their alliance with Priam in the Trojan war and of their invasion of Attica. In the former adventure, Queen Penthesilea was an ally of Priam, but was slain by Achilles. The grief of Achilles when he discovered his victim was a favourite subject of anct. art. In the latter adventure they were defeated by Theseus, and their queen, Antiope, had a son, Hippolytus, by him. The Amazonian legends seem to have grown out of the warlike attitude of the women of the savage Thracian tribes—women much freer and more robust than the women of Greece. In art they are represented with the right breast bared.

**Ambala**, or **Umballa**, the name of a dist. of N. India and its chief city. Here was ratified, in 1869, the treaty between Lord Mayo, governor-general of India, and the Amir Sher Ali of Afghanistan. The tn. has many fine public buildings. Pop. 90,000.

**Ambassadors**, diplomatic envoys sent by a king, or the head of a great state, to a foreign gov. to represent him, negotiate his affairs, and guard the home interests abroad. He bears credentials in the form of a sealed letter addressed by the sovereign who sends the embassy, by which it is understood that his negotiations will be regarded as if transacted by the sovereign himself. Tradition has estab. that only important kingdoms and states are at liberty to negotiate by means of A. proper. Lesser states negotiate by means of ministers of the second rank. An A. is distinguished from a minister of the second rank by the right of transacting his negotiations in the king's presence in public and private, but in practice the sovereign with whom he has transactions is always attended by a few of his ministers. As representing the person of the sovereign, an A. is entertained at the foreign court with great ceremony and pomp. He is not subject to the laws of the state wherein he is resident, and the exemption applies also to his suite, but violent abuse of this privilege may lead to his recall.

**Ambato**, see **HAMBATO**.

**Ambeer**, or **Amber**, the anct. cap. of Jaipur, Rajputana, India, about 5 m. from the city of Jaipur. The present cap. It is now in ruins, which are a testimony of its former splendour.

**Amber**, a resinous fossil. The name is Arabic, but has reached us through the Fr. Thales, one of the 7 sages of Greece, discovered its power of attraction when subjected to friction. Friction really generates in amber negative electricity, and the word electricity is itself derived from the Gk. word ἤλεκτρον, meaning A. A., though now obtained like a mineral product, was originally a distillation from an extinct coniferous

tree. It frequently preserves within itself plant-structures and insects. The Gk. legend is an explanation of its resinous origin. A. among the ancients was said to be the tears of the sisters of Phaethon, who, on account of their grief for his death, were metamorphosed into poplars. A. is of a golden hue varying greatly in intensity. The bluish tints occur when pyrites are present. Sometimes A. is transparent and sometimes opaque. The cloudy appearance is caused by imprisoned bubbles. The chemical formula is  $C_{10}H_{16}O$ . Succinic acid is obtained from A. by dry distillation, and it is this that produces the aromatic odour familiar to those who have burned the substance. A. is obtained in greatest quantities at the Baltic. After storms quantities of A. are found cast up on the shore. Systematic dredging and mining operations are carried on in the sea and in the 'blue earth.' A. has a wide distribution, being found in varying quantities in Europe, Australasia, and America. A., when immersed in a hot oil-bath, becomes soft, and pieces of it may be fused by dipping the required parts in hot oil and pressing. A. is largely used for personal adornments, vases, mouthpieces of pipes, etc. An artificial A. is occasionally substituted composed of copal, camphor, and turpentine, which is detected by the fact that it melts in cold ether, whereas real A. remains unchanged.

**Amber Fish**, a dark-coloured fish of genus *Seriola* with decurved snout.

**Amberg**, a tn. of Germany, in Bavaria, and once the cap. of the Upper Palatinate. It has fine buildings and once had many thriving industries. Pop. 28,000.

**Amberger**, Christoph (c. 1490-1563), a Ger. painter, was b. at Nuremberg and d. at Augsburg. He painted in oil and in fresco chiefly portraits, the most important of which are: The Emperor Charles V. (1532), Berlin Museum; Hieronymus Sulzer (1542), Gotha; Sebastian Münster (1552), Berlin Museum; 'A Portrait of a Man,' Brussels Museum; and a Madonna in the cathedral of Augsburg.

**Ambergris**, a fatty substance excreted by the sperm whale, probably a pathologic product. It has a fragrant musky odour when warmed, and is used in perfumery and also as a medicine in catarrh and nervous diseases.

**Ambert**, industrial tn. in Puy-de-Dôme, France. Its chief historic interest is an old church of the fifteenth century. Pop. 6800.

**Ambianum**, the Lat. form of Amiens, used in documents and in bibliography.

**Ambidexterity**, the capacity of using both hands indifferently. Some philosophers maintain that man is born ambidextrous, and that the habit of using the right hand in preference to the left is acquired. An argument against this theory is the fact that nearly all savage peoples use the right hand more than the left. A. is cultivated in certain schools of drawing.

**Ambie**, a mrkt. tn. and port in North-

umberland, England, near the mouth of the Coquet, and not far from Warkworth. Pop. 4300.

**Ambleside**, a mrkt. vil. in the Lake dist. of Westmorland. It is picturesquely situated, and is surrounded by beautiful hills. It has many literary associations. In its vicinity are Rydal Mount, the famous house of Wordsworth; Fox How, a summer residence of Thomas Arnold; and the Knoll, the home of Miss Martineau. It is an attractive resort for tourists. Pop. 2400.

**Amblygonite**, a mineral similar in appearance to felspar. It is a lithium and aluminium fluophosphate,  $Li(AlF)PO_4$ , and is used in commerce for the extraction of lithium.

**Amblyopia**, dimness of vision not due to refractive errors or organic disease of the eye. It may be congenital or acquired. In the latter case it is sometimes due to hysteria, but more often to the use of tobacco or alcohol, and in some cases to other drugs, or lead poisoning. The condition is progressive and may ultimately, though rarely, lead to total blindness. The centre of the field of vision is most affected, and there are blind spots for both red and green. The cause is said to be retrolbular neuritis or inflammation of the eyeball part of the optic nerve. The treatment consists in rest and nourishment of the system, and the abandonment of the predisposing cause, if it be the use of tobacco, alcohol, or other drugs.

**Amblyopsis** (Gk. ἀμβλῶς, obtuse, ὄψ, eye), a bony fish found in Kentucky. Its name arises from the condition of its eyes, which are covered by the skin.

**Amblypoda**, an extinct species of mammal which had 5-toes on each foot ending in hoofs and not nails. A. belonged to the Eocene period. In size they were not less than the elephant. Remains of the group are found in Eng. soil, but the best specimens have come from N. America. A. were represented in Europe by the Coryphodon.

**Amblystoma** (Gk. ἀμβλῶς, obtuse, στόμα, mouth), a genus of salamanders of the order Urodela, found in N. and S. America. The larva of *A. tigrinum* is the axolotl, which at this stage may become sexually mature and lay eggs; it occurs in the U.S.A., Vancouver, and Mexico. Some axolotls never normally metamorphose into A., but may be made to undergo the change by administration of thyroid gland.

**Ambo** (Gk. ἀμβω, from ἀναβαίνειν), the reading-desk of early basilican churches, superseded by the pulpit.

**Amboise**, an historic Fr. tn. on the Loire in the dept. of Indre-et-Loire. It is situated amid beautiful vineyards and gardens, and the country is called the Garden of France. The castle of A. is of great historical interest. It embraces the famous Logis du Roi, built by Charles VIII., and the chapel of St. Hubert, containing the remains of Leonardo da Vinci. Many other beautiful specimens of medieval architecture are in the tn. It is the scene of the

conspiracy of A., a disastrous Huguenot plot, 1560, and of the edict of A., 1563, conceding freedom of worship to the Huguenots. Pop. 4100.

**Amboise, Georges d'** (1460-1510), a Fr. cardinal and statesman. He came of a noble family of Fr. diplomats. As a youth he attached himself to the duke of Orleans, and through his influence was made archbishop of Narbonne and subsequently of Rouen. On the accession of the duke of Orleans to the throne as Louis XII., A. was made cardinal and prime minister. His foreign and domestic policy were moderate and beneficial. On the death of Alexander VI. he aspired to the papal see, but failed, and the remainder of his life was occupied with abortive scheming. He d. at Lyons after returning from an It. invasion. He was buried at Rouen, where a fine tomb was erected.

**Amboyna**, a Dutch residency forming since 1927 with Ternate residency the gov. of the Moluccas; also an is. and tn., area of residency about 20,000 sq. m. Pop. 405,000. The is. has an area of 266 sq. m. Pop. of is. 40,000, of tn. 11,726, of whom 1453 are Europeans and Eurasians. The tn. of A. is a well-built place with broad straight streets, often treelined. It lies at the head of the bay, which is over 5 m. wide at its entrance. Jap. forces landed on the is., Jan. 31, 1942, and were in complete occupation by Feb. 7. The second largest naval and air base (after Surabaya) in the Dutch E. Indies, A. was heavily bombed on Jan. 30, 1942, by Jap. planes and later 3 Jap. cruisers and 6 destroyers with a number of transports began the invasion of the is. Despite bitter resistance A. fell to the Jap. on Feb. 2 (1942). Surrendered by the Jap. in 1945.

**Ambracia**, a tn. of anct. Epirus. It was colonised c. 640 B.C. by Corinth. It became a democracy, but retained strong allegiance to Corinth. In the Peloponnesian war it played an important part. During the Macedonian supremacy it was autonomous, but eventually became the cap. of Pyrrhus's kingdom.

**Ambrée, Mary**, the heroine of one of the ballads in Percy's *Reliques*. At the siege of Ghent she distinguished herself as a soldier and fought against the Spaniards to avenge the death of her betrothed. Her name occurs sev. times in the plays of Ben Jonson, and was used as a synonym for a virago.

**Amoridge**, a bor. in Beaver co., Pennsylvania, U.S.A. Pop. 20,000.

**Ambriz**, a Portuguese seaport of W. Africa, which exports produce of the numerous plantations of the dist., principally vegetable oils.

**Ambrose, St.** (c. 340-97), one of the most famous fathers of the Church, was b. at Trèves, where his father was prefect of Gaul. He shares, with others, the legend that a heaven-favoured career was predicted for him by the omen of bees swarming on his lips in infancy. He rose to the position of prefect, with headquarters at Milan, and succeeded to the bishopric of Milan in

the year 374. The anniversary of his acceptance of this honour is now marked with a festival in the Catholic Church. In his new capacity he was scrupulously pious, and renounced his wealth and former connections. He was no respecter of persons, and did not hesitate to excommunicate for a time Theodosius, emperor of the E., on account of his consent to the massacre of the Thessalonians. A., as president of the synod at Aquileia in 381, won a memorable victory over the Arian heretics. He also successfully opposed Aurelius Symmachus, who had presented to Valentinian II. a petition for the restoration of divers pagan rites. His victory was largely due to his popularity. The piety of his life, his generosity and sympathy, had drawn to him the hearts of the people. He united to his theological abilities keen political genius, and his diplomatic services to the emperor were signal. He wrote homilies, exegeses, commentaries, but it is on his hymns that his fame mainly rests. Among these are numbered *Eterne rerum conditor* and *Veni redemptor gentium*. To him St. Augustine was greatly indebted. Bigotry was, perhaps, his worst failing.

**Ambrosia**, a term used by the ancients to designate the food of the gods, while their drink was called nectar. The word signifies immortal, and A. was said to be able to bestow immortality on mortals, as in the case of Tithonus and Berenice. A. was also applied to wounds in story, and used as an unguent for the hair.

**Ambrosian Chant**, the name given to the collected music of the early Church, arranged by Ambrose, bishop of Milan, in the fourth century. Of these chants we have no extant specimens, or, if we have, they are indistinguishable from the Gregorian chants of Pope Gregory, by which they were superseded in the sixth century.

**Ambrosian Library**, a famous library at Milan founded (1809) in memory of St. Ambrose by Cardinal Borromeo. It numbers 400,000 vols. and 10,000 MSS. Among its most famous possessions are a Gk. Pentateuch, fifth century, a Josephus on papyrus, a Plautus, and a commentary on the Psalms by St. Jerome. In air attacks in the Second World War fire severely damaged the building, but the most valuable contents were saved from destruction.

**Ambrosius Aurelianus, fl.** in the fifth century. He was king of Britain, and drove the Saxon invaders under Hengist and Horsa to the is. of Thanet. He is said to have been of Rom. stock in the *Historia Brittonum*. Geoffrey of Monmouth, however, calls him a son of Arthur.

**Amby** (Lat. *armarium*, Fr. *armoire*), a cupboard or niche in a wall to hold utensils, etc. It is sometimes written in the form *almery*, being confused with almonry and taken to mean a place for alms. The word is usually applied to a locker in churches wherein were placed sacramental vessels, vestments, etc.

In its corrupt usage the word was formerly applied to the almonry of Westminster Abbey.

**Ambulance** (from the Lat. *ambulare*, to go, through the Fr. *hôpital ambulant*), a conveyance in which the disabled in battle or in civil life are removed to hospital, or in which patients are treated in default of hospital wards. For field use A. wagons were first introduced by the Fr. as late as the end of the eighteenth century. Larrey (1766-1842) was the inventor, and had the fervent support of Napoleon. Improvements were made

ship. Various independent charitable societies render A. aid in time of war. A civil A. association was first organised in England in 1878 by the Knights of St. John. This society provided training in first aid, that assistance might be at hand for those who sustained injuries in civil life. The success of the enterprise led to the formation of A. corps in all parts of the country, and now policemen, railway-men, and factory employees hold certificates of the association. This society also provides auxiliary relief forces which co-operate with the Royal Army Medical Corps in treating the injured and wounded in time of war. The evolution of A. work has been rapid and a notable success.

**Ambulatory**, in architecture, the space enclosed by a colonnade or an arcade. It is the name used for any part of a building intended for walking in, as the aisles of a cathedral or church. In the peripteral temple of the Gks. the lateral or flanking porticoes are properly termed A.; and the cloister of a monastery is surrounded by an A.

**Ambuscade**, or **Ambush** (obsolete Embush). Both words are derived ultimately from the late Lat. *imboscare*. As the derivation shows, this term originally signified a military manœuvre whereby troops were concealed in wooded ground in order to make a covert attack on the enemy, but now the word is more loosely used to denote a surprise attack of any description. An A. is an obvious manœuvre of self-defence and is employed in the most rudimentary warfare. Ditches, trenches, and covers of that nature are merely developments of this simple ruse. The great advantage to be derived from an A. is the fact that by its skilful manipulation a small company of men may gain the supremacy over troops which far outnumber them. The wide range of modern appurtenances of war and more advanced military tactics have made the employment of the simple ambush useless.

**Ameer**, see **EMIR**.

**Ameland** is one of the Friesian Is. situated off the coast of Friesland, Holland. The people are mostly fishermen. Pop. 3000.

**Amelia**: 1. A port on Pemba Bay on the E. coast of Africa and cap. of Portuguese Nyasaland. 2. An is. in Nassau, Florida, U.S.A., about 17 m. long.

**Amélie-les-Bains**, a coast tn. of S.W. France in the dept. of Pyrénées-Orientales. The sulphur springs were famous in anct. times, and remains of Rom. baths are still to be seen. The resort is frequented in summer and winter by sufferers from rheumatism and consumption. In 1840 the name of the place was changed from *Bains d'Arles* in honour of Queen Marie-Amélie. Pop. 1247.

**Amelli**, **Guerrino** (1848-1933), It. critic and historian of sacred music, b. at Milan. Joined the monks of San Benedetto at Monte Cassino, assuming the name of Ambrogio. In 1881 he founded the *Associazione Italiana Santa Cecilia* and

Lomas

INTERIOR OF A ST. JOHN'S AMBULANCE

by the Fr. on the method of Larrey, e.g. a corps of stretcher-bearers was organised. In the Crimean war the Brit. had no systematic A. corps, and attention to this dept. was only given after Lord Herbert's commission of 1857-58. This method of first aid was subsequently adopted by other powers, and by the convention of Geneva (1864) the patients and the A. staff were secured neutral protection. The A. wagon of the Brit. Army prior to the First World War was a canvas-covered vehicle marked with the Geneva cross, and is now constructed to hold 4 stretchers and 6 men seated. It is light and adaptable for quick transport. During action stretcher-bearers pick up a wounded man as he falls, and he is then treated with first-field dressing. Thereafter he is carried on an A. wagon of the first line of assistance to the dressing-station. Should his wounds be of a serious nature, he is removed in a wagon of the second line to the field hospital. Thence, if necessary, he is conveyed to the general hospital or home in a hospital

the next year a higher school of sacred music in Milan. The movement was officially recognised by Pope Leo XIII in 1884 and had its triumph in the famous *Motu Proprio* of Pius X.

**Amen**, a Heb. liturgical word of affirmation. It is used as a response at the conclusion of a doxology, prayer, etc. Justin Martyr is the first of the fathers who speaks of this use of the response. The word varies in meaning according to its position. It has usually a final or detached position, and signifies 'So let it be.' The use in the gospels of the word A. (or more frequently the double A. trans. in the A.V. 'verily, verily') is peculiar. The 'flat' force of the word is there lost, and it serves merely to lay stress on some important statement about to be made.

**Amende Honorable** was in the old Fr. laws a public confession made by persons guilty of crimes coming under the head of public scandals, and was accounted an infamous punishment. It might also be a public acknowledgment of an injury to the reputation and honour of another; and in England the expression is used when a person publicly admits any wrong done to another.

**Amendment**, a legal term signifying the correction of mistakes in the written records of judicial proceedings. For A. in the sense used in parliament and public meetings, see **PARLIAMENTARY PROCEDURE**. In anct. times, after the proceedings were once entered on record, the judges considered that they had no authority by the common law to alter them in any respect, however trifling. This led to much inconvenience, for it frequently happened that one of the parties to a suit would discover some blunder in the record made by the officer of the court, and by bringing a writ of error deprived the successful party of all benefit from the judgment. The judges would appear to have been guided by this rigid observance of words by an ordinance of Edward I., which directed them to record the pleas pleaded before them, but forbids them 'to make their records a warrant for their own misdoings, or to erase or amend them, or to record anything against their previous enrolments.' The inconvenience of this rigid adherence to this ordinance led to a series of enactments called statutes of A. and statutes of *jofoils* (*jeo fail* or *j'at faille*), by the former of which authority was given to amend certain specific errors in the records, and by the latter judges were empowered to proceed to judgment notwithstanding such errors. The tenacity with which judges clung to their position of refusing to alter even the error of a letter in record or indictment (a position entirely laudable in principle) necessitated amending statutes from the time of Edward III. to the present day. Almost any A. is now allowed in civil causes, provided that the A. does not subject the defendant to a larger pecuniary liability or embarrassment or surprise him. In criminal

causes the practice is more stringent, and once the indictment has been formulated at the assizes no A. is allowed. This stringency does not apply to the early stages of a criminal cause in the magistrate's court, and it is for this reason that defence is so often reserved till after the committal of the prisoner to the assize court. The present law and practice of the courts is based mainly upon the Judicature Act, 1873, and, in Scotch courts, on the Court of Sessions Act, 1868.

**Amenemhat**, the name of 4 Egyptian kings of the XIIIth dynasty. See **EGYPT**—*The Middle Kingdom*.

**Amenhotep**, **Amenophis**, or **Ammenophis**, the name of 4 famous early Pharaohs of Egypt. A. I. (c. 1570 B.C.) was the son of Amasis I., conquered Ethiopia and subdued the Libyans. A. II., son of Thothmes III., fl. c. 1500 B.C. He devoted his reign to composing his kingdom and improving the architecture. A. III., son of Thothmes IV., fl. c. 1450 B.C. He also devoted his reign to building. He constructed the great temples at Thebes, of which the ruins of the temple of Luxor remain. The Vocal Memnon, mentioned in Herodotus and Tacitus, was built for him. A. IV. was Akhnaton (q.v.).

**Amenorrhoea**, see under **MENSTRUATION**. **Amentet**, in Egyptian mythology, the 'Hidden Land' or Egyptian Otherworld, and, like most places of the dead, situated in the W. with the setting sun. The chief dweller in A. is Osiris, in his form of a mummy. With him the dead are identified and aspire, like the sun god, to pass through A. to paradise.

**Amenthes**, the lower world of the anct. Egyptians. Thither the dead were conducted by the goddess Ma, and judgment was passed by Osiris on their deeds.

**Amercement**, or **Amerciament** (from the Fr. *à merci*, from the Lat. *merces*, payment), a term in Old Eng. law used to denote an arbitrary pecuniary forfeit imposed on an offender by a jury of his equals in status, or, if in the supreme courts, by the coroner. The amount of the pecuniary penalty was quite arbitrary, and was originally an alternative for a forfeiture of goods. The word in modern usages has practically lost its old technical sense, and is confined to poetical phraseology, where it has merely the meaning of a loss, fine, or deprivation of any kind.

**America**. The general name given to the 2 continents which form the W. hemisphere, extending approximately from beyond 75° N. lat. to below 55° S. lat. The name, derived from Amerigo Vespucci (q.v.), who only reached the mainland of N. A. sev. years after the discovery of the New World, is a historical accident. At the present day, 'America' and 'American' are often used as synonymous with the U.S.A., and a citizen of that nation respectively. As applied to both N. and S. A. the name is also anomalous, for the 2 continents have little in common and are all but

disconnected physically. Geologists, seeking an explanation of the grouping of the continents of the world in the tetrahedral deformation of the earth's crust, afford some justification for treating N. and S. A. as a single geographical unit. There is, however, a recognised tendency in all land masses to assume the form of pyramids, with their vertices directed towards the S. This is strikingly exemplified in the form of both N. and S. A. Again, in some respects the general outlines of both are similar, and both have ranges of volcanic mts. in the W. running almost due N. and S., and both are watered by similar great rvs. The physical features of both are on a vaster scale than the physical features of Europe. The rvs. are extremely long, the lakes very large, the prairies or *Panos* extensive. For the rest, however, the diversities are so great that it is more convenient to treat them separately. For the geology, ethnology, fauna and flora of A. see NORTH AMERICA and SOUTH AMERICA; for physical features, climate, products, manu., forms of gov., hist., etc., see CANADA, MEXICO, UNITED STATES OF AMERICA, and the various countries of CENTRAL AMERICA; and ARGENTINA, BRAZIL, CHILE, and other countries of S. America.

**America's Cup, The.** A silver cup given, in 1851, by the Royal Yacht Squadron for a race for any yachts at Cowes, Isle of Wight. There were 15 competitors and it was won by an Amer. yacht called *The America*, of 150 tons. It has since been offered as an international prize to any yacht-owner of another nation who can win it under certain rather severe rules. Many unsuccessful attempts have been made by Brit. yacht-owners in Amer. waters to bring the trophy back to England. Sir Thomas Lipton built and raced no fewer than 5 yachts. His *Shamrock IV*. was beaten in 1920 and after 10 years' interval *Shamrock V*. failed in 1930. *Endeavour* (T. O. M. Sopwith) lost to *Rainbow*, 1934; *Endeavour II*. (T. O. M. Sopwith) lost to *Ranger*, in 1937.

**American Association for the Advancement of Science** was the name given in 1847 to the new organisation of the former 'Association of American Geologists and Naturalists.' The first meeting of the new association was held on Sept. 20, 1848, and at this meeting the rules were drawn up. The objects of the Association are, 'by periodical and migratory meetings, to promote intercourse between those who are cultivating science in different parts of the U.S.A., to give a stronger and more general impulse and a more systematic direction to scientific research; and to procure for the labours of scientific men increased facilities and a wider usefulness.' Members may be chosen from among the collegiate profs. of natural hist., physics, chem., and mathematics, and political economy, and of the theoretical and applied sciences generally; also civil engineers and architects who have been employed on

the construction of superintendence of public works. In addition, a number of independent organisations and societies are affiliated, and these meet, at about the same time as the larger association, for the reading of papers, etc. The activities of the association cover a variety of subjects under the following heads: agriculture, astronomy, anthropology, botany, chem., economics, education, engineering, geology and geography, hist., mathematics, medicine, philology, physics, psychology, and zoology. The large income which accrues from the permanent endowment of the association is mainly granted in aid of scientific research. The headquarters of the association are at the Smithsonian Institution Buildings, Washington. The present number of members is about 20,000.

**American Blight**, a pest very common to apple-trees. It may be easily recognised by its dark brown colour and white covering. Spraying is essential to get rid of it.

**American Civic Association**, formed in 1904 by the amalgamation of the Amer. League for Civic Improvement and the Amer. Park and Outdoor Art Association. Its object is to combine and render efficient all effort for civic betterment. It claims, *inter alia*, to have prevented the exploitation of Niagara Falls for power purposes, and it conducts campaigns against objectionable outdoor advertising and against the 'typhoid' fly, and fosters parks and playgrounds. Among other activities may be mentioned the planning of parks and boulevards, the abatement of smoke in tns., tree-planting, and tn.-planning.

**American Civil War**, see U.S.A.

**American College Yeh**, see CHEERING.

**American Federation of Labour**, a powerful combination of craft and industrial unions, founded in 1881 in Pittsburgh, Pennsylvania, which took the place of the Knights of Labour founded in 1869, which latter body in the middle eighties had a membership of 700,000, conducted a large number of strikes, and then quickly declined. The A.F.L. was led by Samuel Gompers, a shrewd organiser of Brit. birth and Dutch-Jewish blood. Its policy was, from the first, conservative; it took the capitalist system for granted; and it made astute bargains with employers with as little reliance on the use of strikes as possible. No distinction of nationality, creed, or colour was to affect the rights of membership. By 1900, labour, under the aegis of the A.F.L., had become a power that no statesman could ignore. Its ceaseless agitation the federation has effected many far-reaching reforms, such as the compulsory education of the young, compensation for accidents to employees in industry, and health and sanitary regulations for all workers. The suppression of competitive convict labour and the restriction of alien immigration are also the results of its efforts. In the First World War the federation gave whole-hearted support to the proposals to defend the U.S.A. against all enemies

by advocating the personal services of its members. During the era of Roosevelt's New Deal the A.F.L. continued to represent most of the large craft unions; but beside it then arose a powerful new organisation, the Congress of Industrial Organisations (C.I.O.), which represented unskilled workers and labour in the mass-production industries. Under the C.I.O. collective bargaining received a new impetus; but there has inevitably been some rivalry between the 2 bodies. In foreign affairs the federation has supported Amer. participation in the World Court; the limitation of armaments; and Philippine independence—mainly to stop the immigration of Filipino labour. In general the A.F.L. has been strongly opposed to Fascism wherever it appeared. In 1933 it voted a boycott of Ger. goods and services until the Ger. Gov. recognised the rights of the working people of Germany to form independent trade unions; and in 1935 it voted concurrence with the League of Nations in declaring Italy an outlaw nation. In 1940 the federation came out strongly for full aid to Great Britain. There is now a labour dept. and employment bureau in each of the Amer. states. The federation's official organ is the *American Federationist*.

**American Independence, War of, see UNITED STATES OF AMERICA—History.**

**American Indians,** the aboriginal pop. of America. The application of the word Indian to this race is a misnomer due to Columbus's belief that he had found a new route to India. The name was preserved, only subsequently Amer. was added to distinguish the people from the quite different races of India. Some ethnologists have coined a new word, 'Amerind,' which name has some currency. With the exception of the Eskimo race, the divers tribes of A. I. are remarkably uniform in type, and even the Eskimo and Indian tribes have at least kinship in language, i.e. the various languages are characterised by 'long words' whereby a whole phrase or sentence is compressed into one long compound. Such a language is called holophrastic.

**Original Numbers and Causes of Decrease.**—The best available statistics indicate that at the time Columbus landed there were living in what is now the U.S.A. approximately 846,000 Indians. By 1900 the pop. was reported as 270,000, and apparently had at one time dropped even below this point. Some notion of the causes of Indian declination is to be gathered from the bulletins of the Bureau of Ethnology in which James Mooney states: 'The chief causes of decrease, in order of importance, may be classed as smallpox and other epidemics; tuberculosis; sexual diseases; whiskey and attendant dissipation; removals, starvation, and subjection to unaccustomed conditions; low vitality due to mental depression under misfortune; wars. . . . One historic smallpox epidemic, originating on the Upper Missouri in 1781-82, swept northward to Great Slave Lake, eastward to

Lake Superior and westward to the Pacific. Another in 1801-2 . . . reduced the strength of northern plains tribes by nearly one-half. A fever visitation about the year 1830 was officially estimated to have killed 70,000 Indians in California. . . . The destruction by disease and dissipation has been greatest along the Pacific coast, where also the original population was most numerous. In California the enormous decrease from about a quarter of a million to less than 20,000 is due chiefly to the cruelties and wholesale massacres perpetrated by the miners and early settlers. . . . Wars in most cases have not greatly diminished the number of Indians.'

**Ethnology.**—The average Indian is marked by abundant straight black hair, not frizzled and woolly; copper-coloured skin (whence the name Red-skin and Red man, a peaked skull, aquiline nose, prominent jaw, and tall, massive frame. He is naturally serious in his views of life. In character he is brave, proud, and generous, but very vindictive. Ethnologists for the most part agree that the aboriginal inhabitants of America are of Asiatic descent. In the region of the Bering Strait the 2 continents approach very close together and the passage is simple. Moreover, resemblances in physique, language, and customs all point to racial unity. The contact of the A. I. with European races was for long very destructive to the former. The atrocities committed by the Sp. pioneers have long been a subject of shame to all white peoples. The A. I. do not easily withstand diseases not endemic, and countless natives succumbed to plagues introduced by the Europeans. Fire-water (alcohol) had fatal effects on the constitution of the aboriginals. Whole tribes were thus exterminated, and the great percentage of those who survived lost the civilisation that had reached a considerably high level in their free days and lapsed into savagery. Later the cruelties which had been inflicted on the people were recognised, and a new treatment was organised, which unfortunately proved almost as vicious as the old. The donation of annuities to deported tribes only effected degeneration and pauperisation. Of the pure-blooded A. I. not very many remain. The natives have amalgamated with almost every race. This admixture makes it very difficult to rebuild the fallen structure of pure A. I. civilisation. But to-day the curve of Indian pop. has taken a sudden upward swing and the drift towards assimilation has apparently slowed down. And with these changes in the current of native existence has come a revival of Indian culture, Indian economy, and Indian spirit, the fruits of which no one can accurately foretell.

**Arts and Crafts.**—The main employments of the people were agriculture and hunting. Before the advent of the Spaniards, beans, melons, potatoes, Indian corn, tobacco, cotton, were all

cultivated systematically. Hunting was facilitated by means of intricate and ingenious snares and nets. Spears, bows and arrows, harpoons, and clubs were the chief instruments employed. Sledges and skin-boats (coracles) were the chief means of transportation, and wheels were but little used. Arts and crafts were developed to a high degree. Spinning and weaving were practised with no mean skill. Shells were strung in patterns with or without the addition of porcupine quills. The glass-bead work so often exhibited among native articles is of a much later development. The materials for this work were introduced by the Europeans, and the nature of the work is very tasteful to the Indian. Gold, silver, and iron were worked and manufactured into utensils and various articles of personal adornment. Painting, too, had reached considerable development and adorned articles made of skin, bone, and pottery. But the art that was nearest and dearest to the A. I. was the art of music. Music echoed every phase in the life of the native, and was thus of a very diversified character. There was gruesome war music, wild dance music, sweet love music, thrilling hunting music, and music for seed-time and harvest, music to which to eat, to sleep, and to perform all the little duties of ordinary life, however humble. No other peoples have music with such a wide range. The chief musical instruments known to the Indians, before the advent of the white, were drums, flutes, and rattles.

**Religion.**—The religion of the A. I. is on the whole pantheistic, yet in certain respects it approaches very near monotheism. Divine power is manifest in all the operations of nature, revealing itself in energy. This power was sometimes separately worshipped, according to the various phases in which it manifested itself, and a sort of spirit-worship arose. All the minor spirits had to be honoured and appeased with their own appropriate worship. But sometimes this divine power was regarded in its oneness as the principle and origin of all life, infinite in power and eternal in duration. The A. I., inasmuch as he recognised an omnipresent, omniform God, regarded everything in the light of religion; and just as in his love of music he considered no experience unworthy of musical expression, so, too, in his religious life he considered no aspect of nature and life outside the pale of divine manifestation. Music, in fact, is the expression of the religious feeling of the A. I. The soul of the individual was regarded as being immortal, inasmuch as it was a portion of the life-principle, itself indestructible. In addition to their recognition of this divine power dominating all that is, most tribes recognised their own peculiar demigod. This demigod was for the most part beneficent and benevolent, and was the guardian of the welfare of the race. He was the embodiment of the principle that makes

for righteousness, and herein lies the great superiority of the religion of the A. I. over most savage religions—the development of the race was regarded as progressive and not retrogressive.

**Social Organisations.**—Social organisations varied according to the nature and state of advancement of the diverse tribes. Sometimes the state was almost communistic in principle, sometimes the powers of chieftainship were absolute. The race on the whole was monogamous. No traces can be found of human sacrifices and cannibalism. Such was the state of civilisation among the A. I. before the advent of the white men—a state far removed from savagery. In a very few years this state of civilisation entirely disappeared, leaving only a few traces in names and expressions adopted by the European. The old Indian trails were used by the white settlers and greatly facilitated their progress in the W. Too much stress cannot be laid on the debt the white men owe the red in this direction. So sudden was the reversion of the A. I. to savagery, so rapidly did their numbers decrease, that it was long before their ancient civilisation was realised and attempts were made to reclaim their fallen state. Cortés and the early Sp. invaders totally ignored their claims to humane treatment, though they witnessed the highest level of civilisation and advancement among the Indians. The Sp. pioneers were regarded as gods—children of the sun. Advantage was taken of the ignorance of the people, and whole tribes were massacred to glut the Sp. greed for wealth. The rich gold ornaments and jewels of the Peruvians proved as attractive to Francisco Pizarro, the conqueror of Peru; nor did Pizarro fail to equal the atrocities of Cortés. As late as the nineteenth century compassion was taken on the miserable remnant of a great people, which had survived European cruelty and European disease, but the reservation system was almost as destructive as the former cruelty. Only lately, when educational methods have been put in force, have the possibilities of the race been realised. The occidentalisation of the red men in recent times has been rapid and full of promise. Most promising is the taste of the A. I. for letters. An Indian is able in a remarkably short time to read and write in his own language. When one considers the imaginative faculties of the Indian, his love of music, and his reverence for life, one can easily recognise that the literary potentialities of the people are great, and much is to be looked for in the future.

**Present Conditions on Reservations.**—For a very long time the education of the A. I. has been of constant interest and the plan of many public-spirited bodies and individuals, but it is only comparatively recently that there has been any great response. It is not generally known that the original charter incorporating Harvard Univ. contains special

provision for the education of Indians, while as long ago as 1873 the Amer. Gov., in the arrangements for Indian reservations, estab. boarding and day schools. Education of a rather higher nature was not seriously entered upon until the Indian School was started at Stockbridge, Massachusetts, in 1890. The younger generations of Indians are now making rapid advances, and, particularly in the S., are equipping themselves with professional knowledge and skill. During the last few decades the discovery of oil in the S. settlements and reservations has made the resident Indians enormously rich, so that there is now a great line of cleavage between them and their compatriots in the N., who still remain a poor race. This increase of wealth has had consequences that as yet can scarcely be measured. Money tells in America, and the rich Indian scarcely feels himself a member of a conquered and dying race. On the whole it would appear that the efforts of these new rich are directed towards becoming good citizens and, in the younger generation, the college and the univ. are the selected means. An important point should not be overlooked in any discussion of the A. I., that the average Amer. citizen feels more kindly towards him than towards any of the 'other' races. It is not forgotten that he was the original owner of the soil, and now that he has ceased to hamper the advance of civilisation his rights are more fully recognised. This is exemplified by the fact that the veto on intermarriage of races is not in such strong evidence against Indians as against Negroes and Asiatics. Indeed, many contend that a drop of Indian blood improves the stock, and admit that the early settlers from whom good families spring intermarried with Indians. This attitude towards the Indians is, however, of comparatively recent date, and, in spite of laws that seemed fair, they were subjected to shameful mis-treatment for a considerable period. Even now Indian administration presents serious problems in regard to economic and social conditions among the tribes. In the U.S.A. (1946) there are estimated to be 398,000 Indians, excluding Indians and Eskimos of Alaska. Of the 398,000 about half are full-blooded Indians and the remainder mixed with whites in varying degrees and, in the case of a few tribes, with Negroes. There are more than 200 distinct tribes living in 27 states, most of them W. of the Mississippi R.; the largest number being in Oklahoma, Arizona, and S. Dakota. Of the total Indian pop. all but a very few are to a greater or less degree wards of the Federal Gov., and most of them live on Indian lands set aside for their use by the Gov. Congress appropriates annuities ranging from 12,000,000 to 18,000,000 dols. for Indian affairs, and the Dept. of the Interior, besides administering these appropriations, acts as trustee for the very large amounts of Indian tribal moneys accruing from mining and oil

rentals or other sources of income. In 1928 the Institute for Gov. Research issued the most comprehensive report (the Meriam Report) on economic and social conditions among the A. I. yet produced, and many of the recommendations of that body have been carried into effect, notably for the improvement of sanitary conditions of the reservations, the prevention of overcrowding in schools, the improvement of diet and hygienic conditions of work. Publication of the Meriam Report was followed by a long investigation by a committee of the U.S. Senate whose voluminous hearings and exposures heralded reforms to come. Under the administration of a new body of commissioners, pledged to a programme of reform, the groundwork was laid for a new policy, embodied in the Indian Reorganisation Act, 1934. President Roosevelt, in urging the enactment of this measure, wrote: 'Certainly the continuance of autocratic rule, by a federal department, over the lives of more than 200,000 citizens of this nation is incompatible with American ideals of liberty.' Good progress has been made, especially by the Indians of the Kiowa and Comanche reservations, in securing better homes. The health of Indians still remains a difficult problem; trachoma, tuberculosis, and the diseases of childhood are prevalent, and recently Indian pupils have been separated in trachoma and non-trachoma schools, while many new hospitals and more adequate equipment have had to be provided. The right of citizenship was conferred on A. I. only in 1924; this gives the suffrage to all Indians born in the U.S.A. The commonest occupations of the Indians of to-day are farming and the raising of cattle and horses; while many are engaged in the making of blankets and pottery and in embroidery, the chief market for the sale of their handicrafts being among tourists.

*Indians in Canada.*—Indians are minors under the law, and their affairs are administered by a special branch of the Dept. of Mines and Resources under the authority of the Indian Act. Reserves have been set aside for the various bands of Indians in Canada since the earliest times, and the Indians located on them are under the supervision of the local agents or the departmental branch. The activities of the branch, as guardians of the Indians, include the control of Indian education, the care of health, the development of agriculture and other pursuits among them, the administration of their funds, and the general supervision of their welfare. The Indian Act provides for the enfranchisement of Indians. When an Indian is enfranchised he ceases to be an Indian under the law. In the older provs. where the Indians have been longer in contact with civilisation, many are becoming enfranchised, but great discretion is exercised by the Gov. in dealing with this problem. Indians who become enfranchised lose the special protection attached to their wardship, so that premature enfranchisement must be

avoided. There are approximately 128,000 Indians and Eskimos, of whom over 30,000 are in Ontario, 25,000 in Brit. Columbia, 15,000 each in Manitoba, Alberta, and Saskatchewan, and 12,000 in Quebec.

See also under separate names of tribes: ALGONKIN; COMANCHES; CHINOOKS; CHIPPEWAYANS; CHIKOTOS; CHOC-TAWS; IROQUOIS; MOHAWKS; MUSHKOGES; ONEIDAS; SEMINOLES; SHOSHONES; TUSCARORAS. See R. Karsten, *The Civilisation of the South American Indians*, 1926; D. Jenness (ed.), *The American Aborigines: their Origin and Antiquity*, 1933; E. M. Weyer, *The Eskimos: their Environment and Folkways*, 1933; W. M. Halliday, *Pollatch and Totem*, 1935; C. Wissler, *The American Indian*, 1938; J. Collier, *The Indians of the Americas*, (New York), 1947.

American Institute of Social Service, organised in 1898 to gather and spread information in all branches of social thought and service. Publishes *The Gospel of the Kingdom*. Headquarters, Astor Place, New York.

American Law, see UNITED STATES OF AMERICA—Law; see also ACTION; EVIDENCE; etc.

American Legion, an organisation of Amer. ex-service men, somewhat similar to the Brit. Legion, with patriotic and other motives of a high order. It was inaugurated in 1919. The idea originated among the troops in France. All ex-servicemen who served between Apr. 6, 1917, and Nov. 11, 1918, in the naval and military forces of the U.S.A. or associated powers are (generally) eligible for membership. The legion led a protracted and bitter campaign for a bonus for Amer. veterans.

American Literature, see UNITED STATES OF AMERICA—Literature.

American Scenic and Historic Preservation Society, founded by Andrew H. Green, and incorporated 1895, for the protection of natural scenery, the preservation of historic landmarks, and the improvement of cities.

American War of Independence, see UNITED STATES OF AMERICA—History.

Americanism, a word or phrase originating among the people of the U.S.A., and obtaining general currency there. Some so-called As. are merely Eng. words which have had applied to them a different meaning from that in use in England. For instance 'corn' in America is applied only to Indian maize, whereas in Great Britain it is applied to all cereals. Some other As. are of perfectly good Eng. origin, but have dropped out of current usage in Great Britain. Where Eng. people use the word 'autumn' of Lat. origin, Amers. commonly use the old pure Eng. word of 'fall', which is at once more apt and more poetic—the time of the fall of the year, the time when the leaves fall. Similarly, Amers. say 'guess' for 'think', 'hefty' for 'sturdy' or 'stalwart', 'fetch' for 'bring'.

In another sense As. reveal the story of the colonisation of the ter. that is now the U.S.A. by various European nations, and

also of the relics of the native Amer. Indians whom they dispossessed. Thus of Indian origin are such common words as 'canoe', 'hominy', 'tomahawk', 'pemican', 'toboggan', 'pow-wow', 'wigwag', and the very expressive Eng. word the Indians invented to describe whisky, 'fire-water.' Traces of Fr. colonisation in the U.S.A. are shown by words like 'prairie' and 'bayou.' The Spaniards left their mark in words like 'mustang', 'adobe', 'canyon', 'mesa.' But the greater part of As. is of purely Amer. origin, growing out of the life of the people, their business, their politics, which are different from those in England. Amer. trade has altered the stereotyped vocabulary by a system of curtailed words, or words illustrating new methods of commerce. Amers. have decided inventive genius, and have been just as skilful in creating new names for their new discoveries. The number of patented articles in America is enormous, and many of these have their own made-up names which have passed into current usage. There are many As. which originate as mere slang expressions, then become generally current in America, and finally secure a place even in the Eng. language as spoken in Great Britain. Such are, for instance, 'boodle' for money obtained illegally, particularly by politicians; 'bunkum (q.v.) platform', for a political party programme; 'plank', for an important section of that programme. The prohibition law in America, and the consequent and successful attempts to evade it gave rise to a whole series of new words. Thus 'blind tiger' meant a place where alcoholic liquor was sold despite the law; 'bootlegger' was a man who made a profession of selling liquor illegally, 'hooch' was the name generally given for the stuff that was sold as whisky in the U.S.A. after prohibition came into force.

There are many As. which are to-day in the transitional stage. Now they are mere slang. To-morrow they may be universally adopted or drop out entirely. The origin of many of these is obvious. Thus 'also ran' means an unsuccessful contestant, evidently adapted from the racecourse term. 'Boll-weevil', from being the name of a pest that destroys the cotton plant, has evolved into a term for any obnoxious person. 'Tight-wad' means a stingy person, obviously because he keeps his wad of paper money unspent. 'Gold-digger', originated in the Broadway theatrical district of New York City. It originally meant chorn-girls who wheedled money and presents out of male admirers. It now means any woman who does the same. 'Hen-party' obviously means a party composed entirely of women. 'Muck-rake' (which comes from *Pilgrim's Progress*) to the agile Amer. mind quite obviously suggested obtaining secret and unsavoury data about institutions and public officials. 'Ittzy' is a perfect laboratory example of how Amer. slang originates. At one time in America the Ittzy hotels were supposed to be the last extreme of luxury and also of

costliness. People who stopped at such hotels were supposed to be wealthy, and very likely to be snobs. Hence the word 'litzzy' means giving oneself airs. The origin of other As. is not obvious, and their life is also one of dubious duration. Thus 'apple sauce' for empty talk; 'fall guy' for one who is made a tool of; 'fathhead' for a stupid person (dates from 1842); 'make whoopee' for making unbridled and drunken revelry. There was a time when most As. were confined to America and known only there. But with the spread of both the Amer. silent and talking films, the average Eng. audience has picked them up and the younger people have at times adopted them. Amer. slang may often shock the purists. Some of it is coarse and some of it cheap. But it is one way a sign that the Amers. are in process of creating for themselves a language which steadily tends to differ from that spoken in Great Britain, not only by inventing new expressions, but also by giving old ones new twists applicable to a different continent. The same thing is observable among the Sp.-speaking peoples of S. America, where the language tends to differ from that spoken in Spain.

**Americus**, co. seat of Sumter co., Georgia, U.S.A. Manufs. cotton-seed oil and iron goods. Pop. 8800.

**Amerigo Vespucci**, see **VESPUCCI**.

**Amerling, Friedrich von** (1803-87). Austrian painter, b. in Vienna. His portrait of the Emperor Francis I., 1832, secured his position as the greatest portrait painter of his country.

**Amerongen**, vil. in prov. of Utrecht, Holland, which has gained notoriety solely on account of its association with the ex-Kaiser, William II. of Germany, who fled from the seat of the First World War on Nov. 10, 1918, and found asylum in the castle of Count Goddard Bentinck at that place. After his second marriage, the ex-Kaiser continued to reside in A.

**Amersfoort**, tn. of Holland, very old and retaining many of its medieval characteristics; its walls still stand in places. The Koppelpoort, a crenellated gateway with bridge and water-port, is one of the most picturesque gateways in Holland. A church tower built in 1441, 112 ft. high, contains a carillon of 35 bells. Many manufs. Pop. 46,200.

**Amersham**, a mkt. tn. in Buckinghamshire, 7½ m. E.N.E. of Wycombe and about 20 m. W.N.W. of London. Straw-plaiting and chair-making are the prin. industries. Edmund Waller the poet was b. in the vicinity. Pop. 6100.

**Amery, Leopold Charles Maurice Stennett**, b. 1873. Brit. politician and publicist. Organised *The Times* war correspondence in S. Africa (1898-1900). Author of *The Times History of the S. African War* (7 vols.), which was completed in 1909. In the First World War was assistant secretary of the War Cabinet in 1917 and on the staff of the War Council at Versailles in 1917-1918. Was First Lord of the Admiralty

in 1922 and afterwards, in Mr. Baldwin's administration, secretary of state for the dominions and colonies, in which capacity he has twice presided over the Imperial Conference. Has a good knowledge of the empire, having travelled widely in the E. and, after the war, in the Dominions. As secretary of state for India in Mr. Churchill's Cabinet (1940) it fell to him to formulate a plan for Indian self-gov., while India was actually being invaded by the Jap. An adherent of the anti-appeasement group in the Conservative party in 1938 and 1939. Publications include: *The Stranger of the Ulysses* 1934; *The German Colonial Claim*, 1939; various collected speeches and lectures on imperial affairs and the constitution; *India and Freedom*, 1942; and, autobiographical, *Days of Fresh Air*, 1939, and *In the Itain and the Sun*, 1946. See also **CRIPPS**, **SIR STAFFORD**; **INDIA—History**.

**Ames, Fisher** (1753-1808), Amer. orator, b. at Dedham, Massachusetts. After graduating from Harvard in 1774, practised law and became famous for his articles on Shay's rebellion. Elected to Congress, 1788, and later served on the Massachusetts Council. His works were pub. by Seth Ames, his son, in 1809.

**Ames, Joseph** (1689-1759), a bibliographer and antiquarian, was b. at Yarmouth. The nature of his trade is doubtful, but it was lucrative. A., at the suggestion of the Rev. John Lewis of Margate, undertook to write a history of printing in England from 1471 to 1600—his famous *Typographical Antiquities*. To facilitate his research he circulated a preliminary list of 215 Eng. printers with a request for information concerning their lives and work. This book is of great value to bibliographers. It was pub. in 1749.

**Ames, Joseph** (1816-72), Amer. painter, b. in New Hampshire, U.S.A., and d. at New York. He was self-educated, and from the proceeds of his portrait-painting he managed to go to Rome to study. There he painted a fine portrait of Pius IX. His career was brilliant, and among his best portraits are those of Emerson, Ristori, Prescott, Cornelius Felton, and Rachel. Of his historical paintings the best known are 'The Death of Webster' and 'Maud Muller.'

**Ames, William** (1576-1633), a Puritan divine, b. at Ipswich. At Christ's College, Cambridge, he came into conflict with the authorities on account of his non-conformity and outspoken denunciations of univ. excesses. He took refuge in Holland, and, clothed as a fisherman, he resumed preaching. At the synod of Dort he was the most active and influential of the foreign divines. Installed at Franeker (1622) he brought renown to his pastorate there as prof., preacher, and theologian. His health gave way after 12 years and he accepted a charge at Rotterdam, where he wrote an epoch-making book in Protestantism, *De conscientia et ejus fure vel casibus* (*Fresh Suit against Ceremonies*), 1630. In this book

he brought Christianity again in touch with the common things of life: by its influence Richard Baxter enlisted on the side of the nonconformists.

**Amesbury:** 1. A small tn. in Wiltshire. St. Mary's church is of quaint Early Eng. architecture. Near the tn. is A. Abbey, the old residence of the dukes of Queensberry, which was built by Inigo Jones. Stonehenge and a rampart of the Rom. period are also near by. Here was erected in 980 the nunnery of Ethelfrida, wife of King Edgar. Pop. 1500. 2. A tn. in Essex co., Massachusetts, U.S.A., 42 m. N.E. of Boston. Settled as New Salisbury in 1654, and incorporated under present name in 1666. The home of J. G. Whittier the poet for over 50 years. Manufs. cotton goods and motors. Pop. 10,900.

**Amethyst**, a species of quartz characterised by its beautiful violet, purple, or blue shades. According to the popular etymology, the word comes from the Gk. *amethystos*, to intoxicate, the stone having the supposed virtue of warding off intoxication. The violet colour is said to be due to the presence of manganese, but modern chem. inclines to discredit this. A tinged quartz has a very wide distribution, but pure A. is confined to a comparatively small area—India and Ceylon chiefly. In Scotland A. is found, and it is one of the most popular stones in old Scottish jewellery.

**Amharic**, the language of the inhab. of Amhara, and spoken throughout Abyssinia with slight variations according to dialect. The basis of the language is the old Semitic tongue called the Ethiopic or Geez.

**Amherst:** 1. A vil. about 30 m. S. of Moulmein in Lower Burmah, founded by the Brit. in 1826 and named after the then governor-general of India, but now merely a fishing vil. and bathing-place for Moulmein. 2. A tn. in Hampshire co., Massachusetts, which has an important Congregational college. Pop. 6400. 3. The co. tn. of Cumberland co., Nova Scotia, Canada. It is a manufacturing centre and port of entry. Pop. 8600.

**Amherst, Jeffrey, Baron** (1717-97), b. at Riverhead, Kent. Through the influence of the duke of Dorset he obtained an ensigncy in the Guards. His career was brilliant, and in 1758 Pitt appointed him commander-in-chief in the expedition for the conquest of Canada. For the success of the enterprise A. and Wolfe are mainly responsible.

**Amherst, William Pitt** (1773-1857), nephew of the former. He was sent on an embassy to China in order to procure better terms for commerce between Great Britain and that country, but through his spirited refusal to perform the 'kow-tow' (a degrading ceremony) to the emperor his embassy failed. In 1823 he was made governor-general of India, and held that office till the year 1828. He conducted the first Burmese war with great success, and was awarded the earldom of Arakan.

**Amherstburg**, a tn. in Ontario, Canada, on the N. shore of Lake Erie.

It has a good harbour and does a considerable trade in timber. Pop. 2800.

**Amianthus** (Gk. *ἀμιαντος*, undefiled) : white variety of asbestos (q.v.).

**Amice** (Lat. *amictus*, a wrap), an oblong piece of linen used as a vestment by priests, bishops, etc. It was originally worn like a hood over the head, but afterwards covered only the shoulders and neck.

AMICE

**Amicis, Edmondo de** (1816-1908), It. novelist, essayist, poet, and writer of travel-books. He was master of a delightful style, and in some of his works, especially his books of travel, exhibits remarkable descriptive powers. His chief publications are *Bozzetti della Vita Militare*, 1868; *Novelle*, 1872; *Constantinopoli*, 1877; *Ricordi di Parigi*, 1879; *Poesie*, 1880; *Sull' Oceano*, 1889; *Memorie*, 1899; *Speranze e Glorie*, 1900; *Ricordi d'infanzia e di scuola*, 1901; *Una Tempesta in Famiglia*, 1904; *Nel Regno dell' amore*, 1907; *Ultime Pagine*, 1908.

**Amicus curiæ** (Lat., a friend of the court), a legal term denoting a disinterested person, who, at the hearing of a case, informs or corrects the court.

**Amides**, see ACID-AMIDES.

**Amidines**, organic compounds corresponding to the formula

where R is a radical. They may be regarded as being derived from the acid-amides by replacing the oxygen by the group NH. They may be prepared by the combination of nitriles with ammonia and primary amines. The chief A. are formamidine, acetamidine, and benzamidine.

**Amido-Naphthalene**, see NAPHTHYLAMINE.

**Amiel, Henri Frédéric** (1821-81), a Swiss philosopher, b. at Geneva. In 1841 he became prof. of aesthetics at the Geneva Academy. He afterwards became prof. of moral philosophy in the same univ. The work which secures his fame is the *Journal intime*, which Mrs. Humphry Ward trans. into Eng., 1885.

**Amiens**, an anc. city, cap. of the dept. of Somme, N. France, and situated on the Somme at its confluence with the Arve. The chief interest of the city is Notre Dame, its magnificent cathedral, the most perfect specimen of Gothic architecture in France, dating from the thirteenth century. This splendid structure is embellished with a wealth of magnificent medieval sculpture. Viollet-le-Duc happily calls it 'the Parthenon of Gothic architecture.' The nave is remarkably lofty, and the columns are correspondingly grand. In the newer portions of the tn. are flourishing manufs. of linen, cotton, silk, and wool. A. is a famous market gardening centre, and the produce has a very extensive sale. Pop. 84,700. This city was the scene of the peace of

A., 1802, where the claims of England, France, Spain, and Holland were settled. By it Britain acknowledged the new claims of France in Europe, and agreed to give up her late conquests excepting Ceylon, captured from Holland in 1796, and Trinidad, which she took from Spain in 1797, and to restore Malta to the Knights of St. John. The Peace of A. was concluded in 1264, Louis IX. of France acting as arbiter between Henry III. of England and Simon de Montfort. Louis IX. took the side of Henry, and the Provisions of Oxford were declared null and void. This famous city was often threatened, but never taken by the Gers. in the First World War. In the second battle of the Somme (1918) it was clearly the main object of the enemy to reach the city, an inference which was drawn from the fact that the weight of its attack fell upon the ill-fated Brit. Fifth Army. On the sixth day of the battle (Mar. 26) the danger of the Gers. reaching the city and driving a wedge between the Brit. and Fr. armies was very present, for Gen. Haig had ordered his last reserves to the threatened point and it was doubtful whether it could send up Fr. reinforcements in time. Fortunately the Gers. could not sustain the momentum of their attack and were exhausted by the protracted and stubborn resistance of the allied armies, which, as a result of the Doullens conference, were, at the height of the crisis, put under the supreme command of Foch. On Apr. 24 the Gers. made a last attempt to break through to A., and for a short time were actually in possession of Villers-Bretonneux only 9 m. to the E. But the Brit. Fourth Army, under Gen. Rawlinson, who had been put in command on the A. front on Mar. 28, brilliantly counter-attacked on Apr. 24, recaptured Villers-Bretonneux, and so closed the gate to A. In the following Aug., after Foch had assumed the offensive, Haig attacked the enemy on the A. front (Aug. 8). In the battle of A. he attacked with the 3rd Brit. Corps, the 33rd Amer. div., and the Australian and Canadian Corps of Rawlinson's army, the W. front of the 11-m.-wide salient made by the Gers. the previous Mar., while Gen. Debeney, acting under Haig's orders, attacked some 4 m. southward of the salient. On that day (Aug. 8) 2000 guns were gathered on the Fourth Army's front of attack and they opened the bombardment almost simultaneously. Under cover of a favouring mist, the tanks, followed by the assaulting troops, burst through the Ger. lines in one irresistible torrent. Over 200 tanks, the development of which had by then been greatly improved since the battles of 1916, were used in the first line, and as many more were in support. Demoralisation spread in the Ger. ranks, and by Aug. 10 the dominion troops, aided by the Cavalry Corps, had pierced the Ger. lines to a depth of 12 m. It is worthy of note that

Ludendorff himself says that 'Aug. 8 was the black day in the list of the Ger. Army.' (Consult Maj.-Gen. Sir F. Maurice's *The Last Four Months, 1918*.) In the Second World War A. fell to the Gers. in the early summer of 1940, at which time, and afterwards, considerable damage was done to the city. It was liberated by the Brit. 21st Army Group at the end of Aug. 1944.

**Amilcar**, see **HAMILCAR**.

**Amines**, organic substances formed by the replacement of one or more of the hydrogen atoms of ammonia by an equivalent number of univalent organic radicals, such as alkyl groups (*q.v.*) or those derived from benzene (*e.g.* phenyl,  $C_6H_5$ , groups). They are divided into primary, secondary, and tertiary A. according to the number of hydrogen atoms displaced by radicals. Primary A. are methylamine,  $NH_2CH_3$ , ethylamine,  $NH_2C_2H_5$ , etc.; secondary A. are dimethylamine  $NH(CH_3)_2$ , diethylamine,  $NH(C_2H_5)_2$ , etc.; and tertiary A. are trimethylamine,  $N(CH_3)_3$ , triethylamine,  $N(C_2H_5)_3$ , etc. Among the aromatic amines, aniline or phenylamine,  $C_6H_5NH_2$ , is the most important.

**Aliphatic A.** are formed when an alcoholic or aqueous solution of ammonia is heated with an alkyl halide, the alkyl group taking the place of one atom of hydrogen in the ammonia. When excess of ammonia is employed all 3 A. are formed, but it is often possible by adjusting the proportion of ammonia and the time of the action to obtain a given A. as the main product, whence usually by fractional distillation the smaller quantities of the others can be eliminated. The 3 A. may be distinguished by their behaviour towards nitrous acid, primary A. yielding alcohols with evolution of nitrogen, secondary A. yielding yellowish liquids called nitrosoamines, whilst tertiary A. are unacted upon or oxidised. Aromatic A. are prepared by the reduction of nitro-compounds; thus nitrobenzene,  $C_6H_5NO_2$ , yields aniline on reduction with tin and hydrochloric acid.

The lower aliphatic A. are inflammable gases, very soluble in water; and the higher members are liquids with low boiling points, and are miscible with water. Many have a curious odour of boiled lobster. Methylamine occurs in 'perennial mercury,' and dimethylamine and trimethylamine are constituents of herring-brine. Many of the very poisonous ptomaines (*e.g.*, *putrescine* and *cadaverine*) are A. Aniline (*q.v.*), toluidine, and benzidine are among the chief aromatic A.

**Aminoisocaproic Acid**, see **LEUCINE**.

**Amiot, Père Joseph** (1718-94), a learned Fr. Jesuit, was b. at Toulon and d. at Peking. He was sent as a missionary to China, and arrived at Macao, 1750, and at Peking, 1751, where he lived until his death. His knowledge of Chinese and Tartar languages allowed him to interpret many obscure passages in the Chinese writers, and his works contain valuable information on China

and Chinese literature, arts, and hist. Among them are: *Art militaire des Chinois, 1772*; *Vie de Confucius, 1791*; and *Dictionnaire Tartare-Mantchou-Français, 1789-90*.

**Amir**, see **EMIR**.

**Amirante Islands**, i.e. Admiral Is., named after Vasco da Gama, their discoverer, a group in the Indian Ocean, S.W. of Seychelles, in lat. 5° S., long. 53° E. They are owned by Great Britain as a dependency of Mauritius. The scanty pop. supports itself by fishing.

**Amisia**, the Rom. name of the Prussian tn. of Ems; also of the riv. of the same name.

**Amissus**, see **SAMSUN**.

**Amjhera**, a tn. in Central India, situated in the opium-growing dist. of Malwa; pop. 97,000.

**Amlwch**, seaport of Anglesey, N. Wales, 15 m. N. of Beaumaris. Pop. 2720.

**Amman**, the cap. of Transjordan. Not many years ago it was a small Circassian vil. scattered over the ruins of a Græco-Rom. city famous for its well preserved theatre. The old cap., Es-Salt, has given place to A. largely because the latter, being near the Damascus-Medina railway, was a more natural centre. After the First World War the Brit. and the emir made their headquarters there and to-day a city of some 35,000 people fills the 3 valleys cutting across it and is now encroaching on the surrounding hills. On the plateau E. of the tn. above is an important station of the R.A.F. and in the broad valley below are the headquarters of the Transjordan Frontier Force under a Brit. pasha. The palace of the king and the Brit. residency are 2 solid buildings situated on the opposite crest.

**Amman, Johann** (1669-1730), Swiss physician, b. at Schaffhausen, and graduated at Basel in 1687. Began to practise at Amsterdam. An early authority on the teaching of the deaf and dumb, his method being to attract the attention of his pupils to the motions of the lips and larynx, and then to urge them to imitate these movements. His great work, *Surdus Loquens*, was pub. in 1692. He d. at Warmoud, near Leyden.

**Amman, Jost** (1539-91), Swiss painter and engraver. His productions are extremely numerous, but he is most remarkable for his engravings on wood. His original drawings are chiefly to be found at the Berlin Museum.

**Ammanati, Bartolomeo** (1511-92), It. architect and sculptor. He studied under Sansovino, and did much work for Pope Julius III.

**Ammanford**, a mkt. tn. of Carmarthenshire, 12 m. from Swansea, on the G.W.R. Has coal-mines and tin-plate works. Pop. 7000.

**Ammelide**, a substance obtained from ammeline. It is a white powder, insoluble in water, alcohol, and ether, but soluble by the alkalis and strong acids. Its formula is  $C_8H_8N_2O_4$ .

**Ammeline**, a substance obtained by

the action of hydrochloric acid on melam. It is of a splendid white colour, and is composed of very fine silky needles; it is insoluble in water, alcohol, and ether, but soluble in the caustic alkalis. When fused with potassium hydroxide, A. is converted into ammonia, and potassium cyanate. Its formula is  $C_8H_8N_2O_4$ .

**Ammonophis**, see **AMENHOTEP**.

**Ammeter**, or ampere-meter, an instrument for measuring the strength of an electric current in amperes (*g.v.*). In the best direct-current (D.C.) As., the current passes round a light coil pivoted so that it can rotate in a narrow gap between a soft-iron cylinder and the concentric poles of a horseshoe magnet. The current causes the coil to behave as though its faces were magnetised, and the coil therefore rotates to face the poles of the magnet, but its motion is resisted by delicate hair springs attached to it. The pointer of the instrument is carried by the coil, and the angle through which it rotates is directly proportional to the strength of the current. This proportionality is only achieved by the presence of the iron cylinder, which makes the magnetic field radial in direction, so that the pull on the coil is the same in all positions as it rotates.

In alternating-current (A.C.) As., the attraction of the moving coil is provided by the current flowing round a fixed coil. In this way the alternations of the current do not affect the direction of the attraction. Cheap As. of the moving-iron type depend on the attraction of a piece of soft iron towards the centre of a fixed coil round which the current flows, but for these and other As. such as thermal As., which depend on the heating effect of a current and are equally suited to A.C. or D.C. measurements, see R. T. Glazebrook (ed.), *Dictionary of Applied Physics*, 1923.

**Ammianus Marcellinus**, the last Lat. historian of the Rom. empire, lived some time in the fourth century A.D. He served in his youth in the E. and under Constantius II. in Gaul, and later accompanied Julian in his expedition against the Persians. In his later years he wrote, in 31 books, a hist. of the empire from the accession of Nerva to the death of Valens (96-378). Of this work (*Resur. Gestarum Libri XXXI.*) only 18 books remain, covering from 353 to 378. A. was a Gk., and his work is characterised by impartiality and insight. Ed. Gardthausen, Leipzig, 1875; Eng. trans. Yonge, Bohn's Classical Library.

**Ammir**, a kind of canoe at one time in frequent use in the highlands of Scotland.

**Ammirato, Scipione** (1531-1601), historian, came of a well-known family of Lecce, in the kingdom of Naples. On the advice of Braccio Martelli, archbishop of Lecce, he entered the Church, but on his patron's falling into disfavour with the pope his prospects of advancement were seriously diminished, and he settled down to a life of pleasure and study in Venice. An amorous intrigue

compelled him to leave the city, after which he travelled from place to place, finally securing the favour of the Medici in Florence. Here he received a commission to write the hist. of Florence. This work, entitled *Istorie Fiorentine*, appeared in 2 parts, the first in 1600, the second after his death, in 1641. Amongst his other works are: *Delle Famiglie Nobili Napolitane*, 1580; *Delle Famiglie Nobili Fiorentine*, 1615; *Discorsi sopra Cornelio Tacito*, 1591.

**Ammodytes** (Gk., sand-dwellers), a genus of carnivorous fish of the family Ammodytidae, or sand-eels, and subdiv. Malacopterygii of the order Teleostei. It is related to the mullets.

**Ammon**, later **Ammon-Ra**, i.e. A. the Sun, an Egyptian deity whose princ. city was Thebes. In the Libyan desert there was also an oracle known by his name. He is sometimes represented with the head of a ram, sometimes in human form wearing on his head a disk from which rise 2 tall feathers. His name is more correctly spelt Amūn.

**Ammon, Otto**, (Ger. anthropologist, was b. in 1842 at Karlsruhe, where he was educated. He is best known by his classification of country settlers in tns. into 2 groups, of 'round-headed' and 'long-headed,' the former attaching themselves to the commercial and industrial classes, the latter exhibiting a tendency to join the official and professional classes. This classification is known as 'Ammon's Law.' He is the author of *Die natürliche Auslese beim Menschen*, 1893; *Die Gesellschafts Ordnung und ihre natürlichen Grundlagen*, 1896; and *Zur Anthropologie der Badener*, 1899.

**Ammonal**, see EXPLOSIVES.

**Ammonia**,  $\text{NH}_3$ , a pungent-smelling gas; the name is also applied to the aqueous solution (spirits of hartshorn) and loosely to many of its compounds. It was known to the ancients as being produced by burning feathers and other organic substances, and the name owes its origin to the practice of distilling camel's dung in Libya near the temple of Jupiter Ammon. Many animal and vegetable products containing nitrogen give off A. when heated with the exclusion of air, especially if lime or any other alkali be added. In the distillation of coal, A. is produced and dissolved in the water through which the coal-gas passes. The liquid is then distilled with lime, setting free the A., which is passed into hydrochloric acid to form ammonium chloride, the 'sal ammoniac' of commerce. A. is also produced by the agency of bacteria from decaying animal or vegetable matter. It thus finds its way into surface water and into the atmosphere, where traces are usually found. A. is manufactured according to the Haber-Bosch process by heating a compressed mixture of nitrogen and hydrogen in the presence of certain finely divided metals such as iron and molybdenum.

A. is usually prepared on a small scale by heating together a mixture of 2 parts of

lime and 1 part of ammonium chloride; if needed in a gaseous form, it has to be collected over mercury or by upward displacement, owing to its great solubility in water. A. can be liquefied at  $0^\circ \text{C}$ . by the application of a pressure of 7 atmospheres, and the heat it absorbs in returning to a gaseous form causes a fall in temp. in surrounding objects which has led to its use for refrigerating purposes. In medicine A. is used as an antacid and as a heart stimulant in cases of fainting, hysteria, etc., though if breathed in large quantities it becomes injurious.

A. was at one time supposed to be the oxide of a metal to which the name of ammonium was given, but all efforts at producing it in a free state failed. In 1808 Seebeck discovered that if mercury is brought into a strong A. solution and an electric current passed through it, a spongy mass is formed, which was looked upon as an amalgam of mercury and ammonium. The amalgam rapidly decomposes into mercury, A., and hydrogen, thus pointing to the temporary formation of a substance  $\text{NH}_2$ , which has an action analogous to that of sodium or potassium in like circumstances. The salts of this radical are similar in general character to those of the alkalis. The following are the chief:

**Ammonium fluoride**,  $\text{NH}_4\text{F}$ , obtained by saturating hydrofluoric acid with A. It decomposes silicates and therefore is used in mineral analysis and for etching on glass.

**Ammonium chloride**,  $\text{NH}_4\text{Cl}$ , or sal ammoniac, is prepared on a large scale from the ammoniacal liquor of the gas-works. It is used medicinally in bronchitis, rheumatism, and liver disease; in dyeing and in the processes of tinning and soldering; and in the manuf. of Leclanché and dry electric batteries.

**Ammonium sulphate**,  $(\text{NH}_4)_2\text{SO}_4$ , found in volcanic dists., but prepared in large quantities synthetically and from gas liquor. It is used for the manuf. of other ammonium salts, but chiefly as a nitrogenous manure.

**Ammonium nitrate**,  $\text{NH}_4\text{NO}_3$ , prepared by neutralising A. with nitric acid. It explodes when rapidly heated and is used as a constituent of various explosives (e.g. ammonal, a mixture of A. nitrate with powdered aluminium), and for the manuf. of nitrous oxide. It was formerly used in small-scale manuf. of ice-cream, since a low temp. is produced when it is dissolved in water.

**Ammonium carbonate** is known as rock-A. and is used in smelling-salts and for cleansing purposes. The commercial product is mainly a mixture of ammonium bicarbonate,  $\text{NH}_4\text{HCO}_3$ , and ammonium carbamate,  $\text{NH}_2\text{COONH}_4$ .

**Ammoniac**, Gum, a gum-resin used medicinally as an expectorant or plaster. It is obtained from the umbelliferous plant *Dorema ammoniacum* in the form of a milky juice. Its smell is nauseous.

**Ammonite** (from ammonia), a nitrogen compound used for blasting.

**Ammonites**, a Semitic race descended, according to Gen. xix. 38, from Lot, their progenitor being Ben - ammi; they were closely related to the Moabites. Their chief city was Rabbah, or Rabbath Ammon; their national deity was Moloch or Milcon; their language was akin to the Heb. Frequently at war with the Jews, they were defeated by Jephthah, Saul, and David, and finally by Judas Maccabeus. Their last historical notice was by Justin Martyr, who affirmed that in his day they were still very numerous.

**Ammonius Saccas** (third century A.D.), a Gk. philosopher of Alexandria, who devoted himself to the reconciliation of the teachings of Plato and Aristotle. Through his followers he founded the Neo-Platonic philosophy. His surname was given him on account of his humble origin, he having perhaps been a porter in his youth. His chief pupils were Plotinus, the 2 Origenes, and Longinus. Sev. other important men have borne the same name. The chief are A., the Grammarian, whose writings are of doubtful authenticity, and A., son of Hermias, an Alexandrian, who taught at this tn., and wrote some commentaries on Aristotle.

**Ammonoidea**, a fossil order of cephalopodous molluscs; they are tetrabranchiate, and closely allied to the Nautiloidea, of which some species are alive, while the 500 species of A. are all extinct. The shell is usually discoid, the only straight one belonging to the baccrites. The opening is simple, the first chamber spherical or ovoid, and the last contained the animal, which was probably kept entirely within the shell. The different species are widely distributed. See P. Reyné's *Monographie des Ammonites*, 1879; A. d'Orbigny's *Paléontologie française*, 1840-52.

**Ammunition** (from Lat. *munire*, to defend, through the Fr.), a term embracing all the stores used for attack and defence, including guns, gunpowder, projectiles, and all the accessories. A. is described as *fired* when the projectile, powder, and primer are combined in a single piece generally enclosed in a metal case. In small arms, machine guns, and quick-firers it is invariably of this kind. For the larger guns, the 3 components are kept separate. The powder is generally packed in bags now made of silk, though serge was once common. The primer may be constructed to ignite by percussion, friction, or an electric current, or by a combination of the first and last (percussion electric). Projectiles are of numerous patterns, to suit the various types of guns. Plain spherical stone balls were first used, and *cage-shot*, still in use, may be traced back to the fifteenth century. They are intended for use only at close quarters, and consist of a cylindrical case of sheet iron filled with bullets. On leaving the bore the case breaks and the bullets are scattered broadcast. This shot is useful

only against the persons of the enemy, and is valueless for the destruction of defences. The case is the same with *shrapnel shell* (invented at the end of the eighteenth century). They consist simply of common shell filled with bullets, the bursting charge in the base of the shell being fired by a flash from the fuse in the head passing down a central tube. It was found that the bullets were apt to scatter too far and also that premature explosion was likely, so the bursting charge is now made only sufficiently large to open the shell during flight.

*Common shell*, to which reference has already been made, consist of a hollow cylinder of steel (or occasionally cast iron) filled with ordinary gunpowder or some high explosive such as lyddite. They are essentially a destroyer of material, and so the bursting charge is made as large as possible. High-explosive shell, generally known as 'H.E.', filled with various types of high explosive, are of modern adoption. With the introduction of armour-plating for ships, armour-piercing projectiles became necessary, as the ordinary cast-iron projectile was useless. These consisted of pointed cast-iron shot specially hardened (by a method invented by Sir W. Palliser), but are now made of forged or cast steel, cast from a special mixture. *Hand grenades*, small, spherical common shell filled with powder weighing 3 or 6 lb., though commonly regarded as obsolete, were used in the Russo-Jap. war of 1904. There are also various other extraordinary types of shell, such as the *segment* and *ring* shells, both varieties of the shrapnel. The question of the means to ensure correct rotation is important. In rifled muzzle-loading (R.M.L.) guns this was originally effected by a spiral arrangement of gun-metal studs. This was defective as it caused erosion of bore through the escape of powder-gas. Rotation is now secured by a cupped copper disk or 'gas-check' attached to the base of the projectile. The earlier Armstrong (R.B.L.) projectiles were coated with lead, which the explosion forced into the grooves. The lead coating, however, proved too soft, and the use has now become universal of a copper driving-band fitted into a groove round the body of the projectile. During the First World War many new types of A. were introduced to meet the varying methods of warfare. Among these the following are the more important: *Smoke shells*: these contained a smoky mixture which, on bursting, created dense clouds of smoke. Its tactical use was for screening movement, and for ranging guns where the observation of fall of shot was otherwise difficult. *Star shells*, containing parachute lights and made to open in the air by a small charge, were used to illuminate areas in the enemy's position. *Gas shells*: these were first introduced by the Gers. They contained poisonous gases which were released by the bursting of the shell. *Mortar bombs* were introduced for trench

warfare. They were fired from trench mortars of varying sizes and were charged with gas or high explosive. Their simplicity of design and lightness in transport made them very suitable for use in trenches. *Aerial bombs*: cylindrical and torpedo-shaped, designed for dropping from aircraft by release from carriers in the machine. The chief types used were those filled with high explosives for damaging buildings, earthworks, railways, and A. dumps, and those with incendiary mixture for setting fire to buildings, etc. *Anti-aircraft shell*: these are filled with high explosives for attacking hostile

of V1 (flying bombs) and V2, some of them piloted models, were in the experimental stage. *Anti-aircraft rockets, airborne rockets*, and many other types considerably in advance of any missiles then known were also under development in Germany. The *atomic bomb*, the principle of which depends on the fission of uranium nuclei, was introduced by the Amers. against Japan with devastating results (see ATOMIC BOMB).

*Ammurapi*, see HAMMURABI.

*Amnesia* (Gk., lack of memory), partial or complete loss of memory. Complete A. is practically impossible, as without some memory no intellectual

AMEBA, MULTIPLYING BY DIVISION

**Left: AMCEBA PROTEUS**

ECT, ectoplasm; END, endoplasm; CV, contractile vacuole; D, shell of a diatom which has been taken in as food; PS, pseudopodium; N, nucleus containing granules of chromatin, CHR.

aircraft, and are arranged to burst in the air by means of a time burning fuse. All these types were again in use, though much developed in range and power, in the Second World War (1939). Many great changes were introduced in the Second World War. Among them were the much-increased size of bombs carried by bomber aircraft, ranging from 4500 lb. to 12,000 lb., and even heavier than that (see BLOCKBUSTER). Some of the Ger. anti-aircraft shells were rocket-propelled, and controlled by radar or radio, thus resembling the Amer. proximity fuse. Another development was the *flying bomb*, which the Gers. used for attacking London in 1944-45 (see FLYING BOMB). The V2 or *rocket bomb*, another Ger. missile used against London, had a velocity of 3000 m.p.h. (see under ROCKET). In the closing stages of the war missiles of many types were being developed—controlled and guided, target-seeking and free. The Gers. had under development a transatlantic rocket that would be capable of making the crossing in a little over a quarter of an hour; while new forms

action could continue. The commonest form is that of verbal A., when the names of objects are forgotten. When the patient can partially articulate, the condition is known as A. aphasia. A. may be caused by old age, brain-diseases, various forms of insanity, or even by excessive fatigue or weakness. The condition may be permanent, but is generally temporary. A. due to hysteria or hypnotism may be called periodic.

*Amnesty* (Gk. *amnesia*, oblivion), an act of state granted by a gov. by which pardon (or oblivion) of certain past offences is accorded. It is generally given in the case of whole sections of the community, who have been guilty of some offence against the state, and it completely obliterates the offence, whether granted before or after conviction. As., granted either by the sovereign or by Act of Parliament, are sometimes general, but more often have certain exceptions made; e.g. those responsible for his father's execution were excepted from the A. granted on the

**accession** of Charles II. As. were frequently granted to criminals at coronations.

**Amnion** (Gk. *ἀμνός*, a lamb) is the innermost membrane which invests the fetus of mammals, birds, and reptiles. As time proceeds it thickens and separates from its close adhesion to the embryo; between it and its contents there then flows the *liquor amnii* which preserves the embryo from harm and keeps it at an equal temp. Its softness is responsible for its name.

**Amœba** (Gk. *ἀμοιβή*, change), a genus of Protozoa, the lowest class of animal life, and type of the order Amœboidea. It consists of naked protoplasm containing a single nucleus, and the cytoplasm is granular. It contains a *contractile vacuole*, or pulsating space, and possesses the power of throwing out *pseudopodia*, processes which are continuously being drawn back while others are protruded. It is by this succession of pseudopodia formation that the organism is capable of motion in the water. The food is absorbed into any part of the body by intussusception, and the wastes are expelled by any part of the body. There is no sexual reproduction, the A. merely splits in two when it reaches maturity. The resulting organism is transparent and colourless, or faintly yellow, and may be found in fresh water; frequently it is extremely minute. (See illustration, p. 299.)

Species of an allied genus, *Entamoeba*, differing from A. in the absence of a contractile vacuole, occur in the human intestine; one of them, *E. coli*, is harmless, but another, *E. histolytica*, attacks the mucous membrane, causing amœbic dysentery, a disease which is rife in tropical and sub-tropical countries. See J. Leidy's *Fresh-water Rhizopods of N. America*, 1879; E. Haeckel's *The Radiolaria*, 1862.

**Amœbean Verses** (Gk. *ἀμοιβαῖος*, interchanging), a species of verse in which 2 persons answer alternately. Such are some of Virgil's *Elogues*.

**Amol**, Persian city, prov. of Mazandaran, on R. Heraz. Pop. 10,000.

**Amontillado**, a popular variety of light Sp. sherry.

**Amontons, Guillaume** (1663-1705), a diligent mechanician and experimenter in natural philosophy, was b. in Paris. He improved the instruments and devised others for measuring the density, temp., and humidity of the atmosphere; he was the first to make experiments in a species of telograph.

**Amoor**, see AMUR.

**Amorites** ('mountaineers,' or possibly 'people of high stature') an ancient race of Canaan, occupying the land on both sides of the Jordan. The name is sometimes used in the O.T. as synonymous with Canaanites, sometimes as that of a special tribe. Sihon and Og, the kings of the A. on the E. of Jordan, were defeated by Moses, and later those dwelling on the W. were defeated by Joshua in 2 battles, and their land was divided among the tribes.

**Amoroso** (It., loving or tender), in music, indicates a tender, slow manner.

**Amorphophallus** is a genus of Araceæ found in the E. Indies. The rhizome produces a single enormous leaf annually, and an enormous spadix, bearing both male and female flowers. In the species *A. Titanum* the spadix is sometimes 3 ft. high.

**Amorphous** (Gk. *ἀ-*, without, *μορφή*, shape), a term used in biology to denote that a body is formless or irregular in shape. In chem. amorphism is the state of a substance in which it presents no crystallised form.

**Amortisation**: 1. A law term, signifying alienation in mortmain, that is, the alienation of lands or tenements to a corporation, which was considered formerly as transferring them to *dead hands*, as such alienations were usually made to religious houses for superstitious uses. 2. In finance, the provision of a fund out of income for extinction of debt, redemption of bonds or shares, or replacement of cap. expenditure.

**Amory, Thomas** (c. 1691-1788), an Irish author of eccentric habits who in 1757 was living at Westminster. His books are a medley of autobiography, fiction, scenic descriptions, sentimental rhapsodies, and deist theology. His pub. *Memoirs, containing the Lives of several Ladies of Great Britain; a History of Antiquities, etc.*, 1755; and *Life of John Bunce, Esq.* (his best book), 1756 and 1766.

**Amos**, the earliest of the 12 minor prophets. He was a native of Tekoa, near Bethlehem, and followed the occupations of a shepherd and a tender of sycamore figs. He prophesied in the eighth century B.C. when Uzziah reigned in Judah and Jeroboam II. in Israel. He prophesied the death of Jeroboam and the captivity of Israel on account of the national sins, chief of which is disloyalty to Yahweh, the nation practising in his name rites abhorrent to him. The style of the prophet is clear and vigorous, abounding in picturesque images drawn from pastoral and country life. He was probably not alone in warning the people that the expected 'day of Yahweh' was not to be attended with joy, but he is the first whose prophecies were written as well as spoken. The book of A. contains many difficulties, some of which are textual. Additions have certainly been made to the original work, the most obvious being the concluding passage, plainly of post-exilic authorship. See S. R. Driver, *The Books of Joel and Amos* (Cambridge Bible for Schools), 1877.

**Amoy** (corruption of *Hai-mun*), a Chinese port on is. of same name in lat. 24° 28' N., and long. 118° 8' E., in the prov. of Fukien. It is on the S. of the is., and, though large and possessing some fine buildings, is exceedingly dirty. It was once the chief centre for the export of China tea, but this trade has dwindled away. Prior to the Sino-Jap. war (1931) (q.v.) a great many Chinese

emigrants were accustomed to sail from A. to Malaya, and, after making their fortunes there, return and live there. The self-governing foreign settlement is on a rocky little is. opposite. A Chinese univ. was founded in 1925. The city also exports porcelain and paper, importing raw cotton, cotton manufactured goods, etc. A. was one of the 5 ports opened to Brit. commerce by the treaty of Nanking in 1842, having been taken by the Brit. in 1841. It was captured by the Jap. on May 19, 1938, but surrendered in 1945. Pop. 150,000.

**Ampelopsis** is a genus of Vitaceæ (or Ampelidaceæ), now included in *Vitis* (q.v.), the vine genus. *A. Veitchii* (or *V. inconstans*), which climbs by means of sucker-like disks at the tips of the tendrils, and *A.* (or *V.*) *hederacea* (or *quinquefolia*), are the common Virginian creepers.

**Ampere**, in electricity, the unit of intensity of current. In terms of other units it may be defined as the intensity of that current which is produced in a conductor whose total resistance is 1 ohm when there is kept up between its extremities a potential difference which constantly amounts to 1 volt. The A. is legally defined as the continuous unidirectional current which, when flowing through a neutral solution of silver nitrate, deposits on the negative pole 0.001118 of a gramme of silver in 1 sec. An alternating current is said to have an intensity of 1 A. if it produces in a fine wire the same heat in the same time as a continuous current of 1 A. as determined by silver deposition.

**Ampère, André Marie** (1775-1836), famous Fr. physicist, naturalist, and mathematician, from whom the ampere, unit of strength of an electrical current, took its name. He was b. near Lyons. In 1793 his father was guillotined by the revolutionists. This event threw him into a state of deep melancholy, to alleviate which he redoubled his studies. As prof. of mathematics and physics at Bourg, he pub. his *Considérations sur la théorie mathématique du feu*. His great work was in the field of electrodynamics (electro-magnetism). His records of his discoveries may be found in the *Ann. Chim. Phys.* from 1820 onwards.

**Ampère, Jean Jacques** (1800-1864), b. at Lyons, was the only son of André Marie A. and prof. of the hist. of Fr. literature at the Collège de France. He was a distinguished philologist, cognisant with the languages of most of the many countries he visited. In 1839 and 1841 he pub. hist. of various periods of Fr. literature. In 1848 his *Grèce, Rome et Dante* gave an impetus to the study of the great It. in France. His chief work, on which he was engaged at his death, is his *Histoire romaine à Rome*.

**Ampersand** (corruption of 'and per se and'), the typographical character & or &.

**Amphiaræus**, in Gk. legend, a famous soothsayer and hero of Argos, the son of Oicles and Hypermnestra, and a member of the Argonautic expedition. His

wife, Eriphyle, bribed by Polyntices with the necklace of Harmonia, induced him to take part in the first expedition of Seven against Thebes, where, after fighting bravely, he took to flight and was swallowed up by the ground. He was made one of the immortals, and the temple built in his memory long harboured a famous oracle.

**Amphibia** (Gk. ἀμφί, on both sides, βίος, life), a class of vertebrates of which many are able to live on land for a considerable period—hence the name. The living species include salamanders, frogs, toads, and newts. The class is divided into 4 orders, the *Gymnophiona*, which are sightless, limbless, and snakelike; the *Urodela*, which possess tails and usually 4 limbs, and are scaleless, e.g. salamanders and newts; the *Anura* (or *Batrachia*), which are tailless and scaleless, but have external gills and 4 limbs, e.g. frogs and toads; the *Stegocephali*, an extinct order, lizard-like and bony, usually with long tails.

All A. have gills, though these are often replaced by lungs in the adult; their hearts possess 2 auricles, 1 ventricle, and a conus arteriosus; when they have limbs the legs are pentadactyle; the skin is soft and scaleless except in the *Gymnophiona*. The eggs are usually laid in water; in the case of the axolotl (see AMBLYSTOMA) breeding takes place in the larval stage. The eggs often develop into tadpoles, but some A. are viviparous and bring to life perfect animals. They are carnivorous when adult, and hibernate. In organic life they rank between reptiles and fishes. Many live in tropical countries, but frogs and toads are universally distributed. See H. Gadow's *Amphibia and Reptiles in the Cambridge Natural History*, 1901; G. A. Boulenger's *Catalogue of the Batrachia in the British Museum*, 1882.

**Amphibole** (Gk. ἀμφίβολος, ambiguous), a group of minerals which enter into the composition of a large number of rocks. They are essentially silicates of calcium and magnesium, but also include oxides of iron and of manganese. They crystallise in oblique prisms, and some are used as gems. The chief varieties are tremolite, actinolite, and hornblende.

**Amphibrach** (Gk., short on both sides), in prosody a foot of 3 syllables, the first and last short, the middle long, as in Lat. *āliam* and Eng. *inhūmān*.

**Amphictyonic Council**. An amphictyony was a confederation of neighbouring tribes, or those having interests in common, for purposes of mutual protection and the guarding of some shrine. The participants in such a league were called amphictyons, or dwellers around. There were sev. A. Cs. in ant. Greece, as those of Argos and Delos, but the chief was that of Delphi. Its origin was certainly very early, being connected traditionally with Amphictyon, son of Deucalion, and, though much of its authority was lost in the third century B.C., it still existed with

limited power under Rom. rule, and is last mentioned in the second century A.D. The names of the tribes concerned differ in various accounts. The list given by Æschines includes the Thessalians, Boeotians, Dorians, Ionians, Perthebians, Magnes, Locrians, Ceteans, Phthiot, Malians, and Phocians. It is known that there were 12 tribes, so to this list either the Dolopians or the Ænians should be added. Each tribe sent 2 deputies of equal authority, who met twice each year, alternately at Delphi and Thermopylae. Though the functions of the council were mainly religious, concerned with the sanctuary of Pythian Apollo, judicial rights and the regulation of peace and war came within its scope. See J. B. Bury, *A History of Greece to the Death of Alexander*, 1900.

**Amphidesma** (Gk. ἀμφί, on both sides, *desmos*, bond), or *Semele*, a genus of molluscs of the order Teleodermacea and family Semelidae. Lamarck gave it the above name because he observed that it had a ligament and a cartilage. There are about 100 species to be found in the Tertiary and Recent systems.

**Amphilochus**, in Gk. mythology, son of Amphiaraus (q.v.) and Eriphyle (q.v.). He took part in the expedition of the Epigoni (q.v.) against Thebes, assisted Alcmaeon in the murder of their mother and, later, fought against Troy. Like his father, he was a noted seer. Killed in single combat by Mopsus, also a seer.

**Amphimacer** (Gk., long on both sides), in prosody, a foot of 3 syllables, the first and last long, the middle short, as in Lat. *cōstās*. A. is the opposite of *amphibrach*.

**Amphion**, in Gk. mythology, a skillful musician. Son of Zeus by Antiope, who, driven out of Sicyon by her husband, Lycus of Thebes, and Dirce his wife, fled to Mt. Cithæron, where A. and his twin brother Zethus were born. They were exposed there, but found and reared by a shepherd. On reaching manhood they revenged their mother's wrongs on Dirce by causing her to be dragged to death by a bull. They then took possession of Thebes, and during the building of its fortifications the stones moved to the sound of A.'s lyre. He married Niobe, and was killed by Apollo.

AMPHIOXUS LANCEOLATUS

The notochord runs from tip to tip. T, tentacular cirri; G, reproductive organs, AP, atropore; A, position of anus.

**Amphioxus** (Gk. ἀμφί, on both sides, *oxus*, pointed), a small fish-like animal, is found in all seas. Its organs are all primitive when not absent; visual and olfactory organs are not definitely known to exist, the notochord is never replaced

by a vertebral column, and there are no limbs. It contains, however, a mouth and an anus and many gill-slits. It reaches a length of nearly 2 in., is generally found burrowed in sand, but can swim freely. About 10 species are known, and *A. lanceolatus*, the lancelet, is common to European seas. The particular point of interest of this animal is that it represents a prototype of the Vertebrates, although of course it must not be regarded as their direct ancestor; indeed it has been said 'that if A. had not been discovered it would have been invented.' See A. Willey's *Amphioxus and the Ancestry of the Vertebrates*, 1881.

**Amphipoda** (Gk. ἀμφί, on both sides, *pous*, foot), an order of Crustacea characterised by their laterally compressed bodies, sessile eyes, 3 pairs of swimming and 3 of jumping feet. They are both marine and fresh-water animals. Species of the sub-family Orchestina are known as the beach-flea and sand-hopper.

**Amphipolis**, anct. city of Macedonia, on lt. Strymon, 3 m. from Ægean Sea. Originally a Thracian tn., inhabited by Edonians, it was taken by Athens about 436 B.C. In 424 B.C. it passed to Sparta, later to Macedon, and finally to Rome.

**Amphisbænidae** (Gk. ἀμφίβαινα, a serpent that can go both forwards and backwards), a family of the Lacertilia, or lizards. These reptiles have no limbs, except in a solitary genus, and resemble snakes or worms in appearance. They are found in tropical America and Africa, where they feed on worms and ants. *Amphisbana fuliginosa*, of Brazil and Guayana, is dusky brown and nearly 2 ft. long. The natives regard its dried and powdered body as of medical value.

**Amphissa** (modern Salona), a tn. of anct. Greece, about 80 m. N.W. of Athens, situated at the foot of Mt. Parnassus. Its inhab., the Locri Ozolæ, having tilld the ground of the temple of Delphi, the Gks. under Philip of Macedon attacked and destroyed the tn. Pop. of modern Salona, 9000.

**Amphitheatre**, a form of building invented by the Romans for the purpose of holding gladiatorial shows and displays of wild beasts. Originally these entertainments were held in the forum or the circus, but as early as 70 B.C. a wooden A. of the recognised shape, i.e. having seats all round the portion reserved for the performance, existed at Pompeii. The first A. to be erected in Rome was the temporary one of Curio in 59 B.C., and Cæsar erected a permanent structure in 46 B.C. Augustus, in 30 B.C., ordered Statilius Taurus to build the first A. made partly of stone, and the Colosseum, the most famous building of the kind still remaining, was erected by Vespasian and dedicated by Titus in A.D. 80. It is elliptical in shape, measuring 616 ft. by 510 ft., and the exterior wall, 168 ft. high, consists of 4 stories, the lowest 3 being arcades in the Doric, Ionic, and Corinthian styles respectively, and the top a row of Corinthian pilasters. Inside,

the *cavea* or portion for spectators, consists of the *podium*, or lowest tier, reserved for guests of honour, and 3 rows of *maeniana*, for the various grades of the populace. The arena measures 280 ft. by 176 ft. The ruins of the A. at Arles show that it was capable of containing 20,000 spectators. It was later turned into a fortress, flanked by 4 great towers, of which 2 remain.

**Amphitrite**, Gk. sea-goddess, daughter of Nereus and Doris, and wife of Poseidon.

**Amphitryon**, son of Alcæus, king of Tiryns, married Alcmena, who, during his absence, was visited by Zeus in the shape of her husband.

**Amphiuma** (Gk. ἀμφί, on both sides, πνεύμα, breath), a genus of Amer. Amphibia of the order Urodela and family Amphiumidae. It is allied in most essentials to the water-newt, is eel-like, about 2 ft. long, has 2 or 3 jointless toes on each of its 4 limbs, minute eyes, and numerous teeth in the palate in 2 rows. As a tadpole it has gills; in adult life only the gill-slits remain. It lives in ponds and marshes, and buries itself in mud in the winter. *A. tridactylum*, the 3-toed species, inhabits Louisiana; *A. means* is called the Congo snake by the inhab. of Florida, and is erroneously believed to be venomous.

**Amphora**, a clay vessel used in Greece and Rome for wine and oil, and also as a cinerary urn; usually tall and slender, with a narrow neck and 2 handles, and often ending below in a point for insertion in the ground or a stand. The Gk. A. held about 9 gallons; the Rom. 6.

**Amplepuis**, a tn., Rhône dept., France, 19 m. by rail W. of Villefranche and 30 m. N.W. of Lyons. Manufs. of cotton, silk, and muslin. Pop. 5500.

**Amplifier**, an electrical appliance for increasing the intensity of the electrical currents passing in a communication or sound-reproducing channel. It consists of thermionic valves so connected that each amplifies the output of the previous valve, or arranged in any other combination according to the particular purpose in view. The thermionic valve for wireless reception consists of a filament, surrounded by a wire grid, above which is placed an anode for receiving a positive charge from a high tension battery. A recording A. is one which supplies the electrical transmission power to sound recorders, i.e., the wax-cutter for disk recording and the galvanometer for photographic recording. A television A. is one used for the amplification of television signals, characterised by the provision of efficient amplification of currents of a very wide band of frequency. Besides stability in operation, an A. should introduce no extraneous frequencies such as might result in disturbing noise in the sound-reproducing channel; and generally an A. may not introduce more than a specified degree of amplitude distortion into the system during its normal operation. See also LOUD-SPEAKER.

**Amplitude**, an astronomical term denoting the angular distance of a heavenly body, at the time of its rising or setting, from the E. or W. point of the horizon. Thus the A. of fixed stars is constant, while that of the sun is zero at the equinoxes.

**Amptill**, a mkt. tn. of Bedfordshire, 8 m. S.W. of Bedford. Near it are the ruins of Houghton House, supposed to be the original of the 'House Beautiful' in Bunyan's *Pilgrim's Progress*. A. House is the seat of the A. family. Pop. 2000.

**Amptill**, Odo William Leopold Russell, first Baron (1829-84), was b. at Florence and educated privately. He entered the diplomatic service in 1849 and served as attaché at Vienna. From 1850 to 1852 he was in the Foreign Office. Subsequently he was employed in turn at the embassies in Paris, Vienna, Constantinople, and Washington. As secretary of legation at Florence and Brit. representative at the Vatican he performed valuable diplomatic services from 1858 to 1870. In 1870 he was appointed assistant under-secretary at the Foreign Office, and in 1871 he became ambas. at Berlin, where he attended the Berlin Congress as third plenipotentiary and rendered valuable services. He d. at Potsdam. He was made a privy councillor in 1872 and created a baron in 1881.

**Amptill**, Arthur Oliver Villiers Russell (1869-1935), second Baron, son of the first baron, was b. in Rome, and educated at Eton and Oxford, where he was president of the union. He succeeded to the title in 1883, and was assistant private secretary 1895-97, and from 1897 private secretary to Joseph Chamberlain. He was governor of Madras 1899-1906, and during 1901 temporary viceroy and governor-general of India in Lord Curzon's absence.

**Ampulla** (Lat. *ampulla*, bottle), a Rom. bottle with a narrow neck; in Rom. Catholic Church, a cruet for the sacramental wine; also a vessel for holding the holy oil at the rites, coronations, etc.

**Ampurias**, a tn. in the dist. of Gerona, Catalonia, Spain, situated near the gulf of Rosas. It was founded by the Gks. of Marseilles and called by them Emporium. The Roms. called it Emporiae, and in their time it was a flourishing city. In the time of the Goths it was an episcopal see. Pop. 2800.

**Amputation**, the cutting off of a limb or projecting part of the body, sometimes necessary in order to prevent the mortification or disease of that part poisoning or exhausting the whole body. There are 3 inventions which have made A. safer and more readily resorted to than in previous centuries. These are the tourniquet, to stop the flow of blood in the arteries; anaesthetics, to procure painlessness; and antiseptics, to prevent infection of the wound. The objects of A. are primarily to remove a dangerously diseased or injured part, and then to leave a stump which may be as useful and as free from pain as possible

to the patient. To this end the methods of A. design to leave a pad or cushion of flesh at the end of the severed bone. In the 'circular' method this is attained by an assistant pulling the skin and flesh upwards as far as possible, while circular sweeps are made with the knife in a direction perpendicular to the long axis of the limb. This results in the soft parts being somewhat longer than the bone, so that they may be used as a covering. In the 'flap' method, the tissues are transected by the knife near the bone, and a cut is made downwards and outwards to the surface of the skin. The operation is repeated on the other side of the bone, the blood-vessels are secured, and the bone is sawn through. This leaves 2 semicircular flaps which are afterwards sown together.

**'Amr, Mosque of**, the earliest Arab building of Cairo. It dates from A.D. 613.

**Amraoti**, cap. city of dist. of same name in E. Berar, Hyderabad, India, 28 m. S.E. of Ellichpur. An important cotton-mart, with large textile manufs.; the headquarters of the commissioner of the prov.; and terminus of a state branch railway. Pop. 46,400.

**Amravati**, ruined city in Guntur dist. of Madras, India, on R. Kistna. Formerly one of the chief centres of the Buddhist kingdom of Vengi and later of the Sivaite faith. Identified with the To-no-kie-tse-hia of Hsuan Tsang, and the Arab Rahml.

**Amrilcais**, or **Amru-ul Qais**, Arabian poet of the sixth century, was the son of the chief of the Kinda tribe, and lived a wandering life among the Arab vagabonds and brigands until the death of his father, who was killed by the Bonu-Asud tribe. He is then supposed to have bent his efforts on securing vengeance, and to have obtained troops from the Emperor Justinian. According to tradition, he was shortly afterwards killed by a poisoned cloak presented to him by the emperor, who had been told by some informer that A. had been guilty of seduction. He is the author of one of the 7 *Muallaka*, in which he displays great imaginative powers. He is regarded as one of the founders of Arabian poetry. His poems have been pub. in Ahlwardt's *The Divans of the Six Ancient Arabic Poets*, 1870.

**Amritsar**, cap. city of dist. (1571 sq. m.) and div. (5354 sq. m.) in Punjab, India, 33 m. E. of Lahore. An important commercial and manufacturing centre, with large textile industries. It is the religious centre of the Sikhs, who have there a large temple (built in 1551 by Ram Das on an island in a tank) attended by 6000 priests. The Govindgarh, a large fortress enclosed by a deep ditch 2 m. in length, was erected in 1809 by Ranjit Singh. Semi-revolutionary disturbances broke out in the Punjab and in other provs. in 1919. A., where Brig.-Gen. Dyer was in command of troops, was the scene of the gravest of these disturbances. A crowd of 15,000 natives had assembled in de-

fiance of public proclamation in a space known as Jallianwala Bagh (Apr. 13). They were unarmed, but Gen. Dyer, who considered the situation critical, ordered his troops to fire. Some 400 of the rioters were killed and many wounded. The Brit. Gov. appointed a committee under Lord Hunter to investigate the affair. This committee condemned Dyer's action as being unduly severe, and the House of Commons adopted their report. Sir Michael O'Dwyer, who was governor of the Punjab at the time, was assassinated at the Caxton Hall, Westminster, by an Indian on Mar. 13, 1940. On the partition of India in 1947 into 2 autonomous dominions the holy city of A. was assigned to the dominion of India, there being then, on balance, more Hindus and Sikhs in the pop. than Muslims. Pop. (1941) 390,000.

**Amru-Ibn-Al-Aas** (d. A.D. 663), a famous Arabian warrior, who after bitter opposition to Mohammed ultimately became one of the prophet's chosen supporters. From Mohammed's successor, Abu-Bekr, he obtained a command in the army in Syria. He fought at the battle of Alzadain and distinguished himself in the sieges of Damascus and Jerusalem. In the years 638-40 he conquered Egypt, the campaign terminating in the capture of Alexandria, when he is said to have been responsible for the destruction of the Alexandrian library. This charge, however, has never been proved. In his subsequent administration of Egypt he exhibited great ability, interesting himself in various public works, amongst which is said to have been the construction of a canal joining the Red Sea and the Mediterranean.

**Amrum**, or **Amrom**, one of the N. Frisian Is. in the North Sea. Its length is about 6 m. and its pop. 700.

**Amru-ul Qais**, see **AMRILCAIS**.

**Amsler**, Samuel (1791-1849), Ger. engraver, b. at Schiznach, Switzerland, studied at Zurich, Munich, and Rome. Became prof. of line-engraving at Munich, 1829. Best works, 'Triumphal March of Alexander the Great' (Thorwaldsen), 'Triumph of Religion in the Arts' (Overbeck), and reproductions of Raphael.

**Amsteg**, a Swiss tourist resort in the canton of Uri, 7½ m. S.E. of Altdorf, on the St. Gotthard railway.

**Amstelodamum**, Lat. name for Amsterdam.

**Amsterdam**: 1. (The dam of the Amstel.) The chief commercial and industrial city of Holland, is situated at the mouth of the Amstel R., in the S.W. corner of the IJssel Meer, formerly Zuider Zee. It is connected with the North Sea by the N. Sea Canal, 15 m. long, to the construction of which (1876) it owes much of its present prosperity. Breadth 75 metres, depth 12.5 metres, within short 100 metres and 15 metres respectively. Accessible for the largest vessels by day and night, not depending on tide. Biggest lock in the world, 400 metres long, 50 metres broad, 15 metres deep. Though

the importance of its shipping is secondary to that of Rotterdam, it is the headquarters of the shipowning interest and of the trade with the Dutch E. Indies; its prin. imports are coal, ore, grain, petroleum, tobacco, tea, coffee, cocoa, sugar, timber, and oil seeds, while it has considerable exports of dairy produce, paper, cokes, artificial manure, sugar, and hides.

Among the chief industries are to be mentioned diamond cutting and polishing, for which the city has long been famous, sugar-refining, manufacturing of ready-made clothes, letter-casting, printing offices, iron, soap, dye, chemical manufs., shipbuilding, brewing, distilling. A. is connected with the hinterland by the A.-Rhine Canal, and is remarkable for the number of its well-equipped docks and quays, and for its canals, by which it is intersected in all directions. In this last respect it has been likened to Venice. There are many notable buildings and institutions, among which must be mentioned the royal palace, completed in 1663, built as a tv. hall; the New Church (Nieuwe Kerk), a splendid Gothic building dating from 1408 and notable for its stained-glass windows and monuments; the Old Church (Oude Kerk), dating from the beginning of the fourteenth century; the St. Antonieswaag, originally a tv. gate and now the site of the A. Historical Museum; the Treppenhuis (1662), and of modern date the Exchange (Koopmansbeurs) and the Netherlands Trading Company office building. The Ryksmuseum (state museum) contains the wonderfully fine national collection of pictures. There are also botanical and zoological gardens, the latter being one of the finest collections in Europe. A. has 2 univs., the Municipal Univ. and the Free Univ., and many other educational and charitable institutions. The Portuguese Synagogue, built in 1670, has a magnificent interior. Houses are built on wooden piles, and the royal palace stands on 13,659. The inhab. of this prosperous city are ceaselessly industrious. It is a city of merchants, bankers, traders, and shopkeepers; it is in the forefront of modern sea- and airports, the market for the produce of the Dutch Indies—tobacco, coffee, tea, sugar, rice, spices—and world market for tobacco and quinquina. The goods traffic of the port increased 100 per cent between 1913 and 1938.

The hist. of the city dates from the beginning of the thirteenth century, when Giesbrecht II. of Amstel built a castle there. At this time it was nothing more than a fishing vil. It received its first charter from Guy of Hainault, bishop of Utrecht, in 1300. In the sixteenth century the city's prosperity greatly increased on the decline of that of Antwerp. In 1648, with the closing of the Scheldt by the treaty of Westphalia, A. secured even greater advantages at the expense of the Belgian city, though a due share of its commercial advance in the seventeenth century must be assigned to the foundation of the Dutch E. India Company in 1602 and the Bank of A. in 1609. The

Prussians occupied the city in 1787, and it was taken by the Fr. in 1795. Chosen by Louis Bonaparte in 1808 as the cap. of the Netherlands, it was officially recognised in 1810 as the third city of the Fr. empire. During the brief resistance of the Dutch forces to the Ger. invasion of Holland in May 1940, many air raids were carried out at Schiphol (A. airport).

Ger. destruction of the harbour installations began early in Sept. 1945, when the Allies reached the S. border of Holland. After a few days, with the halting of the advance, the work of destruction was stopped; it was not resumed. Though falling short of what was originally planned, Ger. destruction was great. In spite of so much destruction, the port of A. was far from being a total loss. The greater part of the harbour, especially on the E. side, was almost untouched, except where cranes had blown up. The links with the hinterland—to the E. across the IJssel Meer (Zuider Zee) and to the S. as far as the Rhine—were intact at the end of the war. The restoration of the port began immediately after the liberation of A. and by the close of 1945 much of the damage had been made good and the quays had been cleared. Pop. declined from 803,073 (1940) to 772,941 (1945), mainly in consequence of the deportation of the Jews. See Kroon's *Amsterdam*, 1888; J. ter Gouw's *Geschiedenis van Amsterdam*, 3 vols., 1879-81; H. Brugman, *Geschiedenis van Amsterdam*, 8 vols., 1930. 2. A city in Montgomery co., New York State, 33 m. N.W. of Albany, on the Mohawk R. It has manufs. of carpets, hosiery, etc. Pop. 33,000.

**Amsterdam, New:** 1. Name of New York under the Dutch. 2. Tn. of Brit. Guiana, near mouth of Berbice, 62 m. S.E. of Georgetown. Pop. 9000.

**Amsterdam Island,** volcanic is. in Pacific, midway between Cape of Good Hope and Tasmania. Annexed by France, 1893. Area 976 sq. m. Pop. 197,000. Chief tn. St. Denis, pop. 27,000.

**Amu Darya, sec OXUS.**

AN AMULET

**Amulet,** a charm, worn or placed in a building as a protection against evil spirits. The use of As. comes from the E., where it has existed from very early times. In anc. Babylonians and Egyptians had a strong belief in the protective power of charms, and the custom was to a certain extent handed on to the Gks. and Romans. The phylacteries of the Hebs. were undoubtedly

regarded as a form of A. The early Christian fathers strongly deprecated the use of such charms, and endeavoured to replace them by relics of saints and biblical quotations. The frequent occurrence of the fish symbol in early Christian inscriptions, etc., points to a superstitious belief of this kind. As have been made of many substances, the most common being precious stones, metals, either in the natural state or made into articles of jewellery or images, and inscribed parchments, often enclosed in sachets or gold balls. Plants and parts of animals, especially the teeth, were also used. As are still in vogue in the E. and in S. Europe, where their aid is particularly invoked against the 'evil eye.' Buddhists and the Muslims both use As. with a religious significance.

**Amundsen, Captain Roald** (1872-1928), Norwegian explorer and navigator, took to the sea after graduating at Oslo Univ. and studying medicine. He served for some time as an able seaman in various whaling and sealing vessels, at the same time studying navigation and equipping himself in other ways for more responsible positions. He was subsequently appointed by Capt. De Gerlache to be first mate of the *Belgica* on the occasion of his Antarctic expedition. This expedition did not get very far, but about 4 years later, A. with a few companions started on the ambitious enterprise of navigating the N.W. passage, which he succeeded in doing in 1906, being the first man to accomplish the feat. In 1909 he visited London and announced to the Royal Geographical Society his preparations for an important expedition to the Arctic. In 1910 he set out in the *Fram*, presumably for the N., but the success of Peary in reaching the N. Pole induced him to abandon his project, temporarily at least, and in 1911 it was found that he was going to try to forestall Scott in the dash for the S. Pole. In this attempt he was successful, reaching the Pole on Dec. 14, 1911, after a comparatively easy journey. In the First World War he served with the Norwegian Naval Air Service, and from that time would appear to have favoured aerial navigation for exploration. It was not until 1914 that he took any further part in exploration, in which year he bought the *Maud* with the idea of drifting across the Pole. He navigated the N.E. passage, but early in 1919 his engine broke down and he was compelled to land in Alaska. Two years later he tried to reach the Pole in an aeroplane from the *Maud*, but without success. In 1925, having become bankrupt, he went to the U.S.A., where the Amer. explorer Lincoln Ellsworth offered to finance him in a joint flight from Spitzbergen. The 2 explorers, however, had only traversed some 500 m. when they were compelled to abandon the enterprise. A. then made arrangements to join Nobile in his dirigible, and in May 1926 he and Nobile, together with Ellis-

worth and Lt. Riser-Larsen, started from Spitzbergen and in 3 days landed in Alaska. A.'s days of exploration finished with this feat, but in 1928, hearing of the plight of his old companion, Nobile, he set out in a seaplane to attempt his rescue. In this A. and his pilot lost their lives. See ARCTIC AND ANTARCTIC EXPLORATION.

The story of his 2 chief achievements is told in his *The North-west Passage*, 1908, and *The South Pole*, 1912. He also wrote *The North-east Passage* (1918-20); *The Flight across the Polar Sea* (1926); and *My Life as an Explorer* (1927).

**Amur**, a riv. of E. Asia, formed by the confluence of the Shilka and the Argun, westward of the Khingan Mts. It has a total length of about 1700 m., not counting the head-waters, the first 800 m. being in a S.-easterly direction and dividing the A. region from Manchuria, after which it flows N.E. through the Khingan Mts. into the sea of Okhotsk at Nicolaievsk. It is navigable for its entire course. Its chief tribs. are the Sungari, the Ussuri, the Zoya, and the Bureya. The most important tns. situated on it are Blagoveshchensk, Alguu, Khabarovsk, and Marinsk.

**Amurath**: 1. A. I., sultan of Turkey 1360-89; began Turkish conquests in Europe. 2. A. II., sultan 1422-51; defeated Hungarians at Varna and Kossovo. 3. A. III., sultan 1574-95. 4. A. IV., sultan 1623-40; notorious for his extreme cruelty. 5. A. V., sultan May-Aug. 1876.

**Amwythig**, see SHREWSBURY.

**Amyclæ**, an anct. tn. of Laconia, Greece, on R. Eurotas, 2½ m. S.E. of Sparta. It was the chief tn. of the Achæans, and remained independent after the Dorian conquest. The festival of the Hyacinthia was celebrated here annually. Numerous remains have been found on the site.

**Amygdalin** ( $C_{20}H_{27}O_{11}N$ ), a glucoside found in bitter almonds, cherry kernels, and other vegetable products. When macerated and kept in contact with water, fermentation sets in, due to the presence of emulsin, and the substance is decomposed into hydrocyanic acid (prussic acid), benzaldehyde, and glucose.

**Amygdaloid** (Gk. ἀμυγδαλον, almond, *idos*, shape), the old name of a variety of igneous rock, usually basaltic, containing cavities in which round or almond-shaped bodies are formed, consisting of acate, calcareous spar, or zeolites.

**Amygdalus** is the name of a subgenus of *Prunus*, formerly considered as a genus, of the order Rosaceæ. It includes *A. communis*, the almond (*q.v.*), and *A. or P. Persica*, the peach. The leaves yield prussic acid.

**Amyl**, an organic radical corresponding to the formula  $C_5H_{11}$ . There are 8 A. alcohols, the most important being isobutyl carbinol, which is a constituent of fuel oil. A. nitrite is a yellow liquid with a penetrating odour; it is used in medicine for angina pectoris, etc.,

owing to its power of producing vascular dilation and of stimulating the heart's action.

**Amyloid Disease**, also known as Lardaceous Disease, or Waxy Degeneration, is a disease in which there is a degeneration of the cells of certain organs by which an A., or lardaceous, substance is formed. It is a secondary disease, produced by such causes as a suppurated bone, cancer, syphilis, and pulmonary diseases, and attacks most frequently the liver, kidneys, spleen, intestines, and lymphatics. It is nearly always fatal.

**Amylopsin**, a diastatic ferment from the pancreatic juice, capable of converting starch into sugar.

**Amylum**, see STARCH.

**Amyntas**: 1. A., king of Macedonia (c. 540-500 B.C.). 2. A., king of Macedonia (393-369 B.C.), was the son of Philip, the brother of Perdicas II. He sought the friendship of Athens, and left by his wife Eurydice 3 sons, Alexander, Perdicas, and the famous Philip, called by Ovid Amyntades.

**Amyot, Jacques** (1513-93), Fr. writer and translator, b. at Melun. In 1510 he became prof. of Gk. and Lat. at Bourges, in 1558 tutor to the sons of Henry II.; in 1560 grand almoner of France; and in 1570 bishop of Auxerre, where he d. His most famous translation was that of Plutarch's *Lives*, 1559, which besides being used by Cornille and establishing itself as a model of Fr. prose style, formed the basis of North's translation in Eng., 1575, from which Shakespeare took his Rom. plots. Other works were translations of *Theagenes and Chariclea*, 1546; 7 books of Diodorus Siculus, 1554; *Daphnis and Chloe*, 1559; and Plutarch's *Moral Treatises*, 1572, all of which have become Fr. classics.

**Amyris**, a genus of tropical plants of the order Rutaceæ. They yield a fragrant resin.

**Ana**, a suffix added to the names of famous men to designate collections of their sayings and table-talk, anecdotes about them, and notes in any way bearing on their life, e.g. Johnsoniana, Boswelliana, Shakespeariana. The use of such titles dates from the *Scaligeriana*, collected by the brothers Vassan and pub. in 1666 by Isaac Vossius.

**Anabaptist**, the name given to a Christian sect which appeared in Germany at the time of the Reformation, repudiating infant baptism (hence the name, meaning 'baptised again,' which refers to their adult baptisms) and teaching equality and community of all goods. The movement was begun about 1520 in Saxony by the 'Prophets of Zwickau.' They were strongly opposed by Luther, but their leader, Thomas Münzer, travelled over Bohemia, Thuringia, and Switzerland, preaching with much success, especially at Waldshut, on the Swiss border. He joined and largely engineered the 'Peasants' war' in S. and central Germany, and was executed after the defeat of his party at Frankenhausen in 1525. The doctrines of the

sect continued to be propagated by wandering preachers, such as Melchior Hoffmann, who in 1528 installed John Matthiesen as a bishop at Emden. He sent out many disciples, 2 of whom founded the new theocratic state of Münster in 1553. An era of wild licentiousness in this city followed, under the leadership of Johann Bockholdt, crowned in 1534 as prophet and king, assisted by Rothmann, Knipperdolling, Krechting, Kippenbrock, and Matthiesen. The city was besieged and taken by sev. Protestant princes in 1535, and on the execution of the leaders the movement began to die out, though still continuing in the Netherlands under David Joris (John of Bruzes) and others. A new era began with Menno Simons, who estab. a community which, while rejecting infant baptism, gave up the objectionable features of the A. creed. The Mennonites, who spread all over Germany, Switzerland, and Holland, practically correspond with the Baptist denomination in England, in which adults are re-baptised on joining the church. Menno's doctrines are expounded in his book, *Elements of the True Christian Faith*, written in Dutch. See E. B. Bax, *Rise and Fall of Anabaptists*, 1903; R. J. Smithson, *The Anabaptist to Protestant Heritage*, 1935.

**Anabas** is a genus of fishes of the family Anababidae, allied to the mullets and sword-fish. *A. scandens*, the climbing perch, resembles a perch to some degree. It has large scales, and can remain for a considerable time without water, even travelling overland in search of it. It has been stated that it is capable of climbing trees, and has been captured at a height of 5 ft. in a palm-tree.

**Anabasis**, the name of 2 Gk. historical works: 1. Xenophon's (fourth century B.C.), recounting the defeat of Cyrus the younger by Artaxerxes and the retreat of the 10,000 Gks. in his army under Xenophon. 2. Arrian's (A.D. 166-68), recording the campaign of Alexander the Great.

**Anableps** (from Gk. ἀνάβλεψεν, to look up) a genus of Malacopecterygious osseous fishes. They are remarkable for their projecting eyes, which have 2 pupils. The *A. tetraphthalmus* inhabits the rivers of Guiana and Surinam. Its anatomy was made the subject of a memoir by Lacépède, which was pub. in the second vol. of the *Mémoires de l'Institut*.

**Anabolism** (Gk. ἀνά, on high, βάλος, heap), the building-up process in the protoplasm of a living organism, as opposed to *catabolism*, or the breaking-down process.

**Anacardiaceæ**, an order of dicotyledonous plants growing chiefly in tropical countries. They are trees or shrubs which abound in an acrid resin. The flowers are usually in parts of 5, the stamens less than 10, carpels 3, with a single ovule. *Anacardium*, a small genus of A., includes *A. occidentale*, the cashew nut (q.v.).

**Anacharis** is synonymous with *Elo-dea*, a genus of water-plants of the order Hydrocharitaceae which grows in America. *A. (or E.) canadensis*, the Amer. waterweed, was transplanted to England, and now grows rapidly in our canals by vegetative multiplication.

**Anacharsis**, a Scythian philosopher, said to have been a friend of Solon, and the only barbarian admitted to Athenian citizenship. Some writers place him among the Seven Wise Men of Greece. Numerous witty sayings, among which was his saying that at Athens were men who deliberated but left the decision to fools, and proverbs preserved by Diogenes Laertius, Plutarch, and Lucian, are attributed to him. He was killed by the king of Scythia for worshipping Cybele with Gk. rites. Aldus, in his collection of *Greek Epistolographers* (Venice, 1499, 4to), pub. 9 letters under the name of A., which are pronounced by Bentley to be forgeries. The other works ascribed to A., such as an epic poem of 800 verses, a work on war, on the laws of the Scythians and some Gk. customs, are lost; but they were unquestionably not more genuine than the letters.

**Anacharsis the Younger**, see BARTHELEMY, JEAN JACQUES.

**Anachronism** (Gk. ἀνά, back, χρόνος, time), the reference of an event, custom, or expression to a wrong date. This is common in literature and other forms of art, especially painting, and although it most often is the result of an oversight and sometimes ignorance on the author's part, it is nevertheless sometimes a deliberately adopted device made for heightening a dramatic effect, or for achieving condensation. It is not easy to decide whether an A. is deliberately intended by the author. When Shakespeare peopled auct. Athens with Elizabethan joiners, weavers, and bellows-menders he may have been 'writing down' to his audience or have been unconscious of any A., but when he makes Cassius in *Julius Caesar* say, 'The clock hath stricken three,' the A. was probably intentional. In the sixteenth and seventeenth centuries A.s. abound in the works of dramatic and other writers, but it does not follow that artistic merit of their work is thereby spoilt. When Lucifer is expelled from heaven with the aid of cannons and gunpowder, the dramatic effect of Milton's story is increased, for by the time he wrote his *Paradise Lost* men had come to think always of battle as being enshrouded in a sulphurous canopy. Where, however, an attempt is obviously made to give correct local colour and A. is intended, the artistic harmony is disturbed. For Shakespeare to make, as he does in *Troilus and Cressida*, Agamemnon quote Aristotle, is almost as bad as when he places Verona on the sea-coast (the latter is an error, but not an A., for it has no reference to time). But Virgil, in making Queen Dido the contemporary of Aeneas, violates no artistic canons.

The Renaissance painters were frequently guilty of A., and the Flemish school even went to the length of putting spectacles on the noses of scriptural characters.

**Anacoluthon** (Gk. ἀν-, not, ἀκόλουθος, following), a term employed both in grammar and in oratory to imply lack of logical sequence, i.e. in which the latter half of a sentence does not correspond in construction with the first part. This is common enough in ordinary speech, but is deliberately employed in literature to add grace or emphasis. Example: 'And he charged him to tell no man: but go, and show thyself to the priest' (Luke v. 14).

**Anaconda**: 1. a S. Amer. water snake, allied to the boa-constrictor, which lives on the banks of rivs. in Brazil and Guiana. 2. The co. seat of Deer Lodge co., Montana, U.S.A. Has large copper-refining industry. Pop. 10,000.

**Anacreon**, Gk. lyric poet (c. 560-c. 476 B.C.), b. at Teos, Ionia, and emigrated to Thrace before the Persian invasion. About 540 he went to the court of Polycrates of Samos, and in 521 to the house of Hipparchus at Athens. He lived here till the fall of the Pisistratids, about 514, and then accepted the patronage of Echeocrates of Thesaly. He is said to have been choked by a grape stone. The Alexandrians possessed 5 books of his odes to the muses, wine, and love, but of these only a few genuine fragments remain. The Anacreontic odes trans. by Cowley and Moore are later imitations. A. was first ed. by Stephens in 1554. The 55 odes attributed to A. are in Fischer's ed. (Leipzig, 1793, 8vo); the best separate ed. of the fragments is by Bergk 1834, 8vo.

**Anadiplosis**, a figure in rhetoric and poetry, consisting in the repetition of the last word or an important word in a clause or line at the beginning of the next, as in 'He committed many crimes, crimes such as might be expected of a madman.'

**Anadyomene** (Gk. ἀναδυομαι, I rise from the sea), a surname of Aphrodite (or Venus) in allusion to her having arisen from the foam of the sea. The birth of Aphrodite was a favourite subject of auct. art, and furnished Praxiteles with a theme for his famous Aphrodite of Cnidos.

**Anadyr**, riv. of N.E. Siberia, rising in Lake Ivashkino, and flowing through the Chukchi country into the gulf of A. Length about 500 m. Area of basin, 115,000 sq. m. The tn. of A. stands on the riv. and is a coaling station for ships on the Arctic sea route, coal being mined in the neighbourhood.

**Anaemia**, deficiency of blood as a whole, or deficiency of the red corpuscles or of the haemoglobin leading to lack of colour in the blood. As. may be divided into primary, where the blood or blood-making organs only are at fault; secondary, where the A. is symptomatic of existing disease; and *leukæmia*, where the white corpuscles are greatly increased

in number. Of the primary *As.*, simple *A.* is the most common. It is characterised by general pallor, languor, and a tendency to fatigue; the general health is not much disturbed, and little can be done beyond a rigid attention to hygienic details, proper food, and care in the manner of eating and drinking. Another form of *A.*, *chlorosis*, or green sickness, is usually associated with adolescent girls, but is not so frequently met with as formerly. It is characterised by a greenish pallor, and is attended with headaches, palpitation, and a tendency to syncope. Pure air, plenty of rest and sleep, wholesome food, regular habits, and change of occupation if possible, generally bring about the cure in a few months. Progressive pernicious *A.* is a serious condition in which the red corpuscles are destroyed in huge numbers. Unfavourable surroundings, insufficient nourishment, or the exhausting effects of other disease favour the development of the *hæmolysis*, or destruction of the corpuscles, which may be immediately due to poisons generated in the gastro-intestinal capillaries. The progress of the disease is gradual, pallor increases, palpitation and shortness of breath become more noticeable, and the patient suffers more and more from headache, vertigo, and general debility until a peculiar lemon-yellow tint appears in the face, which is a characteristic symptom of the advanced stage. The disease usually attacks males in middle life, and in its worst form rarely yields to treatment. In 1926, Dr. G. R. Minot (U.S.A.) (who, with other Amer. doctors was awarded the Nobel prize in 1934 for co-operation in research on the blood) discovered the curative effect of liver in cases of pernicious *A.*

**Anæsthesia**, a condition of partial or complete insensibility, particularly to touch. It occurs in connection with diseases of the nerve centres, and is artificially induced for the purpose of conducting surgical operations.

The influence of certain substances in procuring some amount of insensibility to pain has been known for centuries, and there is evidence that opium, mandragora, and other drugs have been used on various occasions to lessen the sufferings attendant on surgical operations. In 1800 Sir Humphry Davy suggested the use of nitrous oxide, or 'laughing gas,' for operations where there was little effusion of blood, and at the beginning of the nineteenth century many observers remarked on the possibility of using the anæsthetic properties of ether in surgical operations. In 1847 the use of ether became general in England and America, and in Nov. of the same year chloroform was introduced by Sir James Simpson, and for a time entirely superseded ether. Other anæsthetics, such as ethyl chloride, were tried and abandoned, and chloroform held the field until recent years, when the value of other anæsthetics and mixtures used under certain con-

ditions have become better understood and recognised.

The chief anæsthetics in use at the present time are nitrous oxide, ether, chloroform, ethyl chloride, and chloroform-ether mixture for general *A.*; ether, eucaïne, novocaine, and cocaine for local *A.*; and stovaine, procaine, and novocaine for spinal analgesia.

**Nitrous oxide** ( $N_2O$ ) is used for short operations, such as occur in dental practice, and is practically free from danger and painful after-effects. It is supplied in a liquid state in steel cylinders, the cylinder being connected by means of a rubber bag to a face-piece designed to cover the nose and mouth. The period of induction is usually less than 1 min., and that of *A.* about 40 sec. The patient's eyes have a fixed appearance, and there is usually a dusky tinge of the face. Prolonged *A.* by nitrous oxide may be effected by the use of the nose-piece, through which the patient is encouraged to inhale the gas, expiring it through the mouth or through a valve in the nose-piece. It is thus possible to conduct dental operations lasting 5 or 10 min., or even longer, but the method is not employed if there is much nasal or post-nasal obstruction.

**Ethyl chloride** ( $C_2H_5Cl$ ) is used as a substitute for nitrous oxide in short operations, such as the removal of adenoids, but it is not considered so safe. The after-effects often include headache and sickness.

**Ether**, ( $C_2H_5$ )<sub>2</sub>O, is commonly used for operations of long duration. In the open method the ether is dropped on a gauze mask which is held at first some distance from the face and gradually brought nearer. By the use of a bag and face-piece, such as Clover's inhaler, *A.* is more quickly brought about. Ethyl chloride and ether are frequently used in sequence.

**Chloroform** ( $CHCl_3$ ) is administered at first in a dilute form and the percentage gradually increased, the supply of air and vapour being of course thoroughly under the control of the anæsthetist. Dangerous after-effects occasionally occur, and its administration is highly dangerous where the *status lymphaticus* exists. In cases where chloroform or ether may not be advisable, a mixture of 2 parts of chloroform to 3 of ether is often used, and is generally considered a safe and convenient anæsthetic.

**Local *A.* or analgesia** is chiefly employed in superficial operations or, where special circumstances make general *A.* inadvisable. Sometimes ether or ethyl chloride is sprayed on the skin until it freezes. Insensibility is produced for a short time and is only superficial. There is, likely, too, to be considerable pain when the skin thaws. Cocaine is often injected for cutaneous and sub-cutaneous analgesia, but its use is attended with some disadvantages. It has a dangerous effect when absorbed into the general circulation, and there is also a risk of a cocaine habit being formed. Eucaïne and novocaine are very effective analgesics

for hypodermic injection, and have no dangerous by-effects.

**Spinal analgesia.**—There are sometimes occasions for serious operations when respiratory affections, alcoholism, diabetes, and other conditions make general A. inadvisable. If the operation is concerned with the lower part of the body, it is possible by a spinal injection to produce insensibility to pain in that part whilst general consciousness is maintained. Stovaine or novocaine is injected just below the second spine into the spinal fluid while the patient is in a sitting position, if that position is possible. The method has been used more on the Continent than in this country, where it is looked upon only as a substitute for general A.

Instead of administration by inhalation, some anæsthetics can be used by injection into the rectum, or by injection into a vein. Among drugs used by intravenous injection are derivatives of barbituric acid.

**Trichlorethylene** ( $\text{CHCl}_2\text{CO}_2$ ), known as **Trilene**, a variant of chloroform, but less potent and less toxic. It has long been used in industry as a rubber solvent and for dry-cleaning. Vaporised accidentally it was found to induce unconsciousness and has since been used as an anæsthetic, particularly in obstetrics. A new pocket trilene inhaler, made for the purpose of deadening pain, may prove to be a great improvement on the morphine tubes equipped with hypodermic needle, which were used widely for the same purpose in the recent war. Exhaustive tests have shown that it is successful with 85 per cent of persons.

On the question which is the safest anæsthetic it would appear that nitrous oxide gas has been responsible for the fewest deaths, while it is said that no fatal result has attended the use of a mixture of that gas with oxygen. On the other hand this anæsthetic is now only used for very short operations, and for long operations chloroform or ether or a mixture of them must be used. Reliable statistics show that deaths due to chloroform are or were at the rate of 1 in 3000, while those due to ether were 1 in 16,000 (*Black's Medical Dictionary*).

In general, successful A. depends to a great extent on the proper preparation of the patient. The stomach should be empty at the time of the operation, so that no food can be forced up to lodge in the respiratory passages. Dangers during anæsthetisation are usually connected with the respiratory processes, and a skilful anæsthetist is always on the watch for any change for the worse. There is an impression abroad that deaths under anæsthetics are relatively on the increase, particularly in hospitals, but this is probably due to the fact that surgical measures are more often taken in desperate cases than heretofore, so that the enfeebled or diseased condition is really the cause of death rather than the anæsthetic. It may be said that with modern appliances and mixtures in the care of a trained anæsthetist

the risk to a person whose general health is anything approaching the normal is comparatively slight.

**Anagallis**, a genus of Primulaceæ growing in all continents but Australia. *A. arvensis*, common to Brit. cornfields, is the brick-red pimpernel. It is also called poor man's weather-glass, as the flowers close in the afternoon and in dull and rainy weather.

**Anagni**, episcopal city of Italy, on a hill 36 m. S.E. of Rome. The bishopric dates from the fifth century, and the cathedral of Santa Maria from the eleventh. Pop. 10,000.

**Anagram** (Gk. *ana*, back, *γράμμα*, an alphabetical letter), the transposition of the letters of a word or short sentence, more often the name of a person, by which a new word or sentence is formed. It is the essence of the A. that the new sentence should have an appropriate connection with the original sentence, and no better example can be given than that of a mediæval anagrammatist who answered Pilate's question, 'Quid est veritas?' (What is truth?) by 'Est vir qui adest' (It is the man who is here). Pseudonyms are often made by A., one of the most celebrated, albeit far-fetched, being *Voltaire*, formed from 'Aronet l. j.' (Arouet le jeune). Although in the past great virtue was found in the A., especially by the cabbalists, modern taste may be said to be represented fairly, if strongly, by Addison, when he said that it was impossible to decide whether the inventor of the A. or of the acrostic 'were the greater blockhead.'

**Anah**, a tn. on the Euphrates in the Bagdad vilayet, Iraq, opposite which is a line of cultivated is. Its position in the desert made it an important resting-place, and it contains the remains of 4 ant. castles.

**Anaheim**, a city of Orange co., California, U.S.A., 24 m. S.E. of Los Angeles. Pop. 11,000.

**Anahita** (Anaitis), a goddess once worshipped by the Persians. The Gks. associated her with Cybele. She was invoked side by side with Mithras.

**Anáhuac**, a geographical region of Mexico. The name was applied by the Aztecs to their whole kingdom, but its boundaries are not definitely known, and the term is now loosely used with regard to the great central plateau of Mexico. By some it is applied to this whole region, from Rio Grande to Tehuantepec, but it is more properly used of the plateau-valley of the city of Mexico, between 18° 4' and 20° 3' N. lat., having a mean elevation of 7500 ft. This region was formerly largely covered by lakes, which fits the meaning of the name 'on the water,' and is now the granary and stock-raising centre of the country.

**Anak**. The ancestor of the Anakim (Deut. II.) (see ANAKIM). Etymologically a common noun, 'necklace' (Song of Solomon, iv.) or perhaps 'neck' (Arabic *unq*, neck, *anaqa*, to embrace). If this be the correct derivation, the name

*bene* 'Anaq meant literally 'sons of the neck' or 'giants.'

**Anakapalle**, tn., Madras, India, 18 m. S.W. of Vizagapatam. Two m. off there are interesting Buddhist remains, preserved as anct. monuments. Pop. 18,000.

**Anakim**, an O.T. term for a section of the pre-Israelitic Inhab. of Canaan. They are represented as a race of giants, the sons of Anak (q.v.), living in S. Palestine, and were conquered by Joshua. They are also called descendants of Arba (as in Joshua xx, 13). Their chief stronghold was Kirjath-Arba.

**Analecta**, a collection of extracts from different authors, an anthology.

**Analectics of Confucius**, see CONFUCIUS.

**Analeptics** (Gk. *ανα*, again, *ληψις*, taking) is a medical term which comprises the means employed in restoring vigour to the system by diet or exercise. In dietary analeptic foods do not include stimulants with temporary action, but rich and nutritious foods which are of real restorative and permanent action, e.g. arrowroot, eggs, milk, and soups.

**Analgesics**, see ANÆSTHESIA; ANODYNES.

**Analogy** (Gk. *ἀναλογία*, proportion) is a term which originally implied an equality of ratios, but though anct. writers used it in this sense and it is still used with this meaning in mathematics, it is now used in many depts. of learning to signify resemblance which falls short of absolute identity. In inductive logic it forms the basis of most hypotheses, but it is subject to much fallacious reasoning. The reasoning runs on such lines as these: A and B resemble each other in possessing one or more similar characteristics; A possesses a certain additional characteristic, and B therefore probably possesses it also. In many cases such a train of thought will bring a true conclusion, as scientists can prove in hundreds of instances, but they usually require a mind which is capable of grasping what are the important points of the A. and forming a judgment from them alone.

A. can never afford proof; at best it is but a suggestion for a good hypothesis. Metaphorical language may be a source of incorrect reasoning by A., e.g. in speaking of a country as being a mother-country and from this arguing that the duties of the country towards the individual should be those of a mother towards her child. See J. S. Mill, *System of Logic*, 1875; W. S. Jevons, *Principles of Science*, 1877; J. M. Keynes, *A Treatise on Probability*, 1921; J. Cook Wilson, *Statement and Inference*, 1926.

**Analogy**, in biology, is a term applied to organs which perform the same functions though in shape and general structure they may be totally different. The wings of a bee and of a sparrow are analogous, and the leaf-like branches of butcher's broom are analogues of the leaves of ordinary plants. See HOMOLOGY.

**Analysis** (Gk. *ἀνά*, up, *λύειν*, to loose), in philosophy, implies the mental act of unloosening some unity into its component parts, e.g. the dissection in thought of a man into his various attributes of height, weight, reasoning powers, and so on. Synthesis is its complement, and implies the converse process of knitting together the parts to form the unity, e.g. the description of his various attributes, until the man is complete. A. plays a great part in inductive logic, for it opens with the complex of experience and resolves it into the elementary relations realised in it; in this way it is largely experimental and leads to discovery. The propositions set forth in geometry illustrate this; they are, however, usually synthetic in proof, but the *reductio ad absurdum* is wholly analytical.

**Analysis, Chemical**, the determination of the elements comprising a compound or a mixture of compounds. For inorganic compounds or mixtures the methods may be divided into dry and wet A. Dry methods usually only give an approximate result, and should be supplemented by wet methods, if possible. The chief processes in a dry A. comprise heating to determine what sublimate is formed, what gas is evolved, or what water of crystallisation given up, or whether any of the substances are oxidised. Heating on charcoal in a reducing flame would possibly give a metallic globule or other indications, and heating with borax on a platinum wire in an oxidising flame produces beads of different colours characteristic of the various metals. The flame test consists in heating a small portion moistened with hydrochloric acid in the high-temp. area of a Bunsen flame, when a characteristic colour may be imparted. Such methods obviously give only a general idea of the constituents of the mixture or compound; some elements may be masked by others unless a spectroscope (q.v.) be employed, when the presence of different elements in a flame test is very accurately indicated.

Wet methods consist of treating the given compound or mixture with reagents in a systematic manner, so that by the nature of the reactions produced, certain groups of elements are indicated, further tests subdividing these groups and so on until the original compound is split up into the simplest possible forms. Such an A. is called qualitative, because it takes no account directly of the relative proportions of the constituents. If those proportions be required, quantitative A. must be employed, which may be either gravimetric, volumetric, or colorimetric. In gravimetric methods it is designed to obtain a precipitate of known composition from a weighed quantity of the compound. This being carefully filtered, dried, and weighed, a simple calculation gives the percentage of the required element in the original mixture. Occasionally electrolysis of the given solution is resorted to, the amount of metal

deposited on the cathode indicating the strength of the solution. Volumetric methods aim at determining the strength of a solution of the substance by finding what quantity is required to bring about a certain definite reaction with another solution of known strength. Certain elements which give well-defined colour reactions with other substances can be determined quantitatively by comparing the colour produced by known weights of the substance with those produced by a standard solution.

The A. of organic compounds proceeds upon entirely different lines. If on burning a small quantity an ash or residue is left, the substance probably contains an inorganic impurity, which may be separated by the use of solvents, such as alcohol, ether, benzene, chloroform, etc., one or another of which dissolves the majority of organic compounds, when filtration and subsequent crystallisation in fractions may effect still further separation. Fractional distillation—that is, distilling at different temps.—is useful in separating liquids whose boiling-points are markedly different. The elements composing organic substances can be detected by characteristic tests; carbon by the formation of carbon dioxide turning lime-water turbid; hydrogen by the formation of water on decomposition; halogens by heating with sodium, when a sodium halide is formed; nitrogen by the evolution of ammonia on heating with lime; sulphur and phosphorus by oxidising to acids on heating with a mixture of potassium carbonate and nitre. The general principle underlying the quantitative determination of these elements is the collection and weighing of the products of combustion of a definite quantity of the substance. In recent years, accurate methods of qualitative and quantitative A. of very minute quantities of substance have been worked out (*micro-analysis*), e.g. by F. Pregl, and these methods have proved exceedingly useful and important in biochemistry, where the amount of material available for A. is often extremely small.

Modern research on the structure of the atom has led to the development of analytical methods based on electrical phenomena, and these enable us to detect even a trace of a particular element in the presence of large quantities of others. See F. Sutton, *Volumetric Analysis*, 1924; Treadwell and Hall, *Analytical Chemistry*, 2 vols., 1924; Thorpe and Whitley, *Manual of Organic Chemical Analysis*, 1926; A. I. Vogel, *Text Book of Quantitative Inorganic Analysis*, 1939; A. I. Vogel, *Text Book of Qualitative Chemical Analysis*, 1937; A. J. Berry, *Qualitative Inorganic Analysis*, 1938; H. Middleton, *Systematic Qualitative Organic Analysis*, 1939; N. J. Allport, *Colorimetric Analysis*, 1945.

**Analyst**, Public, an official appointed by a co. or bor. council under the provisions of the Food and Drugs Acts, 1875 and 1899, for the purpose of analysing samples of food and drugs and agric.

products exposed for sale. The appointment must be confirmed by the Ministry of Health or the Board of Agriculture, and the appointment cannot be annulled without the assent of whichever of these depts. is concerned. Under the latter Act both depts. are empowered to appoint a P. A. where the local authority has failed to do so. The P. A. is generally a F.I.C. (Fellow of the Institute of Chem.). For his duties see article on ADULTERATION.

**Analytical** (also known as Explicative or Essential) **Propositions** are those which affirm of their subject a predicate which is already contained in the definition of the subject. Such a proposition is,

'A parallelogram has four sides and four angles, the having four sides and four angles being part of the definition of a parallelogram.' A. P. are distinguished from *synthetical* propositions, which affirm of their subject a predicate not already contained in the definition, such as, 'A parallelogram is a distressful subject to the unintelligent schoolboy.'

**Anamalai**, or **Annamullay**, **Hills**, a group of mts. forming part of the Sahyadri range, S. India, about 85 m. S. of the Nilgiri Hills. The highest peak, Anamudi, is the loftiest point in S. India, attaining an elevation of 8850 ft. Tea and coffee are extensively grown here, and there is abundance of teak timber and wild beasts, such as the elephant and bison.

**Anambas Islands**, a group of small wooded and rocky is. in the Dutch E. Indies, between Borneo and Malacca.

**Anamnesia** (Gk. *ἀνάμνησις*, *anámnesis*, memory), a term used in medicine to signify the recollection of a patient or his friends of the first symptoms and past hist. of his case.

**Anamour**, or **Anamur**, **Cape**, is the most S. point in Asia Minor. It is named from A., the anct. Anemurium, in which there are ruins of tombs and 2 theatres. A. Castle is 6 m. E. of the cape.

**Ananas**, a genus of S. Amer. plants of the order Bromellaceæ. *A. sativus*, the pineapple, is the best-known species; for a description of its fruit see PINEAPPLE.

**Ananias**, a name borne by 3 characters in the N.T.: 1. A Jewish Christian of the young church at Jerusalem, who, with his wife Sapphira, was miraculously struck dead by Peter for making a false representation in respect of their gift of property to the community (Acts v.). 2. A Jewish Christian of Damascus, mentioned in connection with the conversion and baptism of St. Paul at that place (Acts ix.). 3. A Jewish high priest, who officiated at the trial of St. Paul before the Sanhedrin at Jerusalem and at Cæsarea (Acts xxiii., xxiv.). He was the son of Nedeбалos, and high priest about A.D. 47-59.

**Ananiev**, a tn. in the Kherson Region, Ukraine, on R. Tiligul, 95 m. N. of Odessa. Has some trade in agric. products. Pop. 20,000.

**Anapa**, seaport in Krasnodar ter., R.S.F.S.R., on the Black Sea. Founded

as a fortress in 1771 by the Turks, it was frequently taken and lost by Russia and finally annexed in 1829. The old rampart is now a promenade. Pop. 7000.

**Anapaest**, in poetry a metrical foot, consisting of 2 short, or unaccented, syllables followed by a long, or accented, syllable. It is the opposite to the dactyl, which has 1 long syllable followed by 2 short, and is sometimes called the antidactyl. Examples: 'temporal,' dactyl; 'interrupt,' A. The A. was often employed in Gk. and Rom. poetry, but its employment in England is generally restricted to the lighter forms of verse. In France the use of the A. is very general, forming indeed one of the marked characteristics of Fr. poetry. Aristophanes and Tyrtæus among the ancients, and Swinburne in our time have employed the A. with good effect.

**Anapli**, see **ΝΑΠΛΙΑ**.

**Anarchism** (Gk. *an-*, not, and *ἀρχη*, rule). A. may be defined as the negation of gov., as a state of society without a central gov., and in which individual autonomy is allowed its fullest development. The term *anarchy* is used to imply that state of turmoil which has usually accompanied the weakening of central gov., or the, usually brief, period when there is no gov.

Of late years attempts have been made by Anarchists by means of international conferences, notably that of Amsterdam, 1907, to define their position, and in a negative way their difference from Socialism (q.v.) was made plain by the expulsion of the Anarchists, led by Bakunin, from the International (see **UNDER THIRD INTERNATIONAL**) at The Hague Conference, 1872. Many of the tenets of Socialism are held by Anarchists, and their common opposition to the present order of society is a bond between them. Libertarian Socialism and Communist A. are practically synonymous terms, and the systematic destruction of property (sabotage) practised by the 'direct actionist' or non-parl. Socialists of France and elsewhere (also called Syndicalists) is little removed from the 'propaganda by deed' of the physical force Anarchists. The freedom of the individual being restricted by the monopoly of land and capital by a class, the Anarchist is at one with the Socialist in the desire to overthrow that monopoly, but they differ fundamentally on the question in whom that property should be vested, and on the governance of the remodelled society. The State Socialist's remedy for what he conceives to be the evils of present-day society is more gov., and better gov.; but the Anarchist holds that all gov., however well intentioned, are bad and tend towards privilege and oppression, and that the individual is just as much a slave if he has unwillingly to conform to the majority as if he conforms to a despot. His views are crystallised in the sentence, 'That gov. is best which governs least,' and in this conclusion he is not

far removed from such *individualists* as Herbert Spencer, Auberon Herbert, and Harold Cox.

The modern Anarchist movement may be said to have begun with Pierre Proudhon (1809-65), although an atmosphere favourable to its reception had been created by the writings of the poet Shelley and the Fr. encyclopædists. Proudhon's most celebrated work is that entitled *What is Property?* which he answers by the monosyllable, 'Theft.' He asserted that in a perfect society order would be maintained by the reasonable self-control of the free individual. Since his time perhaps the greatest Anarchist was Mikhail Bakunin, the Russian, the apostle Paul of A. (1814-76). In addition to writing many uncompromising works, including the atheistic *Dieu et l'État*, he will be chiefly remembered for his prolonged struggle in the International with the followers of Karl Marx, the father of orthodox Socialism. From this struggle Marx emerged victorious, but Bakunin had a large following, especially among the Lat. states. In recent years A. has numbered among its supporters many men of considerable erudition. Prince Peter Kropotkin, Russian, and Enrico Malatesta, It., made England their home, and the former wrote many scholarly works on Nihilism (q.v.), a form of A., chief among them being *Fields, Factories, and Workshops*, 1899; *The Conquest of Bread*, 1892 (trans. 1906); *The Memoirs of a Revolutionist*, 1899. The return to the simplicity of the primitive Christians advocated by Count Leo Tolstoy has given rise to the term Tolstoyan anarchy. Prominent Fr. anarchists include Elisée Reclus, Sébastien Faure, Charles Malato, and Louise Michel; It., Amilcare Cipriani; Sp., F. Ferrer; Amer., Emma Goldmann and Benjamin Tucker. 'Propaganda by deed,' repudiated by some Anarchists, is the violent attacks made upon rulers and sometimes indiscriminately on the better-off members of society, the *bourgeoisie*, by pistol, knife, and bomb. A. has a long list of crimes to its 'credit.' Britain's comparative immunity from these attacks has been attributed to the fact that it has no exceptional laws directed against A.; but the recent (1939) bomb outrages in the United Kingdom by the I.R.A. (Irish Republican Army) do not allow too much reliance to be placed on this fact. Among rulers to perish by the hands of Anarchists are: President Carnot of France, 1894; Empress Elizabeth of Austria, 1898; King Humbert of Italy, 1900; President McKinley of U.S.A., 1901. Ravachol (1892), Vaillant (1893), and Henry (1894) were all executed in Paris for bomb outrages on the public.

**Anarrhicas**, a genus of Acanthopterygious osseous fishes, very nearly allied to the Blennies. They have round, smooth, blunt heads; elongated bodies, covered with minute scales; a single long dorsal and an extended anal fin, both separated from the caudal; no

ventrals; the mouth armed with formidable teeth. One species, the wolf-fish, sea-cat, or cat-fish, *A. lupus* of Linnaeus, is common in the N. seas and on the E. coast of Scotland and the Orkneys.

**Anas** (Lat., a duck), the scientific name for a duck (*q.v.*).

**Anasarca**, dropsy of the subcutaneous cellular tissue. There are sev. forms of the disorder, one being known as *A. americana*, the S. Amer. sleeping-sickness.

**Anastasius**: 1. Pope, 398-402; chiefly remembered by his opposition to the writings of Origen, whose advocate, Rufinus, he excommunicated. 2. A. I., surnamed Dicorus, Byzantine emperor 491-518, succeeding Zeno, whose wife, Ariadne, he married. Ruled with great energy and justice. His reign was disturbed by the Isaurian (492-96) and the Persian wars (502-5), and by invasions of Slavs, Huns, and Bulgarians. 3. A. II., surnamed Artemius, Byzantine emperor 713-16. Deposed by a mutiny of the navy, which proclaimed Theodosius III. in his place. A. became a monk in Thessalonica, but later headed a revolt against Leo, the successor of Theodosius, and was executed.

**Anastomosis**, the intercommunication of blood-vessels, so that the supply of blood to any part of the body is not wholly dependent upon one channel; it is particularly free around joints. The term is extended to apply to the establishment of a communication between 2 hollow parts, or 2 different portions, of the same organ.

**Anata**, a vil. of Palestine, 3 m. N.E. of Jerusalem. It is supposed to occupy the site of the anc. Anathoth, the bp. of Jeremiah. It possesses various anc. remains.

**Anatase** (Gk. *anatasis*, extension), or **Octahedrite**, also called **Olsanite** and **Dauphinite**, is a mineral form of titanium dioxide. The crystals have either many pyramidal faces or occur as simple acute double pyramids. They are found in granite crevices in Switzerland and Le Bourg d'Oisans in Dauphiné.

**Anathema**, literally 'that which is set aside, or offered.' Used by the Gks. in respect of gifts made to the gods either in gratitude or for propitiation. As animals so offered were condemned to death, the word has gained a secondary sense of perdition. The word A. was used by the Catholic Church as part of the formula in the excommunication of heretics. In 1 Cor. xvi. 22 occur the words: 'If any man love not the Lord Jesus Christ, let him be Anathema Maran-atha.' The word Maranatha has for this reason erroneously been thought to be an amplification of the curse, but its meaning is merely 'the Lord cometh.'

**Anatidae** (Lat. *anas*, duck), a family of web-footed birds belonging to the div. **Carinatae** of the order **Neornithes**. It includes swans, geese, and ducks among its 150 or so species.

**Anatolia**, 'Land of the Rising Sun' or Orient, the Gk. name for Asia Minor. See **ASIA MINOR**; **TURKEY**.

**Anatoliko**, or **Ætolikon**, a tn. of Greece, built on an ls. 6 m. N. of Missolonghi. It exports fish and oil, and cultivates the vine and olive. Pop. 3500.

**Anatomy**, or **Morphology**, the study of the form or structure of a living thing. Thus there are 2 prin. divs., vegetable A. and animal A. If the latter is concerned with the structures of various classes of animals as compared with one another it is called **Comparative A.** When one particular species of animal is the object of study the science is called **Special A.**, of which **Human A.** therefore forms a branch. It is in this latter sense that the term 'anatomy' is generally applied. It consists in the observation of the form of the various organs and tissues, the materials of which they are composed, and their possible variations, as distinct from physiology, which deals with the functions of these parts. Thus the work of the anatomist is to investigate and describe the shape, size, position, and construction of organs, etc.; he will, for instance, describe the various parts of the liver, the substances of which it is composed, and the position of the liver with regard to other organs, whilst the physiologist will deal with the problem of how the liver makes bile, and how the work it does affects the constitution of the blood and the whole process of nutrition. **Human A.** itself is a wide subject, to be approached from sev. points of view, and the investigation of a single part has provided a lifelong study for many a scientist. **Descriptive A.** is a study of the separate and individual parts in the body, apart from their relationship to surrounding parts; **Microscopic A.** deals with facts gleaned from microscopical examination; **Morbid or Pathological A.** is a study of diseased or abnormal structures; and **Practical A.** deals with the body as a subject for dissection. **Artistic or Surface A.** is an allied subject, and deals with the position of the various structures only so far as they affect the outward appearance for the purpose of representation by painting, sculpture, etc.

The organs may be classified according to function into systems, as the **skeletal system**, comprising the bones and ligaments; the **muscular system**; the **respiratory system**, comprising the lungs, windpipe, diaphragm, etc.; the **circulatory system**, comprising the heart and blood-vessels; the **alimentary system**, comprising the stomach, intestines, liver, and all those organs concerned with nutrition; the **excretory system**, comprising the kidneys, bladder, etc.; the **reproductive system**, comprising the ovaries, testes, etc.; and the **nervous system**, comprising the brain, spinal cord, nerves, and organs of sense. The organs are composed of tissues, of which the epithelial, the connective, the muscular, and the nervous tissues may be taken as the prin. groups.

The introduction of radiography into medical science has been of benefit not only to the physiologist, but also to the anatomist. In the living body the anatomist is now able to study the interdependence of various organs during life, to find out where weight is exerted in natural circumstances, to discover at what age and at what precise points ossification of the bones takes place; and he is also enabled to determine the normal positions of such organs as the heart and the stomach while performing their ordinary functions.

When an X-ray photograph has been taken of the bones, the shadow-picture is made clear because of the solidity of the bones, but where the stomach is under review a 'test meal' of some such nature as porridge mixed with the innocuous and tasteless carbonate of bismuth is administered to make the organ opaque to the anatomist. By the injection of compounds of iodine into the lungs, and of oxygen into the brain, these organs are also enabled to show up clearly in the X-ray photographs.

Consult J. Quain, *Elements of Anatomy*, 1893-1900; A. M. Buchanan, *Manual of Anatomy*, 1925; H. Gray, *Anatomy, Descriptive and Applied*, 23rd ed., 1926; E. R. Bundy, *Textbook of Anatomy and Physiology for Nurses*, 1940.

Anaxagoras (c. 500-428 B.C.), Gk. philosopher, b. at Clazomenae, Ionia. About 484 he went to Athens and taught there for 30 years, among his pupils being Pericles, Euripides, and perhaps Socrates. He exerted great influence, both on account of his mathematical and astronomical wisdom and the ascetic dignity and strength of his character. His attempts to explain physical phenomena by natural means laid him open to the charge of impiety. He was acquitted after being defended by Pericles, but left Athens for Lampsacus on the Hellespont, where he d. He laid the foundations of the atomic theory, and believed in an infinite intelligence in the universe.

The chief treatise of A. was on nature, sev. fragments of which have been preserved by Simplicius and others. Vitruvius attributes to him a work on perspective.

The leading notion of A. was that all things were in a state of confusion till Nous (Intelligence) placed them in order. Many strange opinions on physical philosophy are attributed to him. He said that the sun was a mass of hot iron larger than the Peloponnese; his opinion that the moon derived her light from the sun is probably not his own. His fragments were collected by W. Schorn, Bonn, 1829.

Anaxarchus of Abdera (fourth century B.C.), Gk. philosopher, and intimate friend of Alexander the Great, to whom he is supposed to have spoken with the greatest liberty. The story is told of him that when, on the instructions of Nectaneos, the satrap of Egypt, whose hatred he had incurred, he was pounded

in a mortar, he cried out, 'You may crush my body, but you cannot crush my soul.' He preached the doctrine that the greatest happiness was to be found in virtue.

Anaximander, Gk. philosopher, b. at Miletus, Ionia, c. 611 B.C. Little is known of his life. He probably d. c. 547 B.C. He was a pupil of Thales, a student of astronomy and geography, a pioneer of exact science, and the author of a theory of nature originating in an indeterminate 'first principle.'

Anaximenes, Gk. philosopher, b. at Miletus, Ionia, in the latter part of the sixth century B.C. Said to have been a pupil of Anaximander. He considered air to be the source of all matter, from which it (matter) was formed by condensation.

Anca, see ARAUCANIAN.

Ancah, a coast prov. of Central Peru. Area 10,500 sq. m. Lies partly in the Cordilleras, partly in the Marañon R. valley, and partly on arid coast land. Produces wheat, barley, coffee, and tropical fruits; mining is an important industry. Pop. (1940) 425,000. Chief tn. Huaraz (cap.).

Anenis, a tn., dept. Loire-Inférieure, France; situated on the Loire, 21 m. N.E. of Nantes. Pop. 14,000.

Ancestor Worship, the basis of many religions, and by some extremists maintained to be the basis of all religions. The line of demarcation between gods and men is clearly and distinctly drawn in Greece, but Euhemerus expounded a theory that the gods of Greece were merely men who had gradually acquired divine honours on account of exceptional prowess or benevolence during their lifetime. This type of rationalism is called, after the originator, Euhemerism. Thus even Zeus, the supreme god of the Pantheon, was merely a heroic warrior, whose tomb was located in Crete. The application of this theory to the gods of Greece in general is extravagant, though there is a shade of justness in its application to the origin of the worship of Dionysus and Heracles. While the worship of the gods, as such, in Greece is on the whole distinct from A. W., the worship of heroes was a prominent feature of Gk. ritual, but this worship did not lead to deification. The same distinction is true of Rom. worship. Spirits of the dead, called *manes*, were worshipped with ritual distinct from that bestowed on the gods. They dwelt in the under-world, and access to their abode was obtained through the *lapis manalis*, a stone covering the entrance to a pit; and these *manes* were regarded as partaking of food and drink. It is characteristic of the spiritual nature of Heb. religion that A. W. was not practised. A. W. is undeniably the basis of religion in China and Japan. The Hindus also attached great importance to the power of departed spirits, and believed that all their actions were regarded by these deities. The totem-pillar is characteristic of the worship of the Amer.-Indian,

and the 'ancestor-tablet' was the object of strict veneration among the Maoris. A. W. therefore, is a characteristic of the religion of most primitive peoples, and in many cases results in deification. The subject is exhaustively treated by Herbert Spencer in his *Principles of Sociology*, 1877-96.

**Anchises** was the son of Capys and Thonis, the daughter of Ilus, and king of Dardanus on Mt. Ida. He became the father of Æneas by Aphrodite. He was struck by lightning and became blind for having boasted of his intercourse with the goddess. When Troy was captured by the Gks., A. at first refused to leave the tn., but was at last persuaded to do so by Æneas, who carried him on his shoulders from the burning city. (See Virgil's *Æneid*, II.) A. d. soon after Æneas arrived in Sicily, and was buried on Mt. Eryx.

**Anchitherium** (Gk. ἀνχίτιον, near, θηρίον, wild beast), a genus of mammiferous fossils of the Upper and Lower Miocene found in Europe and N. America. It was related to the horse, and resembles that species more closely than any of the Palæotheriidae. It belongs to the div. Perissodactyla of the order Ungulata. Each limb had 3 toes, a large central one and 2 smaller lateral ones.

ANCHOR

A, palm, blade (or fluke); B, arm; C, crown; D, bill (or pea); E, trend; F, stock; G, shackle (or eye, or ring); H, shank.

**Anchor**, an instrument used for the purpose of fixing the position of a ship by fastening it temporarily to the bottom of a riv. or sea. The word is derived from the Gk. ἄγκυρα, meaning a hook. By its use drifting with currents, tides, and wind is prevented. The A. is attached to the ship by a cable. It is of early origin, though the primitive forms it took were not more scientific than large stones or sacks of sand. The first hook A. has been traced to the Gks. The modern implement is composed of the following parts: a vertical beam called a shank, at the upper end of which is a metal ring called a shackle, just beneath the shackle is a cross-beam called the stock. The shank thickens at the trend, at the opposite end, into the crown, whence 2 arms extend at right angles to the shank and curve upwards. They terminate

in broad wedges called palms or blades, the pointed ends of which are termed bills. The As. used by the Admiralty bear no stock, and have movable blades so arranged that they grip the bed of the sea irrespective of any position the A. may assume. This type is known as the Wasterneys-Smith.

**Anchorage**. In special areas, a fee is chargeable to the captains of those vessels who wish to cast anchor in them. Generally the ownership of the area is restricted to the state which receives the toll, but sometimes private companies and, rarely, separate individuals own the reserved water. The word also means anchor-ground, i.e. a bed composed of stiff clay or firm sand.

**Anchor Ice** (Ground Ice) is a form of ice which adheres to the bottom of only those waters which are characterised by a never-ceasing tempestuous motion. The ice is very porous, and as it rises it often brings to the surface any matter to which it may be adhering. It forms only in a temp. lower than 10° F. Until zero its adherence to the bottom is not of any strength.

**Anchorite**, one who voluntarily secludes himself from all intercourse with his fellow mortals for the purpose of undisturbed and holy reflection. Among the attendant, and in some part, necessary, practices was a rigid asceticism. The first A. was Paul of the Thebaid (Egypt), among his followers being the famous St. Antony.

**Anchovy**, a small fish belonging to the herring family. It is found abundantly round European coasts, particularly those of the Mediterranean. It is recognised by the deeply-marked fork of its tail, the dark green of its back, and the projection of its snout over the under part of the mouth. The industry has declined recently. A light is used to attract the fish and a net accomplishes their capture. This takes place near the shore, to which they make for the purpose of depositing spawn.

**Anchovy Pear**, a tree indigenous to the marshy dists. of Jamaica and the W. Indian Is. It attains a height of 50 ft. and bears leaves from 2 to 3 ft. long. The fruit resembles the F. Indian mango.

**Anchusa**, a genus of plants of the order Boraginaceae, 3 species of which are found in Britain. They are employed in the manuf. of dyes and medicines. *A. officinalis* is the common alkanet; *A. arvensis* or bugloss; *A. sempervirens*, or evergreen alkanet.

**Ancient Buildings, Society for the Protection of**, see PROTECTION.

**Ancient Demesne**, a term which signifies estates or manors vested in the king at the time of the Norman Conquest. Freedom from many of the prevalent duties attached to tenants was a privilege attached to them; among these exemptions were freedom from the Dane-geld, from tolls and duties, from fines, and from sitting on juries. The conditions attached to their ownership gave rise to the modern 'freehold' property.

**Ancient Lights**, see LIGHTS, ANCIENT.

**Ancient Mariner**, the famous poem of Samuel Taylor Coleridge, was first pub. in the *Lyrical Ballads* of 1798. Its theme is the superstition which attaches dire consequences to the killing of an albatross, and its moral that 'He prayeth best who loveth best All things both great and small.'

**Ancient Monuments, Act for the Protection of**, see PROTECTION.

**Ancients and Moderns**. The celebrated controversy between the A. and M. which raged in Fr. and Eng. literary circles at the end of the seventeenth and beginning of the eighteenth centuries centred on the respective merits of classical and modern literature. Though not the first protest against the worship of the classics, the *Traité pour juger les poètes grecs, latins et français* of Desmarets de Saint-Sorlin pub. in 1670, in which he attacks Homer and Virgil, and the work of the same author entitled *Discours pour prouver que les sujets chrétiens sont les seuls propres à la poésie héroïque*, may be said to have actually started the dispute. For these he received severe handling from Boileau in his *Art poétique* (1674), to which Desmarets replied with his *Défense de poème héroïque*, 1674, and *Défense de la poésie et de la langue française*, 1675. Subsequently the cause of the M. found its chief champions in the brothers Perrault, who for many years kept up the dispute with such doughty opponents as Boileau and Racine. An important contribution to the case of the M. was Fontenelle's *Digression sur les anciens et les modernes*, 1688. In England the dispute commenced with the publication of Sir William Temple's *Essay upon the Ancient and Modern Learning*, 1692, written from the classical side, and answered by Wotton's *Reflections upon Ancient and Modern Learning*, 1694. In his defence of classical literature Temple strangely enough found himself opposed to Bentley, the most brilliant classical scholar of the day, who secured a signal triumph in the controversy by proving the spuriousness of the *Letters of Phalaris*, upon which Temple had bestowed high praise. The outstanding literary contribution to the discussion is Swift's *Battle of the Books*, 1701, written in favour of the classical view.

**Ancilla** (Lat. *ancilla*, handmaiden), or **Ancillaria**, the name given by Lamarck to a genus of spiral, univalve, marine shells belonging to the family Olividae. They are chiefly confined to tropical climates, and are found in the retaceous system. They are gastropod molluscs of the order Ctenobranchiata.

**Ancillon, Charles** (1659-1715), historian and a staunch defender of the Protestant cause, was a native of Metz and son of the noted Protestant divine, David A. His chief works are: *L'Irrévocabilité de l'édit de Nantes*, 1688; *Histoire de l'établissement des Français réfugiés dans le Brandebourg*, 1690; and *Histoire de Soliman II.*, 1706.

**Ancillon, David** (1617-92), a learned Fr. Protestant divine, was b. at Metz and d. at Berlin. In 1641 he was licensed to preach by the synod of Charenton, and appointed minister at Meaux. In 1653 he accepted a call for Metz, and officiated until the revocation of the Edict of Nantes compelled him to retire to Frankfurt. He wrote scholarly works in defence of the reformed faith. See *Mélange critique de littérature recueilli des conversations du feu M. Ancillon* (Basel, 1698).

**Ancillon, Johan Peter Friedrich** (1767-1837), Prussian historian, of Fr. extraction, b. in Berlin. Great grandson of Charles A. (q.v.). His family emigrated during the revolution following the Edict of Nantes. In Berlin he became tutor to the crown prince of Prussia. In 1832 he was appointed foreign minister. He is celebrated as the author of *Révolutions du système politique de l'Europe*. The value of his work lay in its recognition of the psychological element in the great movements of hist.

**Ancon**, a S. Amer. seaport in the dept. of Lima, Peru. Pop. 31,000.

**Ancona** is the cap. of the prov. of that name in Italy. It is situated on the shores of the Adriatic Sea. Its name is derived from the Gk. ἀγκών, which means a bend, its position being on a bend of the coast. It is the most important seaport between Venice and Brindisi, and is a railway centre. Its position renders it advantageous as a naval station. Many steamship routes have a terminus at A. Its chief exports include grain, hemp, goat-skins, and silk. The tn. possesses a fine cathedral. It was first colonized, c. 390 B.C., by refugees from Syracuse. In the Middle Ages it became a republic, and later it was annexed to the papal states. The Sardinians captured it in 1860. Its harbour is the finest on the S.W. coast of the Adriatic Sea. Asphalt and calcium carbide abound in large quantities and are extensively exported. The city, with its famous monuments, suffered heavily in the Second World War, the damage being caused by bombing of the port. The cathedral, S. Ciriaco, lost its roof and sev. direct hits by bombs severely damaged the walls, though the building can be restored without grave loss of character. The churches of S. Anna and S. Pietro were destroyed. The campanile of S. Francesco delle Scale was destroyed; the museum was hit and mostly demolished, but the paintings had been removed; the communal library was buried under fallen masonry; and there was other minor damage. Sev. of the most important buildings escaped damage. Pop. 89,200.

**Ancona, The**. An It. liner sunk by an Austrian submarine in 1915 in the First World War. Sev. U.S. citizens perished. The Austrian reply to the Amer. note of protest alleged their belief that the vessel was a transport and that in any case she tried to escape.

**Ancona, Alessandro d'** (1835-1914

It. man of letters, a native of Pisa, educated at Florence and Turin. At the latter place he took a prominent part in the agitation preceding the war of independence and represented the Tuscan Liberal party. In 1859 he founded and for some time ed. *La Nazione*. In 1860 he was appointed prof. of It. literature at the Univ. of Pisa. He ed. Dante's *Vita Nuova*, and various other works of It. writers. Among his original works on literary and dramatic subjects may be mentioned: *Sacre Rappresentazioni dei Secoli XIV., XV., e XVI.*, 1872; *Origini del Teatro in Italia*, 1877; *I Precursori di Dante*, 1874; and *La Poesia popolare Italiana*, 1878. In 1882 was pub. his autobiography, under the title of *Il Primo Passo*.

**Ancre, Battle of the.** This battle was merely an extension of the great Somme battle of July to Aug. 1916. It was fought in mid-Nov., and was the only Brit. effort on the W. front between the Somme battle of 1916 and Arras in Apr. 1917. The Gers. were entrenched in chalk and clay excavations near the riv. The capture of the Schwaben redoubt in the Somme battle had left the Brit. Fifth Army in a good position N. of Thiepval for enfilading these excavations. The actual attack began, after 2 days' artillery bombardment, on Nov. 13, in a thick mist at 6 a.m., 3 Brit. divs. under Gough taking part, the 31st (chiefly Yorkshire battalions) being foremost in the advance. Together with these were machine-gun sections of the Lucknow and Sialkot Cavalry Brigades, who repulsed a severe counter-attack 4 hrs. later. Great losses were sustained by the 3rd Div. on the S. of the 31st Div. on ground between Serre and the riv., a strip of ground on which a quite extraordinary number of Brit. soldiers fell in the course of the war. Some success was obtained by the 2nd Div. on the right of the 3rd; but the divs. which were operating further S., where the high ground between Serre and Beaumont Hamel gave protection from the Ger. artillery at Bucquoy in the N., fared much better, capturing St. Pierre Divion vil. and Beaucourt and clearing the enemy from the last trench system between the Brit. front and the riv. Co-operating with these infantry divs. was the 63rd Naval Div., some of the men of which had fought at Antwerp in 1914, and which comprised 10,000 men, who attacked N. of the riv. under a fortuitous screen of dark and misty weather. Heavy losses were, however, suffered in the centre of this div. through a formidable concealed Ger. redoubt bristling with machine-guns. It was not till 7 p.m. that the actual assault on Beaucourt was ordered. The charge was directed by Commander Freyburg of the Hood (Naval) Brigade, and was undertaken with great dash by combined sailors, riflemen (Rifle Brigade and Royal Fusiliers), and members of the H.A.C. The riflemen, reappearing on the further side of the vil., then consolidated their new positions

and threw a pontoon across the riv. so as to link up with the 39th Div. on the S. Meanwhile the Ger. redoubt still held out. Three tanks (so far these engines of war had not been an unqualified success) were brought up but their performance was eloquent alike of their weakness and of their value at this early stage of their development. Two were hit or became bogged in the mud; the third lumbered across to the enemy line and so frightened the garrison of the redoubt that it promptly surrendered. In these 2 attacks of the 31st and of the Naval Div. some 3500 prisoners were taken; 1500 more were captured in a brilliant attack by the 51st Highland Territorial Div. operating on the left of the Naval Div. The strongly organised and important vil. of Beaumont Hamel was taken and a great haul of machine-guns was made. While the action of Beaumont Hamel was being fought, the remaining divs. S. of the Ancre, of Gough's Fifth Army, also advanced, and made a little headway in the direction of Grandcourt and Petit Miranmont; but heavy losses were suffered by the 14th Brigade at a position called the Munich line during very severe fighting by the 32nd Div. to fill up the gap between Gen. Gough's right and Gen. Rawlinson's left (Fourth Army). A further advance was planned for Nov. 17, but was delayed by weather, the morass-like condition of the trenches, and the tremendous sustained Ger. barrage fire. Two companies of the 2nd Manchester lost half their numbers on that day. At dawn on the 18th, though bomb supplies were lacking, the new advance was begun, the 15th Highland Light Infantry, the King's Own Yorkshire Light Infantry, and the residue of the Manchester's gaining some ground, much of which was lost by a prompt counter-attack. It was the same tale all along the front—the shortage of bombs had rendered useless such gains of ground as were made. This battle was the last combined operation of 1916 and is usually claimed as a Brit. victory.

**Anore, Concino Concini, Marshal d'** (assassinated 1617), a Florentine, was an attendant of Maria de' Medici, a wife of Henry IV. He married Leonora Salgari, one of the queen's women, and with the co-operation of his wife succeeded in aggravating the unhappy relations between Henry IV. and Maria. Upon the king's death he became marshal of France, possessing, extraordinarily enough, no military knowledge or experience. His prodigality was as lavish as it was childish.

**Anoren Riwe** (anchoretess's rule), a prose treatise written in M.E.; it dates probably from the early part of the thirteenth century. It was designed specially for a small body of religious zealots consisting of 3 women and their servants. They occupied a monastic house at a place called Tarrant Crawford in Dorset. The religious house of Tarrant was founded by Ralph de Kahaines.

While the doctrines believed and the observances followed were quite independent of any existing creed, yet later, in 1286, evidence shows that the inmates had joined the Cistercian order. Of the A. R. there exist 7 Eng. MSS. and 1 Lat. The authorship is attributed to Bishop Richard Poor, associated with the endowment of the monastery. Its theme is the need for rigorous renunciation, though the severity of its tone is softened somewhat by the affectionate phrasing. It also contains an interesting account of the early Eng. church doctrines.

**Ancrum**, a vil. on the Alne water, a trib. of the Teviot in Roxburghshire in Scotland. Its name is derived from *crom*, a bend, as it is situated on a bend of the Alne. It possesses many historical associations, and is famous for the battle of A. between the Eng. and Scots in 1545, when the Eng. were defeated. Pop. 1000.

**Ancus Marcius** (640-616 B.C.), a legendary king of Rome, who in spite of peaceful inclinations was forced to war with the Latins, whom he conquered. He founded the port of Ostia and established works and erected a prison. (Livy, I. 32, 35; Dionysius, III. 36-45.)

**Anacylus** (Gk. ἀνακύλος, bent), a genus of fresh-water snails, often called riv. limpots. They belong to the family Limnæidae and order Euthyneura of the gastropod molluscs. Their lungsacs always contain water, and they cannot breathe on land. They are found in springs and streams, adhering to stones and leaves.

**Ancyra**, an anct. city of Galatia on a trib. of the Sangarius. It was once a centre of the Tectosages, 1 of 3 Gaulish tribes who settled in Galatia in 232 B.C. An important ecclesiastical synod was convened there in A.D. 314.

**Ancyra**, Asia Minor, see ANKARA.

**Andalusia**, formerly a prov. of Spain, but divided since 1833 into 8 provs., Almería, Cádiz, Cordova, Granada, Jaén, Huelva, Málaga, and Seville. A. is a great plain enclosed by mountains except on the S.W. Parts of it are sterile, but most of it is very fertile. Its chief riv. is the Guadalquivir, which flows in a S.-westerly direction to the gulf of Cádiz. It has great natural riches. Some of its products are world famous, e.g. its sherry, and the copper mines of Río Tinto. Many of its products are those of an oriental climate, e.g. the cactus plant, the orange, and the sugar-cane. Agriculture is rather backward and certainly primitive. Its chief tns. are Seville, Málaga, Granada, and Cordova. It has passed through the hands of Carthaginian, Rom., Gothic, and Moorish conquerors, and all have left their mark on the prov. Its architecture is famous; its people lively, quick-witted, and of mixed race; its language dialectic and obviously influenced by the Moorish conquest. Area about 33,700 sq. m. Pop. 4,000,000.

**Andalusite** (from *Andalusia* in Spain), an anhydrous silicate of alumina found in France, Spain, and N. America.

It occurs crystallised in the orthorhombic system, usually in square prisms. In colour it is flesh-red to brownish, greyish-red, and violet.

**Andaman Islands**, a group of is. in the bay of Bengal. They number 204 and vary in size. Total area is 2500 sq. m. The main portion consists of 5 large is. so closely connected that they are called 'Great A.' Their names in order from N. to S. are, N. A., Middle A., S. A., Baratang, and Rutland Isle. The 4 straits separating them are Austin Strait, Homfray's Strait, Middle Strait, and Macpherson Strait. The Little A. group on the S. has been used, since 1858, by the Gov. of India as a penal settlement for life and long-term convicts, but the practice is being discontinued as it has had a deleterious effect upon the natives morally. There were 6000 convicts there in 1941. The Brit. settled there in 1789, in the N. A. Is., but abandoned the place for Penang. The cap. of the present settlement is Port Blair, in S. A. Its harbour is one of the finest in the world. There are other harbours and safe anchorages, including Port Cornwallis and Bonington. The climate is warm, tempered by pleasant sea breezes and the modifying influence of the sea. The is. are densely wooded, and among the best known timbers is A. redwood (or *padouk*). Coco-nut and rubber are successfully cultivated. There is wireless communication with Burma and Madras. Raided for the first time by Jap. bombers in Feb. 1942. Jap. forces occupied the is. on Mar. 23, 1942, but surrendered them in Aug. 1945. The total pop. of the is. (excluding the aborigines) in 1941 was 21,500.

**Andante** (It. *andare*, to go), in music, is one of the 5 prin. tempos, and is the medium between *adagio* and *andantino*. It indicates a steady calm movement, and strict equality in the measure of each bar. It is often modified, as *A. maestoso*, slow and majestically; *A. cantabile*, slow, in a singing style; *A. ma non troppo*, slow, but not too slow.

**Andantino** (It., dimin. of *andante*), in music, a movement a little faster (originally slower) than *andante*.

**Andaquí**, formerly an important confederacy of Indian tribes occupying the head-waters of the Caqueta and Magdalena Rr. in S. Colombia. During a period previous to the Sp. conquest they enjoyed a high state of civilisation, evidence of which is afforded by various remains of temples and other buildings. A warlike fragment still occupies the head of the Fragua R.

**Andelys, Les**, a tn., consisting of 2 parts, Petit-Andely and Grand-Andely, in Eure, France. It contains a very anct. Gothic church, and the ruins of Château Gaillard, built by Richard Cœur de Lion in 1193; and was the bp. of Henri and Roger Trouvères, Adrien Turnèbe, Blanchard, Brunel, and the painter Poussin. It trades in cattle, grain, leather, and silk goods. Pop. 5500.

**Andenne**, a tn. in Belgium, 12 m. E.

of Namur. Its manufs. include paper, porcelain, and tobacco-pipes (an industry dependent upon a bed of pipe-clay). A. was one of the Belgian tns. whose inhab. especially suffered at the hands of the invading Gers. in the 1914 invasion. It is particularly mentioned with other places in Cardinal Mercier's famous pastoral letter. In a proclamation dated Aug. 22, 1914, Gen. von Bülow, in an attempt to condone the outrages committed, alleged that the inhab. of the tn. made an attack on the Gers. after manifesting peaceful intentions. Hence he assented to the proposal to burn the tn. and shoot 100 of the citizens by way of warning to the people of Liège. Some 200 civilians were killed and a still larger number deported. Pop. 8000.

**Anderab, or Inderab**, a tn. of Afghanistan, on the Hindu Kush Mts. in a fertile dist.; pop. 6500.

**Anderida**, see PEVENSEY.

**Anderlecht**, a tn. in Brabant, Belgium. One of the main suburbs of Brussels. S.W. of the city itself. Important cattle market and slaughter-houses. Pop. 85,000.

**Anderlues**, a com. of Hainault, Belgium, 7½ m. W. of Charleroi. Coal mines. Pop. 12,000.

**Andermatt**, otherwise **Urserna**, a Swiss vil. in the canton of Uri. It is situated 18 m. S. of Lake Lucerne, and is a noted tourist centre, as it lies at the junction of the Furka Pass with the St. Gothard road. Elevation 4000 ft. Pop. 1100.

**Andernach**, a tn. on the Rhine belonging to the dist. of Coblenz. It was once a Rom. fortress and bore the name of Antunnacum. Later it became a residence of the Merovingian kings. The tn. has an atmosphere of medievalism. Its industries are the manuf. of millstones and cement. Pop. 12,500.

**Andersen, Hans Christian** (1805-75), a most popular Dan. writer, and one of the greatest children's story-tellers of the world. He was b. at Odense in Fünen, son of a sickly shoemaker, who d. in 1816. Thrown on his own resources he built himself a toy theatre, made clothes for his puppets and read borrowed plays, especially those of Shakespeare and Holberg. It was thought to teach him tailoring, but he wanted to be an opera singer and set out for Copenhagen, where he was taken for a lunatic and rebuffed at the theatres. Befriended by the musician Weyse and the poet Guldberg, he became a dancing pupil at the Royal Theatre where, eventually, he gained the patronage and life-long friendship of Jonas Collin, the manager. Later, King Frederick VI., becoming interested in the strange lad, had him educated at the grammar school at Slagelse. In 1830 he pub. his first vol. of poems, including the widely trans. *Dying Child*. This was followed by a literary satire called *A Walk to Amak*. Adverse criticism met him, but he eventually triumphed after travelling abroad, again at the king's expense. His works, the best of which are proverbially known as *Hans*

*Andersen's Fairy Tales*, include: *Picture-books without Pictures*, *A Poet's Bazaar*, *Tales from Jutland*, *The Wild Swan*, and *The Ice Maiden*. His *Ugly Duckling* and *The Brave Tin Soldier* are known and loved by children the world over. See S. Toksvig, *The Life of Hans Christian Andersen*, 1940; C. B. Burnett, *The Shoemaker's Son*, 1943.

**Anderson**: 1. Co. seat of Madison co., Indiana, U.S.A. Manufs. glass, crockery, and tiles. Pop. 41,000. 2. Co. seat of A. co., S. Carolina, U.S.A., 100 m. N.W. of Columbia; has cotton-seed oil mills, lumber and flour mills, and machine shops. Pop. 19,000.

**Anderson, Alexander** (1845-1909), a Scottish poet. His productions include: *Songs of Labour*, *Two Angels*, *Songs of the Rail*, *Hallads and Sonnets*.

**Anderson, Sir Edmund** (1530-1605), an Eng. lawyer. He was appointed serjeant-at-law to Queen Elizabeth in 1579, and was the author of *Reports of Many Principal Cases Argued and Adjudged in the Time of Queen Elizabeth in the Common Bench*.

**Anderson, Elizabeth** (Garrett) (1836-1917), doctor of medicine. She was the pioneer of the movement to include women in the medical profession. After a severe struggle she at last was admitted to the Society of Apothecaries, London. In 1866 she was appointed general medical attendant at St. Mary's Dispensary, an institution for women medical students. It became the New Hospital later; she officiated there 20 years. She obtained her degree of M.D. from the univ. of Paris, 1870. In London she took part in public life, working on the school board. She married in 1871 Mr. J. G. S. Anderson, a ship-owner, who d. in 1907. In 1908 she was elected mayor of Aldeburgh, her native tn., being the first woman mayor ever elected in England. See Naomi Mitchison, *Revaluations*, 1931.

**Anderson, James** (1662-1728), a Scottish genealogist and antiquary, b. at Edinburgh; he worked during his life upon the publication of *Records of Scottish Parliaments* just before the union. Pecuniary losses resulted and he was appointed postmaster-general as a recompense. His other works include *An Historical Essay showing that the Crown and Kingdom of Scotland is Imperial and Independent*, 1705.

**Anderson, John** (1726-96), Scottish natural philosopher, b. in Dumbarton-shire. He founded A. College, Glasgow. In 1756 he became prof. of oriental languages in Glasgow Univ., and 4 years later prof. of natural philosophy. He was interested chiefly in the application of science to industry. He d. in Glasgow. Produced *Institutes of Physics*, which went through 5 eds. in 10 years.

**Anderson, Karl Johan** (1827-67), Swedish explorer, made sev. important expeditions in S. Africa, which he described in *Lake Ngami, or Discoveries in S. Africa*, 1856; *The Okavango River*, 1861; and *Notes of Travel in S. Africa*, 1875.

**Anderson, Mary** (1859-1942), an Amer. actress of great beauty, b. in California. Her father was an officer in the Confederate service during the Civil War. He d. in 1863. His daughter was educated at Rom. Catholic institutions till she was 13, when she studied for the stage upon the advice of Charlotte Cushman. Her first appearance was at Louisville, in Kentucky, in the part of Juliet, in which she was a great success. In 1889 she retired and married Antonio de Navarro.

**Anderson, Robert** (1770-1833), Cumberland poet, was a native of Carlisle. His first vol. of poems was pub. in 1798, and was followed in 1801 by the popular ballad *Nelly Brown*. His best-known work, the collection of ballads in the Cumberland dialect, appeared 4 years later. Amongst the best of his dialect poems are: *The Impatient Lass*, *King Roger*, *Will and Kale*, *The Bashful Wooer*, and *Jenny's Complaint*. Towards the end of his life A. gave way to intemperance and suffered great poverty. His *Works* were pub. at Carlisle in 1820. See also Gilpin's *Songs and Ballads of Cumberland*, 1874.

**Anderson, Sir Robert** (1811-1921), criminologist and writer, was b. at Dublin and educated at Trinity College. In 1868 he was appointed Home Office adviser in matters relating to political crime, and later became assistant commissioner of police of the metropolis. He was head of the Criminal Investigation Dept. from 1888 to 1901. In 1910 he caused a sensation by confessing the authorship of the famous *Times* letters of 1887 entitled 'Parnellism and Crime.' He is well known for his writings in defence of orthodox religion, among which may be mentioned: *The Bible and Modern Criticism*, 1902; *In Defence; a Plea for the Faith*, 1907; and *The Bible or the Church?* 1908. He was also the author of *Sidelights on the Home Rule Movement*, 1906; *Criminals and Crime*, 1907; and *The Lighter Side of my Official Life*, 1910.

**Anderson, Sir Robert Rowand** (1834-1921), Scottish architect, b. at Forres, and educated at Edinburgh. Trained as a draughtsman in the R.E. Designed the Edinburgh Medical Schools in 1875. His other notable works were the Edinburgh Conservative Club, 1883; Edinburgh Univ. dome, 1886; and the Scottish National Portrait Gallery, 1888. Also restored Dunblane Cathedral, Paisley Abbey, Culross Abbey, and other eccles. buildings.

**Anderson, Sherwood** (1876-1941), Amer. author, b. at Camden, Ohio, education was scanty. His first novel, *Windy McPherson's Son*, was pub. in 1916. With marked psychological insight he portrays life in the Middle W. Novels and short stories include *Marching Men* (1917), *Winesburg, Ohio* (1919), *Poor White* (1920), *Many Marriages* (1922), *Horses and Men* (1923), *Dark Laughter* (1925); also verse, *Mid-American Chants* (1918); and mainly autobiographical, *Tar: a Mid-West Childhood*, 1926; *Sherwood*

*Anderson's Notebook*, 1926, and *A New Testament*, 1927.

**Andersonian Institution**, see **ANDERSON'S COLLEGE**.

**Anderson's College**, Glasgow, was founded by John A., 1795, and endowed by him with a library, museum, and philosophical apparatus. The object of the founder was to give instructions, free of expense, in natural philosophy, Geography, mathematics, Lat., Gk., Heb., and Fr. were afterwards taught, but it is now chiefly engaged in the teaching of medicine, physics, chem., and botany. In 1886 the non-medical sections were incorporated with other institutions as the Glasgow and W. of Scotland Technical College. The medical sections are now known as the A. College of Medicine.

**Andersonville**, a vil. of Sumter, Georgia, noted as having been the seat of a Confederate States military prison, where Union prisoners were confined during the Civil war. This prison was kept in so scandalous a condition that those incarcerated in it d. by thousands. Pop. 300.

**Andes**, a great mt. system in one long continuous chain lying along the W. coast of S. America. Its length is approximately 4100 m., and it extends from the Isthmus of Panama to Cape Horn. The width of the system varies considerably, but its widest point has a breadth of 100 m. Necessarily the altitude is not easily given, but roughly the average height of the chain is 13,000 ft. It is the greatest mt. system in the world. A theory that gains in evidence as time progresses is that the A. are connected with the Rocky Mts. of N. America. The whole system may be divided into 2 almost parallel chains separated by a declivity in which lesser mt. ranges rise. In different localities the names undergo changes. Generally, however, the E. range is known as the A., but in Peru, Colombia, and Bolivia it is called Cordillera Real de los Andes. In Argentina the E. system merges into the W. div., and both ranges now bear together the name of Cordillera de la Costa. The W. section, in Colombia, Peru, and Bolivia, is called La Cordillera, while below lat. 23° S. it becomes the Cordillera de los Andes. The southernmost extremity is Cape Horn, and here the range extends into the sea and actually forms is, bearing the name of Diego Ramuz. The great Chonos Archipelago owes its formation to a similar cause, and many authorities aver that it is the is. that constitute the prin. part of the range. In Patagonia the system is interrupted to some considerable degree by glaciers and deeply cut floods. The highest peaks are Toluca (18,300 ft.), in Colombia; Cayambo (19,155 ft.), Antisana (19,336 ft.), Cotopaxi (19,600 ft.), and Chimborazo (20,500 ft.), in Ecuador. Knot of Pasco and Misti, in Peru; Illimpu (21,500 ft.), Illimant (21,221 ft.), and Sabana (21,000 ft.), in Bolivia; Llullallaco (20,243 ft.) and Coplao (19,685

ft.), to the S. of Atacama Desert; Aconcagua (23,000 ft.), the highest peak in the whole range; and Cima de Mercedario, in Chile.

The whole region is volcanic and possesses many active volcanoes, the chief of which is Cotopaxi, in Ecuador, the flames from the crater of Cotopaxi attaining the extraordinary height sometimes of over 3000 ft. above the crater. Of course the ages of the different portions vary, but the main characteristic of their composition is the volcanic element. In tracing the world's 'ring' of volcanoes, the A. form a link of special significance owing to the abundance of volcanic results and present-day activity. In Tierra del Fuego the Cordillera is composed of crystalline schists, the extremity of which portion are Mts. Darwin and Sarmiento. The A. abound in plateaux, as may well be expected, the most important regarding elevation of which are Assuay (14,500 ft.), Colloa (12,500 ft.), Cruz Verde (11,695 ft.), Pasco (11,000 ft.), Quito (9500 ft.), and Bogotá (8958 ft.). The mineral wealth of the A. is fabulous, and the chief metals for which it is famous are gold, silver, platinum, mercury, copper, lead, tin, and iron. Of gold and silver particularly, the A. hold vast stores. The climate in the Andean region is rendered very dry by the effect of the mts. in cutting off the rain-bearing winds. From the A. eastwards, however, a heavy and beneficial rainy season owes its fall to the position of the A., as they lie directly across the trade winds. The great water-courses of the Amazon, Orinoco, and Plata owe their birth to the E. terraces of the A. The tremendous scale upon which all phenomena are created in this vast mt. system forms one of the chief attractions to visitors and tourists, who never fail to be impressed by the hugeness of their masses and the immensity of the cañons. E. Whymper, *Travels Amongst the Great Andes of the Equator*, 1892; E. A. Fitzgerald, *The Highest Andes*, 1899; L. Gallois, *Les Andes de Patagonie*, 1901; Lord Conway, *The Bolivian Andes*, 1902; P. Krüger, *Die paläontologischen Andes zwischen dem 42 und 44 Grade südlicher Breite*, 1909; A. G. Veatch, *Quito to Bogotá*, 1917; I. Bowman, *Desert Trails of Atacama*, 1924; A. Quicker (ed.), *Adventure and Exploration in South America*, 1930; A. M. Renwick, *Wanderings in the Peruvian Andes*, 1939.

**Andesite**, a name given originally to a group of lavas found in the Andes, but now applied to a large number of igneous rocks found in volcanic areas throughout the world and belonging to all geological epochs. They show considerable differences in composition, but usually consist of a ground-mass of felspar crystals, in which other minerals, such as biotite, hornblende, augite, and hypersthene often occur. They are common in the Andes and Cordilleras of S., Central, and N. America. *Andira*, a genus of tropical Leguminosae. *A. inermis*, the cabbage tree,

is a species found in the W. Indies; its bark is a strong anthelmintic.

**Andizhan**: 1. A region of the Uzbek, S.S.R. Area 2800 sq. m. Very fertile, growing cereals, fruit, etc. 2. Cap. of the region of A., on l. b. of Upper Syr-Darya R. Terminus of Trans-Caspian railway. Has cotton factories. Pop. 83,000.

**Andkhui**, a tn. in Afghanistan, due N. of Balkh, on the edge of the desert. Its site is extremely unhealthy, and the pop. consists mainly of Turkomans, Uzbeks, and a few Tajiks. Pop. 15,000.

**Andocides** (439-389 B.C.), one of the celebrated Attic orators. He was concerned in the mutilation of the Hermæ in 415, but in order to save himself he turned informer, in spite of which he had to forfeit many civil rights, and was condemned to exile. Banished from his native land, he followed a commercial occupation. On the democratic restoration he returned to Athens, and, recovering favour, was appointed to sev. high places. In 391 he was sent as an ambas. to Sparta to negotiate for peace. His failure led to complete downfall. He is said to have been banished and to have died in exile. Three of his speeches are extant.

**Andorra**, a small republican state on the Franco-Sp. border. It forms one large valley, being entirely surrounded by mts., a physical circumstance which has made independence easy to maintain and communication with the outside world difficult of establishment. The climate is cold and the winters are severe. Most of the land is used for the purposes of pasturage, with the exception of the S., whose fertile slopes afford scope for cultivation. The chief products are grain, fruit, potatoes, tobacco, dairy produce and wool. The surrounding mts. contain quantities of iron and lead, but the industries that might develop are hampered by a lack of fuel. Nor has the country any financial capital. In religion all the Andorrans are Rom. Catholics. The region comprises the 6 dists. of A.-Vicilla, Canillo, Encamp, La Massana, Ordino, and San Julian de Loria. A. is governed by a council-general of 24 members elected for 4 years; half of the council is re-elected every 2 years. The cap. of the state is A.-Vicilla. A. traces its independence back to Charlemagne. At the present day A. is under the joint suzerainty of France and the Sp. bishop of Urgel. Each appoints a 'vicar', i.e. a judge. A permanent official represents Fr. interests. The franchise was enlarged after a bloodless revolution in Apr. 1933. The language of A. is Catalan. The General Council of A. in 1934 decreed that the country should thenceforth be known only by its true title, Las Valls d'A. instead of La Republica d'A. the cap. has a pop. of about 700. The general character of the Andorrans is good-natured and moral. Area 191 sq. m. Pop. 5000. See L. G. Leary, *The Hidden Republic*, 1912; V. W. Johnson, *Two Quaint Republics, Andorra and San Marino*, 1913; B. Newman,

*Round about Andorra, 1928*; R. Moreno, Andorra, 1931.

**Andover**, a mkt. tn. of Hampshire, England. It is situated on the R. Anton, a trib. of the Test. The centre of an extensive agric. dist., it owes its importance to its agric. products. It contains many very well-preserved Rom. remains. Its former industries of silk, iron, and parchment are now extinct. Pop. 9700.

**Andover**, a tn. of Essex co. in Massachusetts, U.S.A., on the S.E. side of Merrimac Valley, the most important centre in the world for mills. It is noted for the manuf. of twine, woollens, and rubber goods, and for its educational institutions, Phillips Academy, Abbot Academy, and the Theological Seminary. Harriet Beecher Stowe resided, and is buried, at A. Pop. 11,000.

**Andrade e Silva, Bonifacio José de** (1763-1838), Brazilian scientist, author, and statesman, and one of the founders of Brazilian independence. Studied in Europe, and subsequently, in virtue of his distinguished scientific attainments, was appointed prof. of geology and metallurgy at the univ. of Coimbra, Portugal. He returned to Brazil in 1819, took up the cause of independence, and in 1822 became minister of the interior under Dom Pedro I. He was banished in 1823 on account of his democratic opinions, but on the abdication of Dom Pedro was entrusted with the education of the prince imperial. In addition to important scientific memoirs he wrote *Poesias d'America Elysea*, Bordeaux, 1825.

**Andrássy, Count Julius** (1823-90), Hungarian statesman, b. in Kassa in Hungary. He plunged early into political controversy. In 1846 his bitter writings attracted notice. In 1848 he was returned as a Radical member of the Diet. In the Hungarian revolt he took part, and an effigy of him was hanged in Austria. In 1867 he was made the first Hungarian premier, and later succeeded Beust as chancellor. Here he advanced radical changes, and under his influence Austria resumed her position of prominence in Europe. His policy of occupying Bosnia and Herzegovina was very unpopular, and he was compelled to retire from the public arena.

**Andrássy, Count Julius** (1862-1929), Hungarian statesman, son of the above. For a long time a leading member of the Hungarian Diet and the pillar of the old Liberal party, together with Count Apponyi. During the difficult times of 1917 he succeeded Count Tisza as a Magyar obstructionist to constitutional reforms (see AUSTRIA-HUNGARY). In Oct. 1918 he succeeded Count Burian as foreign minister, being the last foreign minister under the Dual Monarchy. In that capacity he notified President Wilson that his Gov. was ready to acknowledge 'the rights of the peoples of Austria-Hungary, especially those of the Czechoslovaks and the Yugoslavs,' and to make a separate peace without awaiting the issue as between Germany and the

Allies. His *Bismarck and Andrassy* is a commentary on the Hapsburgs and the causes of the collapse of that monarchy.

**André, or Andreas, Bernard** (c. 1500), historian and poet, was a native of Toulouse, and an Augustinian friar. He is supposed to have come to England with Henry VII., who made him poet laureate and royal historiographer. He secured various eccles. appointments and became tutor to Arthur, prince of Wales. He wrote in Lat. a valuable hist. of Henry's reign, under the title *Historia Regis Henrici Septimi*.

**André, John** (1751-82), b. in London, was adjutant-general to the Eng. forces during the Amer. war of Independence. He was appointed in 1780 to carry on negotiations with the Amer. general, Arnold (q.v.), who offered to betray his command at West Point. Maj. A., when returning from an interview in disguise, was captured by the rebels and sent to Gen. Washington, who after a trial had him hanged at Tappan as a spy. His remains were brought to England in 1821, and a monument is erected to his memory in Westminster Abbey.

**Andrea del Sarto** (1488-1530), a Florentine painter. He was the son of a tailor, hence his surname ('of the tailor'), and most of his early training was obtained by studying the works of such great masters as Michelangelo and Leonardo da Vinci and the engravings of Dürer. In 1518 he went to France at the inducement of Francis I., but was guilty, through the extravagance of his wife, of appropriating certain sums entrusted to him by his royal patron for the purchase of works of art. His chief pictures include 'The Sacrifice of Abraham,' 'A Burial,' 'The Dead Saviour with Mary and the Saints,' 'The History of Joseph,' 'The Madonna del Sacco,' and sev. holy families. He also copied sev. of the old masters, attaining in this style of work a very high standard. It is said that at the taking of Florence in 1529 the soldiers were so awestruck by his picture of 'The Last Supper' that they left the house without committing any violence. He d. of plague. Browning wrote a poem, *Andrea del Sarto*, in his *Men and Women*.

**Andrea Vanucci**, see ANDREA DEL SARTO.

**Andreas. Laurentius** (1480-1552), Swedish pioneer of Protestantism, studied at Rome, but returned with Protestant convictions, and as archdeacon of his native place, Strängnäs, brought Gustavus I. over to the side of the reformed religion. The king appointed him to superintend the translation of the Bible. He subsequently fell into disgrace, and was sentenced to death for conspiracy, but was ultimately reprieved with a heavy fine.

**Andreas**, an A.-S. poem, in which are described the adventures of St. Andrew in rescuing St. Matthew from prison in Mermedonia. It has been attributed to Cynewulf. Some of the sea passages, such as the description of the stormy voyage, are particularly fine.

**Andreasberg**, a tn. in Hanover, Germany, 14 m. from Clausthal-Zellerfeld, noted for its mines, yielding silver, lead, copper, iron, cobalt, and arsenic. Pop. 3700.

**Andrée, Saloman August** (1854-97), a Swedish engineer and explorer. In July 1897 he attempted to reach the N. Pole by balloon with 2 companions, Strindberg and Fraenkel. This hazardous journey was attempted in the days before the introduction of aircraft of any sort other than the drifting balloon, and before the advent of radio-telegraphy. A's balloon was one of 5000 cub. metres capacity, and a start was made from Dane's Is., Spitsbergen, on July 11. A's only means of communication with the outer world was by buoys dropped overboard and by carrier-pigeons. Sev. of the former were subsequently found, and a pigeon bearing a dispatch dated July 13 returned home. Thereafter nothing further was known of the intrepid party until the summer of 1930. In that year 2 Norwegian vessels engaged in scientific survey work came upon the bodies of the explorers on White Is., between Spitsbergen and Franz Josef Land. This discovery was only rendered possible by an exceptional melting of the snow and ice covering A's last camp. Among the finds were logs and diaries which showed that the balloon had remained in the air for 3 days and that death had overtaken the party, after travelling on foot over the ice, or drifting on the floes, in Oct. 1897. The bodies were brought home to Sweden, with the impedimenta of the expedition, and the contents of the diaries and logs pub. According to these the ice fringe was reached on the first day, the drift being at first northerly and N.W., then easterly. 82° N. was reached at about midnight of the first day. The balloon then remained stationary for some hrs., then moved westerly and then S. The balloon finally landed at 83° 4' N. lat., and was abandoned. The death of the party, after a passage over the ice to a spot many scores of m. to the S., was not due to hunger, for food was found next the bodies.

**Andrew**, the name of 3 Hungarian kings. A. I. reigned 1046-58, and was dethroned by his brother. A. II. reigned 1205-36, and in 1217 conducted a crusade to Jerusalem; while A. III. came to the throne in 1290, and reigned till 1301, after opposition from the pope, who wanted to keep the country in his own power, but the king defeated the army of the Church and held the crown.

**Andrew, Saint**, was the brother of St. Peter and the first disciple of Jesus. Both brothers were fishermen. St. A. preached in Scythia, Thrace, Asia Minor, and in Greece, and tradition tells us that he was crucified at Petre on an X-like form of cross known as St. A.'s Cross. The Russians revere him as having brought them the gospel, and he is the patron saint of Scotland, and the sup-

posed anniversary of his martyrdom, Nov. 30, is honoured with a feast.

*The Order of St. A.* was the highest honour in Russia, and was founded in 1698 by Peter the Great. With a few exceptions, it was only given to those of royal blood. St. A.'s Cross was the emblem on the Russian naval flag, and it forms part of the Brit. Union Jack, where it represents Scotland, being taken from the old Scottish flag.

**Andrewes, Lancelot** (1555-1626), a famous Anglican bishop, who was b. in London. He was educated at Pembroke Hall, Cambridge, and in 1589 was made a canon of St. Paul's and master of Pembroke Hall. He was chaplain-in-ordinary to Queen Elizabeth and in favour also with James I. He was made bishop of Chichester in 1605, and translated to Ely in 1609, and made a privy councillor. He helped with the preparation of the A.V. of the Bible. He was the most learned of all Eng. theologians. In 1618 he was made bishop of Winchester, and d. in 1626. One of Milton's early Lat. elegies bewailed the death of A. His best-known work is his *Manual of Private Devotions and Meditations for every Day in the Week*.

**Andrews, Charles McLean** (1863-1943). Amer. historian and educationist, b. at Weathersfield, Connecticut. Educated at Trinity College, Hartford, and Johns Hopkins Univ. Appointed Farman prof. of Amer. hist. at Yale. A distinguished scholar, A. is known to Eng. research workers by his 'Guides' to the materials for Amer. hist. up to the year 1763. The following are among his chief publications: *River Towns of Connecticut*, 1889; *Contemporary Europe, Asia and Africa*, 1874-1901, 1902; *The Colonial Period of American History*, 1912; *Fathers of New England and Colonial Folkways* in 'Chronicles of America' series, 1919; and *The Colonial Background of the American Revolution*, 1921.

**Andrews, Elisha Benjamin** (1841-1917). Amer. economist, historian, and educationist, served in the Civil war, in which he lost an eye. He was president of Denison Univ. 1875-79, prof. of homiletics at Newton Theological Institution 1879-82, a prof. of political economy at Brown Univ. 1882-88, and president of the same univ. 1889-93. From 1900 he was chancellor of Nebraska Univ. At the Brussels Monetary Conference of 1892, to which he was U.S. delegate, he ardently championed the cause of international bimetalism. Amongst other works he wrote *Institutes of Economics*, 1889; *An Honest Dollar*, 1889; *Wealth and Moral Law*, 1894; *History of the United States*, 1894; *History of the Last Quarter Century in the United States*, 1898; and *The United States in our own Times*, 1904. D. at Interlaken, Florida.

**Andrews, James Pettit** (1737-97), historian and antiquary, was b. near Newbury. After serving in the Berkshire militia, he studied law, and subsequently became a magistrate at the

Queen Square police court, Westminster. His chief works are: *Anecdotes, Antient and Modern*, 1789; *History of Great Britain connected with the Chronology of Europe*, 1794-95; and *History of Great Britain from Death of Henry VIII. to Accession of James VI. of Scotland*, 1796. This last was a continuation of Henry's *History of Great Britain*.

**Andrews, Roy Chapman.** Born Beloit, Illinois, Jan. 26, 1884. Eminent as a zoologist and chief of the div. of Asiatic exploration for the Amer. Museum of Natural Hist. Has discovered oldest known mammals and extensive evidence of primitive human life in the Central Asiatic plateau. Discovered many geological strata previously unknown, including some of the richest fossil fields. He was the first to discover fossilised dinosaur eggs, and skull and parts of the skeleton of the baluchitherium, the largest known mammal. Has proved Central Asia to be one of the chief centres of the origin and distribution of reptilian and mammalian life. Member of many Amer. scientific societies and corresponding member Zoological Society and Central Asiatic Society of London.

**Andrews, Saint,** see SAINT ANDREWS.

**Andrews, Thomas** (1813-83), chemist and physicist, was a native of Belfast, where, after practising medicine for some years, in 1845 he became prof. of chem. at Queen's College. His most important scientific achievement was the discovery of the continuity of the liquid and gaseous states. His scientific papers, with a memoir, were ed. by Tait and Crum Brown, 1889.

**Andreyev, Leonid Nikolaevich** (1871-1919), a Russian novelist and dramatist, b. Orel, of a family of the provincial intelligentsia. The poverty and misery in his life are reflected in the gloominess of his stories. He was the only writer of his generation to rival Maxim Gorky in popularity. He excelled chiefly in short stories, the style of which is Tolstoyan realism, but with something of the lighter touch of Tchekov. A. is as terrible as Gorky, but an essential difference may perhaps be that where Gorky describes life, as he has seen it, as though it were life seen whole, A. seems rather to select abnormalities while recognising them as such. Among his best-known short stories are *The Abyss* and *In the Fog*. His earlier tales are sex problems treated in a bold, crude manner; the later are more artificial and told in a somewhat turgid, declamatory style. His plays, which are symbolical in treatment, e.g. *The Life of Man* (1906), are marred by the crudities of melodrama.

**Andria,** a tn. in the S. It. prov. of Bari, and 30 m. N. of that tn. It has a fine cathedral founded in 1046. Majolica manuf. is carried on, and a trade in almonds. Pop. 51,000.

**Andrieux, François Guillaume Jean Stanislaus** (1759-1833), a Fr. author b. in Germany. At first he was a lawyer, but forsook that calling for literature.

His comedies are distinguished by their wit and charm, among the best being *les Etourdis* and *La Comédienne*. He also wrote many poems and romances. He was secretary of the Fr. Academy.

**Androcles, or Androclous,** was the Rom. slave who, when hiding from his master in the desert, extracted a thorn out of the foot of a lion. When he was caught he was taken to the circus as a punishment, and a lion was let loose upon him. To the astonishment of the people the animal fawned on him instead of devouring him, for it was the identical animal he had succoured in the desert. He afterwards led the lion through the streets of Rome. This story was told by Apion (q.v.), and is to be found in Gellius, v. 11.

**Androgynous** (Gk. *ἀνδρ.* man, *γυνή*, woman), a biological term synonymous with hermaphrodite. It implies in zoology that the animal, such as a leech, possesses in its one body the organs of both sexes; and in botany that the plant, such as the arum lily, has both male and female flowers on one inflorescence.

**Andromache** was the daughter of Eetion, king of Thebes in Cilicia, and wife of Hector, one of the finest female characters in the *Iliad*. After the conquest of Troy captured by Pyrrhus (Neoptolemus), son of Achilles, by whom she had 3 sons, but Pyrrhus afterwards left her to Helenus, the brother of Hector. She is made the chief character in tragedies by Euripides and Racine.

**Andromeda** was the daughter of the Ethiopian king Cepheus and of Cassiopeia. Because of the mother's boast of her daughter's beauty surpassing that of certain goddesses, Neptune, their father, sent a terrible sea-monster to invade the kingdom of Cepheus. To appease Neptune the oracle declared that A. must be given up to the monster. From this danger she was rescued by Perseus, who beheld her chained to the rock; he slew the monster and obtained the beautiful virgin in marriage. This story forms one of Corneille's tragedies, and has given the name to a constellation.

**Andromeda,** a constellation situated in a region of the heavens below Cassiopeia. It is to be found by drawing a line through the brightest star (βeta of the five in Cassiopeia ('My Lady') Chair') and the Pole star. This passes through a star of the first magnitude in the head of A., marked α, and called Alpheretz. Perseus is a neighbouring constellation. A. is a constellation rich in astronomical interest, and includes a remarkable nebula, a triple star, and the radiant point of a meteoric shower. The nebula is remarkable in that it is the only nebula visible to the naked eye. It was first observed through a telescope by Simon Marius on Dec. 15, 1612, who compared it to a candle shining through a horn lantern, but there seems evidence that this nebula was discovered by Al Sufi in the tenth century. Whether this be so or not, the nebula in A. is memorable for being the first discovered nebula, its

great rival in Orion not being discovered till 40 years later. It is spiral in shape, a fact first disclosed by a photograph by Dr. Roberts in 1888. The Andromedids, a shower of meteorites radiating from a point in A. on Nov. 28, have been conjectured to be the fragments of the disrupted, short-period, Biela's comet. Almaach, or Gamma Andromedæ, was found by Herschel to consist of 2 stars of magnitude 2.5 and 5.5, about 10' distant. On examining the fainter of the 2 stars by a very powerful telescope Otto Struve found it to be a very close double star. Subsequent discovery revealed the fact that this pair, green and blue in colour, revolve round the primary, which is an orange-coloured or solar star.

**Andromeda**, a genus of plants belonging to the Ericaceæ. They are shrubs, natives of Europe, Asia, and N. America. *A. polifolia*, wild rosemary, grows in Brit. peat bogs; *A. rosmarinifolia*, rosemary-leaved marsh A., is found in Newfoundland and Labrador.

**Andronicus** was the advocate of the Jews under the reign of Ptolemæus Philometor against the Samaritans in Egypt, who asserted the authority of the temple on Mt. Gerizim against the temple at Jerusalem. Ptolemæus Philometor was appealed to, and in court Sabbal (Sabbæus) and Theodosius, the Samaritan advocates, lost their cause against A., and were put to death.

**Andronicus** (c. 1100), the first Comnenus, an emperor of Byzantium. He killed Alexius II. and seized the throne, but in 1185 he was himself assassinated.

**Andronicus Cyrrhestes** (c. 100 B.C.), a Gk. architect, who was famous for having constructed the Tower of the Winds at Athens. It takes its name from the figures of the 8 winds being cut in relief on the exterior wall of the building. The tower was intended for a sun-dial, and it also contained a water-clock.

**Andronicus, Livius**, the earliest Rom. poet, was really a Gk., and formerly a slave to M. Livius Salinator, who freed him and gave him the name of Livius. He wrote both tragedies and comedies, and his first drama was acted in 240 B.C. He also trans. Homer's *Odyssey* into Saturnian verse.

**Andronicus Palæologus**, the elder and the younger, emperors of Byzantium, the former reigned from 1283 to 1328 and the younger 1328-41. Both reigns were noted for the wars with the Turks, who, in the latter, conquered all the Asiatic ter. of the empire.

**Andronicus Rhodius** (c. 58 B.C.), a Rom. philosopher. He is chiefly known through his exposition of the teachings of Aristotle.

**Androphagi**, a race of cannibals, mentioned by Herodotus as inhabiting a region adjacent to Scythia. Later, the term is used for cannibals generally.

**Andropogon** is a genus of Gramineæ of which sev. species are well known. *A. schæmanthus*, the Indian rusa grass,

yields the aromatic rusa oil, *A. nardus* citronella oil, and *A. Sorghum* a kind of millet seed from which a flour, called durra in India and Arabia, is made.

**Andros**, an is. of the Grecian Archipelago, situated to the S.E. of Eubœa. It is 21 m. long, 8 m. broad. It is mountainous, and the soil is fertile, producing grapes, oranges, citrons, and lemons. The manufs. consist of wine and silk. The most important tn. is A., or Castro, situated on the E. coast. Pop. of is. 17,000.

**Andros Island**, one of the Bahamas group, has a length of 100 m., and varies in breadth from 10 to 40 m. It is low and swampy, but well timbered, and exports sponges and wool. Pop. 7000.

**Andros**, Sir Edmund (1637-1714). From 1671 to 1681 he was governor of New York, and afterwards of New England. In 1689 the colonists deposed and arrested him and he was sent to England to be tried for attempting to seize the charter of Connecticut, but acquitted and appointed governor of Virginia in 1692. This post he held for 6 years.

**Androscoggin**, a riv. of Maine, in America, which rises in the White Mts. and which subsequently joins the Kennebec after a course of 155 m.

**Androsphinx**, a sphinx with the head of a man, not of a woman as is usually the case. An example is the A. of Thothmes III. in the Boulak Museum, Cairo.

**Andújar**, a Sp. tn. in the dist. of Andalusia in the prov. of Jaén, situated on the R. Guadalquivir. The chief manuf. carried on is of porous cooling water-jars. In 1808 the convention of Baylen was signed here. Pop. 22,000.

**Anduze**, a tn. in Gard, France, on the Gardon d'Anduz. It is an ill-built place, but is situated amongst beautiful scenery, and is noted for its basket and paper making, and for its potteries. Pop. 2500.

**Anecdote** (Gk. ἀνέκδοτος, not published) is a narrative of a particular fact or incident often little known, but nevertheless interesting, and affording a side-light on the true character of a person, or of the characteristics of a certain age. Formerly the term was applied to private or hitherto unpub. memoirs or narratives. Muratori and Merseune gave the name of *anecdota* to unknown works which they ed. Procopius wrote an anecdotal hist. of the Emperor Justinian and his wife Theodora, and As. were common among the Gk. and Lat. writers.

**Anegada**, see ANTILLES.

**Anelron**, see ANEURIN.

**Anelectrotonus**, the decreased excitability in the neighbourhood of the anode in a nerve through which an electric current is passing. The part of the nerve near the positive pole needs a stronger stimulus than under normal conditions to display functional activity, whilst near the negative pole the excitability of the nerve is increased. The latter condition is called *catelectrotonus*.

**Anemochord**, a kind of pianoforte

invented by Schnell in 1789, in which the notes were produced by currents of compressed air directed on the strings. On this instrument the music had a peculiar effect of distance.

**Anemometer**, an instrument for measuring the velocity of the wind. In the Robinson or cup A. 4 hemispherical cups are fixed on 4 arms at right angles so that their concave surfaces are in the same direction of rotation. The motion imparted by the wind is trans. by a series of cog-wheels so as to indicate m.p.h.

The Dines or tube A. consists of 2 tubes, one of which has an open mouth kept facing the wind by a vane as in a weathercock. The increased pressure is communicated down the tube to a recording apparatus. The other tube is perforated by small holes arranged in rings so that suction, or a decrease in pressure, is produced by the wind passing across the holes. The decrease in pressure is also communicated to the recording apparatus, which consists of a float in a closed vessel, so arranged that when the wind is blowing the increased pressure in the first tube is applied underneath the float, raising it in the water, and the decreased pressure is communicated to the air above the float, also tending to raise it. The movements of the float are registered graphically on a slowly revolving drum.

SEA ANEMONE, CLOSED AND EXPANDED

**Anemone**, a genus of Ranunculaceæ, includes sev. well-known and beautiful flowers which possess the property of extreme acidity. *A. pulsatilla*, the Pasque flower, and *A. pratensis* are powerful emetics; the leaves of the former will raise blisters on the skin. *A. nemorosa* is the wood-anemone or 'wind-star,' *A. Hepatica*, the hepatica, and *A. coronaria* the common garden anemone.

**Anemone, Petrified**, see CHAONITES.

**Anemone, Sea**, is a name given to the polyps which do not form coral, the Actinaria, of the order Zoantharia, because their spread-out tentacles give

them a resemblance of the flower A. They are found attached to rocks and the shells of hermit crabs; a few can swim freely; they feed on small animal life.

**Anemoscope**, an instrument for determining the direction of the wind. It is usually constructed by connecting with the spindle of a weathercock the hand of a dial on which the points of the compass are marked. The electrical A. of A. Lucchesi, by means of a galvanometer, gives the 8 prin. directions of the wind.

**Anerley**, a London suburb, 7½ m. S. of London Bridge by rail.

**Aneroid**, a term applied to a barometer in which the pressure of the air is measured without the use of mercury or other liquid. It consists essentially of a hollow box of elastic metal in which there is rarefied air. Any external pressure causes a proportionate amount of compression of this box, which is conveyed through a multiplying arrangement to the pointer on the dial. A preliminary graduation in comparison with a good mercury barometer enables the atmospheric pressure to be shown.

**Anethum**, a genus of Umbelliferae, now included in *Peucedanum*, is the dill. *A.* (or *P.*) *graveolens*, the common dill, native of S. Europe, Astrakhan, Egypt, and the Cape of Good Hope, was mentioned by Hippocrates and Dioscorides as a medicinal and savoury herb. The fruit is used as a condiment.

**Aneurin**, or **Aneiron** (fl. c. 603), a Welsh poet, supposed to be the son of Caw ab Geraint, a Welsh chieftain. According to another account he is said to be the same as the historian Gildas. He was educated at St. Cadoc's College at Llanancarvan. His chief poem, *Gododin*, tells of the victory of the Saxons over the Britons at Cattraeth, at which A. was present. He is supposed to have been assassinated by Eldyn ab Einygan. *Gododin* was trans. into Eng. in 1809 by Edward Davies.

**Aneurysm**, or **Aneurism**, a circumscribed dilatation of an artery formed of one or more of its coats. In a *false A.* the coats are ruptured; *military As.* are minute *As.* occurring along the course of the blood-vessels of the brain; an *arterio-venous A.* is occasioned by a direct connection between an artery and a vein, the latter becoming pulsing and dilated; *mycotic As.* are caused by collections of bacteria within the arteries.

*As.* may be caused by *arterio-sclerosis*, or the thickening of the arterial coats, the plugging of a vessel by particles of fibrin or by bacterial growths or by any sudden strain or injury. It is found that men in the active period of life are most affected, pointing to the probability of the condition being caused by strain.

Most cases involve the thoracic portion of the aorta. If the *A.* is small it may give rise to no physical signs, but if large, pain is constant owing to the compression of other organs, a prominence like a pulsating tumour may be formed, and pressure upon the windpipe may give rise to a paroxysmal

cough and constant shortness of breath. There is always danger of perforation and a speedy death, but if the condition is recognised and treated, it may pursue its course for a protracted period until the A. ruptures and hemorrhage into the adjacent cavities or organs takes place. Pulmonary complications, such as tuberculosis or fibrinous pneumonia, may be set up, and in any case there is growing weakness. The treatment aims at the coagulation of the blood, and secondly, the contraction of the sac. To secure the first, absolute rest in a recumbent posture is advisable, but if that cannot be enforced, exertion should be reduced to a minimum, and liquid should form as small a proportion of the diet as possible. Contraction of the sac appears to be promoted by the use of potassium iodide.

An A. of the abdominal aorta may press against the vertebrae and erode the bone, when compression of the cord may take place, producing paralysis. If the growth be low down it may be possible to effect a cure by pressure, which must be maintained for at least 24 hrs. under an anæsthetic.

Angara is a Siberian riv. which flows through Lake Baikal and joins the Ir. Yenisei after a course of 1300 m. The principal town on its banks is Irkutsk.

Angary, Right of, in international law, formerly a right claimed by a belligerent, deficient in vessels, to lay an embargo on and seize neutral merchant vessels in their harbours and to compel them and their crews to transport troops and supplies on payment of advance freight. The modern right consists in the right of belligerents to use, or destroy in case of necessity, for the purpose of offence and defence, neutral property on their own or on enemy ter. or on the open sea. (See further under NEUTRALITY.)

Angel, the word *ánġol* is derived from the Gk. *ἄγγελος*, a messenger, which is the translation of the Heb. *mal'akh*; and in both the O.T. and N.T. it represents a spiritual being awaiting God's commands, a messenger, and a means of manifestation of God to man. In the early historical books of the Bible the A. especially represents a manifestation of God Himself. Sometimes it has no form—only a voice is heard, as when the A. of God spoke unto Jacob in a dream (Gen. xxxi. 11); and sometimes there is a form resembling that of a man, as when Abraham was visited by 3 men (Gen. xviii.), when 2 A. came to Lot and did eat unleavened bread with him (Gen. xix.), and when Jacob wrestled with a man until the breaking of the day (Gen. xxxii. 24-30). Later an A. represented a messenger who carried out the commands of the Lord. In 2 Sam. xiv. 18, when the A. stretched out his hand to destroy Jerusalem, the Lord commanded him to stop; and in Exod. xxiii. 20-23 the Lord sent an A. to bring the people of Israel to the place that was prepared for them, telling them that they were to

obey His messenger, for His name is in him. A comparison of the passages Exod. xxxii. 34 and xxxiii. 2 with the passage Isa. lxiii. 9 implies that there was a distinction between the 'A. of the Lord' and the subordinate A. A. have also been called by other names—'sons of God' (Gen. vi. 2), 'sons of the mighty' (Ps. lxxxix. 6), 'saints' (Zech. xiv. 5), and 'holy one' and 'watcher' (Dan. iv. 13). In the passage Ps. ciii. 20 the A. excel in strength, they are God's ministers and hosts that do His pleasure; and in 1 Kings xxii. 19 they are a host of heaven standing on His right hand and on His left. The notion that they are warlike beings is found in Joshua v. 13 (a man with a sword drawn in his hand), and in Ps. lxxviii. 17, when the A. appear in the 20,000 chariots of God. The whole hosts of A. are divided into different sections of which the archangels are the greatest. In Daniel this idea is shown, for Persia and Greece have special A. called princes (Dan. x.). Michael is the prince (Dan. x. 21), and Gabriel is the *angelus interpretis*, the angel interpreter. In the post-canonical books and in the apocalyptic literature the names, ranks, and classes of A. are given. The chief archangels are Michael, Gabriel, and Raphael, who with Uriel, Chamuel, Jophiel, and Zadkiel, stand before God. Israfil, 'the sweet singer,' is generally regarded as the A. of death in the Mussulman mythology. In the book of Enoch, cherubim and seraphim are mentioned as being distinct classes of A., and Raphael and Phanuel are individual archangels. In Job i. 6, Satan is spoken of as one of the sons of God. Evil A. are mentioned in Ps. lxxviii. 49, but they are not evil themselves—they are so called because through them God destroys the vines and flocks of the faithless and visits them with pestilence. The same idea is expressed in Judges ix. 23 and in 2 Kings xix. 35. In the N.T. guardian A. are frequently mentioned who rejoice and grieve with individuals, as in Matt. xviii. 10 and in Luke xv. 7, 10. According to the passages Heb. ii. and 1 Cor. vi. 3, the A. are inferior to Christians; nevertheless, according to Rev. xiv. 16, Heb. i. 14, and 1 Pet. i. 12, the A. take their part in ministering God's word. A host of A. attended Christ on His ascension into heaven, and they will also accompany Him on His second coming to judge the world. A. worship is strictly forbidden by St. Paul (Col. ii. 18). From Eph. i. 21 and Col. i. 16 we learn of the existence of a hierarchy, thrones, dominions, principalities, powers, and might being mentioned. Pseudo-Dionysius of the fifth century in his work entitled *De Hierarchia Celesti* gives a full account of this angelic hierarchy. In the Book of Revelation A. play an important part. There are the A. of the 7 churches of Ephesus, Smyrna, Pergamos, Thyatira, Sardis, Philadelphia, and Laodicea (i. 20, ii. iii.);

an A. seals the servants of God in their foreheads (vii. 3); 7 As. with trumpets stand before God (viii. ix. x.); there was war in heaven when Michael and his As. fought against the dragon (xii.); and 7 As. had golden vials full of the wrath of God (xv.). The Devil and his associates who were expelled from heaven (Milton, *Paradise Lost*) are sometimes called the fallen As.; the Devil also having the name of Lucifer, 'light-bringing,' i.e. the morning star.

Angel was originally a gold coin of France, where it was first coined in 1340. It was introduced into England by Edward IV. 1465, when it was valued at 6s. 8d., and, being of the same value as the noble, was sometimes called the A-noble. Under Henry VIII. its value was raised to 8s. and under Mary to 10s., and it was last coined by Charles I. The device on the obverse of the coin was St. Michael piercing the dragon with a spear, and on the reverse it had a ship, with a large cross for a mast, and the royal arms in front.

Angel-fish, or Monk-fish (*Squatina angelus*) is a shark much resembling the ray. This elasmobranch is the type of the family Rhinidae and order Selachii, and is found round the coasts of N. America and Australia. The blue angels, deep laterally compressed fish with long filaments to their tails and fins, have become the mascot of Bermuda.

Angelica, a plant of the order Umbelliferae of which the candied roots form a sweetmeat. *A. archangelica*, or *Archangelica officinalis*, is cultivated for its aromatic odour.

Angelico, Fra (1387-1455), a famous Florentine painter, who was also a Dominican monk. His full name was 'Il Beato Fra Angelico Giovanni Angelico da Fiesole,' or in Eng. 'the Blessed Brother John the Angelico of Fiesole.' He was b. at Vicchio. The early part of his life was spent at Florence and the latter at Rome, where he was summoned by the pope. He is famous for his frescoes, which are in Rome, Florence, Fiesole, and other It. towns, the most wonderful being the series at San Marco, Florence.

Angélique and Agnès, see under JANSENISM.

Angell, George Thorndike (1823-1909), Amer. philanthropist, b. at Southbridge, Massachusetts, U.S.A. Admitted to the Boston bar in 1851. In 1868 became president of the Massachusetts Society for Prevention of Cruelty to Animals. Became ed. of *Our Dumb Friends*. Initiated the movement for the establishment of the Bands of Mercy. In 1889 founded and became president of the Amer. Humane Education Society. Notable also as a criminologist.

Angell, James Burrill (1829-1916), Amer. educationist, b. in Rhode Is. Educated at Brown Univ. Was prof. of modern languages and then took up journalism. Subsequently became president of the univ. of Michigan, which institution he brought to a high state of efficiency. Later became Amer.

minister to China and then to Turkey. Pub.: *Progress in International Law*, 1875; *Reminiscences*, 1912, and *Selected Addresses*, 1912.

Angell, James Rowland (b. 1869), Amer. psychologist and educationist, b. at Burlington, son of James Burrill A. (q.v.). From 1894 to 1901 he was assistant prof. of psychology at Minnesota Univ., and in 1905 head of the dept. In 1912 he went to the dept. of psychology at Chicago Univ. and, later, became president of Johns Hopkins Univ. Works: *Psychology*, 1904 (new ed. 1908); *Chapters from Modern Psychology*, 1911; *American Education*, 1937.

B.B.C.

SIR NORMAN ANGELL

Angell, Sir Ralph Norman (b. 1874), Eng. author and journalist, son of Thomas Angell Lane of Holbeach. Educated privately and in France. Early years spent in ranching in the U.S.A. and, later, in journalism. In Paris he ed. *Galignani's Messenger* from 1899 to 1903; then joined the staff of the *Eclair* and, from 1905 to 1911, was general manager of the Paris ed. of the *Daily Mail*. Dropped the name of Lane and became world-known as the author of *The Great Illusion* (1910), the theme of which is that war is unprofitable to victors. Labour M.P. for N. Bradford, 1929-31. Knighted 1931. Nobel Peace Prize, 1933. Other works include *The Story of Money*, 1930; *The Unseen Assassins*, 1932; *The Money Mystery*, 1936; *For What do we Fight?* 1939; *Let the People Know*, 1943; *The Sleep Places*, 1947.

**Angeln** is a dist. in Germany between the Baltic and the Schlei. It is said to be the original country of the Angles, who in the fifth century invaded England.

**Angelo Buonarroti the Younger** (1568-1646) was b. at Florence and d. at Rome. He was the son of Leonardo di Buonarroti, brother of the great Michelangelo; he studied mathematics and natural philosophy under Galileo, and became a member of the Academy of La Crusca and of the Florentine Academy. He is chiefly famous for *La Tancia*, a drama, and *La Fiera*, a series of 5 comedies.

**Angelot**, a gold coin, struck in France by Henry VI. of England; also a Fr. gold coin first struck in 1340; also a musical instrument like a lute.

**Angels of the Elements**, see **ELEMENTAL SPIRITS**.

**Angelus à Sanoto Francisco**, the assumed name of the Franciscan monk, Richard Mason (1601-78), author of *Regula et Testamentum S. Francisci*, 1643; *Apologia pro Scoto Anglo*, 1656, and other rare works.

**Angelus Bell**, in Rom. Catholic countries, is a bell rung 3 times a day, at dawn, noon, and sunset, to call the faithful to prayer. It was instituted in 1326. Its name is derived from A. Domini, the angelic salutation to the Virgin Mary. Millet has painted a famous picture with this title.

**Angelus Silesius** (1624-77), a Ger. poet and philosopher, b. at Breslau. His proper name was Johann Scheffler. He first practised medicine, but in 1653 joined the Rom. Catholic Church, though his parentage was Protestant. He wrote books on mysticism and also many hymns, which are still used by Protestants in Germany.

**Anger** (Old Norse *angr*, pain) is a primitive emotion, often associated with fear, which is experienced by man in common with higher animals. In its lowest forms A. suggests destructive violence and infliction of pain on the object, animate or inanimate, which aroused it, or even on inoffensive objects which have had no share in causing it. In a higher form it desires to inflict mental suffering: here again the angry party receives relief from imposing it on innocent victims. From this it will be seen that it has a deadening effect on the reasoning faculty, and is, in fact, a form of temporary madness.

The physical accompaniments of A. are changes in colour (usually flushing, but in some cases pallor), aggressive postures, agitated respiration, quickened heart-beats, muscular changes of the eyebrows and jaw—arising from protective and biting instincts—contraction of the pupils, glandular secretions (such as tears and increased flow of saliva). The feelings find expression in animals in snarling and growling, in man in crying, screaming, and hysterics. See P. Jessen, *Versuch einer wissenschaftlichen Begründung der Psychologie*, 1855; A. Bain, *The Emotions and the Will*, 1859; Charles Darwin, *Expres-*

*ion of Emotions in Men and Animals*, 1872; H. M. Stanley, *Evolutionary Psychology of Feeling*, 1895; G. F. Stout, *Manual of Psychology*, 1901; J. T. MacCurdy, *The Psychology of Emotion*, 1925; J. Macmurray, *Reason and Emotion*, 1935.

**Angermanland**, a dist. in Sweden and under the gov. of Västernorrland. It is a wild and picturesque country, and well cultivated. Its riv. the Angerman, is over 200 m. in length, and joins the gulf of Bothnia at the prin. tn. of Hernösand. The riv. is navigable near its mouth.

**Angermünde**, a tn. in Brandenburg, Germany, just over 40 m. N.E. of Berlin, noted for large iron works and a woollen industry. Pop. 8000.

**Angers**, the old cap. of Anjou in France, now in the dept. of Maine-et-Loire. Its old name was Andecavi. It is the see of a bishop, has a large theological college and a fine library. The castle, now used as a prison, and the cathedral were both built in the thirteenth century. The R. Maine is navigable at this point, and the dist. has extensive industries in wool and cotton. Large slate quarries are also in the vicinity. Pop. 88,000.

**Angers, Sir Auguste Réal** (1838-1919), Canadian statesman, was b. in Quebec, where he practised for some time as a lawyer. From 1874 till 1879 he sat in the Quebec Assembly, for the last 3 years as leader of the Gov. He subsequently became a puisne judge of the supreme court, which post he resigned in 1887, and was lieutenant-governor of the prov. till 1892. He joined the Thompson administration, and retained his position under Sir M. Bowell, but resigned in 1895 over the Manitoba school question. He retired from politics in 1896 on the defeat of the Tupper administration. He took an active part in the completion of the N. Shore Railway between Montreal and Quebec.

**Angerstein Gallery**, see **NATIONAL GALLERIES, THE**. The A. collection of 38 pictures was purchased by the nation in 1824.

**Angevin Line of Eng. kings** began with Henry II. (1154), who was son of the count of Anjou (whence the name), and ended with Richard III. (1485). John is sometimes erroneously described as the last of the A. dynasty because he was the last Eng. king to reign over Anjou.

**Angghiari**, tn., N. Italy, 10 m. N.E. of Arezzo. The scene of the defeat of the Milanese by the Florentines in 1440. Pop. 8000.

**Angilbert, Saint** (c. 740-814), the friend and counsellor of Charlemagne, whose daughter, Bertha, he married. He ultimately became a monk. He was a distinguished poet and was described by Charlemagne as the Homer of the age.

**Angina**, a medical term for any inflammatory disease of the throat or trachea which hinders breathing or swallowing. *a. humida* is croup.

**Angina Pectoris**, a paroxysmal pain accompanied by a sense of intense oppression about the heart. It is occasioned by a partial blockage of the coronary arteries which supply the heart muscles, and usually occurs in men over 40. The immediate cause of the attack is exertion or emotion; there is a sudden pain affecting the whole chest, then radiating through the left shoulder and penetrating sometimes right down to the fingers. Accompanying the pain is a sense of impending death, the respiration is shallow or arrested, and the patient's anxiety becomes extreme. The attack may suddenly cease, and, although there is temporary weakness, there may be no other signs of the disease until another attack. The number and frequency of attacks vary; there may be only one or two, there may be a chronic form in which the attacks grow in intensity, or a number of severe attacks may end with complete recovery. Usually the outlook is very grave.

The treatment aims at the prevention of the attack. The patient should always carry about with him small glass capsules filled with amyl nitrite, which may be broken into a handkerchief and the vapour inhaled. In the intervals between the attacks any predisposing causes, such as arterio-sclerosis should be treated; gymnastic exercises in the form of passive movements are generally of utility. Recently operative treatment has been introduced. It consists in providing a new blood supply to the heart by sewing on to its wall a piece of omentum. The latter is an apron-like fold of connective tissue which hangs in front of the intestines in the abdomen, and part of which can be moved into the thorax through an incision in the diaphragm.

**Angiolieri**, Cecoo (c. 1250-c. 1312). It, humorous poet and contemporary of Dante, on whom he wrote 3 uncomplimentary sonnets. In his poems he shows himself as an undoubted *bon viveur*, with a marked predilection for wine and women. About 120 of his sonnets are still extant.

**Angioma**, a vascular tumour caused by the enlargement or new formation of blood-vessels. There are sev. varieties.

**Angiosperms** (Gk. *αγγειον*, vessel, *σπέρμα*, seed) include the highest forms of plant life. Together with Gymnosperms (pines, etc.) they make up the great group of Phanerogams, Spermatophyta, or flowering plants; they differ from Gymnosperms in having the carpels arranged so as to form an ovary for the ovules, and, in forming endosperm after fertilisation instead of before it.

The A. are divided into 2 classes, the Dicotyledons and Monocotyledons; in the former are such flowers as buttercups, primroses, and nettles, in the latter arum lilies, grasses, and daffodils. These flowering plants do not necessarily have bright petals or sepals, but it is essential that they should have carpels and stamens; reproduction, however,

may take place also by budding, apogamy, or parthenogenesis.

**Angkor**, the old cap. of Cambodia in Asia, but now only the ruins of a city. It is surrounded by high walls, it is about 2 sq. m. in extent, and 5 gates give entrance to the city. The palaces of A. date from the sixth century, when Then-Ha (Cambodia) won its independence; they were of Hindu, not Khmer, inspiration. In Siemrat prov. are the wonderful ruins of A., or Nakawn, Wat, relics of the architectural genius of the Khmer race. See Osbert Sitwell, *Escape with Me*, 1939.

**Angle**, the difference in direction of 2 lines. If the lines are straight the A. is *rectilinear*, if curved the A. is *curvilinear*. A curvilinear A. is measured by the A. between the tangents to the curves at the meeting point. As. are usually measured in degrees, one degree being 1/360th of a complete revolution. In circular measure the unit is a *radian*, which is an A. at the centre of a circle opposite an arc equal in length to the radius; there are 3.14159 . . . radians in 180°. A *solid A.* is the space contained by 3 or more planes meeting at a point. A *dihedral A.* is an A. between 2 planes, a *trihedral A.* one between 3 planes. *As. of incidence, reflection, and refraction* are, in physics, the As. formed by the direction of a wave with the normal to the surface at the point of incidence, reflection, or refraction. The *critical or limiting A.*, in light, is the A. at which a ray of light strikes the surface between 2 media so that the refracted ray passes along the surface. The *critical A.*, in friction, is the A. at which the component of the weight directed down the slope of the inclined plane balances the friction. The *A. of capillarity* is the A. formed, due to surface tension, when a liquid is placed in contact with a solid.

**Anglers** are any fish of the div. *Pediculati* of the order *Teleostei*, and belong to the family *Lophidae*. The *Lophius piscatorius*, known also as monk-fish, sea-devil, frog-fish, or goose-fish, angles for its prey in a peculiar fashion. The 3 anterior spines of the dorsal fin are transformed into tentacles, the foremost of which ends in a bright, worm-like tip which acts as bait and can grow again readily. The A. swims badly and lurks near the coast; it attains a length of 3 to 5 ft., and is found in Europe and America.

**Angles**, or **Angli**, a Ger. tribe who occupied the dist. of Schleswig-Holstein, a large number of whom came to Britain in the fifth century and settled in E. Anglia, Mercia, and Northumbria. From them the name England is derived (Angleland). These people were first mentioned by Tacitus, who states that they were a part of the Sueti, and Lindenberg and Leibnitz have preserved fragments of the anct. laws used in common by the Angli and the Varini.

**Anglesey** is an is. off the N. Wales coast, and divided from the mainland by the Menai Straits. It is 21 m. long

by 19 broad. It forms a co. and sends a member to Parliament. Lead, copper, and zinc are among the minerals found on the is., and sheep- and cattle-breeding are carried on. It is joined to the mainland by a fine suspension bridge and also by the Britannia tubular bridge. Holyhead is an adjoining is., and the starting place of the route to Ireland. Beaumaris, Holyhead, and Amlwch are the chief tns. Pop. 52,000.

**Anglesey, Henry William Paget, first Marquess of (1768-1854),** and a son of the earl of Uxbridge. He entered the army and served in Flanders and the Peninsula. He was created marquess of A. for his bravery at the battle of Waterloo, where he lost a leg. He was appointed lord-lieutenant of Ireland in 1828, and was afterwards responsible for the Irish Board of Education.

**Anglia, East,** a kingdom founded by Uffa in 575, which consisted of Norfolk, Suffolk, Cambridge, and the Isle of Ely, and formed one of the kingdoms of the Saxon Heptarchy. It was afterwards dependent on Mercia, and submitted to Egbert, king of Wessex, in 826. Soon after it was invaded by the Northmen, and became a Dan. kingdom, until it was taken by Edward the Elder, 921. Under Canute it was one of the 4 great earldoms, the other 3 being Northumbria, Mercia, and Wessex.

**Anglican, see CHURCH OF ENGLAND.**

**Anglicanism** is the name given to the body of doctrines and observances in the Church of England (q.v.) and of those churches throughout the world in communion with it. The recent hist. of A. in Great Britain has been that of the struggles of the different sections within it, but chiefly that of the Anglo-Catholic and Evangelical parties. The Anglo-Catholics (q.v.) hold to a body of doctrines which tend, increasingly, to resemble in dogma and ritual the beliefs and practices of the Rom. Catholic Church. This section is popularly known as the High Church party. The Evangelicals, termed the Low Church party, have sought to preserve the teachings and practices of the Protestant Reformation. The drift 'Romeward' of the Anglo-Catholic section became so pronounced towards the end of last century that Parliament appointed a royal commission in 1904 to consider the matter of eccles. discipline. The commission reported in 1906, and its report set in motion a movement for the revision of the Book of Common Prayer. This, as used in the churches to-day, is essentially that of the reign of Charles II. (1662), and it was held by many, of all parties in the Church, to require revision to bring it more into line with the requirements of to-day. So began that revision of the Prayer Book which forms the outstanding event in the recent hist. of A.

The National Assembly of the Church of England in July 1927 passed, by 617 votes to 133, the Prayer Book Measure. The majority included 34 bishops

and the minority 4 bishops. This measure allowed certain alternative or additional forms of worship to that in the Prayer Book, and, from the colour of its cover, the new Prayer Book was known as the Green Book. Measures passed by the National Assembly require the assent of both Houses of Parliament and of the Crown. The House of Lords gave its assent to the Prayer Book Measure by 241 votes to 88, but the House of Commons on Dec. 15, 1927, rejected the measure by 238 votes to 205. The bishops, deeming this rejection due to 'avoidable misunderstandings,' slightly revised the measure, which was again approved by the Assembly (396 votes to 157), but once more, in June 1928, failed (by 266 votes to 220) to secure the approval of the Commons. Thereafter the bishops decided to put into force the non-controversial parts of the Green Book.

**Angling** is the art of catching fish with a line and hook which is baited with worms, flies, or small fish. The antiquity of this pastime is proved by mention of it in the works of Gk. and Lat. writers, while allusions to it appear in the O.T., and the pursuit of A. is known to have been practised in ant. Egypt. Much has been written about it, and the oldest work printed in Eng. on the subject was issued in 1496 by Wynkyn de Worde, in a later ed. of a work on hunting and hawking, *The Book of St. Albans*, which appeared in 1486. To a woman may belong the honour of being first to write on the piscatorial art, for the work is ascribed to a nun, the prioress of a nunnery in Hertfordshire, Dame Juliana Berners.

The most famous work on the subject, however, is that of Izaak Walton, a linen-draper of Fleet Street, whose book, *The Compleat Angler or The Contemplative Man's Recreation*, is world-renowned. The first ed. appeared in 1653, and passed through 5 eds. during the author's life, the last being in 1676. With the later eds. a treatise was added by Walton's friend, Charles Cotton, containing instructions how to angle for a trout or grayling in a clear stream. This essay is still usually printed with the work.

*The Compleat Angler* is in truth more than a work on fishing, for the author depicted the delights of the countryside with great delicacy and charm, and the unaffected humour of the dialogue and its purity of style all add to the high reputation of the book. Since Walton's day the output of books upon the subject has been very prolific. Some of the prin. are mentioned at the end of this article. In this article we shall deal chiefly with fresh-water fishing.

The chief appliances needed by anglers are the rod, line, and hook. The first are made of various materials. Cane rods are the most common and the lightest, but other rods are made of yellow deal in a 7-ft. joint and a hazel joint of 6 ft., with a piece of fine-grained yew tapered to a whalebone top and measuring

about 2 ft. Salmon rods are usually made of split cane and greenheart. The reel is an apparatus for winding up the line, and is made of aluminium alloy, gun metal, brass, or, in the case of sea-fishing and spinning reels for pike and perch, of wood. The line is made of silk waterproofed or fine cord, and varies in length from 20 to 100 ft. according to the size of the water and the fish angled for. At the end is a piece of fine gut to which the hook is fixed, and above this is the float, made as a rule of quill, either of the porcupine or the goose, though for heavy fish or strong streams the floats are frequently of cork. The line or gut cast below the float must be loaded to balance the float. The angler does this himself, the amount of lead on the line varying with the size or buoyancy of the float. The angler must, of course, choose his bait with reference to his fish. Artificial flies are of 2 varieties, the dry fly and the wet fly. The former is used for cocking on the water and the latter for sinking beneath the water. The dry fly floats on account of its extra dressing. Dry fishing is done with single flies, while 2 or 3 wet flies are used at one time. Wet flies are used in strong running streams.

The finest fresh-water fish in this country is undoubtedly the trout, and affords the best sport to anglers. They abound in most of our lakes and rivers, and are usually angled for with an artificial fly. They are voracious, and by their agility and cunning frequently succeed in making their escape. A good landing-net is necessary for this fish. The trout usually spawns in Oct. and Nov., sometimes earlier or later, according to the season.

There is no great measure of agreement on the choice of rods for fly-fishing. Indeed, as has been well said, 'One of the charms of angling is that it presents an endless field for argument, speculation, and experiment' (T. E. Pritt). But for loch fishing, anglers at least seem to agree that nothing is to be gained by laying down a hard and fast rule, because so much depends on the characteristics of the individual. Progress in rod-building has been rapid in the last century, and 'with the advent of the built cane or split bamboo rod, we have an article which combines lightness with strength to an extent which no wooden rod can equal' (R. A. Chrystal). In salmon-fishing the very long rods of 18-20 ft., once considered essential, have almost disappeared, as the same work can be done by a cane rod of 16 ft., as far as length of cast is concerned—though the long rod enabled the angler to hang the fly over fish lying well out in a river. In loch fishing the conditions are different and trout rods in general have undergone a shortening, so that on a loch a rod of 14 ft. is about the longest in use. Those who still use rods of 14 ft. for loch fishing mostly use wooden rods. In choosing a line for loch fishing the almost universal practice is to have

it short and to splice on enough backing almost to fill the reel. Most reels for trout rods are big enough to take 30 yds. of line and 40 to 50 yds. of thin silk backing, and this is ample to deal with most heavy fish. A level line, which is as heavy as the rod, will cast properly, and is most generally useful, as a very light one flaps in the wind too much and causes loss of touch with the flies. Greasing is of doubtful value; it keeps some lines in good order, but others become soft and sticky and are useless long before they are worn out. For worm fishing for trout, the rod should be fairly stiff; one cannot throw a bait accurately with a supple one. Perhaps the best rod is one not less than 11 ft. and not more than 14 ft. long. For fly-fishing for brown trout on rivers, the rod should be of greenheart or split cane, not too supple in the middle, while the point should be fairly flexible—for with a rod supple in the middle, the angler cannot cast into a wind coming from his front, and not well with a wind blowing from either side; and a stiff top piece does not yield when a fish splutters, and thus the hook is liable to be torn from the fish's mouth. Present-day ideas favour very short and very light rods; but some anglers are strongly opposed to both and think that the length and weight of the rod must depend on the breadth of the river. The reel should be too stiff rather than slack and those made with a brake which can be regulated are often preferred.

The salmon is one of the angler's most coveted prizes and affords excellent sport. It is partly a fresh-water and partly a salt-water fish, though its spawn is generally deposited in the former. The spawning season is from the end of autumn until the beginning of spring. The length of rod for this fish is usually from 16 to 20 ft., and the best fly to use is a large one of gaudy colours. The Scottish rivers are famous for their salmon. See further under SALMON.

Roach are generally caught with maggots or paste lying on the bottom of ponds or streams, or with brandling worms. The perch is a bold-biting fish, but, curiously enough, it will never touch a fly. The best bait is a worm. The pike, or jack, as the young ones are called, are perhaps the greediest of fish, and spawn about Mar. in very shallow water. The finest specimens are those found in clear rivers. The best bait is a small fish.

The barbel is rather a heavy, dull fish, and does not give such good sport as many others, and for this it is a good plan to use ground bait, sometimes put in over-night. Bream are generally reckoned as pond fish (golden bream are common in the Norfolk Broads), although they are sometimes met with in slow-running streams. In fishing for these the angler should take care to keep concealed from the fish and let his bait sink near the bottom among the weeds. Carp are also pond fish, and, like touch, thrive best in mud, but never

well in cold, bare waters. Another well-known pond fish is the tench, but, like carp, these are found in sluggish rivers. They are noted for frequenting the foulest and muddiest portions of the pond, so the fisherman must angle for these very near the bottom and allow the fish plenty of time to gorge the bait. They are in season from Sept. until the end of May. Grayling are remarkably timid fish, and must be angled for with very fine tackle, and when hooked the angler must be careful to work the catch carefully as the hold gives way easily in the mouth. They will return to the bait, however, as a rule. The chub will rise easily at a natural or an artificial fly, and at spawning time will take most bait, such as worms, etc. It usually requires the aid of a landing-net.

Dace are very active and cautious, but will nearly always rise to the fly of a skilful angler. They frequent gravelly and sandy bottoms and deep, weed-shaded holes. In sultry weather they are often caught in shallows with gentles or grasshoppers. Bread and bran kneaded into small round cakes is a very good ground bait for these fish, but it must always be thrown upstream. The gudgeon is allured with almost any kind of bait. It spawns 2 or 3 times a year, and frequents gentle streams with gravelly bottoms. In A. for gudgeon a good plan is to stir up the bottom previously, which rouses the fish from a state of inaction and causes them to collect in shoals. Some anglers will use 2 or 3 hooks for this fish. A float is always used, but time should be allowed for the fish to nibble at the bait, as they will do this for some time before swallowing it. The loach can best be caught with a small red worm, while minnows are of little use for sport, but make excellent bait for pike, trout, salmon, and other fish. Close seasons are observed for most fish according to their natures and haunts.

For further details of all the fish mentioned here the reader is referred to the articles under their various headings, where their natures, habits, and haunts are dealt with more fully. Those we have mentioned here are, of course, those taken by anglers in Great Britain. The Anglers' Association is the chief body in this country which looks after the interests of this sport.

Anglo-Catholics are, as their name indicates, those in the Church of England who regard that church as part of the Universal, or Catholic, Church. This section, therefore, tends to resent the term Protestant and to stress the term Catholic. The more popular name for this party is the 'High Church' party. Anglo-Catholicism is undoubtedly a growing power in the Church of England, and the increase of its influence can be ascribed, in part, to the zeal of its adherents and the intellectual eminence of its protagonists. A.-Cs. are organised in the Eng. Church Union, and their most influential organ is the *Church Times*. From time to time Anglo-Catholic congresses are held in London, which afford evidences of an emotional fervour that has been compared to that roused by the great Wesley, the founder of Methodism.

In general it may be said that A.-Cs. display a desire for recognition by the Rom. Church. The claim to papal infallibility is denied, but in many churches in England the whole of the Rom. ritual and dogmas are practised and inculcated. How far the movement has progressed from, say, the Eng. Protestant position of the eighteenth century may be gauged by the 'Declaration of Faith,' issued in June 1924. This document, signed by 3000 Anglican clergymen (including Bishop Gore), was directed to the Orthodox Patriarch of Alexandria, and stated, *inter alia*, that the signatories held that the consecrated elements in the Anglican Eucharist 'become the true Body and Blood of Christ, and we hold that Christ, thus present, is to be adored.' The Prayer Book Measure, 1927 (see ANGLICANISM) was the Church Assembly's attempt to direct and control the movement.

**Anglo-Egyptian Sudan.** See SUDAN.

**Anglo-Israelite Theory.** During the closing years of the kingdom of Israel, it is known that a considerable proportion of the inhab. of N. Palestine were carried into slavery. In the reign of Pekah no fewer than 27,000 individuals appear to have been taken to Media and Mesopotamia, after the fall of Samaria in 721 B.C. (2 Kings xv. 29). The kingdom of Judah was treated in a similar fashion by Babylon in 587 B.C., but hist., whilst recording the return of the latter, is silent regarding the fate of the former. Thus the 10 tribes which were lost disappear from hist. entirely, and naturally many theories have been propounded as to their probable fate and present-day whereabouts. One of these is that the inhab. of Great Britain and the U.S.A. are sprung from these lost tribes. This theory, known as the A.-I. T., though even now promulgated, has not made much headway. For particulars see Philo-Israel, *An Enquiry establishing the Identity of the British Nations with*

*the Lost Tribes*, 1899, and the *Book of Mormon* by Joseph Smith.

**Anglo-Japanese Treaty.** By the terms of the treaty signed in 1902, Great Britain and Japan undertook to support each other in maintaining the independence and territorial integrity of China and Korea. If measures taken towards this end caused hostilities between one party to the agreement and another foreign power, the second party was to maintain a strict neutrality, but to come to the assistance of the first party when attacked by more than one power. In 1905 this agreement was amplified by an offensive and defensive alliance, applying to E. Asia and India. By the terms of this treaty the respective govts. undertook to support each other in the maintenance of their territorial rights and in the preservation of the independence and integrity of the Chinese empire. The agreement gave a free hand to Japan in the protection of her interests in Korea, and similar freedom to Great Britain on the Indian frontier. It also affirmed the principle of equal opportunities for the commerce and industry of all nations in China. In any hostilities caused by aggressive action directed against the interests specified, the 2 countries agreed to wage war and make peace together. This agreement was renewed, in the form of a new treaty, on July 13, 1911, for a period of 10 years. Substantially the new treaty re-enacted the provisions of the older one, but had one important modification relating to arbitration with third powers. This innovation was set out in Article IV., which ran: 'Should either High Contracting Party conclude a treaty of general arbitration with a third Power, it is agreed that nothing in this Agreement shall entail upon such Contracting Party an obligation to go to war with the Power with whom such treaty of arbitration is in force.' The alliance was formally dissolved in 1921 through the operation of the agreement reached at the Washington Conference on disarmament (1921-22).

**Angliomania** is a term used for the imitation amongst the Fr., Ger., or other foreigners of Eng. manners and customs, or an admiration of anything Eng. In the eighteenth century Eng. literature was greatly admired in Germany, and numerous Eng. books were translated into Ger. In France, just before the outbreak of the Fr. Revolution, there was a decided admiration of the free institutions of England. On the other hand, Anglophobia is a horror or fear of anything Eng.

**Anglo-Saxon Chronicle**, a compilation made in the reign of King Alfred, which may be his own work or written under his guidance. It is the most instructive extant work of A.-S. prose. It is written in a rhythmic style and contains many forceful descriptions of fighting episodes, such as the battle of Ashdown.

**Anglo-Saxon Language and Literature.** see SAXON LANGUAGE AND LITERATURE.

**Anglo-Saxons**, see SAXONS.

**Angmering**, a vil. of Sussex near the coast and not far from Worthing. The newly built part is residential and extends towards the sea.

**Angoche**, see ANGOSA.

**Angola**, the name applied to the Portuguese possessions on the W. African coast, lying between the Congo and Benguela or from the border of Belgian Congo to Cape Frio. A. was discovered in 1486 by the Portuguese and was long famous as a centre of the slave trade. Its landward boundaries are the Fr. Congo, the Belgian Congo, Rhodesia, and S.W. Africa. It has a coast-line of 1000 m. on the Atlantic Ocean. The waters of the Itua (Cana Falls and the Kunene R. are shared jointly for irrigation and power purposes by Portugal and the Union of S. Africa. The area is about 485,000 sq. m. and it is divided into 12 administrative dists. and ruled by a high commissioner. The coast is barren and unhealthy, but inland the country is well watered and tobacco, rice, and sugar are widely grown. The 3 chief rvs. are the Kwanza, the Kunene, and the Kwango. In the mts. are various mines, chiefly copper, lead, and sulphur, and petroleum is also obtained. The resources of the country are not by any means fully developed under Portuguese rule. The old cap. was Sao Paulo de Loanda (*q.v.*) but in 1928 Huambo, now called Nova Lisboa, was made the cap. The other chief tns. are Kabinda, Benguela, and Nova Redondo, which are also seaports. The chief products are maize, coffee, sugar, rubber, and coco-nuts as well as the products noted above; and some of the best agric. lands are traversed by the Benguela railway running from Lobito Bay to Katanga (and thence to Heira)—the last-named being a mineral dist. Benguela's trade has declined but it still exports considerable quantities of beeswax, sugar, and maize, though ships have to lie 2 m. out, the port being on a roadstead. Lengue, Cubal, S. Pedro, and Ganda are other trading centres. There is a wireless station and aerodrome at Nova Lisboa (Huambo). The Mossamedes railway goes inland from Mossamedes to Sa da Bandeira (Huila).

*Consult* Sir Harry Johnston, *The Colonisation of Africa*, 1899; A. Negreiros, *Angola*, 1901; F. I. de P. Conceiro, *Angola*, 1910; A. Marvand, *Le Portugal et ses colonies*, 1912; H. Marquardson, *Angola*, 1920; J. C. B. Statham, *Through Angola*, 1922; W. D. Hamby, *Ovimbundu of Angola*, 1934.

**Angoniland**, a dist. of E. central Africa, situated to the S.W. of Lake Nyasa. It consists of a plateau, with an average elevation of 4000 ft. The inhab., the Angoni, have fine physical development.

**Angora**, see ANKARA.

**Angosta**, see ANCOXA.

**Angostura** (Santo Tomé de la Nueva Guayana), see CIUDAD BOLIVAR.

**A. Bark** is derived from *Cusparia febrifuga*, a species of S. Amer. tree of the

order Rutaceæ. It is used in the manuf. of drugs which have a tonic effect, but its value as a febrifuge is small. Trinidad is the source of A. bitters, the manuf. of which was transferred to the is. from A. or Ciudad Bolívar in 1875, owing to the troubled state of Venezuela.

**Angoulême**, a Fr. city in the dept. of Charente, 60 m. N.E. of Bordeaux. It is situated on an isolated rocky hill. There is an old castle in the market-place, once the residence of the counts of A. The cathedral is very old, and was restored in 1120. A considerable trade is carried on in paper in the dist., where there are many mills. Pop. 39,000.

**Angoulême, Charles de Valois, Duke of** (1573-1650), was b. in Apr., being the natural son of Charles IV. of France and his mistress, Marie Fouchet. He was successively commended to the good wishes of Henry III. and Henry IV. During his early youth he conspired against Henry IV., and suffered imprisonment from 1605 to 1616. In the latter year he was released, and spent the rest of his life as a soldier and diplomat of France, taking part in the Thirty Years War and being in command at the siege of La Rochelle. He was an author of some note.

**Angoulême, Duchesse de Montmorency et d'**, see **DIANE DE FRANCE**.

**Angoulême, Louis Antoine de Bourbon, Duke of** (1775-1844), was the eldest son of Charles X. of France, and was b. in Aug. He was educated at Turin in military studies, but retired from France at the time of the revolution. In 1799 he married his cousin, Marie Thérèse, and on the recall of his uncle, Louis XVIII., to France he was made lieutenant-general of the kingdom. He attempted to oppose Napoleon's return in 1815, but was deserted by his troops. After the revolution of July he retired with his father, Charles X., into exile. He d. at Görz.

**Angoumois**, the name of one of the provs. of France before the revolution of 1789. It is now included in the dept. of Charente.

**Angoxa, Angoche, or Angosta**, tn., riv., and coast dist. of Portuguese E. Africa. The dist. produces cocoa, sesame oils, ground-nuts, rubber, and ivory. The inhab. are mostly Arabs.

**Angra do Heroísmo**, a seaport in Terceira, and cap. both of Terceira and of the whole group of the Azores. It is strongly fortified, has a cathedral, fine churches, a military college, and an arsenal. It exports grain and wine, but its harbour is very much exposed. Pop. 31,000.

**Angra Pequena**, a bay in S.W. Africa, lat. 28° 38' S., long. 15° E., on which stands the tn. of Lüderitz. This was estab. in 1883 by a Bremen merchant of that name, and in 1884 the dist. was proclaimed a Ger. protectorate. The surrounding country is desert, and the harbour itself is not good, freight having to be landed by lighters. The tn. is connected by rail with the S. African system at De Aar.

**Angrezabad**, see **ENGLISH BAZAR**.

**Angrì**, tn. of S. Italy, 15 m. N.W. of Salerno. Pop. about 18,000.

**Ångström, Anders Jonas** (1814-74), Swedish physicist, was educated at Upsala Univ. From 1867 to his death he was secretary to the Royal Society of Sciences at Upsala, at which Univ. he had already occupied sev. posts. His chief work is *Optiska Undersökningar*, on spectrum analysis. The unit for expressing wave-lengths of light is named after him.

**Anguilla**, or Snake Is., one of the Leeward Is. (Brit. W. Indies), has an area of about 35 sq. m. The surface is flat, some cattle are pastured there. Sea Is. cotton and salt are the chief products. Pop. 5500.

**Anguis** is a genus of reptiles of order Lacertilia and family Anguide. *A. fragilis*, the blind-worm, is a limbless, snake-like lizard with well-developed eyes, found in Asia, Europe, and America. The genus is viviparous.

**Angul**, dist. in the prov. of Orissa, India. Rice is principally grown. Area 1681 sq. m.; pop. 200,000.

**Angular Motion**, the motion of a body about a fixed axis. As different parts of the body describe arcs of different lengths in the same time, the A. velocity is understood to be the velocity of a point at unit distance from the axis of rotation.

**Angus**, official and anct. name (whence the earls of A. derive their title) for Forfarshire, a maritime co. of Scotland, bounded by Aberdeenshire and Kincardineshire on the N., the North Sea on the E., the Firth of Tay on the S., and Perthshire on the W. It has an average length of 35 m. and a width of 25 m. and an area of 885 sq. m. The surface is varied: the Binnchinn Hills lie in the N., and between the heights are fertile valleys. The Sidlaw Hills, rising to 1300 ft., run parallel to the former range, and between these 2 systems stretches the wide valley of Strathmore. The chief streams are the Isla and the N. and S. Esk; the lochs are Forfar, Lee, Balgavies, etc. Sandstone and granite are quarried in the hills. Wheat is grown extensively in the valley of Strathmore; oats and potatoes are other crops cultivated. The salmon and herring fisheries are important, but the chief industry is the flax and jute manuf., Dundee being the seat of the linen trade. At Carnoustie and Monifieth on the coast there are noted golf links. The chief tns. are Forfar (the co. tn.), Dundee, Arbroath, Montrose, Brechin, Kirriemuir. Pop. (1931), 270,190.

**Angussola** (or *Angusciola*), Sophonisba (c. 1535-c. 1625), was b. at Cronoma. She was a famous It. portrait-painter, and of her Van Dyck is said to have declared that he learnt more from her conversation on art than from the best masters. She was called to the Sp. court by Philip II. to paint portraits of himself and his queen.

**Anhalt**, until 1918 a duchy of the Ger. empire, later a free state. The

country is agric., and is generally fertile, the mountainous parts affording timber and some minerals, chief of which are lignite and salt. Till 1918 Protestantism was the state religion. Area 906 sq. m.; pop. 364,000.

**Anhinga**, the Amer. snake-bird, darter, or water-turkey (*Potus anhinga*), akin to the cormorants.

**Anholt**, a small Dan. is. in the Cattegat. It was occupied by the Eng. from Mar. 1811 to Jan. 1814. Pop. 250.

**Anhui**, or **Anhui**, see NGANWHEI.

**Anhydride**, or anhydrous acid, a term applied to compounds formed by the dehydrating of acids, or which represent in their composition the acid minus water. Thus sulphuric A. is  $\text{SO}_2 = \text{H}_2\text{SO}_4 - \text{H}_2\text{O}$ .

**Anhydrite**, a mineral consisting of calcium sulphate,  $\text{CaSO}_4$ , but differing from gypsum in that it contains no water of crystallisation. The colour is white, red, grey, or blue, and it usually contains a small amount of sea-salt, being found in salt deposits. Nearer the surface the mineral absorbs water, and is converted into gypsum; its liability to this change makes it unsuitable for building purposes.

**Ani**, an anct. ruined city of Armenia, about 25 m. S.E. of Kars on the Arpa-chai. During the Middle Age. it was the seat of the Bagratide kings of Armenia. About 1062 it was taken and pillaged by the Seljuks, and during the next 2 centuries it was repeatedly sacked. Its ruin was finally completed by an earthquake. Sev. interesting remains (of buildings and the city wall) are still to be seen.

**Aniche**, tn., dept. of Nord, France, 8 m. E.S.E. of Douai. Has coal-mines, glass-works, and chemical manufs. Pop. 8000.

**Aniello**, **Tommaso**, called by corruption Masaniello (1623-17), a young fisherman, was b. at Anali and d. at Naples. At this time the duke of Arcos, viceroy of Philip IV. of Spain, was governor of Naples, and in 1647 he levied a tax on fruit and vegetables. The people with A. as their chief rose in revolt, and the troops of the viceroy were defeated. Cardinal Filomarino was chosen as mediator between the viceroy and the people, and all imposts upon articles of consumption were abolished, and the privileges granted by Charles V. were restored. For a short time A. was master of Naples, but he gave himself up to despotism and excess, and was assassinated by the viceroy's agents.

**Aniline**, amidobenzene or phenylamine,  $\text{C}_6\text{H}_5\text{NH}_2$ , first prepared by the dry distillation of indigo, whence it derives its name (Portuguese *anil*, indigo). It is now manuf. by the action of steam and iron scraps, together with a little hydrochloric acid, on nitrobenzene contained in a cast-iron cylinder with a stirring apparatus. Lime is added when the reduction is complete and the A. distilled with steam. It is also obtained by the electro-reduction of nitrobenzene.

A. is a colourless liquid, but if not pure

it turns brown on exposure to the air, probably owing to the presence of sulphur compounds. It boils at  $183^\circ$  and has a sp. gr. of 1.024 at  $16^\circ$ . It is slightly soluble in water, but is easily dissolved in alcohol and benzene. It is very poisonous if taken internally, and workmen who are engaged in manufs. in which it is used often suffer from headaches and nausea through inhalation of its vapours. It forms salts with the mineral acids, combines with alkyl iodides to form secondary and tertiary amines, and when heated with acetic acid it produces acetanilide or antifebrin.

A. is largely used for the manuf. of dyes and the preparation of benzene derivatives. The so-called A. dyes (see DYES) are not necessarily derivatives of A., but were developed after the study of A. compounds which provided the earliest dyes, e.g., mauveine. *Rosaniline*, or magenta, is produced by the oxidation of A. and toluidine. By substituting methyl groups for hydrogen, the colour becomes reddish-violet and then bluish-violet as the number of methyl groups increases. By substituting ethyl, phenyl, or benzyl groups still more marked changes are produced, so that a series of reds and blues with all their intermediaries can be obtained in substitution products of rosaniline.

**Anima Mundi**, an anct. belief that all the chances and changes of the universe are due to an over-ruling consciousness, just as the ordering of the body is due to the operation of the human mind. Anaxagoras was one of the earliest westerners to believe that the universe was ordered by a single consciousness or reason. Aristotle held much the same view, but he held that nature itself is a living, conscious being, separate from God, who is a transcendent spirit. The Stoics' belief merged into pantheism, for they conceived of the A. M. as pure spirit, the one vital force pervading everything. The belief was revived by Cornelius Agrippa (1486-1535), who, however, changed the terminology to *spiritus mundi* and has been held with slight variations by many moderns, including Bruno, Sebastian Franck, Boehme, Van Helmont, More, and Cudworth.

**Animalcules** (dimin. of Lat. *animal*, living being), a term formerly applied to the smallest forms of animal life such as can be seen only with the aid of a microscope. They include Bacteria, Protozoa, and Rotifera, and the term is applied in a loose sense to the Infusoria.

**Animalcules**, **Bear**, or **Sloth**, see TARDIGRADA.

**Animalcules**, **Wheel**, see ROTIFERA.

**Animal Flowers**, a name sometimes applied to the genus *Actinia*, a sea-anemone. The name, of course, originated in the resemblance to a flower of this polyp, which belongs to the animal kingdom.

**Animal Magnetism**, see HYPNOTISM.

**Animal Worship** is a cult found in some form or another in most anct. religions, and to be found at the present day among notable races. Its origin is doubtless

due to various interacting causes. Savages early held that animals had souls (see ANIMISM), and since the animals were swifter, stronger, and infinitely more cunning than themselves, they respected and feared them. Then the idea of the transmigration of souls led to the belief of the souls of ancestors being present in some particular beast. Connected with this is the totem system so general in America. Every tribe and div. has its totem or figure of an animal which it holds sacred, regarding the animal as its protector and its image as a charm. Somewhat similar to this was the Teutonic use of the boar, but the Amer. Indians further claim tribal descent from the beast in question. The origin of this idea is quite uncertain. Herbert Spencer and many ethnologists hold that the confusion arose through a remote ancestor having received some nickname descriptive of him (e.g. if long-legged he might be nicknamed 'the crane'), and the surname having afterwards been taken literally. A. W. may be divided into 2 great classes, viz. that in which the animal itself is worshipped, and that in which the animal is revered as a symbol of a spirit. The prin. race now practising A. W. are the Hindus. 'Here the sacred cow is not merely to be spared; she is, as a deity, worshipped and bowed to daily by the pious Hindu, who offers her fresh grass and flowers. Siva is incarnate in Hanuman, the monkey-god, as Durga is in the jackal; the wise Ganesa wears the elephant's head; the divine king of birds, Garuda, is Vishnu's vehicle; the forms of fish and boar and tortoise were assumed in those avatar-legends of Vishnu, which are at the intellectual level of those Red Indian myths which they so curiously resemble.'—Tylor's *Primitive Culture*, 1871. See also ANIMISM; TOTEMISM. See Andrew Lang, *The Secret of the Totem*, 1905; Sir J. G. Fraser, *Totemism and Exogamy*, 1910, and *Totemica*, 1937.

**Animals** (Lat. *animus*, mind), living organisms which are distinguished from plants by their powers of locomotion, capacity for assimilating organic substances, and the absence of the compounds chlorophyll and cellulose. None of these distinctions, however, is complete;—they may be unicellular, may be unable to move from the spot to which it is attached,—plants are usually in this condition, but they frequently have reproductive cells or spores which are free-swimming. Corals remain stationary, whilst amongst plants, diatoms and certain algae and fungi have distinct powers of locomotion; some plants (e.g. the sundew) are insectivorous and digest organic matter; chlorophyll is absent from fungi; the cellulose cell-wall is absent in some plants and present in some A. such as tunicates, or sea-squirts. Both plants and A. frequently live in a parasitic state. A. require to have their carbohydrate and protein substances already formed for them, and take into their systems in living or dead form pre-

existing organic life; all green plants, however, which possess chlorophyll can, with the aid of sun and air, manufacture from inorganic salts their own carbohydrates and protein substance. It is thus in their method of nutrition that A. differ fundamentally from green plants. Both plants and A. are sensitive to external conditions and have an irritable protoplasm. In reproduction there is again great similarity, for in the lowest forms of each cell-div. may take place or specialised cells may form new life. Higher A. and higher plants differ from one another to a great extent, but the processes of nutrition and reproduction are common to both.

In view of the difficulty of an absolutely distinct line of demarcation, it is justifiable to assert that both forms of life have a common origin and that the processes of differentiation have roughly followed the 2 directions as laid down in the above definition. That both botanist and zoologist consider certain forms to belong to their respective spheres is a gain rather than a loss, and does not disturb the bases of their classification.

In all but the lowest A. the process of life is carried on by a more or less complex machinery of organs—muscles, alimentary canal, heart and blood-vessels, gills or lungs, nervous systems, organs of excretion, and organs of reproduction. But in all A. as in all plants, the effective and essential part consists of protoplasm, and A. exist with structures varying from the mere mass of protoplasm of the amoeba to the highly complex organism of man.

**Classification.**—Each large group is divided into phyla, which are divided either into classes containing orders or directly into orders, and these again are divided into families, genera, and finally individual species. In a very broad sense they may be grouped under the heads of Invertebrates and Vertebrates. The following groups or phyla are arranged in order of complexity:

**A. Invertebrates.** I. Protozoa, unicellular organisms such as amoeba. II. Porifera, or sponges. III. Coelenterata, including jelly-fish, sea anemones, and corals. IV. Platyhelminthes, or flat worms. V. Nematelminthes, including Nematodes, the round or thread worms. VI. Trochelminthes, including rotifers. VII. Molluscoida, including corallines and certain shell-A. VIII. Echinodermata, including star-fishes and sea-urchins. IX. Annelida, including earth-worms. X. Arthropoda, including crustaceans, insects, and spiders. XI. Mollusca, shell-fish, and cuttle-fish.

**B. Vertebrates.** XII. Chordata, including A. possessing a structure called the notochord, a cord of cells along the middle line on the dorsal side of the enteric cavity, developing into the backbone in vertebrata. It is an extensive and important group, including fishes (Pisces), amphibians (Amphibia), reptiles (Reptilia), birds (Aves), and mammals (Mammalia). The Tunicata (e.g. sea-squirts) and amphioxus or lancelet

possess a notochord, and are simple forms of chordates, resembling in some respects the ancestral Vertebrate. (See AMPHIOXUS.)

**Animals, Cruelty to.** It was not until the beginning of the nineteenth century that any measures were taken either for the prevention or for the punishment of C. to A. England took the lead, and founded the Royal Society for the Prevention of C. to A., 1824, and Scotland followed in 1839. Later the U.S.A., France, and Germany had organisations for the prevention of C. to A. The various statutes on the subject were consolidated in the Protection of Animals Act, 1911. All domestic animals come within the statutory provisions and also wild animals if in captivity or confinement, or maimed, pinioned, or subjected to any contrivance for the purpose of preventing their escape from captivity. The Act of 1911 re-enacts the general provisions of the old Acts by which animals may not be ill-treated, over-driven, or kept without proper food and water. It is also forbidden to perform painful experiments on living animals except under licence from the Home Office and then only in accordance with statutory regulations. An application for such licence and a certificate for any exception from the regulations must be signed by the president of certain scientific bodies such as the Royal College of Physicians and Surgeons. By the Animals (Anæsthetics) Act, 1919, anæsthetics must be used for certain specified operations on horses, dogs, cats, and bovines. Besides the more obvious forms of cruelty, it is also forbidden to convey any animal in such manner as to cause it unnecessary suffering; or to administer poisonous or injurious drugs or to perform an operation without due care and humanity, while bull-baiting, bear-baiting, and cock-fighting have long been prohibited. The Act also regulates the business of knackers and licensed slaughterers. Other offences are selling poisoned grain or flesh for animal food and using dogs for draught; while the exhibition and training of performing animals are regulated by the Performing Animals (Regulation) Act, 1925, which provides for the registration with a local authority of persons so training or exhibiting animals. People convicted of C. to A. may, under the Act of 1933, be prohibited from keeping animals. Under the Protection of Animals Act, 1934, certain public contests, exhibitions, and performances in which animals are used are prohibited. These include throwing or casting with ropes or other appliances, any unbroken horse or untrained bull; or wrestling, fighting, or struggling with an untrained bull; or riding or trying to ride a horse or bull which, by appliances or treatment involving cruelty, has been stimulated to make it buck. On a conviction under the Act of 1911 the court may order the destruction of any animal if satisfied that it would be cruel to keep it alive,

or deprive the offender of its ownership. Compensation up to £10 may be awarded for any damage or injury to the animal or any person or property. A constable may, on getting a veterinary certificate, cause an injured animal to be slaughtered. The enforcement of the statutory provisions relating to C. to A. is mainly undertaken by the Royal Society for the Prevention of C. to A. with the assistance of the police. A number of homes for stray dogs and cats have been founded in Great Britain and in the U.S.A. See also VIVISECTION.

**Animé**, a term applied to various oleo-resins, sometimes to a variety of copal, but most frequently to elemi. Brazilian A. is the product of a leguminous tree called *Hymenæa courbaril*.

**Animism** (Lat. *anima*, soul) was a term first used by the Ger. chemist Stahl in the early eighteenth century to denote the doctrine that all the phenomena peculiar to the animal world are produced by an immaterial 'soul' or vital principle distinct from matter. Dr. Tylor, however, in his *Primitive Culture*, 1871, used the word to denote the attribution of a living soul to inanimate objects and natural phenomena. The use of the term is that now generally employed, but it is often loosely applied to the general belief in the existence of a soul or spirit apart from matter; in a word, to the belief in spiritualism and a spirit world as opposed to materialism. The phenomena of death, sleep, dreams, hallucinations, sickness, shadows, etc., seem from the first to have exercised the minds of savage races. The body of a man after death was in form the same as before. What was the difference? Something had evidently departed. Similarly in sleep, some immaterial part of him seemed to depart and make voyages in lands he knew not. The two phenomena combined would inevitably lead to a belief that at death the soul of the dead merely went on another journey, and this idea would be strengthened by appearances in dreams and by the imagined appearance of ghosts. The action of the departed soul might be variously described. Some races taught the transmigration of souls: that they took new bodies, either human or animal, after each death. Some taught that the soul then set out on a laborious journey to the land of the blest, or else was doomed to wander in the neighbourhood it had occupied in life. Almost all races have held that the relation between living and departed is not broken, and also that the souls become by death more powerful both for good and for evil. The spirits can be propitiated and pleased by offerings of food, drink, and goods. Sometimes they remain near the earth to take vengeance for death or injuries done them. They can also be controlled by magic; hence the speedy rise of the sorcerer and medicine-man. Since fear is the chief emotion in the savage, it follows that evil spirits receive more attention than good ones, and so the influence of simple

A. has generally a bad effect. The theory of moral retribution hardly exists. In one way, however, it may do, and this case is connected with the development of ancestor-worship (q.v.). Death did not change the character of the soul; a man went on doing the same kind of thing after it as before. The souls of ancestors, then, would be considered as watching over and protecting their descendants. The departed chief would still have the care of his tribe. Since, in the primitive state, every stranger is an enemy, almost all other spirits would be malignant. Here also arises the idea of moral retribution, for if in his lifetime the chief, the ancestor, had dispensed rewards and punishments to his inferiors, would he not continue to do so? By gradually working backwards, tribes practising ancestor-worship have sometimes come to the idea of a first source, the spirit of the first ancestor, lord of the dead, and supreme ruler and even creator. The soul has been conceived of in various ways, the material and the spiritual curiously blended. Anct. tradition in Europe and other countries has associated it with the breath. The Rom. custom of sucking in the breath of a dying person may thus have arisen. Other peoples connected the soul with the shadow; it will be remembered that Dante gives the dead none.

But primitive man makes no distinction between man and the lower animals. Animal worship (q.v.) would lead one to think he often conceives of them as greater than himself. Animals, too, appear in dreams; so they are given souls. Indeed, the worship of animals may have arisen from this principle. Dead animals are credited with a knowledge of how their remains are treated, and even with the power of taking vengeance on their slayers. But the idea is carried still further. In sickness strange spirits enter a man; they can change their abode, and are not the spirits of disembodied ancestors. The abode of these is fixed in natural and material objects. Hence on the one hand arises fetishism, and, on the other, nature religion, and, ultimately, polytheism. Fetishism is by far the lower form, the spirit often being compelled by force of magic to remain with the fetish. The conception of natural objects as possessing spirits soon develops by separating the spirit from the object—by setting the spirit free, in fact; just as in animal worship the animal tends more and more to become a mere symbol of the spirit. Similarly, the spirit which was at first contained in the corn, the tree, the riv., becomes in time the presiding genius of the crops, the forest, etc.

Dr. Tylor postulates A. as the first requirement of religion, stating that nothing below this should be considered as religion. Strictly speaking, pure A. is not religion, but rather philosophy. It shows no form of emotion, but is a form of explanation of given pheno-

mena. As we have said, the term is commonly used as above. A. is composed of simple elements. In later developments of religion some survivals generally remain of earlier superstitions which are quite irreconcilable with the later teaching. Not so with A.; rather are traces of its crude developments found in the earlier religions. Even in Christian and civilised countries fetishism (exemplified by the belief in charms, mascots, and lucky coins), magic (shown by the use of incantations, charms, and the faith in omens), etc., still have strong influence in many quarters. The nature religion has been taken up and explained by Christianity in the doctrine of the divine immanence, and is held in another form by various schools of nature worshippers. See E. B. Tylor, *Primitive Culture*, 1871; R. M. Dorman, *The Origin of Primitive Superstitions*, 1881; Sir James Frazer, *Golden Bough*, 1890-1915; R. R. Marett, *The Threshold of Religion*, 1914; G. F. Stout, *Mind and Matter*, 1931.

Animuccia, Giovanni (c. 1500-71), It. musician and composer. In 1553 he was appointed *maestro di capella* at the Vatican. His hymns, *Laudi Spirituali*, are said to be the origin of the oratorio. He composed a number of masses, motets, magnificats, madrigals, and other pieces.

Anio (modern Aniene or Teverone), a trib. of the Tiber, in central Italy, which, after a course of 70 m., passing Tivoli, joins the main stream 3 m. above Rome. Since the third century its aqueducts have supplied Rome with water.

Anions, the negatively charged particles in a dissolved or liquid electrolyte. On electrolysis they pass to the positive electrode or anode, where they are discharged. The positively charged particles are known as *cations* or *kations*.

Anise, or *Pimpinella anisum*, is a species of the Umbelliferae found in the S. of Europe. The fruit is known as aniseed, and is much used in flavouring.

Anjar, tn. of India in Cutch, 10 m. from gulf. Pop. 13,000.

Anjou, an old prov. of France, now covered by the dept. of Maine-et-Loire, and parts of those of Indre-et-Loire, Sarthe, and Mayenne. In Rom. times it was the ter. of the Andecavi, whence the name of Angers, the anct. cap., is derived. The son of Geoffrey V. of Anjou by Matilda, daughter of Henry I. of England, came to the Eng. throne as Henry II., and thus founded the Angevin line of kings. In 1204 Philip Augustus of France took it from King John. It was later bestowed as a fief upon Charles, the son of Louis VIII., who, conquering Naples and Sicily, became there the founder of the Angevin line. Charles was also count of Provence, and for nearly half a century the two were united. Margaret, daughter of Charles II. of Naples, took A. with her as part of her dowry to Charles of Valois. In 1328, on the accession of her son, Philip VI. of France, it was joined to the Fr. crown. In 1360

it was made a duchy, and with Louis I. returned to the dominion of Naples. In 1480 A. was finally annexed to the Fr. crown, and the title of duke of A. became an honorary title given to princes of the royal family of France.

Anjouan, see JOHANNA.

Ankara, or Angora, a tn. in Asia Minor and cap. of the vilayet of the same name and, since 1923, of Turkey and headquarters of the Republican Gov. The city was a poor substitute for Constantinople, being poorly laid out and of primitive sanitation. Kemal Atatürk planned a new city on the Amer. system and, by the time he d., many modern improvements had been carried out. Its ant. name was Ancyra, and it was the cap. of the Rom. prov. of Galatia Prima. A marble temple, now in ruins, contains the *Marmor Ancyranum*, inscribed with a record of the reign of Augustus Caesar. It is just over 200 m. E.S.E. of Constantinople. It was the scene of a great battle in 1402 between the Turks and the Tatars, when the former were defeated. It is famous for its breed of goats, which have long, silky hair and are very valuable. This hair is known as mohair in its manufactured state. Pop. of vilayet 535,000; of tn. 157,000.

Anker, a measure of wine and spirits, containing about 10 wine gallons, formerly used in England. It was borrowed from the Dutch, and is still used in Holland, Denmark, Sweden, etc. The name is also given to a cask containing an A.

Ankerite, a rhomboidal crystal, yellowish-white, translucent, and vitreous in lustre. It consists of magnesite, 25.7; carbonate of iron, 20.0; carbonate of manganese, 3.0 = 99.8. It is closely related to the dolomites.

Ankh, in Egyptian art, a symbol of enduring life and of the regenerative energies.

Anking, see HWAISING.

Anklam, a tn. of Germany, prov. of Pomerania, on the R. Peene, 4 m. from its outlet in the Kleine Haft. It has iron foundries, and manufs. soap and sugar, while its medieval buildings are of some interest.

Ankle, the joint between the leg and the foot. It is a hinge joint with backward and forward motion, although a certain amount of lateral motion is possible. There are 3 ligaments, the anterior, internal, and external. As the A. is the joint which most often has to bear the whole weight of the body with the greatest amount of leverage, sprains are a common occurrence. Hot fomentations should be applied if the swelling is considerable, and not too severe bandaging resorted to. Complete rest for the joint is the first desideratum, after which gentle massage should be employed. Passive movements of the muscles should precede any effort to move the joint by the muscles alone, and exercises gradually proceeded with until the weight of the body can be endured.

Ankober, or Ankobar, tn. of Abyssinia, in Shoa, situated about 8500 ft.

above the sea, in lat. 9° 34' N. and long. 39° 54' E. It contains a royal palace, the climate is good, and the pop. was once considerable. It is now about 3000.

Ankole, or Ankori, dist. in the Uganda Protectorate, Brit. E. Africa, bordering on Lake Edward.

Ankylosis (Gk. ἀγκύλος, curved), the immovable union of 2 bones naturally connected to form a movable joint, caused by an osseous growth in *true ankylosis*, by a fibrous growth in *false ankylosis*. It is liable to occur after a fracture in the neighbourhood of the joint, but the condition also occurs normally in the growth of the human body, as when certain of the vertebrae in the spinal column of a child become fused as it proceeds to adolescence and adulthood. Because of the rigid position of the limb, A. naturally attacks the Indian fakirs, whose religious devotion condemns them to remain motionless for years. Cases are on record of a general A. of all the bones of the human body. Remedial measures include excision of the joint and the use of electrolysis, a solution of sodium chloride being the electrolyte employed.

Ankylostomiasis, or Uncinariasis, the morbid condition produced by the presence of the parasite *Ankylostoma duodenale* (hook-worm) in the human intestine. The parasite is found in tropical countries, and is also known in Germany, Belgium, Switzerland, England, and the S.E. section of the U.S.A. The disease is most common amongst brickmakers, tunnel-workers, and miners. The eggs of the parasite are expelled from the intestine with the faeces, and develop in warm, damp soil into larvae which can infect new hosts by boring through the skin, usually of the foot. The larvae are taken in the blood to the lungs, whence they are coughed up into the mouth and then swallowed. In the stomach and intestine they become the mature hook-worms, 1-2 cm. long, which attach themselves by their hooks to the mucous membrane, producing internal hemorrhage, often fatal; milder attacks cause anaemia and vomiting. Moreover it is impossible for infected individuals to lead a normal, active existence, and attacks of the parasite were responsible for such epithets as 'poor white trash,' formerly applied to dwellers in the S. U.S.A. Vermifuges and purgatives remove the worm from the intestine; carbon tetrachloride is much used nowadays, and is extremely effective. Infection can be prevented by the wearing of leather footwear and faeces should be properly disposed of by adequate sanitation. The disease may also be spread by the practice in many countries of using human manure for the growing of crop plants.

Ann, or Annat, in Scottish law, is the half year's stipend payable for the vacant half year after the death of a minister to his family or next of kin. As it belongs to his next of kin, and not to the minister himself, it is not assignable by him, nor can it be attached for his debts.

**Anna**, an Indian coin, value about 12., the sixteenth part of a rupee.

**Anna Carlovna, Leopoldovna**, or **Anne of Russia** (1718-46), Russian princess, and regent for her son Ivan, 1740-41, was the wife of Anton Ulrich, duke of Brunswick. The Empress Anna Ivanovna, her aunt, left the throne to Ivan, but after a year's reign the infant emperor was murdered. The regent-mother and her husband were thrown into prison, where Anna d. in 1746 and Anton in 1776.

**Anna Comnena**, daughter of the Emperor Alexius I. (Comnenus), b. in the year 1083, and famous as being probably the first woman historian. She was carefully trained in the learning of the time by her father, whose favourite she was. Having unsuccessfully attempted, first by means of influence over her father and secondly by means of conspiracy, to obtain the crown for her husband, she retired to a convent, where she wrote her hist. called the *Alexiad*. It consisted chiefly of a panegyric of her father's reign.

**Anna Ivanovna** (1693-1740), second daughter of Ivan V., brother of Peter the Great. Her girlhood was spent in the vicinity of Moscow, and she was married at an early age to Frederick William, duke of Courland. He d. soon after the marriage. In 1730, being offered the crown of Russia, she accepted, signing articles which limited her power, but which she soon repudiated. She and her lover, Biron, ruled Russia sternly and well, but gradually their rule became very unpopular. During her reign was fought the war of the Polish succession, and later a Crimean war.

**Annaberg**, tn. of Saxony, Germany, in the Erzgebirge range, 18 m. S.E. of Chemnitz. It is situated over 1800 ft. above the sea in a mining dist., and has lace and button manufs. Pop. 20,000.

**Annabon**, or **Annobon**, Sp. is., gulf of Guinea, W. Africa, 4 m. long, 2 m. wide. It is mountainous (3000 ft.), and has a pop. numbering between 2000 and 3000. On it is situated the town of San Antonio de Praia.

**Annab**, see ANAH.

**Annals** were formerly records of events (in chronological order) which happened during the year, and the Chinese, Assyrians, Egyptians, Gks., and Romans had their A. According to Cicero (*De Oratore*, xii.), it was the custom from the commencement of the Rom. state down to the time of Publius Murius for the pontifex maximus to draw up an account of the transactions of the past year to be publicly exhibited. These A. were afterwards called *Annales Maximi*, the Great A., and it is probable that they were the same as those referred to by Livy as *commentarii pontificum*. *Annales Gentium* and *Annales Consulares* were written by such men as C. Calpurnius Piso, consul, 67 B.C., which contained the hist. of Rome in chronological order. Later

the term A. was given to any historical work written in chronological order, e.g. the A. of Tacitus; and now it is frequently used of an account of events digested into so many successive years, as the *Eccles. A.* of Baronius and the *A. of Scotland* by Sir David Dalrymple, or of a periodic publication containing records of discoveries, transactions of societies, as the *A. of Science*.

**Annam**, until 1946 a protectorate of Fr. Indo-China; now part of the republic of Viet-Nam. Though the term is sometimes used to cover the whole of

Paul Popper

#### ANNAMESE FISHERMAN

Fr. Indo-China, and sometimes to include Tongking, A. proper extends from Cochín-China on the S. to Tongking on the N., and from Siam and Cambodia on the W. to the sea on the E. The area is about 52,000 sq. m., and the soil in the interior is fertile. A range of mts. runs the length of the country on the E. On the W. is the basin of the Mekong, which is the only considerable riv. Short coast rivs. unfit for navigation are common. The productions of A. include the usual Asiatic cereals and fruits, cinnamon bark, cotton, sugar, silk, tea, coffee, tobacco, and areca nut, and various valuable kinds of timber. As the mulberry is indigenous, silkworm-rearing is an old-established industry. There are about 11 sq. m. of mulberry-tree plantations and much silk was exported. There is a coal-field. The exports (before the Second World War) were sugar, rice, cotton and silk tissues, cinnamon, tea, and paper. There is also some coastal fishing. The trade was almost entirely in Chinese

hands. Binh Dinh, with 70,000 people, is the largest tn. The cap. is Hué, and the chief ports are Turun, Quinhon and Xuan-dai. These were open to European commerce, though entirely under Fr. influence. The Annamese proper are found chiefly in the tns. and on the coast. They are of Mongolian race, though they show different characteristics from the Chinese, whose influence over them has been considerable, and with whom they have intermixed. They are lazy and pleasure-loving, and generally in a state of ignorance. Their chief physical peculiarity is a strange swaggering walk, said to be due to a peculiar conformation of the pelvis and femur and an extra widening of the space between the big toe of each foot and the others. In the mountainous interior are to be found various tribes of Mois, indigenous to the country. These are unmixed with Chinese blood. As in all the group of which the Chinese are the chief, the language is mainly monosyllabic, and it further contains a large admixture of Chinese words. The characters in use for writing are also a modification of the Chinese. The religion, borrowed, as is all the rest of the culture, from China, is chiefly Buddhism. There are some 420,000 Rom. Catholics. Extreme reverence is shown to the dead, and ancestor-worship is in great vogue.

In the third century A. was conquered by the Chinese, who ruled the country vigorously till the middle of the tenth century. At this time it became self-governing, though China still retained its suzerainty. About 1400, however, a great war began, which ended in 1428 with the recognition of A.'s independence. In the middle of the eighteenth century the king of Cochinchina made a treaty with France in return for aid, and thus introduced Fr. influence. In 1858 the execution in A. of a Fr. subject gave cause for a war, and a Fr. squadron stormed Turane and Saigon. France, in 1867, took possession of Cochinchina, following this up in 1882 by taking the protectorate of Tongking. By a treaty of 1884 the Fr. protectorate was estab. in A. Theoretically, A. was a monarchy of the most despotic kind, but the power was vested entirely with the Fr. resident superior, who, with troops at his disposal, resided at Hué. The local gov. was mainly in the hands of native officials, but the army officers were Fr. Bao-Dai succeeded to the throne in 1925, the gov. during his minority being carried on by a regency Council. A popular representative chamber was estab. in 1926. Soon, however, A. was lost to the Fr. when the Jap. invaded Fr. Indo-China in the Second World War (see under INDO-CHINA, FRENCH). In Mar. 1945 there was an abortive Fr. resistance rising, and the Annamese swept down to the neighbourhood of Saigon and proclaimed an Indo-China republic. Great Britain became involved in this quarrel, which soon be-

came a serious matter, and the 20th Indian Div. was drafted in. The Annamese, despite the fact that the Fr. have done much in the way of health services and education, have always been sullenly resentful of Fr. rule, although oddly enough they have absorbed much more Fr. culture than the Cambodians, who are more akin to the Siamese. In Sept., however, the revolt died down, and A. reverted to Fr. rule. In view of the strong nationalist movement, however, the Fr. Gov. was compelled, like the Dutch Gov. in Java, substantially to modify their colonial policy. In order to satisfy the aspirations of the patriotic movement known as Viet Minh, they agreed, in 1946, to the establishment of a new republic, comprising A., Tongking, and Cochinchina. Pop. 5,600,000. See also VIETNAM. See F. Jammes *Au pays Annamite* (Paris), 1898, and *Souvenirs du pays d'Annam* (Paris), 1900; De Lanessan, *L'Empire d'Annam* (Paris), 1898; Sombsthav, *Annam et Tonkin* (Paris), 1898; V. Thompson, *French Indo-China*, 1937.

**Annamaboo**, or **Annamaboo**, a tn. with a Brit. fort on the Gold Coast, 10 m. E. of Cape Coast Castle, W. Africa. It is a strong fort, and has a good breakwater. Pop. 5000.

**Annamuka**, or **Homuka**, the native name of New Rotterdam, one of the Tonga Is.

**Annan**, an anct. Scottish tn. and parli. bor. in Dumfriesshire, on a riv. of the same name, 17½ m. from Carlisle. It has cotton and rope manufs. With Dumfries it sends 1 member to Parliament. Pop. 6300.

**Annapolis**, cap. of Maryland, U.S.A., port of entry and co. seat of Arundel co., Maryland, on the Severn R., 26 m. S.E. of Baltimore. It is on the A., Washington, and Baltimore, and Baltimore and A. Short Line railways. The U.S. Naval Academy was founded here in 1845. The students, formerly called cadets, are now called midshipmen. Two are allowed for each senator, representative, and delegate in Congress, 2 for the dist. of Columbia, and 3 each year for the U.S.A. at large. After a course of 4 years the midshipmen go up for examination, and those who pass are appointed in the lower line of the navy. Chief industry oyster tinning. Pop. 13,000.

**Annapolis Royal**, port of entry of Nova Scotia, Canada, co. seat of A. co. The oldest settlement in Canada, founded by the Fr. in 1604 under the name of Port Royal. A. Valley is famed for its extensive fruit cultivation. Exports apples, fish, and lumber. Pop. 1000.

**Ann Arbor**, a city of Michigan 38 m. W. of Detroit, has manufs. and is seat of the univ. of Michigan. Pop. 29,815.

**Annat**, see ANN.

**Annotes**, see FIRST-FRUIT.

**Anne**, queen of Great Britain and Ireland (1702-14), was b. on Feb. 6, 1665. She was the second daughter of James II. (of England, but James VII. of Scotland). When she was 6

years old her mother died. Although her father had professed his adherence to the Catholic Church, A. was educated in accordance with the ideas of the Anglican Church. She married, in 1683, Prince George of Denmark, who possessed little inclination for the active work demanded of those interested in public affairs, and much less ability. Soon after her marriage, Lady Churchill, wife of Colonel (Lord) Churchill (afterwards duke of Marlborough), was appointed to the position of lady of the queen's bedchamber. Needing support, the queen made Lady Churchill her intimate friend and confidante. How Lady Churchill used that favour to the advancement of her husband's interests and the furtherance of her own personal desires all the world knows. While her father reigned A. lived a life of seclusion, the glamour of court life holding no attractions for her, but as soon as William of Orange had landed, she hurried to his side. On his death she succeeded to the throne. Although A. bore 17 children only 1 survived infancy, and he, Philip, *d.* in his twelfth year. Colonel Churchill (now the duke of Marlborough) and his wife secured a great amount of influence over A., and she was involved with the Churchills in not a few intrigues concerning the return of her father and Jacobitism. In her reign the beginnings of party gov. are noticed. Intense and bitter contention characterised the attitude of one party to the other, and the queen, by the constant determination she showed in securing the throne to her brother James, the elder pretender, made matters worse. She possessed few ideas concerning constitutional gov. Such as they were opposed the atmosphere of political and religious freedom. The Marlboroughs now abandoned the cause of James II. This disappointment, together with the constant bickering between and even among the different parties, gave A. a considerable amount of trouble. A breach developed between the queen and her one-time favourite, the duchess of Marlborough. Spoiled by her brilliant position, the duchess trespassed with too great a degree of arrogance upon her privileges. A quarrel ensued, and they parted, never to be reconciled. Mrs. Masham succeeded the duchess as confidante of Queen A., and it can be traced chiefly to her influence that the Whig ministry collapsed, 1710. Their leader was Godolphin, a determined supporter of the Jacobites. Harley (afterwards earl of Oxford) and St. John (Lord Bolingbroke) led the new ministry. Dissensions among them caused a still greater delay in the prosecution of A.'s plans. She now wished to assure the success of her brother's accession at all costs, but want of uniformity in the House made the project impossible of execution. In 1714, bitterly disappointed at the failure of her fond hopes, A. died. She was succeeded by the elector of Hanover, George I.

Among the notable events of her reign, most of which are treated separately, mention must be made of (1) the Act of Union, 1707, which united the parliaments of England and Scotland; (2) the war of the Spanish succession, 1702-13, the chief events of which were the battles of Blenheim (1704), Ramillies (1706), Oudenarde (1708), Malplaquet (1709), and the capture of Gibraltar (1704). The war was ended by the treaty of Utrecht, 1713.

**Anne of Austria** (1601-66), eldest daughter of King Philip III. of Spain; she married in 1615 Louis XIII. of France. Owing to the influence of Richelieu this marriage was one long estrangement. On the death of Louis XIII. she became regent for the young king, Louis XIV., adopting as her minister Mazarin. That she was deeply under the influence of this minister can be proved, but we have no conclusive evidence of their marriage. On his death in 1661 she retired to a convent, where she *d.*

**Anne of Cleves** (1515-57), a Ger. and Lutheran princess. Married as a fourth wife to Henry VIII. in Jan. 1540. This marriage proved unsuccessful, owing to the plain looks and dullness of the princess herself. She, however, was quite satisfied to be divorced (June 1540), and received a pension. Her marriage, arranged by Thomas Cromwell, was the immediate cause of his downfall and death, 1540.

**Anne of Denmark** (1574-1619), daughter of Frederick II. of Denmark and Norway, and wife of James I. of England and VI. of Scotland. Married in 1589 to James in spite of the opposition of Queen Elizabeth. Showed tendencies towards Catholicism, and probably for that reason was deprived of the education of the young Prince Henry. Was very extravagant and vain, but very highly esteemed by the king.

**Anne of England** (1456-85), daughter of the earl of Warwick (the king-maker). She was betrothed to Edward, Prince of Wales, but after his death at Tewkesbury in 1471 was compelled by Richard of Gloucester to marry him in 1473. In 1483, when he usurped the crown, she became queen.

**Anne Hathaway's Cottage**, at Shottery, 1 m. from Stratford-on-Avon. It is a thatched farmstead, the undisturbed bp. of A., wife of the poet. Contains curious Tudor and Jacobean furniture. National property controlled by the bp. trustees.

**Annealing**, a process to which glass and metals are subjected, which consists in heating and subsequent gradual cooling. On the other hand, tempering consists in heating a metal and then suddenly cooling it. The result of A. is to make the material ductile and tough, whilst the result of tempering is to make it hard and brittle. The ultimate condition is probably brought about by a certain arrangement of the crystals or fibres of the material, accompanied by a degree of occlusion of gas. Glass,

before it is annealed, is excessively brittle, so that a hard body like a small stone dropped into an unannealed glass vessel shivers it to pieces. For purposes where metals have to undergo any strain they have to be annealed, that is, cooled more slowly than in ordinary air, while they are being worked, or afterwards. It is found, too, that pieces of metal, such as the links of a chain, undergo changes in their molecular arrangement with lapse of time, so that it is no uncommon thing for a chain to be re-annealed after it has been in use for some time.

**Annecy**, cap. tn. of dept. of Haute-Savoie, France. It is situated at the N. end of the Lake of A., in a beautiful country, and contains interesting buildings. Pop. 23,000.

**Annelida** (Lat. *annellus*, little ring), a phylum of animals differing little from the Arthropoda and the Mollusca. It consists of segmented worms most of which bear minute spines or setæ by which locomotion is assisted; the blood is usually red, and the perivisceral cavity is part of the celome. The arthropods differ from them in the last particular, and the molluscs are unsegmented. Usually the A. are aquatic, but in some cases they are terrestrial (earth-worms); some species are hermaphrodite. There is a vascular system in most As., the nervous system consists of ganglia; respiration is often effected by means of gills; the alimentary system contains a tubular canal opening in the first segment as the mouth, and in another as the anus. Reproduction may take place sexually or asexually by budding; in many instances, if a worm is cut in two each part will produce the missing segments. These animals generally hide themselves by means of burrowing, but some may form round themselves a dwelling made of exudates from their bodies and accumulated external material. The As. include earth-worms, lob-worms, blood-worms, and leeches.

**Annexation**, the term applied in international law to the act by which a nation adds to its territory lands previously independent or in the possession of another state. It may be the result of conquest, of voluntary cession, or of mere occupation of a previously unoccupied or uncivilised district. Often, again, it is the sequel to the establishment of a protectorate. Acquisition of territory by purchase or lease, as a bilateral action, is not spoken of as A., except in case of cession, must always be supported with an armed force sufficiently large to carry the proclamation into effect; otherwise it is purely fictitious. For example, in Sept. 1900 Lord Roberts proclaimed at Pretoria that Great Britain had annexed the territory of the Transvaal republic. Yet the war continued for another 2 years.

The annexing state takes over all the territory annexed, with its obligations and benefits, provided they be not contrary to the new order. Laws previously

passed are, of course, no longer binding. Questions of detail are perpetually being settled in the courts of various nations, and recourse should be had to these cases for fuller information as to the practice of individual states.

**Anniston**, co. seat of Calhoun co., Alabama, U.S.A., among the Blue Ridge Mts., 63 m. N.E. of Birmingham. It is a centre of the cotton trade, and has large manufs. of all kinds of ironwork and machinery. It is the seat of the Alabama Presbyterian College. Founded in 1873. Pop. 22,000.

**Anniversary** (Lat. *anniversarium*, from *annus*, year, and *vertere*, *versum*, to turn) is a term used to express the yearly return of any remarkable day. As. of religious festivals, of the commemoration of great events in hist., and of birthdays in domestic life are kept. The Christians keep Christmas Day, Good Friday, Easter, and Whitsun in commemoration of the great events in the life of Christ. The king's birthday is officially kept on June 12.

**Anno Bom**, Annobon, or Annabon, is a small volcanic is. in the bight of Biafra, in the E. part of the gulf of Guinea. It was discovered by the Portuguese in 1483, and was ceded to Spain in 1778. Pop. 2,500.

**Annonay**, tn. of Ardèche, France. It manufs. leather (for gloves), paper, etc. Pop. about 15,000.

**Annotto**, Anatta, Anatto, a dyestuff from the *Bixaorellana*.

**Annual Register**, pub. yearly, a record of contemporary events. It was started in 1753 by Dodsley the bookseller. It is now pub. by Messrs. Longmans, and contains information on literature, art, science, and events of the current year.

**Annals**, a class of books sumptuously produced with splendid engravings very popular during the first half of the nineteenth century. They were particularly in vogue as Christmas, New Year, and birthday presents. The succession was commenced in 1823 by the *Forget-me-not*, followed in the next year by *Friendship's Offering* and the *Literary Souvenir*. Other successors were the *Keepsake*, ed. by Lady Wortley and later by the Countess of Blessington, who also ed. the *Book of Beauty*. The *Gift* and the *Token* were Amor. productions. About 1840 their popularity declined rapidly. The *Forget-me-not* continued for the unparalleled length of 22 years. The *Book of Beauty* and the *Keepsake* survived it till 1856. The name, though not the genus, remains in the present Christmas A.

**Annuity**, a term applied to a sum of money which is paid yearly, or at certain periods of each year. The most general application of the term is in the case of what are otherwise called *life As.*, that is, where a certain sum is paid per annum until the death of a stated person. *As. certain* are not dependent upon any contingency, and may be *terminable*, in which case the payments continue until a stated date, or *perpetual*,

where the payments are presumably for ever. When the first payment has to be made at the time of the transaction, it is called an *A. due*, but when payment has not to commence until a stated date, it is called a *deferred A.*

The Gov. uses the principle of terminable *As.* to discharge certain obligations within a given time, with a view to limiting in some degree the burdens placed on posterity by the national debt. Such *As.* may be held by private persons, and are exchanged either for cash or for gov. stock, which is cancelled when the *As.* are taken up. The Gov. may also make an arrangement with itself, as it were, as a banking concern, to make payments to include a proportion of the cap. as well as the interest of gov. stock, as in the 'Old Sinking Fund.' The value of such an arrangement is that it can be varied upon an emergency, although, for obvious reasons, such a proceeding is usually avoided if possible. Instances of perpetual *As.* are provided by the various irredeemable gov. stocks, where the security is practically absolute. In calculating the present value of an *A.* certain, or the yearly amount for a certain purchase value, the interest reckoned is compound. Methods of calculation are to be found in any text-book of algebra. See also PUBLIC DEBT.

Life *As.* present some more complicated features than *As.* certain, because the probability of the contingency becoming actual enters into the calculation. Hence the importance of tables of mortality, etc., for insurance companies and others who deal with *As.* The tendency in early times was to use very simple rules for the probability of death, which were generally very inaccurate for extreme cases. Thus the rule in Rome up to A.D. 230 was to reckon for all ages under 30 an *A.* was worth 30 years' purchase, and for every additional year of age 1 year was taken off the purchase value. Thus the purchase value actually vanished at 60 years of age. In 1725 Abraham Demolive enunciated the rule that out of 80 children born 1 would die every year until the last one died between the ages of 85 and 86. This was found to fit in approximately with observed facts, but continual improvements have since been made. Perhaps the same conclusion had been arrived at in 1671 by Hudde, in a correspondence with Jan de Witt, grand pensionary of Holland. In 1693, Halley, the famous astronomer, worked out the probability of death for every fifth year from the records of birth and deaths in the city of Breslau, and computed the purchase value of *As.* at 6 per cent interest, this being probably the first attempt to arrive at values on a scientific basis. Shortly afterwards the Eng. Gov. attempted to raise money by the sale of *As.* at 14 per cent., that is to say, at about 7 years' purchase. Notwithstanding the pub. tables of Halley, which showed that such *As.* were worth from 17 years' purchase at age 10 to 4½ years'

purchase at age 75, the proposal was by no means eagerly accepted by the investing public. In 1808 the Northampton table was adopted by the Gov., based on statistics of the deaths in Northampton between 1735 and 1780. *As.* were offered on the lives of nominees, this time based on age with no distinction of sex, but at much too favourable a rate. Again little business was done except by Dutchmen, who were more conversant with the subject and chose their lives carefully, but the loss on such transactions increased until it amounted to as much as £8000 a week. The next scheme was much more scientifically constructed, but included *As.* for men of 90 years of age at 62 per cent or less than 2 years' purchase. This provided an opportunity for speculators who nominated all the healthy old men they could lay their hands on and reaped a rich harvest. Thenceforward *As.* on aged lives were not offered, and some time afterwards it was enacted that no one could nominate a life over 65 unless the nominee had a direct interest in the *A.*

Naturally such experiences and the gradual accumulation of reliable statistics have enabled the Gov. to ascertain what rates are profitable. The Gov. tables, however, are based on the assumption of a 2½ per cent interest, whereas many insurance companies can afford to allow for at least 3 or 3½ per cent interest. The tables in general use by the prin. insurance offices are those prepared by the Institute of Actuaries, and are distinguished by the symbols *HM*, *HP*, *HMF* and *DMF*, representing healthy male lives, healthy females, healthy males and females, and diseased males and females. Examples of such tables are appended.

TABLE I. *HM*

Showing the value of an *A.* of £1 at certain ages.

Age next Birth-day.	Value of an <i>A.</i> of £1.	Age next Birth-day.	Value of an <i>A.</i> of £1.
20	£20 043	50	£13 896
25	21 038	55	12 094
30	19 867	60	10 236
35	18 587	65	8 418
40	17 176	70	6 657
45	15 594	75	5 061

TABLE II.

Approximate *As.* for a purchase price of £100.

Age next Birth-day.	<i>A.</i> for £100 Males.	<i>A.</i> for £100 Females.
40	46 0 4	45 5 6
45	6 9 10	5 14 0
50	7 1 2	6 8 0
55	8 0 10	7 5 6
60	9 0 4	8 1 0
65	10 13 4	9 7 10
70	12 19 2	11 8 6

**Annulus**, in geometry, the name of the space or ring enclosed between the circumferences of 2 concentric circles.

**Annunciation**, the announcement made to the Virgin Mary by the angel Gabriel of Christ's Incarnation. The Feast of the A. (commonly known in England as Lady Day) was instituted in memory of this fact. It is kept throughout the Church on Mar. 25. The highest lit. order of the knighthood is that of the A. The subject has frequently been treated in sacred art.

**Annunzio**, *see* D'ANNUNZIO.

**Annus Deliberandi**, the period allowed to an heir by Scots law to decide whether he will accept or reject the inheritance, including any debts or mortgages thereon. The period is 6 months, at the expiration of which time creditors may take action.

**Annus Mirabilis**, the title of a poem written in 1667 by John Dryden. The title, meaning 'The Wonderful Year,' refers to 1666, in which the Eng. were victorious in the war against the Dutch, and in which the great fire of London occurred.

**Anoa**, a species of ruminating quadruped apparently intermediate between the antelopes and the ox or bovine group. It is about the size of a sheep; is wild and fierce; and its horns are erect, straight, sharp, depressed anteriorly, and irregularly ranged at the base. It is found in large herds in the is. of Celebes.

**Anobium** is a genus of coleopterous insects. It consists of small beetles which live on organic matter. *A. panicum* is the biscuit weevil, and *A. striatum* the death-watch, which makes a curious tapping sound.

**Anode**, in electrolysis (*q.v.*), the electrode in connection with the positive pole of the battery. The direction of the current is from the A. through the liquid to the cathode.

**Anodynes**, or **Analgesics**, medicines which relieve pain by their action on the brain, or their influence over the conductivity of the sensory nerve fibre. The principal A. are opium, Indian hemp, belladonna, aconite, chloroform, antifebrin, antipyrine, etc. They should never be used except in accordance with the advice of a medical man. *Hoffman's A.* is a colourless liquid consisting of ether, alcohol, and ethereal oil; it is used in nervous irritation, angina pectoris, and asthma. *A. colloid* is an unofficial remedy used for painting over the course of nerves in neuralgia, sciatica, etc.

**Anointing**, *see* BAPTISM, CHRISM, CONUNCIATION, EXTREME UNCTION.

**Anolis**, a genus of lizards belonging to the Iguanian family (*see* Dumeril and Blinn's work on *Reptiles*, vol. iv, p. 85), and peculiar to America and the adjacent is. The structure of their toes enables them to traverse a smooth wall or ceiling, and to climb with great facility. They are slender, active, and for the most part of small size, and are mostly found in woods and rocky places.

They are timid and harmless, and when under the influence of fear they dilate the dewlap, and the skin especially of the throat changes its hues with great rapidity.

**Anomalistic Year**, the period of time between 2 successive passages of the earth through its perihelion, the point in its orbit when it approaches nearest the sun. This point is not fixed, and as a result the A. Y. is nearly 5 min. longer than the sidereal.

**Anomaluridae**, an African rodent closely allied to the flying squirrels, but forming a distinct genus (*Anomalurus*) by reason of the horny scales on the lower surface of the tail. These project from the skin and probably assist the animal in climbing trees. *Idiurus* is another genus of A.

**Anomaly** (Gk. *án-*, negative, *μαλός*, even), a variation from the ordinary rule. In astronomy the angle subtended at the centre of the sun by a planet in any part of its orbit and the perihelion it has passed. The *mean A.* is that which would be true if the body moved at a uniform rate throughout its course, the rate being calculated from the actual time taken.

**Anonaceæ**, an order of dicotyledonous plants consisting of tropical and sub-tropical trees and bushes. The flowers have a perianth in 3 whorls of 3, numerous hypogynous stamens, and numerous superior carpels, usually with many ovules. The genera *Anona* and *Arbutus* have edible fruits such as *Anona reticulata* or the custard apple, while the species *Uvaria aromatica* yields Ethiopian pepper.

**Anonymous** (Gk. *án-*, negative, *ώνυμα*, dialect, name), a writing or work of which the author is not named. The work is described as *pseudonymous* when an assumed name is used. Most of the works of art of antiquity which have come to us are A., and in past centuries many great writers have pub. their works in this form. Swift's *Tale of a Tub*, etc., and Goldsmith's *Citizen of the World*, may be cited as examples of works pub. thus, from the authors of which the veil has afterwards been withdrawn. The author of the *Imitation of Christ*, a book circulated throughout the world, is yet unknown. Most journalistic essays were until comparatively late years pub. anonymously, as concealment was felt to give greater freedom to the writer. It has frequently, however, been made a cover for little more than personal spite. Anonymity forms one of the greatest difficulties of bibliography. The titles of some 24,000 A. works are given in Barbier's *Dictionnaire des ouvrages anonymes et pseudonymes* (Paris, 4 vols. 3rd ed. 1872-79). A similar work of reference is Haikett and Laing's *Dictionary of Anonymous and Pseudonymous Literature*, 1926-31.

**Anopheles** (Gk. *án-*, without, *σάκκα*, use), a genus of mosquitoes, of the order Diptera and family Culicidae. *A. maculipennis*, a common Brit. species, is one of the distributors of malaria in tropical countries. *See also* ROSS, SIR RONALD.

**Anorthite**, a mineral of the feldspar group, consisting of calcium and aluminium silicate. The colour is white, grey, or red, and its hardness about 6. A. is a constituent of igneous rocks such as basalt and gabbro, but the most completely developed crystals are found in rocks ejected from Mt. Vesuvius.

**Anorthoclase** (Gk. *an-* not, *orthos*, straight, *klasis*, fracture), feldspar similar to orthoclase, but with soda in place of potash in its composition.

**Anquetil Duperron, Abraham Hya-cinthe** (1731-1805), Fr. orientalist, brother of Louis Pierre Anquetil. He studied theology, and his slight acquaintance with oriental languages became a passion. He visited India and collected stores of knowledge and manuscripts. In 1771 on his return he pub. the first European translation of the *Zend-Avesta* (3 vols.). In 1801-2 he pub. a Lat. translation from the Persian of the *Oupnek'hat* (*Upanishad*).

**Anquetil, Louis Pierre** (1723-1806), Fr. historian, b. at Paris. For some years he was director of the Rheims seminary. Imprisoned during the Reign of Terror, he later became a member of the Institute. The best known among his many historical works is the *Histoire de France*.

**Ansa**, in architecture, the handle of a vase; in astronomy, the jutting parts of Saturn's rings.

**Ansars**, or **Nossairians**, an Arab tribe inhabiting the N. of Tripoli, whose mystic religion is a compound of Mohammedanism and the anct. Syriac cults. There are also traces of Gnosticism. The origin of the religion is lost in obscurity, though it probably dates from the ninth century. See Dussaud's *Histoire et religion des Nossairis* (Paris, 1900), a standard work on the Alawis and Druses.

**Ansbach**, or **Anspach**, a tn. of Bavaria, dist. of Middle Franconia, on the Rezat, 25 m. S.W. of Nuremberg. The tn. contains 2 fine churches, various public monuments, and a castle, once the residence of the margraves of A., who belonged to the Franconian branch of the Hohenzollern house. In 1791 the last margrave gave up his principality to Prussia, and in 1806 Napoleon I. transferred it to Bavaria. Pop. 23,000.

**Anschluss**. The movement of the political union of Austria and Germany, which first found concrete expression in 1931 in the Austro-Ger. Customs Union proposal and finally ended successfully in the incorporation of Austria in the Reich in 1938. See AUSTRIA.

**Ansell, Richard** (1815-85), an Eng. landscape and animal painter, b. at Liverpool, first exhibited at the Royal Academy in 1840. His travels in Spain led to various Sp. subjects. Among his paintings are: 'Grouse Shooting', and 'A Galloway Farm' (both exhibited at the Royal Academy, 1840), 'Death of Sir William Lambton at Marston Moor' (1842), and 'Treading out the Corn' (1865).

**Anselm** (1033-1109) was b. probably

of noble parentage in the vicinity of Aosta in Piedmont. From early youth he desired to enter upon a monastic life, but did not succeed in carrying out his desires until 1056, when he was attracted to the monastery at Bec by the teachings of Lanfranc. He became an attached and worthy pupil of this great prior. Lanfranc was, however, raised to the see of Canterbury, and Anselm succeeded him in the abbacy of Bec, then probably the most famous school in Europe. On the death of Lanfranc in 1089 William Rufus kept the see vacant until 1093. In that year William, being taken ill and, imagining himself on the point of death, practically caused Anselm to be dragged from his monastery and given the regalia of the see of Canterbury. Anselm was very unwilling to accept the post, knowing probably the great difficulties he would have to face when Rufus recovered. He had not long to wait; the rest of Rufus's reign was spent in attempts to coerce the bold and fearless archbishop, who was at last driven into exile. Anselm, however, showed his real character in the magnificently fearless way in which he refused the requests of the king. Recalled on the accession of Henry I., he almost immediately plunged into a controversy with him over the question of investiture, and so undeviating was he in following his principles, that he went into exile, and even in 1105 threatened Henry I. with excommunication. A compromise was arrived at, however, by which temporal investiture was to be the prerogative of the king, and the investiture with the emblems of spirituality the papal prerogative. This compromise was practically adopted by empire and papacy in 1122 at Worms. Of A.'s writings we possess his philosophical treatises, *Monologion*, *Proslogion*, and *Cur Deus Homo*, and also a deep revelation of the piety and sincerity of his life in his *Meditations* and *Letters*. He was buried next Lanfranc in Canterbury and was canonised in 1494. Festival, Apr. 21.

**BIBLIOGRAPHY**.—The most noted ed. of A.'s works is that of Gerberton, first pub. 1675 and reprinted in Migne's *Patrologia Latina*; also F. S. Schmitt (ed.), *Opera Omnia Sancti Anselmi*, 1948. Life: R. W. Church, *St. Anselm*, 1870; M. Rule, *Life and Times of St. Anselm*, 1883; Eadmer (A.'s chaplain), *Vita Anselmi* (ed. M. Rule), 1884; J. M. Rigg, *St. Anselm of Canterbury*, 1896; J. Clayton, *Saint Anselm: A Critical Biography*, 1933. Consult also J. Fischer, *Lehre Anselms v. Canterbury über den Willen*, 1912; C. C. J. Webb, *Studies in the History of Natural Theology*, 1915; and C. Beyer, *La Vie de St. Anselme*, 1921.

**Anser** (Lat. goose) is the scientific name for the genus of birds which contains the goose (q.v.). *A. cinereus* is the grey goose, *A. hyperboreus* the snow goose, *A. segetum* the bean goose.

**Ansgar, Ansharius** or **Ansgarius**, St. (801-63), 'the Apostle of the North,' was b. in Picardy and d. at Bremen.

He went as a missionary first to Denmark, and then to Sweden. In 831 he was made archbishop of Hamburg, and the see was transferred to Bremen in 847. Among his works are some essays and a *Life of St. Willibrord*.

**Anshelm, Valerius**, Ger. physician and author of early sixteenth century. He practised in Bern from 1509, and in 1529 wrote the *Berner Chronik*, a hist. of the city largely based on original documents. He is especially valuable on the Reformation, of which he was an ardent supporter. An ed. in 6 vols. was issued by Stierlin, 1825-53. A. d. in 1540.

**'Anson'**, a battleship of the *King George V.* (q.v.) class, laid down on the Tyne in 1937 and commissioned in 1942. Displacement 35,000 tons. Complement 1500 men. Length 739 ft. 8 in., beam 103 ft., and draught 27 ft. 8 in. Equipped with 4 aircraft, with enhanced defence against air attack. Armament 10 14-in. guns, 16 5.25-in. guns, and 4 multiple pom-poms. The 14-in. guns were a new model with an effective range greater than the 15-in. guns mounted on earlier ships. Other ships of the class are, besides the *King George V.*, the *Duke of York*, and the *Hove*. The *Prince of Wales*, sister ship of the *King George V.*, was sunk by the Jap. in the S. China Sea on Dec. 10, 1941.

**Anson, George, Lord** (1697-1762), a famous Eng. admiral and circumnavigator of the world, was b. at Shugborough in Staffordshire. In 1712 he entered the navy, and by 1724 had reached the rank of captain. In 1740, during the war with Spain, he was made commodore of the S. Amer. squadron, and though the expedition was hopelessly mismanaged, his indomitable perseverance earned some success. See his *Voyage round the World*, 1748.

**Anson, Sir Wm. Reynell** (1843-1914), notable Eng. jurist, b. at Walberton, Sussex. In 1874 became Vincian reader in Eng. law at Oxford. In 1899 was returned as Liberal-Unionist M.P. for the univ. In 1902 became parl. secretary of the Board of Education. He pub. *Principles of the English Law of Contract*, 1884; *Law and Custom of the Constitution*, 1886-92.

**Ansonia**, city of New Haven co., Connecticut, U.S.A., on the R. Naugatuck. Manufs. brass, copper, hardware, clocks, etc. Pop. 20,000.

**Anstey, Christopher** (1724-1805), a country gentleman, was educated at King's College, Cambridge. His *chef-d'œuvre* was the *New Bath Guide*, a poem pub. in 1766. This satirical sketch of Bath life made a decided hit at the time, and is enthusiastically praised by both Gray and Walpole in their correspondence. None of his other works attain the standard of the *New Bath Guide*.

**Anstey, F.** (1856-1934), the *nom de plume* of Thomas Anstey Guthrie, a novelist of a clever and humorously fantastic imagination. He was educated at King's College School, London, and Trinity Hall, Cambridge. He made

a big success with his first book, *Vice Versa*, 1882, which he followed up (amongst others) by *A Fallen Idol*, 1886; *The Talking Horse*, 1892; *The Man from Blankley's*, a play, 1893. *Baboo Jabberjee*, 1897; *Loose among the Lions*, 1898; *The Brass Bottle*, 1900; *Only Toys*, 1903; *In Brief Authority*, 1915; *Four Molière Comedies*, 1931; *A Long Retrospect*, 1936.

**Anstruther**, a tn. on the Firth of Forth, Fifeshire, Scotland, composed of the 2 royal burghs, Easter and Wester Anstruther. Fishing and fish-curing are the main industries. It is the bp. of the poet Tennant and Dr. Chalmers. Pop. 2000.

**Ant** (O.E. *amele*, A.-S. *æmele*; Ger. *Ameise*, from Old High Ger. *meizan*, to cut), Emmet, or Pismire, an insect of the family Formicidæ (Lat. *formica*, ant) of the order Hymenoptera, to which also belong the wasp and the bee. They are social animals of many genera and about 2000 species; they vary greatly, not only among the various genera, but also among the individual species. The *white As.* (termites) are often thought to belong to the A. family, but they are in reality members of the order Isoptera, and though in habit and construction of their homes they somewhat resemble As., they are not related morphologically.

As. are omnivorous, feeding on both vegetable and animal life, when alive and when dead. The harvesting As. (*Aphaenogaster*) store up grain for food, the leaf-cutting As. (*Atta*) completely denude trees and store the leaves in their nests for the sake of a fungus which will grow on them; other As. are cannibalistic. All delight in saccharine matter, and it is on this account that they keep their *cours*, i.e. aphides, which excrete a sweet substance, seen on plants as *honey-dew*.

The queen A. is the greatest in size, and in her nest there will be males, females, and neutrs, or aborted females. Sometimes both male and female are winged, sometimes winged and wingless live together. Among neutrs the *soldiers* have larger heads than the mere ordinary *workers*, and these defend their home when it is attacked. Both workers and fertile females have stings, and the poison they eject is known as *formic acid*. The male A. is usually smaller than the female. In the colony occasionally beetles and smaller As., as the *Formica rufa*, live peacefully, and are thought to take the place of domestic pets. Mating takes place between winged As. when in flight; the male soon after perishes, and the females which escape such perils as drowning and insectivorous birds tear off their wings and perform their new rôle. They either go voluntarily to a nest to lay their eggs, or are dragged to one by workers who will attend to the needs of the young. Occasionally the females found a new colony without the workers, performing all the work alone until the first brood is hatched; as this consists of workers, the female does not long pay attention to the eggs. The workers

carry the eggs from one part of the nest to another as the temp. requires, the nest consisting of irregular cells connected by passages. The larvæ are fed on semi-digested food by the workers, and when they grow older some species form cocoons: even in the pupa stage the workers feed them, and when the time is ripe for their entrance into the world, they help them to extricate themselves from their cases and lick them over when they are free. The so-called 'ants' eggs' often used for feeding goldfish, are really the pupal stage of the A.; their food value is small. Some *As.*, as the *F. sanguinea* and the genus *Polyergus*, make slaves of other *As.*, and in some instances are unable all through life to feed themselves, actually depending on their slaves to put the food

into their mouths. *F. sanguinea*, the blood-red robber A., occurs in Britain; the workers carry out special slave raids during which they attack workers of other species (chiefly *F. fusca*), and carry off the pupæ.

Mention may also be made of the peculiar partnership existing between some common species of *As.* and certain butterflies, reaching its highest level in butterflies of the family *Lycaenidæ*. The caterpillars have on the seventh abdominal segment a gland secreting a sugary liquid which is licked up by *As.*; the caterpillars benefit from the association since they are protected from their enemies (ichneumons) by the *As.* The caterpillars of the large blue butterfly are not only attended and 'milked' by *As.*, but they are even taken by the *As.* into their nests. Here the caterpillars become parasitic and prey on the A. larvæ; if deprived of the larvæ, they are unable to complete their development into the adult butterfly.

*As.* are usually very short-lived. The queens may last for sev. years, but the ordinary *As.* usually endure for only 1 summer; the workers survive in winter by hibernating. The intelligence of *As.* is a disputed sub-

ject, but they are known to show signs of excitement at the return of a strayed companion or on the approach of the queen, and they recognise members of their own species which have entered other nests. The workers of some species are almost sightless, but *As.* have the power of vision generally. They communicate with each other seemingly by means of their antennæ, and by stridulating organs of the abdomen. They take great care of the sanitation of their nests, removing the dead and all unnecessary objects immediately. The nests are frequently mounds of earth and leaves, but often are found beneath stones. An Australian A., the *Myrmecia*, builds enormous mounds, and a S. Amer. A. forms hills 5 or 6 ft. in height. See J. T. Moggridge, *Harvesting Ants*, 1873; F. White, *Ants and their Ways*, 1883; F. W. Frohawk, *Natural History of British Butterflies*, 1926; H. St. J. K. Donisthorpe, *British Ants*, 1927; Sir John Lubbock, *Ants, Bees, and Wasps* (ed. J. G. Myers), 1929; E. N. Marais, *The Soul of the White Ant*, 1937; and Carol P. Haskins, *Of Ants and Men*, 1946.

**Antacids**, in medicine, substances which have the power of neutralising or counteracting acids in the gastric juices or excreta. The most important are caustic soda and potash, with their carbonates, bicarbonates, acetates, and citrates; ammonia and magnesia, with their preparations; bismuth subcarbonate. Some of these, like soda, act directly upon the gastric membrane; others, like the acetates and citrates, act indirectly through the blood, being converted into carbonates. The direct A. are used in dyspepsia, where it is required to counteract the excessive acidity of the stomach; and the indirect in gout, where the excess of uric acid in the blood is to be counteracted.

**Antæus**, son of Poseidon and Gea, was a Libyan giant of Gk. mythology who was invincible at wrestling until overcome by Hercules.

**Antagonist Muscle**, one which acts in direct opposition to another which is attached to the same part. The flexors are antagonists of the extensors. Con-  
gener muscles are those which produce the same movements.

**Antakleh**, see **ANTIOCH**.

**Antalcidas** was a Spartan soldier and diplomatist, who succeeding in undermining the friendly relations between Athens and Persia in the fourth century B.C., and who later, by his naval operations in the Hellespont, forced Athens, in 386 B.C., to accept the peace of A. By this treaty all Asia Minor was to be under Persian rule, and all the Gk. cities, except Lemnos, Imbros, and Scyros, became independent.

**Antalkalia**, substances which neutralise alkalis, such as acids.

**Antalo**, a tn. and plain in the Tigré dist., Abyssinia. In some parts of the plain agriculture is followed.

**Antanarivo**, or **Tananarivo**, the cap. of Madagascar, situated in the interior

of the is. It is built on the summit and slopes of a large Y-shaped ridge, nearly 700 ft. above the encircling *padi* fields, which themselves are more than 4000 ft. above sea-level. This ridge, 3 m. long, is very narrow, and most of the houses are built in artificial terraces rising tier on tier like the seats in an amphitheatre. Up to 1895, when it was bombarded by the Fr., A. was a tn. of wood or rush dwellings, and a few timber palaces. To-day it contains numerous public buildings of some architectural pretensions—an observatory, a cathedral, a royal palace, Gov. buildings, sev. brick and stone churches, hospitals, schools and colleges, law courts, and hundreds of substantially built dwellings and good if narrow roads; while the Fr. residency, sent of the governor-general, is a handsome building in the Renaissance style. There is also a municipal theatre, where native players give Malagasy comedies, and where Fr. opera companies pay visits. The city is lighted by electricity, has a good water supply and telephone service, and a really superb railway station. Pop. 120,000.

**Antar**, an Arabian warrior and poet of the sixth century. He was one of the poets whose works were called 'Moullakât,' and the hero of a romance, trans. into Eng. by Terriek Hamiltou, 1819. This romance gives a description of the manners and customs of the Bedouin Arabs.

**Antarctica**, a circumpolar S. continent. It has as yet no permanent settlements, but divs. have been named Adelle Land (q.v.), Alexander I. Land, Ballery Is., Coats Land, Enderby Land, Graham Land, Ingrid Christens Land, Kaiser Wilhelm II. Land, Kemp Land, King Edward VII. Land, King George V. Sound, Knox Land, Mary Byrd Land, Oates Land, Princess Elizabeth Land, Queen Mary Land, S. Victoria Land, Wilkes Land. The Brit. Empire has succeeded in claiming three-quarters of A., an area between three and four million sq.m., by the application of the sector principle. By this principle, all lands S. (or, in the case of the Arctic, N.) of certain inhabited areas are held to be the natural property of those areas. There are 3 main Antarctic sectors: the Falkland Is. Dependencies, administered from the Brit. Colonial Office; the Ross Sea Dependency, governed by New Zealand; and the vast new prov. claimed by Australia in 1933, when Sir Douglas Mawson took possession of a large sector of A. Norway in 1939 annexed that part of the Antarctic coast stretching from the border of the Falkland Is. Dependencies in the W. to the border of the Australian Antarctic Dependency in the E.—i.e. between 20° W. and 45° E.—together with the land within this coast and its territorial waters. The ter. is of great importance for the Norwegian whaling industry. In 1939 the Lincoln Ellsworth expedition claimed 430,000 sq. m. of A. for the U.S.A. and named it Princess Elizabeth Land. With an average elevation of 6000 ft., the highest

peaks range between 10,000 and 15,000 ft. Some parts are known to have copper and coal deposits; but the coastal lands are chiefly important for the whaling fisheries.

Some day a delicate task may await the International Court at the Hague or elsewhere in adjudicating on the claims to the S. Polar continent which in recent years have been pressed with increasing insistence. Commander Byrd, for example, set out in Jan. 1940 from New Zealand for A., among his aims being 'the consolidation of the work of previous Amer. explorers with a view to making formal territorial claims to some 650,000 sq. m. of Antarctica.' Until lately, previous exploration has been the commonly accepted principle. Thus Norway, in making large claims in 1939, took care to avoid inclusion of parts discovered by Britain in the W. or by Australia in the E., just as Australia, in delimiting the regions charted by Sir Douglas Mawson, left a gap where the name of Adelle Land (Fr.) bears witness to the exploration of D'Urville in 1840. An added difficulty subsequently arose from a new type of claim. Both in the Arctic and in the Antarctic it has been suggested that nations whose shores border on the oceans in question should draw lines from their E. and W. extremities to the Poles and claim all in between. On this basis Argentina would gain a S. Polar section that would strike straight across regions charted by Great Britain and the U.S.A. But the final element of confusion is added to the whole question because, if it were referred to the judgment of the International Court of Justice, that court would be bound to find that till now international law has taken no account of any claim to ter. that was not backed by permanent settlement, and that as no country has yet found it worth while to keep a permanent pop. in that inhospitable land all claims alike are spurious.

**Antarctic Ocean and Exploration.** Until the eighteenth century the A. regions existed in human imagination as a great continent extending into temperate latitudes; but though, unlike the Arctic regions, the A. consists largely of land, as was estab. before Cook's voyage of 1774, it was certain that such southward land as might exist only extended beyond the A. circle in one place—to the S. of S. America. Since Cook's voyages no new land has ever been found S. of the A. circle, apart from the southward extension of what may be the E. coast of Graham Land (60° W.), but it has been fairly clearly estab. since the year 1900 that the A. regions consist of a continent extending N. and S., over an area one and a half times greater than that of Europe, completely cut off from the rest of the world by the A. Ocean. Various explorers have touched the N. limits of this continent at King Edward VII. Land, Victoria Land, Wilkes Land, Budd's High Land, Kaiser Wilhelm II. Land, Enderby Land,

Coats Land, and Graham Land, the great masses of pack ice between the last and first named leaving the line of the continent conjectured between 70° W. and 15° W. Antarctica or the A. Continent appears to be an ice-clad mountainous continent crowned by a vast glacial table-land. Between King Edward VII. and Victoria Lands extends the Great Barrier, an ocean ice-cap of great extent

E. N. A.

A photograph by Herbert Ponting, taken during Scott's last expedition to the Antarctic.

and stupendous thickness, covering perhaps nearly 200,000 sq. m. of the A. Ocean, and apparently ending in a bight in 86° S. The glacial covering of Antarctica stretches N. and S. for over 1000 m. and covers an area of perhaps 5½ million sq. m. The glacier-covered plateau within 100 m. of the Pole was found by Sir Ernest Shackleton to be 11,000 ft. in altitude in 88° S. 162° W., the average elevation of the continent being about 6500 ft. Mt. peaks discovered by Amundsen in 164° W. 85° S. were found to attain a height of 15,000 ft. The S. Pole Plateau itself is estimated to be nearly 11,000 ft. high. Active volcanoes have been seen in Graham Land and Victoria

Land, and the hypothesis of earthquakes is an inference from the great increase in the amount of drift-ice from the A. and the size of the bergs observed in 1891-96. The N. limit of the pack appears to lie along 60° S. in summer, but its winter lat. is unknown. The depth of the A. Ocean varies considerably. From the neighbourhood of Tierra del Fuego to Kerguelen Is. it is about 2500 fathoms. Round the Pole at 80° S. it is over 2000 fathoms, while E. of Victoria Land it varies from 200 to 800 fathoms. Submarine ridges rise up at Graham Land to about 100 fathoms of the surface. Borchgrevink assigned to the magnetic pole the position of 73° 20' S. and 146° E., but the local attractions of volcanic rocks and magnetic storms made his observations erroneous, and Profs. Mawson, Mackay, and David have subsequently located it with more probability at 72° 25' S. 155° 16' W. on the inland ice some 7000 ft. above sea-level. The summer climate of the A. region has long been recognised as cold and ungenial, but the presence of coal seams within 300 m. of the Pole points to a former milder climate conducive to extensive vegetation even at the Pole itself, though late discoveries now establish Antarctica as being barren of all terrestrial life except that of the lowest microscopic organisms. Generally speaking, the summers are remarkably cold, the winters not extraordinarily so. There is evidence of a permanent S. Polar anti-cyclone, and terrific storms of wind and a succession of cyclones prevail in the vicinity of Victoria Land, and indeed the N. side of the A. is recognised as the windiest part of the world, records showing that for some months the average wind velocity is 50 m.p.h. The fall of snow and rain observed is estimated to be equivalent to an annual rainfall of about 30 in. The flora of Antarctica appears to be limited to a few species of lichens and reindeer moss found on Victoria Land and in the Palmer Archipelago, though the *Belgica* expedition discovered mosses and grass on the shores of Belgica Strait off Graham Land. The fauna comprises different species of seals, penguins, petrels, skua; of insect life, diptera with rudimentary wings, minute acarides; and of marine life a great number of species representing plankton, littoral forms, and benthos. There appear to be no right whale (or Greenland whale), walrus, or narwhal, and no land mammals.

The hist. of A. exploration may be said to begin with Capt. James Cook's voyages in the *Resolution* and *Adventure*, 1772-75, though Bouvet, Dalrymple, and others had done something to dispel the illusion of a S. Atlantic continent stretching to tropical lat.

It is impossible here to describe in any detail the voyages prior to that of the *Challenger* under Nares in 1874, but Ross in H.M.S.S. *Erulus* and *Terror* discovered and explored Victoria Land (1839-43), naming numerous is. and

capcs. The *Challenger* in 1874, commanded by Nares, was the first steamer to cross the A. circle, but though Nares went only to 66° S. southward of Kerguelen Is. the marine flora he collected and his recorded soundings and other information enabled Sir John Murray to draw numerous valuable inferences as to the existence and trend of an A. continent. The circle was not again crossed until 1893, when Evensen in the *Hertha* sighted Alexander Land, reaching 69° 10' S. in 76° 12' W. In 1894 Christensen reached 74° S. at Coulman Is., finding that the sea was easily navigable to the S. Landing near Cape Adare, his party were the first people to set foot on what is generally believed to be the A. continent. In 1898 funds were raised to organise the expedition of the *Belgica*, which in Jan. of that year left Staten Is. for the A. The geographical results were poor so far as land discovery or penetration towards the Pole are concerned, but soundings estab. the existence of a continental shelf of great breadth connected with land to the S. In 1900 Borchgrevink (*q.v.*) with his party of the *Southern Cross* landed on Possession Is. and on the mainland at the base of Mt. Melbourne. With the aid of sledges and dogs he advanced S. to 78° 50'. The next year the *Discovery*, equipped under the supervision of Sir Clements Markham, under the command of Commander R. F. Scott, R.N., left Cowes with Lt. (later Sir Ernest) Shackleton, Dr. Wilson, and others on board. The expedition during 1901-4 discovered King Edward VII. Land, a vast stretch of the austral continent reaching from 152° to 157° E.; ascended the glacial ice-cap of Victoria Land, touching, after a 300 m. journey, an altitude of over 9000 ft. in 77° 39' S. 146° E. The work of this expedition, together with the contemporaneous voyages of Nordenskjöld, who explored Palmer Land, and of the Ger. expedition under Drygalski, and the somewhat later journey of Dr. Charcot in 1904 to W. Palmer Land, confirmed the theory of the existence of an A. continent which, until Bruce discovered Coats Land in 74° S. 24° W., directly opposite S. Victoria Land, had begun to be disbelieved. In 1908-9 Sir Ernest Shackleton carried out the brilliant scientific, geodetic, and geographical discoveries which earned for him his knighthood. He travelled nearly 2000 m., and ascertained the nature and extent of the Great Barrier and reached a glacier-capped plateau of 11,000 ft. elevation in 88° 23' S. 162° W., approaching within 100 m. of the Pole. After the expedition of Mawson above alluded to, Capt. Scott in 1910 set out on his tragic second journey to the Pole. In the meanwhile Amundsen, the celebrated N. Pole explorer, wintering on the Great Barrier in 1911, reached the Pole on Dec. 16, 1911, having followed 164° W. to the mt. range in 84° S., and thence,

crossing the Devil's Glacier, traversed the S. Polar plateau. Scott also reached the Pole, only to find when he did so that Amundsen had preceded him. (See SCOTT, ROBERT FALCON.) In Jan. 1913 Lt. Filchner, in command of a Ger. expedition, reported the discovery of Prinz Luitpoldland and Kaiser Wilhelm II. Barrier. Later news of the A. is that of Prof. (now Sir Douglas) Mawson, who set out in the *Aurora* in 1911 with Dr. Mertz to gain additional knowledge of those lands which lie close along the arc of the A. circle due S. of Australia between S. Victoria Land and Kaiser Wilhelm II. Land (where the *Gauss* Ger. expedition had its winter quarters in 1902-3), a tract which had scarcely been touched since the voyages of Balleny, Wilkes, and D'Urville. Sir Douglas Mawson has done much to delineate the A. plateau from the N., and the installation nearly 40 years ago of 2 wireless stations in communication with the Gov. Meteorological Office of Australia on lands never before sighted proved of great value as a means of warning ships and agriculturists and others, especially in Australia, of the approach of blizzards and storms.

No explorer has yet crossed the A. continent. Shackleton in 1914 proposed to make the attempt, as did Bruce in 1908, but the expense involved in such an expedition was prohibitive. It is regrettable that public support is not generous where an appeal is made solely to promote scientific research. Hence it is the better opinion that some concession must be made to the popular prejudice in favour of an effort that may be at once spectacular and utilitarian. (Consult *The Polar Regions* by R. N. Linderoth Browne.) At the end of 1928 Commander Byrd set out at the head of an Amer. expedition for a comprehensive exploration of the A. continent, and since establishing a base in the Bay of Whales, has made aeroplane flights. He took wonderful pictures during his flight over the S. Pole and obtained much new scientific information on meteorology, geology, etc. Meanwhile the Brit. Discovery Committee (*q.v.*) has organised whaling research expeditions in these waters, both in the wooden boat *Discovery*, and in the new steel boat *Discovery II.*, the main object of these expeditions being the utilitarian one of checking the threatened disappearance of the whale as a commercial asset by supplementing our existing knowledge of its migrations and breeding. At the end of 1928, Sir Hubert Wilkins, using Deception Is. as a base, flew over Graham Land, proving that it was not part of the main mass of the A. continent. In 1934 Admiral Byrd claimed to have discovered extensions of Little America to the N. of the Edsel Ford Range, which he named Marie Byrd Land and described as giving evidence of important coal deposits some 200 m. from the S. Pole. Lincoln Ellsworth, the Amer. explorer, with a

Brit. pilot, Herbert Hollick-Kenyon, left N. Zealand towards the end of Nov. 1935 for a research flight, reaching Little America by sledge, after which their wireless sets failed and nothing further was heard of them till mid-Jan. when they were rescued by the R.R.S. *Discovery II*. They had flown some 2,000 m. to Admiral Byrd's base on the Ross Sea before being forced down. In the same year Norwegian explorers are said to have found new land between 80-45° E. long. and 67-50° S. lat. and 73-00° E. long. and 69-10° S. lat. in the Enderby quadrant, which they named Ingrid Christens Land. Early in 1937 Lars Christensen, the Norwegian explorer, accompanied by M. Wideroe, as pilot, reported the discovery of a range of mts. between the 35th and 40th deg. of long., the highest peak of which was 4500 ft. They dropped the Norwegian flag at a point 38° E. and 69-30° S. New mountainous country with peaks rising to 10,000 ft. were seen running from 26° E. and 71-30° S. for some 200 m. westward. Between 1935 and 1937 the *Discovery II* circumnavigated the A. continent, covering a distance of 50,000 m., investigating the distribution of whales in the whole region, besides taking observations of the hydrology and biology of the Ross Sea. The principal geographical features discovered by the Brit. Graham Land expedition under Mr. John Rymill, which left London in 1934, have been named King George V. Sound. This sound separates Graham Land from Alexander I. Land and at its mouth is 15 m. wide, extending some 250 m. in a southerly direction before turning W.

There were sev. A. expeditions during and following the Second World War, the largest being from the U.S.A. Brit. explorers and scientists of the Falkland Is. Dependencies Survey commenced in 1941 a systematic survey of all aspects of their sector and research into human adaptation to low temps. See also ANT-ARCTICA. Antares, the name of a bright star, Alpha scorpiotis.

Ant-bear, the popular name of the

*Myrmecophaga jubata*, is also known as the great ant-eater (q.v.).

Ant-catcher, the ant-thrush or ant-bird of Old and New Worlds.

Ant-eaters, popular name for members of the mammals known as Myrmecophagidae of the order Edentata, peculiar to S. America. It is toothless, its head being prolonged into a long snout containing a protrusible tongue always well moistened with saliva, with which it picks up the ants and termites on which it feeds. The body is about 4 ft. long, and the bushy tail, which serves as protection against cold, about 2½ ft. As it walks it bends its long and sharp claws beneath it, but it can use them in its defence. It produces a single offspring at a birth. *Myrmecophaga jubata* is the great A., also known as the ant-bear or tamanoir; *Tamandua* and *Cyclocuratus* are other genera, both arboreal.

ANT-EATER

Ant-eater, Scaly, see PANGOLIN.

Ant-eater, Spiny, see ECHIDNA.

Antecedent : 1. In grammar, the substantive to which a relative refers. 2. In logic, (a) the first of 2 propositions in an enthymeme, or argument of 2 propositions. The second proposition is called the 'consequent', e.g. in 'Every man is mortal; therefore every king is mortal', 'Every man is mortal' is the A., and 'every king is mortal' is the consequent. (b) The conditional part of a conditional or hypothetical proposition, e.g. in 'If luxury prevails, kingdoms must decay', 'If luxury prevails' is the A. 3. In mathematics, the first of the 2 terms of a ratio. Thus in the proportion 2:4::8:16, 2 and 8 are As., and 4 and 16 are consequents.

Antediluvian (Lat. ante, before, diluvium, flood), a word used in speaking of anything which existed before the Flood. In palaeontology it is not used with the biblical significance, as science does not recognise a universal flood, but with the sense of having existed before the transformation of the earth by water, in which connection, however,

it is to be noted that recent excavators at Ur and Kish, in Mesopotamia, have found proofs of a flood having occurred there and that the inhabitants after it differed from those that preceded it. The 10 antediluvian patriarchs were Adam, Seth, Enos, Cainan, Mahalaleel, Jared, Enoch, Methuselah, Lamech, and Noah. The term is now used generally in irony.

**Antefixa** (Lat. *antlc*, before, *fixa*, fixed), blocks with vertical fronts placed along over a cornice in classical buildings to hide the ends of the joint tiles. They were usually ornamented with a flower, leaf, bead, or group of figures. The word was also applied to small bas-reliefs ornamenting friezes.

**Antelope**, a name applied to many ungulates of the order Artiodactyla. It is most properly used in speaking of the *Antilope*, or Indian black-buck, but it is often used in connection with the *Antilocapra*, N. Amer. prongbuck, or prong-horned A., which constitutes in itself the family Antilocapridæ and is the sole species. As. are, however, confined to the family Bovide, which do not shed their hollow horns; the Antilocapridæ, however, shed their horns, which are branched. Among the Bovide are included sheep, goats and oxen, and the As. may almost be regarded as any of the animals which cannot be considered as any of these. They are found in immense numbers in S. Africa, and also in other continents, but are totally absent in Australia; in many cases reckless hunting has practically exterminated genera which were extremely numerous. They are graceful creatures living in the plains (exceptionally on mountains, e.g. chamois), have rounded or lyrate horns present in all males, though not in all females, and generally there is a curious tear-gland filled with waxy matter beneath the eyes. They are dependent on their swift flight for their safety, as their horns provide small means of defence.

Among the numerous animals grouped under the term A. are the gnu, eland, bartebeests, addax, klipspringers, chamois, gazelles, cheirus (serows), pallas, saigas, nilgais, and kudood; the bliesboks, duikerboks, black-bucks, springboks, water-bucks, bonteboks, reedboks, gemsboks, steinboks, grysboks, bushbucks; the royal, sable, roan, quino, Baker's, and harnessed As.

The royal A., or *Neotragus*, includes only one species, and the females are hornless; it is about the size of a hare. The sable, roan, quino, and Baker's As. belong to the genus *Hippotragus* (with the extinct blaubok), and greatly resemble the addax; they are large animals, and both males and females carry long horns. The harnessed As. constitutes the genus *Tragelaphus*, to which the bushbucks belong; they are the largest of the As., usually only the males have horns, their faces are marked, and their beautiful bodies are striped as if they bore harness. For characteristics of the gnu, eland, etc.,

see under their respective headings. Consult P. L. Sclater and O. Thomas, *The Book of Antelopes*, 1894-1900; W. H. Flower and R. Lydekker, *Introduction to the Study of Mammals*, 1891.

**Antennæ** (Lat. *antenna*, a sail-yard), popularly known as *horns* or *feelers*, are the anterior appendages on the heads of some Arthropods, namely, the crustaceans, insects, and myriapods. In insects there are always 2, but crabs and lobsters have 4 or more. They vary greatly in length, form, and comparative thickness, and may have over 100 joints; they form tubes consisting of auditory, sensory, and olfactory nerves.

**Antenor**: 1. Athenian sculptor of sixth century B.C. He made the bronze figures of Harmodius and Aristogiton, which were carried away to Persia by Xerxes in 480 B.C. They were restored to Athens by Alexander the Great. 2. In Gk. legend, the wise Trojan who advised that Helen should be sent back to her husband, and advocated peace. There is a legend that he betrayed Troy to the Gks., and others that he founded another city on its site, or migrated to Cyrene, or founded Patavium.

**Antequera**, a tn. in Málaga prov., Spain, on l. b. of the Guadalhorce. Held by the Moors from A.D. 712 to 1410, and has among its antiquities a Moorish castle and walls. Trade in oil and fruit, and some manufs. of silks, leather, etc. Pop. 32,000.

**Anthelia** (Gk. *ἀντί*, against, *ἥλιος*, the sun), a phenomenon observed by a person whose shadow is cast upon a moist surface, such as a cloud, fog, or dewy grass; around the shadow are sev. concentric rings, luminous and coloured, shading into white at the edge.

**Anthelmintics**, medicines which destroy or cause the expulsion of worms, as santonin for the round worm; koussou, kamala, male fern, turpentine, arca nut, and pomegranate for the tape and broad worms; injections of salt, tannin, quassia, alum, iron, etc., for the thread-worm; and thymol for *Ankylostoma duodenale*.

**Anthem**, a shortened form of antiphon, is a musical composition set to sacred words and used in the service of the Church since Elizabeth's reign. It was first written for alternate parts, but may now be written for solo, soli, or chorus, or a combination of all three.

**Anthemis**, a genus of the Compositæ, of which the Brit. species are known as chamomile; they possess medicinal properties. *A. arvensis*, *A. cotula* (mayweed) and *A. nobilis* grow in fields and on commons. *A. tinctoria* is used in France for a yellow dye.

**Anthemius** (d. c. 534), Gk. mathematician and architect, b. at Tralles in Lydia. He began the rebuilding of St. Sophia in Constantinople for the Emperor Justinian, the church having been destroyed by fire in 531; it was completed by Isidorus of Miletus in 537. He wrote sev. mathematical

treatises, and he is credited with the invention of domes. See *Mémoires de l'Académie des Inscriptions*, 1786.

**Anthems, National**, see NATIONAL.

**Anthér** is a term applied to the pollen-bearing body at the tip of the filament of a flower. It is united to the filament by means of a *connective*; and A., filament, and connective form the stamen. The A. consists of 2 A.-lobes, sometimes of 1, which contain the 4 pollen-sacs, which burst open when ripe to free the pollen. It is said to be *versatile* if it swings on the filament (as in grasses), *dorsifixed* if immovable. In some plants, e.g. daisy and potato, the As. cohere, while the filaments are free; this is called the *syngenesious* or *syanthærous* condition.

**Anthocyanins**, in botany, are a complex group of pigments which, in the main, give to red and blue flowers, etc., their peculiar colours. The red colour of roses, poppies, and geranium flowers as well as of the roots of beets and radishes, is due to A. Similarly, the blue colour of violet, larkspur, and cineraria flowers, as also of the fruits of grape-vines and bilberry bushes, is due to A. Again, it is due to the development of a red A. pigment that many leaves derive their autumnal redness. Expressed in botanical language, the different colours of flowers and of fruits are due to the varying colour of the cell-sap and also to the different distribution of the cells containing the coloured cell-sap, and also to the different combinations of dissolved colouring matter with the yellow, orange, or red chromoplasts and the green chloroplasts. Like litmus, some A. are blue or violet in an alkaline solution and red or reddish in an acid solution. Under certain conditions they are also dark red, dark blue, and even blackish blue. Alkalis, too, frequently change the colour to green. Willstätter's researches have extended our knowledge of the chemical constitution of A. They are glucosides, i.e. compounds of glucose with other substances known as anthocyanidins, into which they can be decomposed by boiling with acids (hydrolysis). Thus cyanin, the blue colouring matter of the cornflower and the first A. to be studied by Willstätter, yields on hydrolysis 2 molecules of glucose and cyanidin. The other fundamental anthocyanidins besides cyanidin itself are pelargonidin (in the geranium) and delphinidin (in the larkspur). A large number of compounds of glucose with these 3 parent substances cyanidin, pelargonidin, and delphinidin are possible, giving a wide range of colours in different flowers. The anthocyanidins are closely related to flavones, yellow pigments of wide occurrence in plants. Blood-coloured leaves, such as those of the copper beech, owe their characteristic appearance to the combined presence of green chlorophyll and A.; when such leaves are boiled in water the A. is dissolved, leaving chlorophyll, so that the leaves turn green in colour. See M. Wheldale, *Anthocyanin Pigments of Plants*, 1916; L. T. Hogben, *Pigmentary Effector System*, 1924.

**Anthology**, a compound Gk. word, used metaphorically, which means literally a 'collection of flowers.' This title is applied to a work which is a collection of select extracts or choice passages from various branches of literature, but more generally the term is restricted to collections of short or lyrical poems. Most countries have their poetic As., Asiatic literature being extremely rich in them. From Turkey to Tartary, from Persia and Arabia, on through India to China and Japan one finds these caskets of the gems of national literature. The Psalms of David and the Proverbs of Solomon are veritable Heb. As. To Confucius is attributed the compilation of the Chinese *Shi-King* (Book of Songs), and it is claimed for it that it is the oldest A. in the world. Knicker pub. a Ger. translation of it in 1833, and his countryman, Von Hammer-Purgstall, rendered in 1818 a similar service by introducing Persian literature to the W. By far the most important A. is the Gk. A. The first collection of Gk. poems, called the *Stephanos* (Garland), was made by Meleager, a Syrian b. at Gadara at an uncertain date, but probably about the end of the second century B.C. It included poems by 46 poets, among them being Sappho, and, as is not an uncommon thing in As.—their compilers being but human—a few poems by the editor. This work was added to by succeeding editors, whose MSS. have been lost, the earliest and fullest of the extant versions being that of Constantinus Cephalas, a grammarian who fl. in the middle of the tenth century A.D. It contained excerpts from more than 300 poets, and the poems ranged from the sixth century B.C. to the tenth century A.D. Early in the fourteenth century Maximus Planudes laid violent and clumsy hands upon this beautiful collection of Cephalas, abridging, rearranging, and even altering. For 300 years his was the only Gk. A. known, but in 1606 Salmasius rediscovered the A. of Cephalas in the library of the counts palatine at Heidelberg. A good ed. of this is Dübner's. There was no A. among the anc. Romans, and it was not until 1573 that Scalliger pub. in Leyden an imitation of the Gk. A. under the title *Catalecta Veterum Poetarum*. Other editors of Lat. As. are Pithou (Paris, 1590) and Peter Burmann (Amsterdam, 1759 and 1773). That of Riese (1870) contained nearly 1000 poems. Eng. verse from the Elizabethan poets down to Wordsworth has been collected in F. T. Palgrave's *Golden Treasury*. By many this is regarded as the standard Eng. A., and undoubtedly as a pioneer in this field it may be said to have influenced its successors. The *Oxford Book of English Verse* was ed. by Sir A. T. Quiller-Couch, who profted by the mistakes of his predecessor, and in it are included many beautiful numbers the omission of which by Palgrave is difficult to account for. Such omissions included Coleridge's *Kubli Khan* and Keats's *Ode on a Grecian Urn*. The range of the *Oxford Book*

is from 1260 down to 1918 in strict chronological order of birth. The total number of poems is 967. Other modern Eng. As. are Allan Ramsay, *Tea-Table Miscellany*, 1724-40; Thomas Campbell, *Spectimens of British Poets*, 1841; T. H. Ward, *English Poets*, 1883; F. Locker Lampson, *Lyra Elegantiarum*, 1867 (rev. 1891); W. B. Yeats, *A Book of Irish Verse*, 1895 (revised 1900 as *Modern Irish Poetry*); Robert Bridges, *The Spirit of Man*, 1916; Sir Henry Newbolt, *An English Anthology of Prose and Poetry*, 1921; T. Caldwell, *The Golden Book of Modern English Poetry*, 1922; Robert Lynd, *Anthology of Modern Poetry*, 1922; Sir A. C. Quiller-Couch, *The Oxford Book of English Prose*, 1925; Grace Rhys, *A Celtic Anthology*, 1927; H. E. Rollins (ed.), *England's Helicon* (1600, 1614), 1931-32; G. Bullett, *The English Galaxy of Shorter Poems*, 1933; Sir A. C. Quiller-Couch, *The Oxford Book of Modern Verse* (1892-1933), 1936; W. B. Yeats, *The Oxford Book of Modern Verse*, 1936; G. Lacey May, *English Religious Verse* (Everyman's Library), 1937; W. H. Auden, *Oxford Book of Light Verse*, 1938; Walter de la Mare, *Behold this Dreamer*, 1939, and *Love*, 1945; Lord David Cecil, *The Oxford Book of Christian Verse*, 1940; Edith Sitwell, *Anthology* (verse from Chaucer to Hardy), 1940; Hugh Macdarmid, *The Golden Treasury of Scottish Poetry*, 1941; while among Am. As. should be mentioned: E. C. Stedman, *American Anthology* (1787-1899), 1900; Bliss Carman, *The Oxford Book of American Verse*, 1927; Louis Untermeyer, *American Poetry from the Beginning to Whitman*, 1931; H. H. Clark, *Major American Poets*, 1936.

**Anthron**, Charles (1797-1867), Amer. classical scholar, was b. in New York. He was called to the bar in 1819, appointed adjunct prof. of anc. languages in Columbia College in 1820 and prin. prof. in 1835. He ed. Lemprière's *Classical Dictionary* in 1841 and compiled a *Dictionary of Greek and Roman Antiquities* in 1843.

**Anthony**, Saint, see ANTONY, SAINT.

**Anthony**, Susan Brownell (1820-1906), Amer. reformer, b. at Adams, Massachusetts, of Quaker parents, and taught in a New York school from 1835 to 1850. She was a zealous agitator for total abstinence and the abolition of slavery, and, after the Civil war of 1861-65, for woman suffrage. In 1868 she founded the *Revolution*, and was one of the authors of a *History of Women Suffrage*, 1881-87. See her *Life* by Harper, 1898.

**Anthophyllite** (Gk. *άνθος*, flower, *φύλλον*, leaf), a mineral belonging to the Amphiboles, containing silicate of magnesium and of iron. It is of a brownish-yellow colour, has a pearly lustre, and its structure is fibrous. It is a metamorphic mineral.

**Anthospermum**, or amber-tree, a genus of Rubiaceæ found in Africa and Madagascar. It is allied to the coffee and cinchona.

**Anthoxanthum**, a genus of grasses (Gramineæ) of which the species *A. odoratum* is known to farmers as sweet

vernal grass. It has pale yellowish-green flowers and only 2 stamens; the stems contain coumarin, which causes the fragrance of new-mown hay.

**Anthozoa** (Gk. *άνθος*, flower, *ζωον*, animal), a class of Coelenterata, which includes corals, madrepores, and sea-anemones. All inhabit the sea, usually in the warm climates. They are synonymous with the Actinozoa.

**Anthracene** (C<sub>14</sub>H<sub>10</sub>), a substance prepared from coal-tar. The coal-tar is subjected to fractional distillation; the fraction up to 170° consists of crude naphtha, from 170° to 230° carbolic oil is separated, from 230° to 270° creosote oil is separated, and above 270° the distillate is A. oil, whilst the residue in the still is pitch. The A. oil is distilled again with one-third of its weight of potash in an iron retort; the distillate, which consists of A. and phenanthrene, is treated with carbon bisulphide, which dissolves the phenanthrene, leaving A. The A. is afterwards purified by crystallisation from benzene.

A. is a crystallin. solid, melting at 213° C. and boiling at 351°. It is only slightly soluble in alcohol and ether, but is easily soluble in benzene. Its commercial importance arises from the fact that it is the basis of the manuf. of the important dye-stuff alizarin (*q.v.*) employed in producing Turkey-red.

**Anthracite**, or stone coal, a particularly hard and lustrous variety of coal, slow in ignition, but giving out an intense heat with little effusion of smoke. It is used for drying hops and malt; in blast furnaces where a high temp. is required; and for steam navigation purposes. It has been suggested that A. has been produced from vegetable matter that has been more completely macerated and deprived of its putrescible constituents before submergence than that producing ordinary bituminous coal, or that the submergence took place in shallow water where the plant substance was exposed to the oxidising influence of the air, thus minimising the amount of hydrogen and carbon compounds. Most As. contain 90 per cent of carbon, whilst bituminous and gas coals contain from 75 to 80 per cent of carbon, the remainder being made up of hydrogen, oxygen, and nitrogen together with varying amounts of ash.

A. is found in large quantities in Pennsylvania and in S. Wales, where more than half of the supply is exported for use on steamers in all parts of the world.

**Anthracotherium**, genus of mammiferous fossils found in the Eocene and Miocene strata of Paris and Tuscany. They belong to the family Anthracotheriidae of the order Ungulata and somewhat resembled pigs in shape. They appeared in the Eocene and Miocene periods.

**Anthraquinone** (C<sub>14</sub>H<sub>8</sub>O<sub>2</sub>), an organic substance derived from anthracene by oxidation with nitric acid or chromic acid. It is manufactured on the large scale by oxidising 50 per cent anthracene

produced in the distillation of coal-tar with sodium bichromate and sulphuric acid. The dried filtrate is heated at 100° with concentrated sulphuric acids, by which means the impurities are converted into soluble sulphuric acids, so that the pure A. may be separated out.

A. crystallises in light yellow needles, melts at 277°, and sublimes at higher temps. in sulphur-yellow prisms. Its commercial importance lies in the fact that it is an intermediary substance by which anthracene is ultimately converted into alizarin.

**Anthrax**, an acute, infectious disease, common to animals and man, caused by the *Bacillus anthracis*. It is also known as splenic fever, from the enlargement of that organ which invariably accompanies all types of A.

The disease is widely distributed as it affects animals, but appears to be particularly associated with marshy dists. There are 2 forms, external and internal. External A. is accompanied by malignant pustules in any part of the body, accompanied by fever. They rapidly attain a great size, general infection takes place, causing death within a few hours. Internal A. exhibits no reliable premonitory symptoms in animals; the first indication may be sudden death or staggering followed by convulsions. If death does not take place at once, ultimate recovery is possible. The only protective measure is inoculation with A. serum.

A. in man may also be external or internal. In external A. a small papule appears at the point of infection, which is usually a small wound on an exposed part. The papule increases in size, then breaks, leaving a dark blue or black scab. The area gradually extends, may be cast off if recovery occurs, but is accompanied by general disturbances comprising fever and prostration leading to ultimate collapse in unfavourable cases.

Internal A. is usually due to infected drinking-water or diseased meat. Indefinite symptoms, such as headache and languor, are followed by gastro-intestinal disturbances with bloody diarrhoea. Convulsions or spasms are followed by collapse. Certain cases of A. are traceable to particular occupations, such as woolsorters' disease, occurring among operatives in factories in which imported wool or hair, mostly from Russia and S. America, is sorted; and rag-pickers' disease, occurring among the rag-sorters in paper-mills near Graz. These latter forms affect the respiratory tract, causing septicaemic broncho-pneumonia, which is usually fatal.

Where cases of A. have occurred in animals, the hair, hides, wool, and bodies should be burnt. Disinfection of the premises and prohibition of grazing in the infected area should be made compulsory.

**Anthropoid Apes** (Gk. *ἄνθρωπος*, man, *ἰδος*, resemblance) is a term sometimes applied to large monkeys of the family Anthropomorphidae or Simiidae, on account of their morphological resemblance to man. They have no cheek-pouches

or tails, are arboreal and omnivorous. There are extinct and fossil species, but there also occur living species in the gorilla, orang-outan, chimpanzee, and gibbon, which are found in the E. Indies and W. Africa. See T. H. Huxley, *Man's Place in Nature*, 1863; R. Hartmann, *Anthropoid Apes*, 1883; R. M. and A. W. Y. Yerkes, *Great Apes*, 1929; Zuckermann, *Functional Affinities of Man, Monkeys, and Apes*, 1933.

**Anthropolatry** (Gk. *ἄνθρωπος*, man, *λατρεία*, worship), the payment of divine honours to a human being, a term always used in a condemnatory sense. The charge of A. was brought against the heathen by the early Christians, for, according to the pagan mythology, men had qualified themselves to receive divine honour. The same accusation was levelled against the Christians themselves by the sect of the Apollinarians (c. 400), a heretical body which refused to acknowledge the divinity of Christ.

**Anthropology**, the study of man; a subject of great complexity involving the consideration of man's place in the animal kingdom as determined by his physical, mental, and moral characteristics, his hist. and development, the origin and growth of language, ethics, religion, and social institutions; the div. and subdiv. into races, nations, and castes, and all the manifold activities of which man is capable. Every fact has its value in throwing some light on the place and destiny of man in the universe; in this article it is proposed merely to indicate under certain headings the scope of the various divisions of the subject.

**Physical A. or somatology** deals principally with anatomical measurements. Such measurements may have 1 of 3 ends in view: to provide material for scientific classification, to test the efficiency of the individual for military or other service, or to aid in the identification of the individual in any registered class, such as the criminal. The attention of physical anthropologists has been taken up mainly with measurements of the skull. The reason is that man's distinctive characteristics as compared with other animals have had their expression in the modification of the shape of the skull. The assumption of the erect attitude caused a change in the relationship of the head to the cervical vertebrae, and the liberation of the hand relieved the jaws from much heavy work, so that the human jaw became reduced in size. The size of the brain increased with greater brain power, so that the state of civilisation of a race can to some extent be gauged by skull measurements. Too much reliance must not be placed upon observation of the shape of the skull, for it is notorious that in any group of civilised men all varieties of skull may be met with, but in taking a general survey, what is called the cranial index varies considerably for different races. The cranial index is obtained by measuring the greatest breadth and greatest length and computing what percentage the former is of the latter. When the

index is under 75 the skull is said to be dolichocephalic; between 75 and 80, mesocephalic; and over 80, brachycephalic. It is noteworthy that skulls of the different types are distributed generally over the world.

The discovery in China of what has been named the 'Peking Man' (*Sinanthropus*), a pre-Neanderthal skull, constitutes a valuable landmark in the hist. of human paleontology. This skull was found near the tn. of Chou Kou Tien, some 37 m. S.W. of Peking, in 1929, and 3 further specimens were revealed in the same cave in 1936.

that it was long disputed whether it should be classed with apes or with man; also with the Neanderthal (*q.v.*) skull, the longest known skull of an extinct type; and with the Piltdown skull. The better opinion seems, so far, to be that the discovery establishes beyond all reasonable doubt (1) that in Pleistocene times there were sev. genera of man all now extinct, or, in more appropriate words, which have left no descendants; (2) that these classes were all closely allied to the gorilla and that the necessary inference is that man and the great apes are not only descended from a common ancestor

SKELETONS OF THE GIBBON, ORANG, CHIMPANZEE, GORILLA, MAN

Photographically reduced from diagrams of the natural size (except that of the gibbon, which was twice as large as nature), drawn by Waterhouse Hawkins from specimens in the Museum of the Royal College of Surgeons.

As a guide to our knowledge of the descent of man, these challenge comparison with *Pithecanthropus* (see *PITHECANTHROPUS ERECTUS*), the Javan skull, and with *Eoanthropus*, the almost equally famous Piltdown skull which Charles Dawson found in portions, in Sussex, between the years 1911 and 1913 and in doing so discovered the remains of the earliest Briton known. (In 1938 Sir Arthur Keith unveiled a monolith memorial in the grounds of Barkham Manor, Piltdown, to mark the spot on which Charles Dawson found the fossil.) 'In many of his features Piltdown Man foreshadowed some of the structural modifications found in modern races of mankind. He came by such features independently, for discoveries of recent years had proved that diverse races of mankind had undergone the same structural change quite independently of each other. Through all his known parts there ran a similar vein in Piltdown Man, in his skull and brain as well as in his lower jaw' (Sir Arthur Keith, in 1939). According to the late Sir Grafton Elliot Smith, the Peking skull is that of an extinct genus of the human race, having affinities with *Pithecanthropus*, which latter goes back to so primitive an age

but have separated comparatively recently (as time is reckoned in geological terms). These deductions are consistent with the conclusions of Darwin and Huxley as opposed to the view that human and anthropoid stocks have been separated almost from the era when the common stock of man, anthropoids and all monkeys separated from other mammals. Summing up the evidence afforded by this Mongolian find, the late Prof. Elliot Smith states that we can say that while it presents features analogous to those of *Pithecanthropus* and the Neanderthal man, it belongs to a genus which is definitely distinct from both, but approximates more nearly to its Javan contemporary than to its relatively recent successor, Neanderthal man. The braincase is decidedly bigger than that of *Pithecanthropus*, but the features at the base of the skull (unknown, unfortunately, in the case of the Javan skull) show startlingly simian characteristics, which suggest a close affinity between the most primitive members of the human family and the anthropoid apes of Africa.

Many scientists, while not denying the received doctrine of descent, think that Darwin and Huxley were wrong in placing the gorilla and the chimpanzee

among the ancestors of man. The retort of Brit. biologists is that this misconception of the position of Darwin is a phase through which Eng. opinion passed before becoming reconciled to the strength of those evolutionists. The immense growth of knowledge in the last 50 years has furnished much fresh evidence in support of Darwin's theory, and Sir Arthur Keith, with other eminent scientists, are satisfied that the bases of his position cannot be shaken. Modern anthropologists have sought and found evidence of the immense antiquity of man in many quarters of the world, and this evidence goes to show that human beings, who used tools and had habits not unlike those of the surviving remnants of the lower races, existed for periods variously reckoned at from 200,000 to 1,000,000 years ago. Actual fossil remains seem to establish that there were sev. species of these primeval men, one of them probably the ancestor of modern man, the others all probably now extinct. In the matter of skull, skeleton, and brain, the older forms are more bestial than the later. A simple diagrammatic tree of the human pedigree omitting the 'missing link' between a gorilla or a chimpanzee and savage or primitive man as something never propounded by Darwin himself, but familiarised by his various interpreters, must, almost of necessity, be abandoned in favour of a longer, more complex, and at the same time more plausible family tree. Whether or no anthropologists will ever be able to trace with more marked precision the course of human descent from the Gordian knot of data at present available, seems doubtful.

Prior to the discovery of the 'Peking Man,' A. Hardlicka's *The Neanderthal Phase of Man* was the most significant recent event in the sphere of physical A. Hardlicka postulates only 2 major glacial movements for the 4 Pleistocene movements commonly accepted, and thinks that Neanderthal man existed towards the end of the intervening warm era. But the better opinion inclines to the view that man's ancestry is to be found before the Neanderthal man. (*Journal of the R. Anthro. Inst.*, 57, 249; *Science*, May 20, 1927.) The great number of fossil remains found in the Old World, assigning man to an anthropoid simian ancestry, is now accepted for the most part by Amer. anthropologists as pointing to his origin in this quarter. The only find indicating an early New World existence was the molar tooth found in Nebraska, which the scientist Osborn in 1922 supposed to be a new species, *Hesperopithecus*. But since then certain new finds have been declared by W. K. Gregory to afford conclusive evidence that *Hesperopithecus* was neither ape nor man, and that the Nebraska tooth belonged to an extinct peccary. This upset the best evidence for an Amer. origin, and receives still more cogent refutation from the Chou Kou Tien discovery. On the question whether the recent fossil remains found in S. Africa

(1947), and now assigned to the sub-family *Australopithecinae* (of the extinct group of primates, *Australopithecus* or the S. Ape), should be grouped with the *Hominidae* or with the anthropoid apes, see under MAN.

Practical or experimental psychology may be looked upon as a div. of physical A. Such observations are difficult to carry out, and usually require the co-operation of the individual experimented upon. The character of sensations, existence of colour-blindness of any kind, and rates of nervous impulse all provide data for any future system of race-culture. In addition to these spheres of inquiry may be mentioned racial and regional pathology, embryology, vital statistics, statistics of fertility and sterility. The subject of human biology, and evolution itself, must form part of physical A. It is obvious that no mere theorising on insufficient data will do much more than propagate errors, so that the work of anthropologists is mainly confined to the making of observations, the collection of statistics, and a general search for material, out of which future scientists may be able to build up a real science of A., which may have its value in directing the efforts of mankind towards a greater perfection, as far as the qualities which we know to be good are concerned.

*Ethnology*, or *Historical and Analytical A.*, deals with the general development of man in many directions as traced in written hist. and reliable deductions from written hist. Important among its branches is the study of sociology, which may be said to investigate the way in which communities have developed. Hist. gives us accounts of organised communities, but the business of sociology is rather to determine the causes which led to the survival of those organisations. Systems of govs. at various periods are analysed, showing how power is arrogated, or delegated by the consent of the governed. This leads to the discussion of the nature of what is called the 'social contract,' that vast mass of assumptions and unwritten laws which are necessary to make even a primitive society possible. It is desired to trace how these assumptions became valid, or rather how they emerged in the evolutionary struggle with other relationships between man and man. The development of the conceptions of duty and right seems to have progressed along the parallel lines of ethics and law, with their occasional divergence and rarer convergence under the stimulus of religious inspiration. The application of the idea of evolution is of great value in the study of sociology as of A. generally, but there are dangers which such evolutionists as Spencer, Wallace, and Huxley did not escape in dealing with the growth of ethical ideas. The tendency of the sociologist is often to dogmatise on the absolute value of social qualities, whereas such an inquiry as we are discussing should be, in the main, limited to determining the course and causes of man's development up to the present. Such doctrines as the modern

'eugenics,' for example, must not be looked upon as the legitimate offspring of evolutionary sociology, for it is shown that even physical qualities, and still more moral qualities, are transmitted from age to age across great distances, and are not dependent upon the efficiency of the individual. Certain special aspects of social relationships need to be studied, such as the development of marriage laws and conventions, and restrictions as to consanguinity, the grouping and separating effects of war, commerce, and colonisation. In dealing with these latter, sociology must go still deeper than history: it has to estimate the effect of war on the social relationships of the conquered as well as the conquerors, to trace perhaps, where an apparently obliterated social tendency recurs in a mixed people, the result of a fusion of the victors with the defeated. It is to be observed that the anthropologist has to deal with the individual as well as the social organism, and the correcting influence of either study may save him from the liability to error of the sociologist as such.

Technology is a branch of ethnology involving the study of the origin and growth of the utilitarian and aesthetic arts. Among savage races we can find the rudimentary tools and appliances which have become elaborated into the mechanisms of the civilised world. The original tool was probably a stone or cudgel which was used indifferently for digging, striking, piercing, grinding, or cutting. The way in which this primitive tool becomes differentiated is illustrated in the objects associated with the stone, bronze, and iron ages, as well as in the appliances of savage tribes of our own day. Such a development as the means of transport can be traced by survivals in the United Kingdom alone. The earliest means of transport was of course the 'human beast of burden,' carrying or dragging, after which animals were pressed into the service. In Scotland, Ireland, and Wales there are still to be found carts without wheels, ranging from a single pair of poles to a vehicle with a permanent receptacle for goods. The built-up wheel was a later development which led naturally to a considerable increase in size. Other branches of technology can be studied by reference not only to ancient accounts and drawings, but also to curious survivals of our own day, due in some cases to peculiarities of circumstances, and in others to the fact that even in highly civilised countries there are some secluded spots which have escaped the struggle for survival, and which therefore preserve ideas and contrivances which have long been obsolete elsewhere.

The study of religion is of prime importance in ethnology. It is desired to investigate the psychological origin and development of religion: personal, family, tribal, and world religions: animism, fetishism, polytheism, monotheism, and atheism; mythology and mythogeny; symbolism and religious art, sacred places

and objects; rites, ceremonies, and mortuary customs; religious teachers, classes, and doctrines; theocracies; analysis of special religions; philosophy and natural list of religions.

Psychologists, particularly in Germany, have long been engaged in seeking to explain religion by the phenomena of mind, and to trace it back to its origin. Comte described the primitive religious feeling as the consciousness which man has of the life in him being shared by all external bodies. It has been suggested that the consciousness of life in man and animals as distinct from inorganic matter first gave the idea of a higher power or potency. Some, like Grant Allen, have thought that the phenomenon of death first stimulated the idea of 'something, not ourselves' which may depart without any visible sign, and that worship really started with the idea of propitiating the thing that might come back and resume its power over the body. To this fear was attributed also the origin of putting cairns or large stones over the corpse to make it secure. That the religious feeling originated at a very early stage in man's conscious life is evident from the fact that no savage tribe of to-day, no matter how low their organisation, appear to be absolutely devoid of a religious idea.

Yet another branch of ethnology is the study of linguistics. This may be divided up into the following fields for research: gesture and sign-language, spoken language, parts of speech, logic of grammar, origin, growth, and classification of languages, relation to ethnography; written language, pictographic, symbolic, ideographic, and phonetic writing, evolution of alphabets, phonetic systems; forms of expression, poetic (metrical and rhythmic), dramatic, and prosaic.

The importance of language in the development of the human race cannot be overestimated. It is here that evolution is most gradual, and least susceptible to acute crises amongst all the records of human progress. Changes there are in plenty, but they follow such well-recognised tendencies that language may be said to be a science with definite laws, and the evidence of language is of great value in determining past movements of masses of the human race. The origin of language undoubtedly was the desire for communication, and it is the possibility of communication in fairly definite terms which has enabled man to inherit from his predecessors their stores of knowledge and to co-operate with his contemporaries in all those forms of collective activity which are increasingly characteristic of man's development. Communication can be established by pictorial illustration (the origin of writing), by gestures and movements of the face, and all these have been employed and are still employed by certain sections of mankind. But the greater economy of the voice, the fact that speaking left the hands free to be engaged in other work, favoured that means of communication in preference to any other. How far

imitation was the directing principle in the production of the first words is difficult to estimate; probably most language originated in conventional expressions with any sort of authority, evolution deciding which should survive. In graphical illustration, imitation is less difficult and more expressive, but even here we find the need for economy gradually determining the evolution of the picture into a conventional symbol; and the restriction of the number of symbols to an alphabet is simply the result of the recognition of the possibilities of the permutations and combinations of a limited number of symbols.

Ethnology also includes the study of folklore, embracing traditional customs and narratives, folk-sayings, superstitious beliefs and practices. The origin of many traditional narratives may undoubtedly be found in myths explanatory of religious and natural phenomena. The philological school of folklorists made the mistake of associating the folk tradition with the myth when the connection had long ceased to exist. In their development through different ages and peoples folk traditions have received sundry additions and undergone many modifications, sometimes with and sometimes without a parabolic intention. The foundation of the Folklore Society in England in 1878 did much to stimulate the collection and comparative study of folklore in this and other lands.

*Ethnography* includes the study of people on a geographical basis, and is therefore closely allied with ethnology. It may be divided into *general ethnography*, which discusses the origin, characteristics, and sub-divs. of races and peoples, 'geographical provs.' or 'areas of characterisation,' anthropo-geography, and lines of migration and national intercourse; and *special ethnography*, which divides up the races for special study, as the Eurasiatic or white race (N. Mediterranean and S. Mediterranean branches); the Austriatic or black race; the Asian race (Sinitic and Sibiric branches); the Amer. race; insular and littoral peoples (Negritic, Malayic, and Australic stocks).

The colour of the complexion or of the hair and eyes, the blood group, the conformation of the cranium, nose, jaw, or the skeleton generally, and tests of mental capacity or the accuracy of the senses have all been suggested at various times as means of differentiating racial groups. Colour is the most conspicuous of all criteria and Linnaeus (1707-78) made this the basis of his div. Until 1900 all broader ethnographical classifications followed these lines. The work of Deniker and F. Müller, however, introduced a change, and in the most recent scientific classification the characteristic types of hair are regarded as more important than skin pigmentation. The so-called 'racial science' exploited for political ends in recent years has its roots in a scientifically untenable identity between race and language ('Aryan,' 'Germanic'), and it should be the aim of every true scientist to oppose this practice.

In many ways ethnography will only differ from ethnology as being a scheme of attack, and anthropologists have found that the method of selecting one area for exhaustive study has been productive of good effects, and a good collection of anthropological material, accurate in detail and free from rash generalisations, is rapidly being accumulated. Among special considerations in ethnography may be mentioned the necessity for acclimatisation and the influence of climate on races, individuals, and institutions.

The last great div. of the subject is *Archæology*, which deals generally with antiquities, especially with material remains. General archæology deals with the geology of the epoch of man, glacial phenomena, diluvial and alluvial deposits, physical geography of the Quaternary, prehistoric botany and zoology; the prehistoric ages, the Stone (Palæolithic and Neolithic), Bronze, and Iron Ages; prehistoric commerce, palæoethnology, and the proto-historic epoch. The chief sub-divs. of special archæology are Egyptian, Assyrian, Babylonian, Chinese, Græco-Rom., medieval, and Amer. archæology.

Numerous societies are now in existence for the purpose of archæological research, and, although the study was originally looked upon as a mere aid to the elucidation of classical literature, and afterwards as a means of recovering objects of great artistic value, its place in the science of A. is now assured. Many stages in the development of savage races of modern times have been well illustrated by objects recovered from the Stone, Bronze, and Iron Ages, for it must not be forgotten that in the present time there are peoples who have not yet emerged from what is often looked upon as a purely prehistoric condition. See also *EVOLUTION; MAN*.

**Anthropomorphism**, a word of modern adaptation, signifying the attribution of human physical and moral qualities generally to God or the gods. The most recent extension of the word is by psychologists to denote the principle according to which man is said to interpret all things through himself.

**Anthrophophagi**, a tribe of cannibals mentioned by Pliny as inhabiting a region near the Caspian Sea. They pursued the custom of eating the flesh of their aged parents in order to preserve the ancestral soul from decay.

**Anthropophagy**, see CANNIBALISM.

**Anthus**, name given by Bechstein to the pipit or titlark, of which genus there are many species. It has a slender body, notched and fairly long beak. It resembles the *Alauda*, or lark, and is related to the wagtail. The meadow, tree, and rock pipit are those best known in Britain.

**Anti-Aircraft Defence.** A.-A. D. existed in the First World War and, by 1918, consisted of under 300 guns, about 375 searchlights, and a dozen fighter squadrons. After the war, in 1922, 4 heavy A.A. brigades and 2 searchlight battalions were formed, all for London. But it was not until 1936, when the political horizon began to darken, that there was a complete A.A. Div.; and by 1938 there was a corps of 5 divs. In the year in which the Second World War broke out there were 7 divs. forming a command. A year later a formidable artillery manned by skilled gun-crews was available against the attack by the Ger. Luftwaffe. In 1943 the A.A. Command, under Gen. Sir Frederick Pile, had 2 main research stations, employing large numbers of scientists, and progress in research was very marked. An integral part of the A.A. Command was the Royal Observer Corps, the duties of which included listening with headphones and the use of a plotting instrument (or circular dial, marked with numbers and squares), on top of which is an altitude finder. These observations were reported into the telephone to a centre, the mouthpiece of the phone being fixed over the listening observer's chest. At the centre 'tellers' charted the progress of the reported aircraft, and as raiders passed out of the area of the centre the neighbouring centres were warned of their approach. The whole A.A. Command was a network of communication working in conjunction with the Royal Corps of Signals. Every gun and searchlight site was connected with its gun-operations room and the neighbouring site. Gun and light sites, observer posts, operations room, fighter sectors, and air fields were all interconnected in a labyrinth of phone cables, supplemented by radio and dispatch riders. The Royal Army Ordnance Corps supplied and maintained all the guns and instruments, lights, and generating sets of the A.A. Command.

Experience in the Second World War showed that though A.A. guns destroyed numerous raiding aircraft, the value and effect of A.A. gunfire was, generally

speaking, to keep hostile aircraft at a great height, and to prevent them from following a straight and even course necessary for accurate bombing. An important function of A.A. guns is also to indicate the position of hostile aircraft to fighters, which is done by firing rounds to burst as near as possible. Sev. times Brit. A.A. gunners shot down more than 50 Ger. planes over Britain in a week. On Aug. 15, 1940, they destroyed 23. In the first 2 years of the war some 600 were shot down by A.A. fire over Britain (as against 4000 shot down by fighter planes). In the closing stages of the war A.A. guns were most successful in winging or destroying in mid-air flying bombs projected from sites in France and the Low Countries. (See FLYING BOMB.)

The chief types of heavy A.A. guns in the war were: 4.5-in., which fired a high-explosive shell of nearly 56 lb. to a height of 8 m. in 50 sec.; and the 3.7-in. with a faster rate of fire, but a smaller shell. There were, too, 3-in. guns firing high-explosive or shrapnel shell every 3 sec. The Bofors light A.A. gun weighs 2 tons and fires anything up to 120 2-lb. shells a min. to a height of 6000 ft., bursting on impact. Lewis guns (from the previous war) proved effective against low-flying raiders. At a heavy-gun site there were normally 4 guns run by a half battery divided into 2 sections and the 2 sites might be sev. m. from each other. The guns were spaced around the sides of the gun park, and at the centre was the command post containing the predictor, the identification (or spotter's) telescope, and the height-finder. The post was in the charge of a position officer, who controlled the firing, and was responsible for identifying doubtful aircraft. He was assisted by a non-commissioned officer, who relayed his orders to the gunner. An approaching plane is first seen through the spotter's telescope. The height and bearing of the approaching craft are shouted out from the scales at the base of the telescope. A skilled gun-position assistant does not read out the height and bearing registered on the scales, but makes the necessary adjustment for a moving target. The predictor is a calculating machine which finds out the location of the aircraft, and predicts its future movements, so that allowances can be made in laying aim; and its calculations are based on information provided by the layers and partly by the height-finder, which can tell both the height of the plane and its distance from the gun-site.

The predictors transmit all necessary gunnery data, electrically, to dials on the gun, and no gun sights are used, the layers merely keeping the gun laid by following up the indications on the dials. The target is small, and so direct hits with the heavier projectiles cannot be expected, and it is necessary to rely on placing a high-explosive burst near the aeroplane to achieve effect; in the case of the low-flying aeroplanes the opportunity is so fleeting that a spray effect from a machine-gun is the only possible method of engaging it. The A.A. gun must be

capable of firing at all angles of elevation from 0° to 90°, and must have all-round traverse. The elevating and training gears must be such that the gun can be moved rapidly and smoothly, as firing is continuous once the target has been engaged, and the layers must keep the gun pointed in the right direction all the time; there is no deliberate laying and firing shot by shot, as in other forms of artillery. Owing to the speed of the target, saving of time is all-essential. Breech mechanisms must be automatic, and the muzzle velocity and ballistic efficiency of the projectile must be great, so as to reduce the time of flight to a minimum. The ammunition must be fitted with a very accurate time-fuse, as an error of one-tenth of a second causes an error in space of about 50 yds. Rates of fire are as high as 25 rounds per min. for the 3-in. gun; the target may move more than a m. between the time the gun is fired and the time the shell bursts. Searchlights (q.v.) are of great assistance to night-fighters. They indicate to them the position and course of hostile aircraft. Searchlights also expose their lights to direct to their bases home-coming aircraft which have lost their bearings. They also mark enemy mines which fall in estuaries, which they do by taking the bearing and so co-operating with mine-sweepers. Finally there are balloon barrages. The conception of balloons as a weapon of air defence began even before the First World War, the balloon aprons or nets operating as a kind of stockade against hostile planes. The stockade idea was abandoned before the Second World War and the new balloon barrage was conceived as flexible, each balloon being independent and mobile. The usual type of barrage balloon is a streamlined bag of rubber-proofed cotton fabric, with a gas capacity of 19,000 cub. ft., 63 ft. long and 31 ft. high, and weighs 550 lb., and is flown on a flexible steel cable, and can be raised in under 20 min. See also RADAR (or RADIOLOCATION).

**Antiarin** ( $C_{17}H_{15}O_6 + 2H_2O$ ), the active principle of *Antiaris toxicaria* or *Upas antiar*, a Javanese poison tree. It is intensely poisonous and is used as an arrow-poison.

**Antiaris**, botanical name of a genus of trees of the order Moraceae found in the E. Indies. The *A. toxicaria* is the upas-tree of Java, which contains a deadly poison. The is. contains volcanic valleys which emit carbonic acid gas, fatal to animals and plants.

**Antibes**, an ant. fortified seaport and health resort in the Fr. Riviera, 12 m. S.W. of Nice. It has some tobacco factories, and grows oranges and olives. Pop. 26,000.

**Antiburghers**, a name given to those members of the Secession Church of Scotland who in 1747 condemned the burgess oath, and formed the General Associate, or Anti-burgher, Synod.

**Antichrist**. It follows from the duality of the universe, a duality in which every positive has its negative, that the figure of Christ should, as the shadow follows

the sunlight, be accompanied by the idea of A. The use of the word shadow here is no chance metaphor, for though the word or words implying the idea of A. is common enough in the Jewish and the early Christian sacred writings, the anti-Messianic power is very shadowy and indeterminate. Part of this is doubtless due to the dual meaning attached to the Gk. preposition *anti*, a word implying both substitution and opposition. Thus the A. may be either a false claimant to the Messiahship or an opponent of the true Messiah. Much of the importance attached to the concept of A. in the early Christian writings arose from the fact that the idea of A. was bound up with the imminent second coming of Christ, an idea which so obsessed the early Church. With the gradual decay of the belief in a speedy second advent the idea of A. also receded in importance, and to this day the Rom. Catholic Church has never decided anything concerning his hist. or even his existence. Such a reluctance to apply the term definitely has not characterised the Protestant reformers. With Luther they did not hesitate to apply this appellation to the pope, and such a declaration is embodied in the Schmalkald articles and later in the Westminster Confession of Faith. Such an attack brought its natural reaction, in which Luther was declared by some Catholics to be A. or the 'Man of Sin.' Mohammed, the Grand Turk, and both the Napoleonic emperors of France have been identified with A. In the N.T. the word occurs only in the Epistles of John (1 John ii., 18 and 22; iv. 3; 2 John, verse 7), and here it has the significance of an antagonist to Christ, but in the synoptic gospels is found the older or Jewish conception of A. as a false Messiah. It is curious to reflect that while the Jews, especially in their later rabbinical books, regarded A. as one who should arise among the Gentiles and whose presence and teaching would be inimical to the faith and race of Israel, on the other hand Paul the apostle, who had to bear the brunt of Jewish opposition to the new faith, and other early eschatologists personify A. as a Jewish pretender. Thus to the devout Judaist A. was known as Armilos, or Armillus, an equivalent for Romulus, i.e. Rome. The early Christians, struggling for their belief against their Jewish persecutors and believing in the early return of the Founder of their faith, gave ready ear to prophecies which depicted A. as a Jew, who should rebuild the Holy City and by his signs and wonders gain the allegiance of the multitude. Enoch and Elijah should with a faithful few withstand the pretensions of this false prophet; and in the end he should be finally overthrown by the true Christ. It is against this impostor that Paul warns the Thessalonians in his second epistle to them (2 Thess. ii.). The march of time brought with it the persecution of both Jews and Christians by imperial Rome, and the role of A. was attributed by both parties to the mad Caligula and the fiendish

Nero. Thus Rome was bound to be the fourth kingdom foretold by Daniel, and in the then growing apocalyptic literature of both religions the dragons and beasts therein described came naturally to be associated with the persecutors of their faiths. The number of the Beast '666' (Rev. xiii. 18) was identified with Nero by the Christians. Finally, it is necessary to emphasise the fact that A. is not depicted as Satan himself, but merely the human representative of Satan, as Christ was of God.

**Anticlimax** is a rhetorical figure in which the expressions, after rising in intensity, suddenly fall to a lower level, producing a ludicrous effect. It is allied to bathos and opposed to climax.

**Anti-Comintern Pact.** This pact was signed by Germany and Japan in Berlin on Nov. 25, 1936, being, ostensibly, an agreement for mutual defence against Communist subversive activities. In its preamble, the agreement refers to the aim of the Communist International, known as the Comintern, to disintegrate and subdue existing states by all the means at its command and records the conviction of the signatories that the interference by the Communist International in the internal affairs of the nations 'not only endangers their internal peace and social well-being but is a menace to world peace.' By the first of the three articles of the agreement, the 2 countries agreed to inform each other of Communist activities and to collaborate in preventive measures; by the second article they agreed jointly to invite other states, whose internal peace was threatened by the International, to come into the agreement; and by the third article the agreement was to remain in force for 5 years 'but before expiration the parties would come to an understanding for the further method of their co-operation.' In a supplementary protocol the parties agreed that their competent authorities should 'within the framework of the existing laws take severe measures against those who at home or abroad were engaged in the service of the Communist International or promoted its subversive activities.' In Jan. of the following year a standing committee was formed under the terms of the pact 'to consider and discuss the further defensive measures necessary for the struggle against the subversive activities of the Communist International.' On Nov. 6, 1937, Italy announced that she had joined the pact and the supplementary protocol, Count Ciano saying: 'With the signing at Rome of the three-power pact, three great nations engage themselves against the snares of Bolshevism. The pact has no hidden aims. It is directed against no one and is open to all states which wish to associate themselves with it. It is an instrument placed at the service of peace and civilisation, which Fascism intends to safeguard against all menaces.' The Soviet at once informed Italy that her adherence was contrary to the Russo-It. agreement of 1933

and was an unfriendly act (under that agreement each country undertook to continue its policy of reciprocal non-interference in the internal affairs of the other; not to take up arms against the other; to remain neutral in any war between the other and a third power; and to abstain from any political agreement with a third power calculated to prejudice the other). Nothing, however, came of this protest and a year later (Jan. 1939) Hungary joined the pact and, still later in the year, Franco's Sp. Gov. also joined. Public opinion in the W. democracies condemned the pact as a thinly disguised alliance, designed, not to combat a comparatively innocuous body, but to pursue, in common, a policy of aggression against any states which might not be able to resist absorption—in short, a pact to overawe and dominate the world—the other adherents being merely catpaws. It is true that in the years following the close of the First World War, the Soviet directed a continuous stream of propaganda against capitalist countries—particularly against Great Britain—and continued to do so even after undertaking to cease such activities; but while, in its inception, the A.-C. P. may conceivably have been actuated by a desire to crush Communism, the success which attended the aggressive policy of Japan, Italy, and Germany against defenceless countries convinced the 'Western democracies'—as they were now derisively described in the totalitarian press of Germany and Italy—that the pact had long since lost its original *raison d'être* or pretext and was now a barely disguised military alliance between, at least, Germany and Italy—with the possibility that Japan would only be restrained from participation in joint aggressive action against the W. powers if overawed by America. In the course of 1939 Germany and Italy announced that they had effected a military alliance but, as was anticipated, Japan declined to join the alliance, the reasons for her abstention being the movement of the U.S. fleet from the Atlantic to the Pacific during the crisis consequent on the rape of Czechoslovakia, and the negotiations between Great Britain and Russia for a mutual pact of defence.

The Russo-Ger. treaty (Sept. 29, 1939) was a severe rebuff to Japan for apparently it stultified the A.-C. P., though the terms of the pact were as vague as they were menacing, and therefore might mean much or little. Japan and Germany were, however, brought into some kind of alliance by the pact of Berlin (q.v.), and Germany even invited Russia to join this alliance; but the Kremlin had not forgotten the A.-C. P. The Fascist powers had always made considerable propagandist use of the 'threat' of the Comintern and its Communism, whereas, in fact, the role of the Comintern had been declining ever since the early days of the Russian revolution. The Kremlin now (1943) at length appreciated that the Comintern was more of a liability than

an asset to the Soviet Union, at least while prosecuting the war, and accordingly it was dissolved by a resolution of the executive committee of the Communist International, at Moscow (May 15, 1943)—an astute move and one which was evidently disconcerting to the Axis.

**Anti-Corn Law League** was formed in 1838-39 at Manchester. Its object was to effect the repeal of the corn laws in Britain. The cause was promoted by oratory and by a special paper called *The League*, and among its leading supporters were Cobden, Bright, and Villiers. It dissolved itself when its object was achieved in 1846-49.

**Anti-corrosive**, a material employed to prevent the rusting of iron when exposed to moisture or other harmful influences. As. are of 2 classes: protective, such as an application of hot tar or some magnetic oxide of iron; and galvanic, such as a coating of zinc or some other electropositive metal to which the corrosion is transferred.

**Anticosti**, an is. in the gulf of St. Lawrence, which it divides into 2 channels. It is low-lying and sterile, though there are considerable salmon, trout, and herring fisheries, and seal and bear hunting. It is 140 m. long and 30 broad. In 1896 it was purchased and stocked as a game preserve by M. Menier.

**Anticyclone**, an atmospheric system marked by an area of high barometric pressure, caused by descending air, and surrounded by circular isobars. The descending air becomes warmed and dried, and transmits radiation freely. Hence anticyclonic weather is marked by clear air and frost in winter and by blue sky and heat in summer, with heavy dews. The centre of the system is calm, but winds blow out from it spirally, in the N. hemisphere in the direction of the hands of a watch, and in the opposite direction in the S. hemisphere.

**Anticyra** was the name of 3 tns. of ant. Greece, 2 of which were noted for hellebore, the ant. remedy for insanity.

**Antidotes**, medicines that relieve or remove the symptoms caused by poison. An A. may be *chemical*, i.e. one that changes the nature of the poison so as to make it insoluble or harmless; *mechanical*, i.e. one that prevents absorption by holding the poison in mechanical suspension, or by coating the stomach; or *physiological*, i.e. one that counteracts the physiological effects of a poison. A *universal A.* is provided by mixing 1 part of dissolved iron sulphate with 2 parts of magnesia water.
